On Early Discovery of Mathematically Creative Children using Artificial Neural Networks Modeling (with a case study)

H.M. Mustafa

Faculty of Engineering, Albaha University, KSA

mustafa_hasan47@yahoo.com

Abstract: Learning creativity is an interesting educational phenomenon usually observed at children classrooms. Early discovery of individual children having mathematical creativity is a challenging interdisciplinary research issue. This piece of research focuses on quantitative analysis and evaluation of mathematical learning creativity on the basis of acquired “Subjective Domains of Experiences” (SDE) inside children's brain. Acquisition of (SDE) assumed to modify a children's stored experience via application of various multimedia Computer Assisted Learning (CAL) packages (modules). Accordingly, fairly assessment of mathematical learning time response has been adopted herein for analysis and evaluation of learning creativity acquired by (SDE). By some details, early discovery of creativity could be performed well in accordance with obtained learning assessment results. That is after solving correctly a suggested mathematical topic (at children classrooms). Furthermore, interactive interference between Reflective and Spontaneous Vorstellungen* during mathematical education has been simulated using supervised and autonomous Artificial Neural Network (ANN) learning paradigms.

* The German word Vorstellungen is used in replacement of the vague English expression “internal representation” [H.M. Mustafa On Early Discovery of Mathematically Creative Children using Artificial Neural Networks Modeling (with a case study). Journal of American Science 2011;7(6):418-429]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Learning Creativity Phenomenon ,Artificial Neural Network, Vorstellungen, subjective domain of experiences, Computer Assisted Learning.

1. Introduction

The field of educational sciences is represented by a growing community internationally. Many educational experts now recognize that conventional ways of conceiving knowledge, educational systems and technology-mediated learning are facing increasing challenges [1]. That is due to rapid technological and social changes arise in this time considering modified educational field applications [1-3]. Quantitative evaluation of learning creativity phenomenon is an interesting, challenging, and interdisciplinary research issue associated with educational field applications and activities [4&5]. So, for long time ago and till recently, educationalists as well as psychologists have been cooperatively interesting in systematic searching for quantified analysis, and evaluation of that interdisciplinary issue. Accordingly, for quantifying learning creativity phenomenon, an interdisciplinary research work integrating : cognitive and educational sciences, with educational psychology and neurobiology has been adopted recently [3&4]. More specifically , this piece of research focuses on quantified analysis, and evaluation of mathematically creative children using a novel interdisciplinary approach. That is by adopting application of realistic Artificial Neural Network (ANN) modeling of acquired children's “Subjective Domains of Experiences” (SDE) [6]

,which build up mathematical learning creativity (at children classrooms). Furthermore, presented ANN models simulate realistically two types of internal children's brain representations Reflective and Spontaneous (Vorstellungen). Respectively these two types have been modeled by ANN as supervised and autonomous learning paradigms. Interestingly, both types of “Vorstellungen” together form individual children's (SDE). It is worthy to note that: intuitive “common-sense” and a conscious knowledge of rules and facts are basically considered in order to perform well development of (SDE) [6]. By some details, both presented ANN models are simulating two types of internal children's brain representations (Vorstellungen) Reflective and Spontaneous.

Referring to Meissner [6], it is announced by words that (“Reflective Vorstellungen” may be regarded as an internal mental copy of a net of knowledge, abilities, and skills, a net of facts, relations, properties,..... etc. The development of "reflective Vorstellungen" certainly is in the center of mathematics education. To reflect and to make conscious are the important activities). Moreover, spontaneous Vorstellungen mainly develop unconsciously or intuitively. Consequently, both presented ANN models are inspired mainly by realistic request to statistical analysis of learning response time according to dynamical internal representations of children's brain, (See Appendices

I&II). By more details, that analysis obtained in accordance with response time assessment results, after solving correctly the presented mathematical topic problem "How to solve long division problem?". Its correct solution is performed well following sequential steps: Divide, Multiply, Subtract, Bring Down, and repeat (if necessary) (See appendix III). A special attention has been developed herein towards comparison between two types of children's brain internal representations (Vorstellungen) considering statistical average of learning response time, and learning rate values.

Conclusively, obtained simulation results revealed the superiority of Spontaneous Vorstellungen over Reflective Vorstellungen in improvement of quantifying mathematical learning creativity provided by (SDE). Moreover, two ANNs design parameters: gain factor (of neuronal sigmoid activation function), and learning rate value, proposed for quantified assessment of mathematical learning creativity. Additionally, effective impact on creativity improvement observed by neurons' number increase via dynamical synaptic connectivity (internal brain Plasticity) during interactive learning process.

The rest of this paper is organized as follows. The basic concept of creativity and its close relation with human brain cells (neuronal and Glial) is presented at the second section. At the third section, general model illustrating concepts of Vorstellungen its relation with diverse ANN learning paradigms are presented. The obtained results for brain functions (number of neurons) in addition to the effect of design ANN parameters on learning performance are illustrated at the fourth section. At the fifth section, some interesting conclusive remarks are introduced.

Finally, by the end of this paper, four attached illustrative Appendices are given as follows. At APPENDIX I, a simplified macro level flowchart describing algorithmic steps for simulation learning programs is presented. Two lists of simulation programs for both Vorstellungen types (Reflective and Spontaneous) are shown at APPENDIX II (A&B). At APPENDIX III, a simplified flowchart for Computer Assisted Learning (CAL) packages for suggested mathematical topic problem "How to solve long division problem?" is presented. Furthermore, three print screens samples representing obtained results after running of designed time response assessment program, are shown at APPENDIX IV.

2. Creativity and Brain Function

This section is dedicated to introduce a general clarification about what is meant by creativity and its close relation with human brain. According to recently published article by Dr.Linda Karges-Bone,[7], it is announced that "creativity is the spark

that never burns out". Functionally, true creativity is defined to have a goal, a purpose, and an outcome [8]. Both declared evidences are well supported by more recent research results suggests that fresh neurons arise in the adult brain every day and that the cells ultimately help with learning complex tasks—and the more they are challenged, the more they flourish [9]. By more details, thousands of new cells are generated in the adult brain every day, particularly in the hippocampus, a structure involved in learning and memory. Moreover, during a period of two weeks, most of those newborn neurons will die, unless the animal is challenged to learn something new that is a learning task. In other words, by more neural interconnections learning creativity emerges. That is resulting in more extended brain capacity for neural plasticity over time [10]. Recently, some research papers are published describing quantifying of main brain functional phenomena (learning and memory)[11-16]. Moreover, researchers need essentially to know how neurons synapses inside the brain are interconnected together and communication between brain regions,[17].

In some details, at any instant brain state (synaptic weight pattern) in neural systems leads to some expected spontaneous behavioral response to any of external stimuli. So, dynamically changes of weight synaptic pattern (vector) measures the learning convergence process in consequence with internal / stored level of intelligence. Consequently, the initial brain state of synaptic connectivity pattern considered as pre-intelligent creativity parameter.

In addition to above clarifications about neurons at hippocampus brain area, interesting analysis for the effect of brain Glial cells on learning performance (convergence time factor) is shown at Fig.1, in below. It illustrates mutual inter-communication among Glial cells and typical neuronal brain cells. Noticeably, increasing of synaptic connectivity value is measured as ratio between number of Glial cells versus number of typical neuronal cells. This ratio leads to improvement of learning performance time factor [4][15][16] that considered as number of training cycles. For more details, it is referred to[4],and other references therein is recommended.

3. Effect of Gain factor values on Learning Performance

3.1 Effect of Gain factor values on Learning Convergence time

The obtained results for various gain factor values are comprehensively shown (in a statistical graphical form) at Figure 2.

Fig.1: Illustrates the relation between number of training cycles during learning process and the synaptic connectivity (weights) values (adapted from [4]).

Fig.2. Illustrates improvement of average response time (no. of training cycles) by increase of the gain factor values (adapted from[13])

The above results illustrate gain factor effect on improving the value of time response measured after learning process convergence [13]. These four graphs depicted at Fig.2 are concerned with the improvement of the learning parameter response time (number of training cycles). That improvement observed by increasing of gain factor values (0.5, 1, 10, and 20) that corresponds to decreasing respectively number of training cycles by values (10, 7.7, 5, and 3) cycles, (on approximate averages). Conclusively, Learning creativity is virtually improved by such increase of gain factor values.

3.2 Effect of Gain factor values on Learning Achievement (Scores)

At Fig.3, the effect of increasing number of neurons contributing to learning process_(Inside a child's brain) on learning achievement (scores) is illustrated. That is considering Spontaneous

Vorstellungen for different gain factor values (0.5, 1, 2).

Fig.3 Illustrate learning performance accuracy versus different gain factor values. Shown results obtained at #cycles = 300 and Learning rate = 0.3 (adapted from Hassan & Ayoub [18]).

4. Modeling of Vorstellungen

4.1 General Interactive Block Diagram

Generally, practical performing of interference between Reflective and Spontaneous Vorstellungen utilizes two basic and essential brain cognitive functions[18-21]. Firstly, pattern classification /recognition function based on visual /audible interactive signals stimulated by CAL packages. Secondly, associative memory function is used which originally based on Pavlovian classical conditioning motivated by Hebbian learning rule[19]. Referring to Fig.4, it illustrates a generally modeled block diagram that well qualified to perform simulation of internal brain cognitive functions. At this figure, inputs to Vorstellungen learning model are provided by spontaneous environmental stimuli (autonomous learning).The correction signal, in case of learning under supervision is given by responsive output reflective action of the model. It would be provided to ANN model by either spontaneous (autonomous) learning signal (environmental conditions)or by teacher's reflective (supervision) signal. Interestingly, tutor plays a role in improving the input data (stimulating learning pattern), by reducing noise and redundancy of model pattern input. According to obtained realistic simulation results; tutor's experience concerned with either conventional (classical) learning or CAL provide educationalists with relevant analysis of acquired children's (SDE). Acquiring of experience seems to be tightly related to the increasing number of neurons (inside a child's brain), contributing to learning process as illustrated by simulation results given at the fifth section.

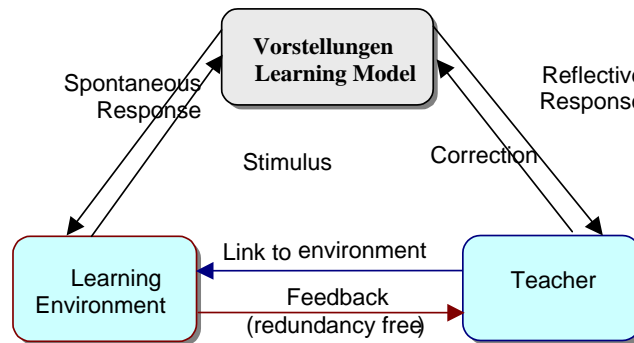

Fig.4: A generally modeled block diagram for interactive interference between Reflective and Spontaneous Vorstellungen in mathematical education.

4.2 Basic ANN Model

Searching for an optimal Reflective and Spontaneous Vorstellungen is inspired by realistic cognitive simulation of classical mathematical teaching as well as computer assisted learning (CAL) performance. By using relevant Artificial Neural Network (ANN) learning model, fairly learning assessment for adopted mathematical topic problem topic has been performed. Consequently, optimal evaluation of mathematical creativity via analysis of fairly obtained simulation results.

At Fig.5, a general block diagram for an ANN learning/teaching model is depicted. It presents realistic simulation of two diverse learning paradigms. Both concerned with interactive tutoring / learning process as well as self-organized learning. The first paradigm is concerned with classical (supervised by tutor) learning observed at our classrooms (face to face tutoring). Accordingly, this paradigm proceeds interactively via bidirectional communication process between a tutor and his learner(s) [18]. The second paradigm performs self-organized (unsupervised) tutoring process [19]

Fig.5: Generalized ANN block diagram, adapted from Hassan [5].

Referring to Fig.5, the error vector at any time instant (n) observed during learning processes is given by:

$$\bar{e}(n) = \bar{y}(n) - \bar{d}(n) \tag{1}$$

Where $\bar{e}(n)$ is the error correcting signal controlling adaptively the learning process, $\bar{x}(n)$ is the input stimulus, $\bar{y}(n)$ is the output response vectors, and $\bar{d}(n)$ is the desired numeric value(s).

The following equations are easily deduced:

$$V_k(n) = X_j(n) W_{kj}^T(n) \tag{2}$$

$$Y_k(n) = \varphi(V_k(n)) = (1 - e^{-\lambda V_k(n)}) / (1 + e^{-\lambda V_k(n)}) \tag{3}$$

$$e_k(n) = |d_k(n) - y_k(n)| \tag{4}$$

$$W_{kj}(n+1) = W_{kj}(n) + \Delta W_{kj}(n) \tag{5}$$

Where X is input vector, W is the weight vector, φ is an activation (odd sigmoid) function characterized by λ as gain factor and Y as its output. e_k is the error value, and d_k is the desired output. Noting that $\Delta W_{kj}(n)$ is the dynamical change of weight vector value connecting the k^{th} and j^{th} neurons. Eqs. (2-5) are commonly applied for both the supervised (interactive learning with a tutor), and the unsupervised (learning through students' self-study) paradigms. The dynamical changes of weight vector value for supervised phase are given as following:

$$\Delta W_{kj}(n) = \eta e_k(n) X_j(n) \tag{6}$$

where, η is the learning rate value during learning process. However, for unsupervised paradigm, the dynamical change of weight vector value is given by:

$$\Delta W_{kj}(n) = \eta Y_k(n) X_j(n) \tag{7}$$

Noting that $e_k(n)$ in (6) is substituted by $y_k(n)$ at any arbitrary time instant (n) during learning process. At next section, some previously published simulation results are given, after running of two MATLAB programs. Their general common

flowcharts are shown at APPENDIX I. Furthermore, the two program listings are given at APPENDIX II (A&B).

5. Results

Referring to previously published work [20] that deals with analysis and evaluation of learning convergence time using ANN modeling. Therein, it is declared that application of technologically improved educational methodologies implies increasing of learning rate values. More recently, an interactive realistic educational model is presented for assessment of children's response time as learning convergence time parameter[21].

That results in better learning performance quality by minimizing of learning convergence (response) time. Therefore, application of presented three teaching methodologies (classical , CAL multimedia modules with visual and with simultaneous auditory and visual tutorial materials).That could be considered as three deferent educational technology levels (representing three teaching methodologies). Consequently, those three methodologies may be mapped (virtually) into three analogous learning rate values. More specifically, the

three values(η) =0.05, 0.1, and 0.3 present virtually analogues mapping of the three levels of children's acquiring (SDE): Reflective (classical) , Partially Reflective/ Spontaneous (CAL with visual) ,and Spontaneous (CAL with simultaneous auditory and visual materials) . At Fig.6&7, graphical illustration of obtained simulation results for learning performance considering two case of Vorstellungen (Reflective and Spontaneous). The simplified flowchart of computer simulation program for assessment of time response values (at three different learning rates (η) =0.05, 0.1, and 0.3) is given at APPENDIX I . The comparison between Reflective & Spontaneous Vorstellungen for learning time response is presented at Fig.8. Moreover, tabulated comparative results are given at Table.1. Furthermore, at Table. 2., comparison between considering Output Achievements and Responsive Learning Rate .Finally, Relative improvement of Responsive Learning Rate ratio fulfilled by Spontaneous versus Reflective Vorstellungen is given at Table 3.

Fig.6: Illustrates Reflective Vorstellungen performance & time factor with considering three different learning rates: 0.05,0.1, and 0.3 for gain factor = 0.5.

•Fig.7: Illustrates Spontaneous Vorstellungen performance & time factor with considering three different learning rates: 0.05,0.1,and 0.3 for gain factor = 0.5.

Fig.8: Illustrates comparison between Spontaneous and Reflective Vorstellungen performance associated with learning response time.

Table 1. Illustrates time response comparison between Spontaneous and Reflective Vorstellungen for different number of neurons contributing in learning process.

Number of Neurons contributing in learning	3	5	7	9	11	14
Reflective Vorstellungen	79.7	61.8	36.9	19.8	14.8	7.3
Spontaneous Vorstellungen	56.5	36.7	19.5	10.7	6.7	3.9
Relative Response Time Gain factor	1.41	1.68	1.89	1.85	2.21	1.9

Table 2. Illustrates comparison between Spontaneous and Reflective Vorstellungen considering Output Achievements and Responsive Learning Rate provided that: Gain Factor = 1.5, Learning Rate=0.05, #Learning Cycles=500.

# Neurons	Output Achievements (Scores)		Responsive Learning Rate	
	Spontaneous Vorstellungen	Reflective Vorstellungen	Spontaneous Vorstellungen	Reflective Vorstellungen
2	50.31	49.3	0.87	0.62
3	63.39	62.76	1.21	0.82
4	74.47	71.5	1.55	1.02
5	79.9	78.53	2.28	1.38
6	87.04	86.74	3	1.73
7	92.07	90.92	4.65	2.48
8	94.52	93.28	6.3	3.22
9	96.61	95.9	8.57	4.3
10	97.43	96.83	10.83	5.38
11	98.34	97.83	15.23	6.78
12	98.81	98.49	19.62	8.21
13	98.84	98.69	22.18	10.28
14	98.93	98.79	24.73	12.35

Table 3. Illustrates Relative improvement of Responsive Learning Rate ratio fulfilled by Spontaneous versus Reflective Vorstellungen for different number of neurons contributing in learning process.

# Neurons	2	3	4	5	6	7	8	9	10	11	12	13	14
Spontaneous Vorstellungen	0.87	1.21	1.55	2.28	3	4.65	6.3	8.57	10.83	15.23	19.62	22.18	24.73
Reflective Vorstellungen	0.62	0.82	1.02	1.38	1.73	2.48	3.22	4.3	5.38	6.78	8.21	10.28	12.35
Relative improvement of Responsive Learning Rate (Ratio)	1.4	1.48	1.52	1.65	1.71	1.88	1.96	1.99	2.01	2.25	2.39	2.16	2

6. Conclusion

This interdisciplinary research work motivated mainly by two recently published research results: firstly, about internal brain representation (Vorstellungen)[6] and secondly, about the study Einstein's brain based on other half of the brain Glial cells effect in providing creative performance[14]. Moreover, the analysis and evaluation virtual improvement of learning creativity obtained of

performance quality for any CAL module is frequently measured after investigational analysis of obtained educational field results [13].

Above presented assessment approach provides educationalists with unbiased fair judgment tool for quantitative measurement of learning creativity based on comparison between Spontaneous versus Reflective Vorstellungen. The obtained results seem to be promising for future extension research work to

get more elaborate investigational analysis and evaluation of issues related to learning creativity phenomenon. Furthermore, it is worthy to adopt using realistic implementation of ANNs modeling, as a relevant simulation tool for evaluating other observed educational field phenomena issues.

Corresponding author s email: mhasheminia@riau.ac.ir

Abstract: Rice product after wheat has special importance as the second agriculture strategic product. Rice weevil as one of the most important stored pest has the main role in losses of stored product. So in this research, the pest effects was studied on 4 common varieties of rice in Guilan province "Taroum, Hashemi, Ali kazemi and Dylamani" in two conditions of facultative and obligatory nutrition. Results showed that Taroum variety was the most sensitive variety in conditional of facultative and obligatory nutrition and after it Hashemi variety was in the second category and had significant difference with Taroum variety. Ali kazemi and Dylamani varieties didn't have significant difference with together and had the lowest sensitive.

[Seyedeh Masoomeh Hasheminia. The study of food preference of *Sitophilus oryzae* L.on common cultivars of rice in Guilan province. Journal of American Science 2011;7(6):430-434]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: Rice weevil, Food preference, Rice varieties

1. Introduction

Regarding production, rice is the second important agricultural product after wheat. Paddy lands under cultivation are approximately 628000ha. Province of Guilan with 200000ha land under cultivation has the second rank regarding rice production after Mazandaran which has 201000ha land under cultivation. Rice is traditionally the main food in Iran which meets 13% of required calorie. Mean per capita consumption of rice in the world equaled to 81.3 Kg in 2003 per capita, consumption of rice in developing countries is 98.5 Kg whereas per capita consumption of rice in Asia equals to 119Kg and Iran equals to 53.5 Kg. National organization of rice research has performed measures in the area of preservation and increasing rice production which resulted in performance increase from 2-4 ton/ha. Some of these measures are as follows: 1-Introducing high yield varieties which resulted in 7 ton performance increase in some varieties such as Sepidrood, Amol3, Khazar, Neda, Nemat and so on. 2- Creation and development of mound brook reservation in order to decrease seed density as well as proper control of reservoir irrigation, using plastic cover at reservoirs in order to prevent damage of early spring cold. 3- Useful recommendation about amount, time and application way of fertilizer based on soil properties and the needs of cultivated varieties. 4- Introduction, planting, preserving and harvesting and keeping performance at storage conditions by decreasing damages to pest. Recent investigation has shown that paddy storage loss contains a high percent. Based on research result, proper storage management can have a basic role in decreasing storage loss and most of the wastage in due to weak storage conditions

and lack of protective qualifications against rodents and birds attack. Result has shown that usually there is 4% of paddy loss at current stores (Anonymous, 2000). Weevils of wheat and rice are cosmopolite insects which are most spread worldwide due to international exchanges. However distribution of wheat weevil is limited to cold and moderate areas whereas rice weevil is seen at tropical and semitropical areas. These pests feed on grains such as wheat, barley, rye, corn, sorghum and cause heavy loss (Bagheri-Zenouz, 1996). Storage pests attack as well as ignoring principles of stored products protection sometimes results in quality loss. Consequently chemical composition, color and taste of such products change and become low quality and sometimes completely useless. In general keeping storage preparations either economically or sanitarly based on technical and scientific principles is very important. In this regard not only establishment of proper stores but also recognizing pests and prevention ways is necessary (Anonymous, 1989). The most important damage caused by rice and wheat weevils is related to their larvae. Adults feed on seeds during life (Bagheri-Zenouz, 1996). Cogburn (1978) investigated viability of rice weevils as well as two other pests of these products against six varieties of rice and concluded that seed content is a determining factor in different insect's responses (Cogburn, 1978). Bernabe and Bernardo (1976) have done food preference tests on rice weevils in order to determine resistance mechanisms of ten varieties of corn against them. They observed differences in the seed varieties regarding spawning point and found that feeding on some varieties resulted in decreasing reproduction of adults, body weight and the number of progeny (Bernabe et al.,

1976). Singh and Thapar (1998) investigated resistance of six varieties of rice against rice weevil and realized that varieties Jaya and IR8 had lower senility compared to PR107, PR109, PR103 and PR108 and growth duration of rice weevil on Jaya and IR8 was respectively 41 and 42 days and on varieties of PR was 35.6-36.8 day (Singh et al., 1998). Investigating effective factors in survival and growth of rice weevil on outer layers of rice grain, Haryadi and Fleurat-Lessard (1982) observed that removing outer layers while peeling off rice had an effect on growth time of weevils so that lack of some of the outer layers such as fetus layer affected growth life of the these insects (Haryadi et al., 1982). Sarup (1991) examined the relationship between some of the food ingredients and different parameters for measuring resistance of 24 varieties of corn against *Sitophilus oryzae*; they found that percent and rate of corn loss showed a negative correlation with fat ingredients and positive correlation with sugar ones as well as tryptophan amount of rice (Sarup, 1991). Balbasi (2001) investigated food preference of rice weevil on the growth duration and least progeny of weevil during one year was the most vulnerable ones and Neda ranked average (Balbasi, 2001). Asemi (2002) examined food preference of rice weevil on different varieties of rice and found that Neda and Tarom were the most sensitive varieties to this pest (Asemi, 2002). The objective of the present study were as follow: 1- Decrease in loss due to activity of storage pests 2- Increase in farmers benefit 3- Keeping product quality during storage time and protecting seeds and their nutritious value 4- Selection and introducing the best native variety among examined varieties with respect to storage.

2. Materials and Methods

This experiment was done in two obligative and facultative food preference conditions of *Sitophilus oryzae* at fully randomized design with three replications in the fall of 2008. Means comparison was performed using multirange Duncan test by SAS and MSTATAC software. Treatments in this research contained the most common native varieties in Guilan such as Hashemi, Alikazemi, Musa Taroum and Dylamani which were exposed to obligative and facultative conditions of food preference. Experimental procedures are explained in the following section respectively:

2.1. Mass production of *Sitophilus oryzae*

Some pest damaged rice was collected to product rice weevil on different native varieties of Guilan rice. Hashemi variety was selected as the main variety and 200g of this grain was scattered at glass containers.

Some pores created at the containers lids for air ventilation and gauze was sticked on the pores. Forty pairs of male and female insects collected from rice native varieties were randomly released at the containers. In this way a lot of insects were collected during 28- 30 days before beginning of the respected experiments.

2.2. Investigation of food preference of *Sitophilus oryzae*

Rice used in this experiment was prepared from standard varieties produced by national rice research organization. These varieties included Hashemi, Alikazemi, Musa Taroum and Dylamani. Each variety was placed at single line bags. In order to disinfect the varieties, bags were placed under a large plastic cover containing pesticide pill to prevent pollution. Then the bags were opened for air ventilation. Finally rice grains were saved and sound grains were separated from damaged ones. After separating the said varieties experiment was done in two different following ways.

A- Investigation of food preference in facultative food conditions:

The objective of this experiment was to consider insect tendency for selecting the aforesaid rice varieties completely facultative so that only the insect tendency and the grain variety were effective factors in selection. In this regard a cylindrical container made from transparent polystyrene with diameter of 20 cm and high of 10 cm was selected. Then the container circumference was partitioned by four equal parts using cardboard walls. A cylindrical space was regarded for releasing insects at the center of the container. 50g of grain per experimental unit was randomly scattered inside each part. Then hundred male and female insects of 1-3 days were released at the center of experimental container. After twenty days the insects were returned to the original stub with the help of an aspirator. Since the laid eggs on the grains surface were not recognizable, the number of hatchings was considered as food preference criteria. In order to count the insects of f1 generation, every grain of different varieties was transferred to single glass containers. Containers containing f1 insects were controlled every day and the numbers of exited insects were determined followed by separating males from females and noting their counts. This experiment was performed at the temperature of $27 \pm 1^\circ\text{C}$ and relative humidity $65 \pm 5\%$.

B- Investigation of food preference in facultative food conditions:

The objective of this experiment was to know that whether forcing insects to feed on a special variety of

rice will change food preference. Again in this research some glass containers were regarded for four varieties of rice followed by removing 50g of rice grains and scattering them at the containers. Eight pairs of male and female 1-3 days insects were released at the containers using an aspirator and after twenty days feeding, these insects were transferred to the original stub.

3. Results and Discussion

A-Investigation of feeding and spawning in facultative food conditions:

1-3 days insects and counting f1 insects within 25 days, we observed that Taroum and Hashemi rice prevalently had the most average insects count. On the other hand Taroum rice was approached to its most count regarding adult insect number compared to other

rice varieties, i.e. Hashemi, Ali Kazemi and Dylamani needed more time to reach their peak regarding adult insect counts. In order to further investigate food preference on different rice varieties hatching or the numbers of male and female insects appeared on rice grains were determined and analysis of variance of data of male and female insect count in facultative releasing conditions showed a significant difference at probability level of $\alpha=1\%$. Results showed the most count of the male insects were placed on Taroum at "A" group, on Hashemi at "B" group and on Dylamani at "C" group. Similarly the most count female insects were placed on Taroum at "A" group, on Hashemi at "B" group and on Ali Kazemi and Dylamani at "C" group. These results are in line with Balbasi observations.

Table 1. Analysis of variance of male insects count appeared on different rice varieties in facultative releasing conditions

SOV	df	SS	MS	F
Treatment	3	159.427	53.142	7.407**
Error	8	1.084	0.135	-
Total	11	162.354	-	-

Table 2. Comparing means of regarded parameters for determining food preference on rice weevil in facultative releasing conditions

Variety	Mean number of male insects	Classification
Taroum	68.47	A
Hashemi	59.27	B
Ali Kazemi	19.31	C
Dylamani	17.54	C

Table 3. Analysis of variance of female insects count appeared on different rice varieties in facultative releasing conditions

SOV	df	SS	MS	F
Treatment	3	179.354	59.784	456.366**
Error	8	1.051	0.131	-
Total	11	181.451	-	-

Table 4 Comparing means of regarded parameters for determining food preference on rice weevil in facultative releasing conditions

Variety	Mean number of female insects	Classification
Taroum	84.31	A
Hashemi	72.53	B
Ali Kazemi	29.43	C
Dylamani	26.54	C

Based on analysis of variance and comparing the means of different treatment a significant difference was observed between treatments. In the facultative food conditions, the most percent of weight loss was related to Taroum followed by Hashemi, Ali Kazemi and Dylamani ranked lower but there wasn't any significant relationship between them.

Table 5. Analysis of variance of the percent of weight loss of different rice grain in the facultative food conditions

SOV	df	SS	MS	F
Treatment	3	51.471	17.157	22.024**
Error	8	6.235	0.779	-
Total	11	61.422	-	-

Table 6. Comparison between the means of percent of weight loss of different rice grain in the facultative food conditions

Variety	Rate of weight loss	Classification
Taroum	5.21	A
Hashemi	3.27	B
Ali Kazemi	1.42	C
Dylamani	1.01	C

B- Investigation of feeding and spawning in obligative food conditions:

Investigation of adult insects was observed at Taroum variety with the average of 47 insects follow by Hashemi, Ali Kazemi and Dylamani with the average of 38, 29 and 27 insect respectively. In Taroum variety the number of insects reached to its peak earlier compared to the other varieties. Female insects were counted and analyzed too. Results showed that the most count of the male insects was seen at Taroum variety followed by Hashemi while there wasn't any significant difference between the two other varieties.

Table7. Analysis of variance of male insects count appeared on different rice varieties in obligative releasing conditions

SOV	df	SS	MS	F
Treatment	3	154.421	51.473	411.784**
Error	8	1.005	0.125	-
Total	11	160.325	-	-

Table 8. Comparing means of regarded parameters for determining food preference on rice weevil in obligative releasing conditions

Variety	Mean number of male insects	Classification
Taroum	79.27	A
Hashemi	57.41	B
Ali Kazemi	27.22	C
Dylamani	25.41	C

Table 9. Analysis of variance of female insects count appeared on different rice varieties in obligative releasing conditions

SOV	df	SS	MS	F
Treatment	3	175.437	58.479	467.832**
Error	8	1.005	0.125	-
Total	11	179.223	-	-

Table 10. Comparing means of regarded parameters for determining food preference on rice weevil in facultative releasing conditions

Variety	Mean number of female insects	Classification
Taroum	95.41	A
Hashemi	84.21	B
Ali Kazemi	22.11	C
Dylamani	19.47	C

Based on classification of experimental treatments the most count of female insects was appeared on Taroum variety which showed a significant difference with other varieties and after that Hashemi variety differed significantly from the other varieties. However Ali Kazemi and Dylamani varieties were in the same group and didn't show significant difference.

Table 11. Analysis of variance of the percent of weight loss of different rice grain in the obligative food conditions

SOV	df	SS	MS	F
Treatment	3	48.274	16.091	21.744**
Error	8	5.927	0.740	-
Total	11	51.231	-	-

Table 12. Comparison between the means of percent of weight loss of different rice grain in the obligative food conditions

Variety	Rate of weight loss	Classification
Taroum	6.01	A
Hashemi	4.23	B
Ali Kazemi	1.47	C
Dylamani	1.23	C

4. Conclusion

Sitophilus oryzae L. was an important stored pest. Based on this research Taroum variety was the most sensitive variety in conditional of obligative and facultative nutrition. On the other hand Ali Kazemi and Dylamani varieties had the lowest sensitive.

Investigating the Strategies to Achieve Success in Human Resource Planning

Masoud GhorbanHosseini¹

¹PhD student, Department of Management, Saveh branch, Islamic Azad University, Saveh, Iran
masoudghorbanhoseini@yahoo.com

Abstract: Human resource planning has traditionally been used by organizations to ensure that the right person is in the right job at the right time. Under past conditions of relative environmental certainty and stability, human resource planning focused on the short term and was dictated largely by line management concerns. Increasing environmental instability, demographic shifts, changes in technology, and heightened international competition are changing the need for and the nature of human resource planning in leading organizations. Planning is increasingly the product of the interaction between line management and planners. In addition, organizations are realizing that in order to adequately address human resource concerns, they must develop long-term as well as short term solutions. As human resource planners involve themselves in more programs to serve the needs of the business, and even influence the direction of the business, they face new and increased responsibilities and challenges.

[Masoud GhorbanHosseini. Investigating the Strategies to Achieve Success in Human Resource Planning. Journal of American Science 2011;7(6):435-439]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Human Resource, Planning, Organizations, Line Management Concerns.

1. Introduction

Human resources planning refer to classic HR administrative functions, and the evaluation and identification of human resources requirements for meeting organizational goals. It also requires an assessment of the availability of the qualified resources that will be needed. Human resources planning should be a key component of nearly every corporation's strategic business planning. To ensure their competitive advantage in the marketplace, organizations must implement innovative strategies that are designed to enhance their employee retention rate and recruit fresh talent into their companies. Effective human resources planning strategies are those that include having sufficient staff, with the right mixture of talent, and who are in the appropriate locations, performing their jobs when needed. It moves beyond the traditional role of human resources as primarily an administrative control function. (DeLuca, J. R., 1988) In today's corporate environment, it is viewed as a valuable component for adding value to an organization. Both employees and the company will often realize many benefits of planning over the long-run. In uncertain business settings, the significance of strategic human resources planning can become obvious very quickly. A company that reacts to circumstances by cutting staff as a measure to reduce short-term overhead can create unwanted repercussions. What initially looked like a smart and necessary move to economize in lean times can end up costing the company much more in the long-run. The resources that will be needed to subsequently recruit, hire, and train new employees may well exceed any short-term cost savings.

Forward-looking human resources planning typically anticipates future staffing requirements. It can help organizations avoid cost errors. Strategies are formulated to not only anticipate their needs over time, but to consider optimal solutions for the long term and under challenging economic conditions. This approach minimizes the chance of short-sighted and reactive choices being implemented by decision-makers. Organizations with a plan in place, and a keen understanding of their long-range objectives, may instead decide to weather the economic storm and keep trained, talented, and dedicated staff in place for the inevitable business uptrend. (Dyer, L., 1982).

2. Practical benefits

When it concerns human resources, there are the more specific criticisms that it is over-quantitative and neglects the qualitative aspects of contribution. The issue has become not how many people should be employed, but ensuring that all members of staff are making an effective contribution. And for the future, the questions are what are the skills that will be required, and how will they be acquired. There are others, though, that still regard the quantitative planning of resources as important. They do not see its value in trying to predict events, be they wars or takeovers. Rather, they believe there is a benefit from using planning to challenge assumptions about the future, to stimulate thinking. For some there is, moreover, an implicit or explicit wish to get better integration of decision making and resourcing across the whole organization, or greater influence by the centre over devolved operating units. (Fleishman, E.

A., & Quaintance, M. K., 1984) Cynics would say this is all very well, but the assertion of corporate control has been tried and rejected. And is it not the talk of the process benefits to be derived self indulgent nonsense? Can we really afford this kind of intellectual dilettantism? Whether these criticisms are fair or not, supporters of human resource planning point to its practical benefits in optimizing the use of resources and identifying ways of making them more flexible. For some organizations, the need to acquire and grow skills which take time to develop is paramount. If they fail to identify the business demand, both numerically and in the skills required, and secure the appropriate supply, then the capacity of the organization to fulfill its function will be endangered.

3. Planning: A business strategy

There are numerous considerations that the human resources professionals must take into account. For instance: "Inconsistencies between culture and strategy can severely impair the successful pursuit of a given course of action." Often the political aspects of producing a viable plan are insurmountable obstacles to overcome; as are other primary factors such as the process itself or the plan measurements. Only the most seasoned corporate politician often has enough sensitivity and negotiating skill to achieve the pre-planning buy-in of the critical powers. The concept of planning boiled down is that in order to determine the direction for human resource plans you must have "a series of questions that your organization needs to answer in order to predict and perhaps control some of the major change areas for the future. This means that you begin by asking the right questions – the questions which, if asked regularly and systematically, will force you to produce answers of maximum value in shaping your future human resources."

It is also important to look at the planning activity from an activity standpoint. From an operational view human resources planning is the analysis of human resource requirements of organizations and the related needs for management policies, programs and resources to satisfy these requirements. (Odiorne, G. S., 1981, July) As is shown by Figure 1, human resources planning is critically interdependent with all aspects of the business. "A human resource strategy is a critical component of the firm's corporate and business strategies, comprising a set of well-coordinated objectives and action programs aimed at securing a long-term, sustainable advantage over the firm's competitors. A human resource strategy should be consistent with the firm's corporate and business strategies, as well as with the other managerial

functional strategies." The primary objective of people responsible for doing human resources planning is to acquire, develop and implement the technology, tools, expertise and resources necessary to effectively do Human Resource Planning and Development as an integral part of the business planning processes. It must not be done in a vacuum. "Human resource strategies should be developed within a company's strategic business planning process." The strategy that is often the basis for the planning process is to build networks of internal human resources professionals and external human resources professionals that will promote the sharing of information, technology and tools to be applied to the Human Resource Planning and Development activities; Collect, evaluate and implement tools, processes and resources; integrate tools and resources into a consistent strategy which uses existing resources whenever possible. Again and again it is important to make sure that the process is a legitimate piece of the company plan. "Human resource strategic planning takes place within the overall corporate / total organization strategic planning model. "They will consult with and to human resource managers and line management to achieve a high utilization of tools and resources to achieve functional goals. Those goals include creating and implementing a workforce inventory and forecasting tool customized for Line Organizations; and creating and consulting on custom management planning tools and strategies for line Organizations. (Walker, J. W, 1988)

Figure 1 is an overview of human resource planning from a strategic planning viewpoint. The model shows the relationship of internal factors and external factors as they relate to the human resources issues. They are factors that not only create; but also shape and change the issues. The business plan usually establishes the basic environment within which other variables impact in order to determine those issues. Out of those issues grow the human resources strategies and plans that are most often developed and implemented by and with the assistance of the human resources department. (Hay Group, 1988, April 3).

4. Long-Term Planning for Short-Term Success

Often, however, operating pressures move all of the planning from a longer-term focus to a short-term one. That normally tends to create an environment within which the plan cannot be fully successful. "Over-reliance on short-term planning can be quite costly. Ample lead time is required to recruit or develop talented personnel, and reaction management that responds to short term events or needs will usually limit the choices of options or

endanger longer-range economic plans.”As most planning models would indicate, the planning processes need to be circular and connected dynamically. “The link between human resource planning and business strategic planning is vital if personnel programs and systems are to be attuned to the changing needs of an organization.”The relationship between short and long-term planning goals and activities are shown in Figure 2. This is a dynamic model. If you consider each of the four boxes as analogous to the legs of a four-legged stool, you can see the impact of removing one leg of the process. The impact of not doing long-term human resources planning is to cause the overall business plan to be limited to current human resources in trying to accomplish the plan. To achieve most long-term business plans requires some change in human resources from current state to the necessary state. The business goals achieved are often less than those possible with successfully implemented human resource plans.

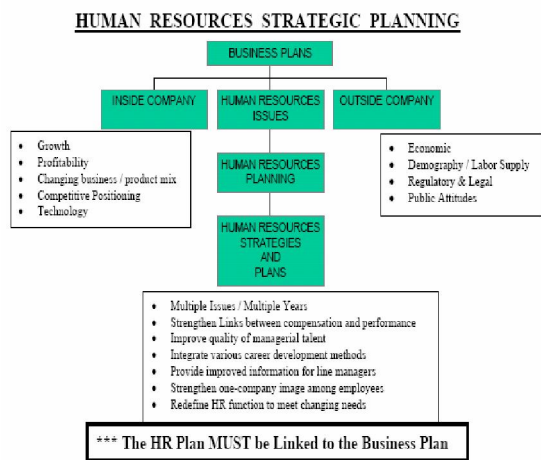

Figure 1: an overview of human resource planning

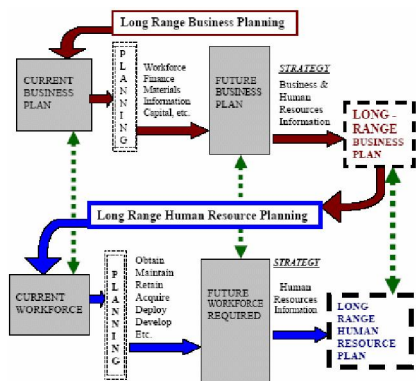

Figure 2. The relationship between short and long-term planning goals and activities

6. Factors Underlying Increased Interest in Human Resource Planning

Undoubtedly, there are many factors that account for the increased attention directed to human resource planning, but environmental forces-globalization, new technologies, economic conditions, and a changing work force-seem particularly potent (Dumaine, 1989; Dyer & Heyer, 1984; Greenhalgh, McKersie, & Gilkey, 1986). These create complexity and uncertainty for organizations. Uncertainty can interfere with efficient operations, so organizations typically attempt to reduce its impact; formal planning is one common tactic used by organizations to buffer themselves from environmental uncertainty (Thompson, 1967). The changing characteristics of the work force, which is but one important environmental factor, make the need for planning evident. Between 1976 and 1980, the labor force grew an average of 2.8%, but between 1991 and 1995, the rate of growth will drop to 1.1%. Additionally, whereas more than 3 million people joined the labor force in 1978, less than 2 million people are projected to enter the labor force each year from 1987 to 1995. Comparatively, the proportion of younger people (aged 16 to 24) and older people (aged 55 and over) in the work force will decline. People aged 25 to 54 will constitute a greater percentage of the labor force, increasing from 61% in 1975 to 73% in 1995. The number of mothers in the work force with children under one year old increased from 42% in 1980 to 55% in 1989. The ethnic mix of the labor force is also changing. The Bureau of Labor Statistics estimates that ethnic minorities will account for 57% of the growth in the labor force between now and the year 2000. Of the approximately 25 million workers added to the work force between 1985 and 2000, 42% are expected to be native White women and only 15% are expected to be native White men. Fully 22% are expected to be immigrants (Glickman, 1982; Johnston & Packer, 1987; "Managing Now," 1988; "Needed," 1988; Nelton, 1988). All of these demographic projections have significant implications for managing human resources, thereby increasing the importance of human resource planning (Coates, 1987; Davis & Associates, 1986) (Hennecke, M., 1984).

7. Short-Term Human Resource Planning

Many psychologists work on activities related to designing and implementing programs (e.g., recruitment, selection systems, and training programs) to meet short-term organizational needs. Such activities generally involve an element of planning in that they are future-oriented to some extent. Even projects for which objectives are

expected to be achieved in as little time as a few months have, ideally, been designed with an understanding of how the short-term objectives are linked to the achievement of longer term objectives. For example, an aeronautics company engaged in a recruitment campaign to hire 100 engineers should have a clear understanding of how this hiring goal will help the company achieve long-term goals such as becoming the world's most innovative company in that industry. This hypothetical company also might have a college recruiting drive designed to find 75 college graduates to enter a training program in recognition of the fact that a growing company needs to prepare for the middle managers it will need 5 to 7 years hence, as well as the top level managers it will need in 10 to 15 years. As this hypothetical example highlights, in order for a clear linkage to exist between human resource planning and strategic business planning, it is essential that an organization's top executives have a fully articulated vision for the future, which has been communicated and accepted by managers throughout the organization. (Milkovich, G. T., & Phillips, J. D., 1986)

8. Intermediate-Term Human Resource Planning

As we have noted, planning is used by organizations to buffer production or service delivery processes from sources of uncertainty. Human resource programs for the recruitment, selection, training, and motivation of employees help reduce uncertainty by ensuring that a sufficient number of people with the required characteristics and skills are available at all levels in the organizations. When the planning horizon is short, there is little uncertainty about which skills and how many people will be needed, and it is relatively easy to predict supply. (Page, R C., & Van De Vroot, D. M., 1989).

However, rapid and ongoing changes in today's business environment mean that the future cannot be easily anticipated by simply projecting past trends. As the focus of planning moves from short term to intermediate term, the question "What will we need?" is less easily answered and so becomes more dominant. For intermediate-term planning, there is also more uncertainty related to the question, "What will be available?" Consequently, human resource planning for the more distant future quickly raises the question, "How can we determine what will be needed and what will be available?" In other words, more technical attention must be given to the problem of forecasting. As in short-term human resource planning, the twin problems, of forecasting, demand and forecasting supply both must be addressed before objectives can be established and programs developed. With increased uncertainty, interaction between the human resource planner and

line managers is even more critical for making accurate demand and supply forecasts.

10. Conclusion

Human resource planning is probably one of the most critical elements in linking the work of the human resources function to the business goals of the company. "It is important to recognize that certain aspects of human resource management tend to have potentially high strategic consequences." Especially in the areas of policy development and implementation it is "obvious and difficult to refute advice that effective human resource policies require human resource planning, which in turn, requires effective integration with an organization's strategic planning process." It is evident that human resources planning is becoming more and more important in business circles. "Because business profits are squeezed by inflation and a weakened economy, management is also concerned with personnel costs and is seeking to achieve increased output with the same or fewer staff." Productivity concerns and material constraints also add to the emphasis on the ability to plan and fully utilize all of a company's resources. The human resources are right on the top of the list in most enterprises. (Burack, E. H., 1988) "The current demands on the world's material resources and their spiraling cost are building pressure to increase the productivity of human resource." Government at all levels both nationally and internationally (Federal, state, local, etc.) is interested in how employers treat their employees. They, therefore, add factors that must be considered in any human resource plan (work and wage laws, labor laws, etc.). (Dyer, L., & Heyer, N. D., 1984) "The net impact of the expanding government intervention has been an increase in the attention given to human resource planning in all of the problem areas." So, while the principles and processes of planning have not changed much, the complexity and timeliness have. Information technology enables the collection and analysis of more data than was even dreamed of in the 1980s. The complexity of planning across countries, cultures, economies, and new technologies is almost infinite. This makes the art, the gut feeling, the best guess, that much more important. The best that can be accomplished is to predict the probability of multiple successful solutions. Because the purpose of human resource planning is to ensure that the right people are in the right place at the right time, it must be linked with the plans of the total organization. Traditionally, there has been a weak one way linkage between business planning and human resource planning. Business plans, where they exist, have defined human resource needs, thereby making human resource planning a reactive exercise.

A Survey on the Human Resource Management Perspectives as an Emerging Managerial Function

Masoud GhorbanHosseini¹

¹PhD student, Department of Management, Saveh branch, Islamic Azad University, Saveh, Iran
masoudghorbanhoseini@yahoo.com

Abstract: Human resource management can be defined as the process of acquiring, training, developing, motivating, and appraising a sufficient quantity of qualified employees to perform the activities necessary to accomplish organizational objectives; and developing specific activities and an overall organizational climate to generate maximum worker satisfaction and employee efficiency. While the owner-manager of a small organization is likely to assume complete responsibility for human resource management, larger organizations use company specialists called human resource managers to perform these activities in a systematic manner. The position is becoming increasingly important because of increased competition, government intrusion, emphasis on cost control, complex wage and benefit programs, and a changing work force. This article reviews the perspectives and the important considerations over the HR management and what HR managers should care about to achieve better Performance Measures.

Keywords: Human Resource Management, Performance Measures, Maximum Satisfaction, Managerial Function.

1. Introduction

A Human Resource Management System (HRMS) or Human Resource Information System (HRIS) refers to the systems and processes at the intersection between human resource management (HRM) and information technology. It merges HRM as a discipline and in particular its basic HR activities and processes with the information technology field, whereas the programming of data processing systems evolved into standardized routines and packages of enterprise resource planning (ERP) software. On the whole, these ERP systems have their origin on software that integrates information from different applications into one universal database. The linkage of its financial and human resource modules through one database is the most important distinction to the individually and proprietary developed predecessors, which makes this software application both rigid and flexible. (Paauwe, J., 2009)

Human resource managers, also known as personnel managers, assume primary responsibility for forecasting personnel needs and recruiting and aiding in selecting new employees. They also assist in training and evaluation, and administer compensation, employee benefits, and safety programs.

2. Human Resource Management (HRM)

Human resource management: the management of the people and the staff policies and practice that enable an organization to carry out its work. This affects staff from the moment an

individual contacts the organization in response to a job advertisement, to the time they leave the organization. Human resource management is about enabling staff to use their qualities in order to fulfill their role and contribute to the organization's mission and purpose. Good human resource management is essential if organizations want to attract and retain good staff. If people see that an organization values its staff, they are more likely to apply for a job with the organization and more likely to stay once they are recruited. Good human resource management means that an organization reduces risk to its staff and reputation. It can do this by considering issues such as employment law, child protection and health and safety. Good human resource management can also reduce costs for an organization. For example, good recruitment policies and processes mean that organizations can efficiently recruit people who will carry out their jobs effectively. (Odiorne, G. S. 1981) Good systems for performance management mean that organizations can ensure that they are getting the best from their staff. It should be noted that volunteers are an important resource for many organizations. Some sections of this book, such as salaries and employment contracts, are not relevant to volunteers. However, sections such as benefits, performance management and staff development are relevant to volunteers. Development organizations should consider carefully which policies and practices should also be used with volunteers. (Golding, N., 2010)

3. Human Resource and HR managers

Human resource managers are well positioned to play an instrumental role in helping their organization achieve its goals of becoming a socially and environmentally responsible firm – one which reduces its negative and enhances its positive impacts on society and the environment. Further, human resource (HR) professionals in organizations that perceive successful corporate social responsibility (CSR) as a key driver of their financial performance can be influential in realizing on that objective. While there is considerable guidance to firms who wish to be the best place to work and for firms who seek to manage their employee relationships in a socially responsible way, there is a dearth of information for the HR manager who sees the importance of embedding their firm's CSR values throughout the organization, who wish to assist the executive team in integrating CSR into the company's DNA. And as high profile corporate failures such as Enron make all too clear, organizations that pay lip-service to CSR while neglecting to foster a CSR culture run the risk of damaging their corporate reputation if not their demise. Indeed, HR's mandate to communicate and implement ideas, policies, and cultural and behavioral change in organizations makes it central to fulfilling an organization's objectives to "integrate CSR in all that we do." That said, it is important to understand that employee engagement is not simply the mandate of HR. Indeed people leadership rests with all departmental managers. HR can facilitate the development of processes and systems; however, employee engagement is ultimately a shared responsibility. (Walker, J. W, 1988) The more the HR practitioner can understand their leverage with respect to CSR, the greater their ability to pass these insights along to their business partners towards the organization's objectives in integrating CSR throughout their operations and business model.

As human resources influence many of the key systems and business processes underpinning effective delivery, it is well positioned to foster a CSR ethic and achieve a high performance CSR culture. Human resource management can play a significant role so that CSR can become "the way we do things around here". HR can be the key organizational partner to ensure that what the organization is saying publicly aligns with how people are treated within the organization. HR is in the enviable position of being able to provide the tools and framework for the executive team and CEO to embed CSR ethic and culture into the brand and the strategic framework of the organization. It is the only function that influences across the entire enterprise for the entire 'lifecycle' of the employees who work there – thus it has considerable influence if

handled correctly. HR is poised for this lead role as it is adept at working horizontally and vertically across and within the organization, so important for successful CSR delivery. Of course, for effective CSR deployment, it needs to become a Board and C-suite imperative first. Should such an organizational gap exist, the senior HR leader can champion, lead and help drive a CSR approach if necessary. In the coming years as CSR increasingly becomes part of the business agenda and the fabric of responsible corporations, it will become a natural agenda for the HR practitioner. The following is an overview of the key trends and business drivers for fostering this CSR-HR connection, followed by a proposed roadmap or pathway for human resource leaders seeking to make a substantial contribution to sustainability, CSR and their firm's business goals. A companion CSR-HR Checklist is available which summarizes the roadmap at a glance.

4. Purpose

The function of Human Resources departments is generally administrative and common to all organizations. Organizations may have formalized selection, evaluation, and payroll processes. Efficient and effective management of "Human Capital" progressed to an increasingly imperative and complex process. The HR function consists of tracking existing employee data which traditionally includes personal histories, skills, capabilities, accomplishments and salary. To reduce the manual workload of these administrative activities, organizations began to electronically automate many of these processes by introducing specialized Human Resource Management Systems. HR executives rely on internal or external IT professionals to develop and maintain an integrated HRMS. Before the client-server architecture evolved in the late 1980s, many HR automation processes were relegated to mainframe computers that could handle large amounts of data transactions. In consequence of the high capital investment necessary to buy or program proprietary software, these internally-developed HRMS were limited to organizations that possessed a large amount of capital.

5. Human Resource Concerns in the 1990s

Two issues will continue to grow in importance during this final decade of the twentieth century: encouraging employees to remain on the job rather than retiring early and corporate responses to the needs of two-career couples.

6. Encouraging Late Retirement

Less than two decades ago, concerns about age discrimination in employment led to the passage

of laws ending mandatory employment for most workers. Today, many firms use financial incentives to encourage voluntary retirement by workers nearing the traditional retirement age. The worker buyout plans grew out of the recession of the early 1980s as firms attempted to reduce their payroll expenses, while avoiding morale-stunting layoffs. A financial package including a cash bonus, continuation of such employee benefits as insurance coverage, and higher-than normal monthly retirement benefits (to cover the gap between retirement and the onset of social security payments) prompted thousands of employees at such companies as Monsanto and Eastman Kodak to retire early. Worker buyouts reduced company payrolls by eliminating the typically above average wages and salaries of older, more experienced workers. Also, they contributed to the morale of remaining workers who saw tangible evidence of management's attempts to maintain job security by resorting to a buyout rather than a layoff. Finally, unclogging job and promotion opportunities improved the upward mobility of younger employees. (Armstrong, Michael, 2006) The programs were extremely successful: only 32 percent of workers age 55 and older hold jobs today, compared with 45 percent in 1930. And the median retirement age for men keeps sinking—to about 62 today, from 65 in 1963. As the ranks of younger employees thin, and shortages of workers and skills increase, astute companies are bending over backward to keep older employees. By the end of the century, only 39 percent of the work force will be under age 35, compared with 49 percent now. The number of people age 50 to 65 will increase at more than twice the rate of the overall population. Firms such as Corning Glass Works are beginning to create so-called platinum handcuffs in the form of shorter hours, company-paid vacation trips, and bonus plans that reward employees for staying on past a certain age or period of service.

By redesigning the job of store clerk to eliminate heavy lifting, Builders Emporium, a chain of 121 home improvement centers, was able to attract older workers as store clerks. Today, 15 percent of these 5,000 jobs are performed by employees age 55 or older. In general, the older staff knows the merchandise better and has more experience in dealing with people.

7. Two-Career Couples

By the year 2000, 62 of every 100 women will hold jobs outside the home. Already, 73 percent of all mothers with school-age children are employed. Two career households have specific job-related needs that must be addressed by employers. These issues frequently arise when a manager, professional

staff member, or highly skilled employee is hired from another geographic area. Relocation services for the spouse are often required to attract the new employee. For example, IBM reimburses spouses for up to \$500 in job-search expenses. Other firms aid by providing employment leads and financial assistance until the spouse locates a job in the new city. Flexible work arrangements may be important for two-career couples, especially those with children. Child-care facilities and parental leave programs for both mothers and fathers may be determinants in retaining highly qualified employees. (Pierce, M., and Madden, K., 1999) For example, Colgate-Palmolive's 12-week unpaid leave program allows salaried women or men to take time off for birth, adoption, family illness, or elderly care. Shoe manufacturer Stride Rite Corporation became the first large corporation to provide intergenerational day care in 1989 when it opened its elder-care facility.

8. The HR management module

The HR management module is a component covering many other HR aspects from application to retirement. The system records basic demographic and address data, selection, training and development, capabilities and skills management, compensation planning records and other related activities. Leading edge systems provide the ability to "read" applications and enter relevant data to applicable database fields, notify employers and provide position management and position control. Human resource management function involves the recruitment, placement, evaluation, compensation and development of the employees of an organization. Initially, businesses used computer based information systems to:

- produce pay checks and payroll reports;
- maintain personnel records;
- Pursue [Talent Management](#).

9. Human Resource Management as an Emerging Managerial Function

A hundred years ago, companies hired workers by posting a notice outside their gate, stating that a certain number of workers would be hired and the day of hiring. The notice might have listed skills, such as welding or carpentry; or it might simply have listed the number of workers needed. On hiring day people would appear at the front gate—a small number in prosperous times, large crowds during periods of unemployment—and the workers would be selected. The choices were often arbitrary; the company might hire the first four in line or the four people who looked the strongest or the healthiest. Workers operated under a precise set of strict rules. (Fleishman, E. A., & Quaintance, M. K., 1984)

10. Two Perspectives on Human Resource Management

Human resource management can be viewed in two ways. In a narrow sense, it refers to the functions and operations of a single department in a firm: the human resource or personnel department. Most firms with 200 or more employees establish a separate department with the responsibility and authority for selecting and training personnel. In a broader sense, human resource management involves the entire organization. Even though a special staff department exists, general management is also involved in training and developing workers, evaluating their performance, and motivating them to perform as efficiently as possible.

The core responsibilities of human resource management are the following:

- Human resource planning
- Recruitment and selection
- Training/management development
- Performance appraisal
- Compensation and employee benefits.

Trained personnel from the human resource department are typically involved in carrying out each of these responsibilities. However, the responsibilities are typically shared with line managers, ranging from the company president (who is involved in overall planning) to first-line supervisors (who may be involved in preliminary interviews with applicants and in employee training). By accomplishing these critical tasks, the human resource management department achieves its overall objectives of (1) providing qualified, well-trained employees; (2) maximizing employee effectiveness in the organization; and (3) satisfying individual employee needs through monetary compensation, employee benefits, advancement opportunities, and job satisfaction. (Burack, E. H., 1988)

11. Departmental human resource management plans

Departmental human resource management plans are used to link together the overall policies of the Civil Service Branch, the mission, objectives and values of the department, and any specific Human Resource Management activities being undertaken at line management level. The plans thereby provide clear policies and guidelines for staff and managers. (Hay Group, 1988)

Table 1: Departmental Human Resource Management Plans

12. Human resource management at organizational level

There are many aspects of human resource management. Some organizations may feel overwhelmed and unsure about where to start making improvements. This is particularly the case for organizations that do not have a team or department specifically responsible for human resource management. (Hennecke, M., 1984)

Where there is no specific team, it is worth considering giving someone responsibility for aspects of human resource management as part of their entire role. There are many benefits of having a member of staff with ownership of human resource management. For example:

The organization can be kept up-to-date on legal issues.

A coordinated approach can be taken with regard to strategy, policy and practice. This helps to ensure that the organization has a fair and consistent way of treating its staff.

Staff have access to good advice on issues relating to staff.

Salaries are fair and consistent.

Good policy and practice can be put in place.

Job descriptions can be kept up-to-date. Staff and line managers then know what to expect and performance can be measured successfully.

Recruitment procedures can be thorough and enable the best people to be recruited.

Staff briefing and induction is planned and well organized.

As the organization shows it thinks human resource management is important, staff feel valued and encouraged to stay with the organization. Some organizations may be large enough to establish their own team that is responsible for human resource management. In this case, it is important to gain permission from the leadership of the organization first, including the Chief Executive Officer and the board. It may be necessary to inform them of the benefits of human resource management in order for them to understand its importance. It is worth noting that some donors will provide funding for activities related to human resource management.

13. Conclusion

Human resource managers are well positioned to play an instrumental role in helping their organization achieve its goals of becoming a socially and environmentally responsible firm – one which reduces its negative and enhances its positive impacts on society and the environment.

Herein, effective monitoring depends on having the right performance measures in place.

Human Resource Management performance measures should therefore relate to all aspects of Human Resource Management. However, management information will not always be statistically quantifiable and measurable data, but it should be as objective as possible and based on observable quantifiable measures wherever possible.

A Critique of Richard Rorty's Paradigmatic View: Avicenna's Practical Philosophy as a CounterexampleMohsen Mahmoudi¹ Musa Akrami²¹ PhD Student, Department of Philosophy, Islamic Azad University, Science and Research Branch, Tehran, Iran² Associate Professor, Department of Philosophy of Science, Islamic Azad University, Science and Research Branch, Tehran, IranMohsenmahmoodi97@yahoo.com

Abstract: The aim of this article is to criticize Richard Rorty's view on epistemic gap between philosophical paradigms, being done through a comparison between Avicenna's view on moral statements and pragmatic reasons on the one hand and Rorty's view on the other hand. Avicenna's view concerning pragmatic reason has some similarities to Rorty's view, while each of these two views belongs to one of two different philosophical paradigms. Authors argue that there is not so epistemic gap between different philosophical paradigms preventing us to compare them with each other. Rorty's views have consequences, such as breaking off the relations and conversations among cultures, that he didn't accept them. According to the central role of the concept of conversation in Rorty's ideas, on the one hand, and its coming to stop, on the other hand, Rorty's philosophy encounters contradictions in such consequences.

[Mohsen Mahmoudi, Musa Akrami. A Critique of Richard Rorty's Paradigmatic view: Avicenna's Practical Philosophy as a Counterexample. Journal of American Science 2011; 7(6):445-447]. (ISSN: 1545-1003).

<http://www.americanscience.org>.

Keywords: paradigm, epistemic gap, conversation, practical reason, moral statements, consensus

1. Epistemic Gap among Paradigms and Its Consequence

According to Rorty's critique of epistemology and his analysis of the history of philosophy, we are observing different philosophical paradigms. Because of special historical circumstances, philosophical paradigms are created in special historical contexts and are fully different from each other. Rorty accepts Thomas Kuhn's thesis of incommensurability of paradigms and expands it to the whole of human learning and culture (Rorty, 1980, 324).

Whatever is important in Kuhn's view is the shift between paradigms. Kuhn believes that paradigm difference is so fundamental that we cannot make an epistemic relation among them. Really, according to Kuhn's view, it is not merely the scientists' interpretations of observation that change with paradigm shifts, but, rather, they live in different worlds, experiencing different things (Kuhn, 1962, 149).

As a preliminary note, one must pay attention to the fact that the doctrine of paradigm shift as set forth by Kuhn and used by Rorty is more ambiguous to be applied in analysis and explanation of some principles of practical ethics. One of the important questions here is that what is the criterion on the basis of which we would be able to realize the borders between paradigms? How is it possible for two paradigms having no common part to enter into dialogue with each other? How is it possible to decide between two different statements belonging to different paradigms if, according to Rorty, there is no

impartial objective ground for any judgment? (Rorty, 2000, 2) Moreover, how is it possible to conclude that an epistemic gap exists between paradigms? Recognition of an epistemic gap presupposes a determination of the limits and borders of the paradigms. How it is possible to determine such limits and borders if, according to Rorty, there is no objective foundation and impartial ground? One needs a meta-paradigm if (s)he wants to recognize the limits and determine the limits of the paradigms.

In addition, one of the necessary consequences of Rorty's thesis of epistemic gap between paradigms is that conversation between various cultures and thought paradigms is not possible, while conversation has an important role in Rorty's philosophy. Presenting both Sellar's behavioristic critique of the "whole framework of givenness" and Quine's behavioristic approach to the necessary-contingent distinction as forms of holism, Rorty argues that their holistic doctrines sound pointlessly paradoxical as long as knowledge is conceived of as accurate representing, because such accuracy requires a theory of privileged representations. He argues "that their holism is a product of their commitment to the thesis that justification is not a matter of a special relation between ideas (or words) and objects, but of conversation, of social practice." (Rorty, 1980, 170). To the extent that conversation between cultures or paradigms is possible, one must recognize a connection between them, denying the gap.

2. Avicenna on Practical Philosophy and Moral Statements

Avicenna has recognized moral propositions consisting of "goodness and evil" of events and behaviors on the one hand and "ought and ought not" on the other hand. He has good comments on some propositions called *Mashhūrā* (indemonstrable, generally accepted) which are not certain and their validity is not based on any conformity with reality, rather, their validity is depended upon thinkers and their consensus. From his point of view, the cause of accepting these propositions is the fame that among people, who generally accept them.

Avicenna, following Aristotle, divides reason into two types: theoretical and practical. According to him, practical reason has no faculty of understanding and is the impulse for excitation of the faculties of the body. From his point of view, the realm of practical reason and moral statements are of the type *Mashhūrāt* in which the criterion of truth is the consensus (general opinions) of the intelligentsia (or learned men) not the real world. Moral statements have no reality other than conformity to that consensus. He, in logic, divides syllogism into five types: 1) demonstration, 2) dialectics, 3) rhetorics, 4) poetics, 5) paralogism (*moghāleteh*). These five types are called "five techniques" (*Sanā'āt-e-Khamsah*). Each of them is based on premises. Demonstration is formed of theorems and certain premises. (*Al-Ishārāt wa-'l-tanbihāt (Remarks and Admonitions)*, part 1, P. 341-343 and p. 460) Preliminaries of demonstration technique are: 1) first principles, 2) sensible data (observations), 3) data of experience (empirical premises), 4) *hadsyat* (accumenalia, conjectures), 5) *mutawatirat* (successive hearsays), 6) *fitriyyāt* (innate data). The premises of the second technique, i.e. dialectics, are of the kinds of *Mashhūrāt* (indemonstrable, generally accepted) ones. (*ibid.* e, p. 460-461). In *Kitāb al-Shifā' (The Book of Healing)*, Avicenna believes that the demonstrative syllogism is certain and its aim is discovering the truth, while, in contrary, dialectics does not give the certainty, its aim being to silence the opponent. (*Kitāb al-Shifā' (The Book of Healing)*, vol. 3, p. 51)

From Avicenna's point of view, moral propositions such as "justice is delightful", "oppression is immoral", and "theft is ill-favored" are not certain and human reason is not able to prove their truth. Avicenna believes that if a man, having the faculty of recognition and discrimination, assumes that has been born suddenly and has no habit and education to accept moral statements, having no judge except reason to judge moral affairs, without any shame to be excited to state a moral judgment, and there being no expediency to state moral judgment, now if such a man decides to fall into

suspicion regarding propositions such as "justice is delightful" and or "oppression is ill-favored", (s)he recognizes that it is possible for him/her to hesitate; if these propositions are true, their truth is not recognized by (theoretical) reason (*Kitāb al-Shifā' (The Book of Healing)*, p. 66)

In summary, in Avicenna's view, the propositions of practical philosophy are formed in relation with behaviors of the intelligentsia and specific customary rules of each region. One may see some relativism regarding such propositions, so that one may believe that each society has its own specific morals and policies. Therefore, Avicenna gathers together and combines absolutist and relativist approaches: in the section of theoretical philosophy, with its own metaphysics, he reaches to fixed, absolute and universal principles, while in the section of practical philosophy with its own pragmatism far from such metaphysics and foundationalism; he reaches to changeable particular propositions. In practical reason, Avicenna, very similar to Rorty, denies the objectivity of moral propositions, though Rorty completely denies the objectivity.

3. Comparison of Avicenna and Rorty

Now, the question is this: is there so deep epistemic gap between philosophical paradigms, as unrelated islands, that one cannot find similarities between two philosophers belonging to two different paradigms? Is it possible that there is a relation between two philosophical paradigms on the one hand and one cannot absolutely compare them on the other hand?

As an example for the separation and conflict between Rorty's philosophical theses and their consequences, we compare the theses of Eastern Iranian Muslim philosopher Avicenna (980-1037) and Western American neo-pragmatist philosopher Rorty to show and explain their similarities, while they have different metaphysical and epistemological attitudes. Avicenna's view on moral judgments and statements in the realm of practical reason is similar to Rorty's ideas in this field, while Avicenna belongs to metaphysical paradigm and Rorty belongs to language paradigm. In spite of belonging to two completely different cultural-philosophical contexts and traditions, one could find a possibility of conversation and understanding between Avicenna and Rorty with so many similarities in views and recommendations.

According to Rorty, it is impossible to achieve the objective reality, the possibility of which has been accepted in Aristotelian (peripatetic) tradition from West to East. In Rorty's view, it is not possible to justify our recognition claims by appealing to their objectivity. If the justification of our recognition

claims through appealing to objectivity is not possible, which way remains to justify them? It is here that Rorty, as a nonfoundationalist in epistemology, sets forth his "solidarity" thesis. Social cohesion (as well as trust and reciprocity) is the only way for people to justify and support their recognition claims. In other words, a speech is not defensible and justified according to its truth and in its correspondence with external reality, but it is defensible on the basis that people of a society can reach to "consensus" and intersubjective agreement (Rorty 1996, 23).

Rorty emphasizes on social cohesion and conversation of the people living in a society to the extent that he sees the root of morals in conversation and its consequent, i.e. consensus. In other words, it is not possible to attribute some objective or real root to morals; rather, social norms are the only bases of moral truths. Social cohesion among some people belonging to a society with its own norm leads to an ethnocentrism, justifying moral statements on such relativistic grounds. Any judgment concerning the truth or falsity of propositions refers to their consistency or inconsistency with other accepted propositions or beliefs. A proposition is regarded to be true if people could reach consensus on it. Thus truth or justifiability of a moral proposition is itself a moral concept, leading to more expansion of consensus on moral propositions. The criterion for truth of moral statements is to be understood on the basis of social cohesion and solidarity in a society organized by some people living with each other (ibid. 21).

4. Conclusion

It is true that we cannot do a point-by-point comparison between Rorty's and Avicenna's philosophy as probably two philosophical paradigms; but this doesn't mean that we cannot find any common ideas and common language between them to have conversation concerning the statements in practical affairs. There are many examples to show this claim, but, of course, we need another article to give more examples. Besides Avicenna and Rorty, there are many philosophers and thinkers in West and East to be compared.

Rorty not only holds that moral propositions are related to the agreement of the group, but he has such an idea regarding all human knowledge. He, as a pragmatist (or neo-pragmatist) does not believe in separation of theory and practice, and, of course, he argues that practice is prior to theory. Avicenna, instead, holds that theory is prior to practice, though he reaches to some relativism in practical reason. Of course, Rorty's pragmatism is completely ethnocentric and relativistic.

Accordingly, contrary to Rorty, it is possible to do some comparison between different philosophical paradigms, so that there is home for their conversation and reaching to some agreement. We have argued, against Rorty, that it is not true that there are unbridgeable gaps among paradigms in all cases, but rather, they may have interference and overlap with each other in spite of differences in metaphysical or philosophical foundations (if there is a belief in some philosophical foundation at all). If there is similarities and possibility of conversation among paradigms, then it is possible for them to understand each other. Avicenna's practical philosophy is a good example to contradict Rorty's claims concerning the impossibility of philosophical foundations in theoretical philosophy on the one hand, and the impossibility of similarity and conversation between ideas belonging to different philosophical paradigms on the other hand. And as we observed, this claim, specially, about Avicenna and Rorty in practice reason part is true. Moreover, we are allowed to speak of both intrinsic interconnection and discontinuity between theory and practice.

Evaluation of Damages on Arc Frames of Reinforced Concrete by using Pushover

Mehrdad Dorvaj

M.Sc. in Earthquake engineering, Building and Houses Research Center, Tehran, Iran
Mehrdaddorvaj@yahoo.com

Abstract: Qualification the scope of damage on structures is of the most important categories recently has been considered very much by researchers. For this purpose, different researchers by consideration of different aspects of structures have paid to presenting indexes. Depending most of these indices to nonlinear dynamic analysis performance which is very complex and time consuming has caused that using of these indices more be restricted to research project. The aim of this research is representing a simple and effective index on the basis of increasing load analysis and proportionate with operation point of structures which can represent a fair estimation of the scope of damages on structures.

[Mehrdad Dorvaj. Evaluation of Damages on Arc Frames of Reinforced Concrete by using Pushover. Journal of American Science 2011; 7(6): 448-453] (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Damage, Reinforced Concrete, Arc Frames, Pushover.

1. Introduction

However, in last earthquakes of the world, designed structures on the basis of existent seismic criteria, have performed fairly in preserve of individuals' safety, but the scope of created destructions in structures and entered economic damages has been very extended and unexpected. Nowadays, it has been specified well that designed structures on the basis of this criteria, against hard earthquakes will bear heavy damages. Thus, designing on the basis of operation as a method which is based upon acceptance of displacement and expected transformation (and according to anticipated level) was considered. From the most categories in operational designing, is having clear image of scope of damages entered on designed structure in different level of hazard. For this purpose in instructions such as FEMA and AAATC40 [1, 2] different level of damages entered on structures have been represented. Determinant criteria of structure situation in these instructions are on the basis of lateral transformation; however in some researches it has been indicated that using this standard as only standard of destruction is considerable [3].

We can investigate damage in various aspects, but generally, damaged entered on a structure is decreasing structure capacity in sustaining types of entered loads relative to safe structures before occurrence of earthquake or each another criterion which caused decreasing capacity of structure. For determining scope of entered damages on structure, researchers have introduced many indices which of them in a manner, estimate damages entered on

structure. These indices can be categorized in three category: The first category are indices on the basis of most experienced transformation of structure, such as most relative displacement of stories[4] and the most ratio of transforming of stories[5]. Second category are indices on the basis of aggregate damage among it we can refer to Gobara damage index which is based on pushover analysis[6] and Chai and Fejfer damage index which is based on entered energy[7]. In third category there are indices that are combination of maximum transformation and aggregate damage, among them we can refer to damage index of Park and Ang [8] Venchzo and Banon [9]. From other damage indices introduced by researchers in recent years we can refer to Falerbo, et al research which by using of plastic energy in plastic joints they paid to representing an index for evaluation of scope of damage entered on reinforced concrete frames, of course it is necessary to mention that in this research idea of centralized plastic joint is used that in the case of reinforced concrete structures because of cracking phenomena can not to model real behavior of structure in a desired form [10]. Jang, et al. by using of method of force analogy and the combination of energy and displacement of structure (3rd category) introduced an index and paid to comparison of results from this index by using of time history analysis and combination of square root of sum of squares resulted from considering three first mode of structure for two Elcentro and Northrij earthquakes[11].

Study of literature of subject indicates that however some referred indices have suitable compatibility

with observed damage on structures, but calculation of most of them needs to performance of nonlinear dynamic analysis which time consuming and complexity of this method and also uncertainty about specifications of future earthquakes has caused that these indices less be used in common designing of building frames and more delicate to activities and research projects. Nowadays, pushover analysis as a model which can model capacity of structure and in any case has not complexity of nonlinear dynamic analysis is considered very much. Now if we can define an index based on performance of this analysis and proportionate with operation point of structure which have suitable computability with real behavior of structure and also by using it we can estimate real damage rate, we can have an important pace in aspect of more practically of determining the rate of damage entered on structures in categories such as designing and strengthening. In this research, at first it is paid to investigation of lateral transformation criterion accuracy (emphasized by standard such as FEMA273 and ATC40) in evaluation of rate of damages entered on structures and in the following it is paid to effective strategies in evaluation of rate of damages entered on structures. For this purpose, by considering 7 record of earthquake, it is paid to nonlinear modeling of several arc frames and index of Park and Ang damage is calculated for them. Then by comparison of results of this modeling with results of damage indices suggested in pushover analysis, a new criterion is introduced.

2. Indices of Evaluated Damage in this Research

1-2- Index of Park and Ang Damage

In present research, this index which was suggested by Park and Ang in 1984, as index of base is used for comparison with other indices. Main advantage of this index is in its compatibility with experimental results and also its simpleness and grading proportionate with observed damage. This index is given by relation below:

$$DI_{P\&G} = \frac{\theta_m - \theta_r}{\theta_u - \theta_r} + \frac{\beta E_h}{M_y \theta_u} \quad (1)$$

there, θ_m is the most created circulation in element in history of loading, θ_u is the most capacity of cross circulation, θ_r recovering circulation after loading, M_y yielding anchor, β constant of model and E_h is wasted energy in cross. In table 1 proportionate of real damage entered in structure with amounts of this index which has been by Park, is shown:

Table 1: Details of damage, proportionate to Park Index (8)

Degree of Damage	Apparent Sight	Index of damage	Situation of Building
Collapsing	Local or general collapsing of	>1	Demolition
Hard	Crushing of concrete spread, appearing of ricocheted armatures	0.4-1.0	Un-repairable
Average	Big and expanded cracks, laminating of concrete in weaker elements	0.25-0.4	Repairable
Little	Small cracks, local crushing of concrete in columns	0.1-0.25	Repairable
A few	Appearance of scattered cracks	<0.1	Repairable

2-2- Lateral Deforming Damage Index

This index is the most famous indices in classification of general indices of structure which is calculated by equation below:

$$DI_{Drift} = \frac{\Delta_m}{H} \quad (2)$$

there, Δ_m is maximum movement of roof (corresponding to operation point) and H is height of structure. In present research this index is calculated by using push over analyzing and is compared with results of Park and Ang damages (dynamic).

3-3 Index of Energy Damage

Using of wasted energy by structure in many researches for determining the rate of entered damages on structure most of which were on the basis of dynamic analyses. Kaeo and Akiyama considered wasted accumulated energy by hysteresis attenuation as acceptable index for estimation of structure damage [12]. Jang and et.al used entered energy and plastic energy of structure for determining the rate of damage entered on structure [11], etc. By referring to energy equilibrium of energy equation for a nonlinear system, under stimulation of an earthquake:

$$\int_0^u m \ddot{u}(t) du + \int_0^u c \dot{u}(t) du + \int_0^u f_s(u, \dot{u}) du = - \int_0^u m \ddot{u}_g(t) du \quad (3)$$

Or
KE+DE+SE+PE=IE

There in, $KE = \int_0^u mu(t) \cdot du$ is kinetic energy,

$DE = \int_0^u cu(t)du$ is attenuation energy,

$SE = \frac{f_s^2}{2k}$ is strain energy,

$PE = \int_0^u f_s(u, \dot{u})du - SE$ is plastic energy and

$IE = -\int_0^u m\ddot{u}_g(t)du$ is the energy entered into system.

As we consider, entrance energy to a structure is wasted by four mechanisms. In general condition, kinetic and strain Mechanisms generally undertake little share of rate of wasted energy by structure and most of energy is wasted by attenuation and yield mechanisms. In these two mechanisms, whatever structure enters into nonlinear phase, share of yield energy of attenuation energy is more which is explaining of lower speed of non-elastic systems to elastic systems. The aim of this section is representing an index on the basis of absorbed energy by structure in pushover analysis. With regard to this point that, curve of capacity resulted from pushover analyzing is structure Hysteresis ring push, then we can know low surface of this curve in operation point indicator of absorbed energy of structure in the biggest Hysteresis ring of it under a special square mostly has the large share of absorbed energy by structure. This index is calculated by relation bellow:

$$E_{pp} = a_y d_p - d_y a_p$$

There in,

d_p and a_p is coordinates of operation point.

Figure 1- Hysteresis ring of structure in operation point

In definition of this index initial point which is entrance of structure to nonlinear phase and is considered beginning of structure damaging, a point of capacity curve corresponding to the first cracking of structure member has been considered and amount of damage index in this point is zero and whatever structure behavior enters into nonlinear phase, structure element is more damaged and the amount of this index is more to finally in a point final capacity of structure, the amount of this index would be reached to unit number. In purpose of determining final capacity of structure, different definitions have been brought up by researches. But in this research final capacity point of structure is considered a point

of curve of structure capacity in which by little increase of lateral force, structure causes to very big sudden deformation to the previous phase and so-called in curve of capacity structure cutting occurs. Phase of calculation of E_{fp} also is similar to E_{pp} . E_{fp} is the area related to sub-curve of capacity in the point of first cracking. It should be mentioned that, this index hereinafter is called under title of index of energy damage.

3. Modeling of Frames

In this section in purpose of evaluation of introduced damage indices in last sections, the number of 14 reinforced concrete frame were considered which be concluded of large level of stories number and spans. All frames have selected from reference [13]. Four span frames have number storeys of 5, 8 and 12 and 15, 5 span frames have storeys number of 2, 4, 6, 8 and 10 and 2 span frame have storeys number of 1, 3, 5, 7 and 9. Height of all storeys is 3.2m and length of all spans also is 4m. In modeling of these frames it is assumed that all frames there are in stone bed and by average risking according to loading 2800 standard and according to ABA by-law have been designed for the region (in designing these frames all standards such as restriction of lateral transformation in 2800 by-law has been observed). Frames have loader wide of 4m and in all storeys having dead load of 760 and live load of 200 km/m^2 . Importance of frames are assumed of middle type according to standard 2800. In process of analyzing and designing of these frames specified strength of concrete equal to 30 MP, elasticity module of concrete equal to 2386 MP, corresponding strain with maximum strength of concrete equal to 0.002, final strain of concrete equal to 0.003, strength of flowing steel 300 MP and steel elasticity module equal to 200000 MP have been assumed. General scheme of these frames has been indicated in figure 2 and details related to their designing are indicated in table 2.

Figure 2- General View of Under-study Frames

Table 2- General Specification of Under-study Frames

No. of Frame	S3B4	S8B4	S12B4	S15B4	S2B5	S4B5	S6B5	S8B5	S10B5	S1B2	S3B2	S5B2	S7B2	S9B2
G. Height (m)	16	25.6	38.4	48	6.4	12.8	19.2	25.6	32	3.2	9.6	16	22.4	28.8
Structure Period	0.56	0.79	1.07	1.27	0.28	0.47	0.64	0.79	0.941	0.167	0.38	0.56	0.72	0.87
Base Shear (K Newton)	159.8	202.1	247.6	276.8	114.1	173.5	215.2	248.3	277.76	22.83	73	94.3	111.8	105.5

4. Choosing Earthquakes

For performance of nonlinear dynamic analyzing it is necessary that some velocity writer proportionate to geo-technique specification and conditions of soil of establishment of project place being chosen and these velocity writers be compatible with spectrum of designing of region. As it was mentioned, modeled frame in this project are designed on stone bed and as a result, registered records also have chosen on stone bed. In this research 7 records earthquakes from collection of existent records in FEMA440[14] registered on stone bed, in a manner have been chosen from data base PEER and according to principles of bylaw 2800 have been scaled which average spectrum resulted of them in range of 0.03 to 2.4 second which upon bylaw 2800 is an important limit for designed frames in this research (limits between 0.2T and 1.5T), have the least difference with spectrum of plan of 2800 bylaw, which specification related to these records and average spectrum resulted from them in sequence are indicated in table 3 and figure 3.

Table 3- General Specification of Earthquakes

No. of Earthquake	1	2	3	4	5	6	7
Name of Earthquake	Imperial Valley	Landers	Loma Prieta	Loma Prieta	Loma Prieta	Northridge	Northridge
Station No.	286	21081	58131	58151	58338	23590	90019
Component (degree)	135	90	270	90	45	90	180
Maximum velocity (g)	0.195	0.146	0.06	0.09	0.084	0.056	0.256

5. Numeric Study

In this section initially we pay to comparison of Park and Ang damage indices and lateral transformation index and then we will pay to evaluation suggested index of this research. For this purpose, considered frames are modeled and pushover and nonlinear dynamic analyses is performed on model. Pushover analysis in this research by using of loading model of existent sequence in reference [1] has been performed which diagram of shear base-displacement roofs of considered frames are shown in figure 4. For performance of all analyses DARC V6.1 has been used which is the very powerful software in analyzing reinforced concrete structures [15]. For calculation of damage indices in pushover analyzing, firstly operation point of structure by capacity spectrum method determined and then amount of

these indices were calculated in operation point of structure [16]. In the following for this purpose that relation between explained indices be determined in a vast level, for each of frames 5 operation point was calculated which in order are related to spectrum of average response indicated in figure 3 and spectrums which by co-efficient of 1.5, 2, 2.5 and 3 equal to first spectrum are scaled and then amounts of damage indices in these points are calculated. In the following, for calculation of damage indices in dynamic condition, existent compatible records, became compatible with scaled spectrums and it was paid to performance of nonlinear dynamic analysis. Analogous to each calculated damage in operation point in pushover analysis, by averaging of results related to 7 earthquakes being compatible with scaled spectrum, damage related to nonlinear dynamic analysis was calculated. In presented forms in this section, triangular point are related to damage correspond to average spectrum in figure 3 and are correspond to planning earthquake of 2800 bylaw; square points are analogous to 1.5fold of average spectrum in figure 3, which approximately can be analogous to hazard level of M.E. in ATC40 which indicates probability of 5% occurrence in 50 year, (however, determining of this level needs to more investigations, but by referring to reference [2], this level nearly is 1.25 to 1.5fold of designing level spectrum which with regard to this subject, for explaining relative estimation of damages in this level, the most limit of this approximation i.e. 1.5fold of average spectrum, has been selected) and other points have been specified by square points. In the following in this research these points are mentioned by their figure.

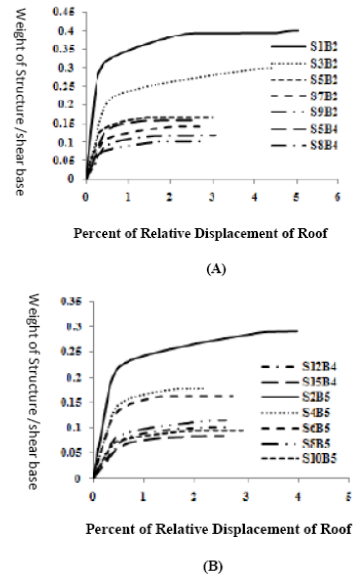

Figure 4- Base shear curve – Displacement of frames roof

6. Comparison of Park and Ang Damage Index with Index of Lateral Transformation

In this section we have paid to comparison of Park and Ang damage index in dynamic analysis and index of lateral transformation in pushover analysis results of which are shown in figure 5.

Criterion of damages of relative displacement of roof (%)
Figure 5- Comparison of Park and Ang Damage Index and Relative Displacement of Roof with Linear interpolation

As we see in figure 5, these two criteria have many scattering to each other. From this point we can result that displacement criterion cannot be suitable index for assessment of operation of structure. We can know this subject relevant to non-consideration of final capacity of structure in this index because in this criterion only in this criterion only the rate of lateral displacement of roof has been considered and general capacity of structure in bearing this displacement is not considered. In consideration of triangular points which are correspond to designing spectrum and are indicating of hazard level of 10% in 50 year, it is observed that amounts of Park damage index, changes from 0.841 to 0.27. By referring to table 1, this range of changes, is indicating without damage and a few damage situations with regard to specification of operation levels which with regard to indicated operation level specifications, can considered operation level of OP and IO. This subject is indicating suitable operation of ABA bylaw and 2800 in restriction of damaged entered on designed structures by using of standards of these bylaws and upper hand operation of them. Also by referring to circle point which are indicating of hazard level of 5% in 50 year, it is observed that range of changes of these points is from 0.27 to 0.42 which by referring to table 1, indicating of average damage level and by referring to operational level, it can be indicating of operational level of LS. This subject again indicates suitable operation of ABA bylaws and 2800. Results show that for triangular points, range of relative displacement changes from is 0.673 to 1.25 and for circle point is from 0.915 to 2.1 which with regard to specifications of operational levels, defined in reference [1] on the basis of amounts of this criterion, is indicating suitable operation of structures. Among other considerable points of these figures we can

refer to this point that to relative displacement limits of %1.7, amounts of Park and Ang index is less than 0.4 which is border of repairable and un-repairable damage levels.

7. Comparison of Park and Ang damage Index and Index of Energy Damage

In this section, amounts of Park and Ang damage index in dynamic analysis, by amount of index of energy damage which is calculated in operation points, have been compared. Results from this comparison are shown in figure 6.

Figure 6- Comparison of Damage Indices with Linear interpolation

As it is seen in figure 6 the least amount of achieved damage is related to a point by coordinates of (0.841 and 0.027) and the most amount is related to a point by coordinates of (0.683 and 0.94) and is observable that at the first of this diagram the amounts of Park and Ang damage index are more and whatever we go to end of diagram, this difference will decrease which we can now this subject because of increasing of hysteresis energy share from wasted energy by structure, by evermore entrance of structure into nonlinear phase. Also, average amount of energy damage index is 0.4 which is very close to index of Park damage. From other considerable cases in this diagram, scope of changes of energy damage index for limit of triangular and circle point is as 0.027 to 0.176 and 0.11 to 0.36. Now if the aim is preparation a table such as provided table by Park (Table 1) but is according to lateral transformation of roof and energy damage index we can represent a table as table 4.

Table 4- Various level of damage, proportionate to amounts of damage index of transforming of plastic and relative displacement of roof.

Amounts of Relative Displacement of Roof %	D<0.67	0.67<D<1.15	1.15<D<1.8	2.1<D
Amounts of Energy Damage Index	D<0.076	0.076<D<0.165	0.165<D<0.38	0.38<D<1
Details of Damage	Without Damage: Existence of crack in few and little number	Little damage: Small crack in length of element	Average damage: Hard crack and existence of split	Hard damage: hollowing of concrete and appearin

Conclusion:

In this research, at first it was paid to criteria of relative displacement by using of Park and Ang damage index. Results state that using this criterion of lateral transformation of roof, as the only criterion of recognition operation of structure is not suitable. Comparison of Plastic transformation damage index in pushover analysis and index of Park and Ang damage index in dynamic analysis, is indicating of more suitable operation of transforming index to the relative displacement criterion. On the basis of resulted nearly much points that each of them is result of two analysis of damage in nonlinear dynamic and nonlinear static conditions, relations for estimation of dynamic index amount in account of static results were extracted. Evaluation of damage entered on designed structures on the basis of ABA bylaw and 2800 of Iran, showed that in earthquake of planning level of 2800 bylaw and level of hazard M.E. in ATC40 a, ABA and 2800 bylaw of Iran in limitation of damage entered on structures has a suitable operation of life safety. Represented table in this research, on the basis of suggested index, give simple and effective criteria for prediction of operation level and damage of reinforced concrete arc frames, without need to performance of complex and time consuming nonlinear dynamic analyses to designers.

Abstract: The current work aimed to study the effect of preeclampsia on maternal serum level of beta subunit of human chorionic gonadotropin and maternal plasma level of adenosine deaminase. Ninety pregnant women with gestational age 24 - 26 weeks were selected for this study, they were classified into three groups: group 1 consists of 30 women with normal pregnancy, group 2 consists of 30 patients with mild preeclampsia and group 3 consists of 30 patients with severe preeclampsia. Maternal serum level of beta subunit of human chorionic gonadotropin, and maternal plasma adenosine deaminase level were measured. Maternal serum level of beta subunit of human chorionic gonadotropin was significantly higher in severe preeclampsia compared with the mild preeclampsia group and normal pregnancies. Maternal plasma adenosine deaminase level was significantly higher in the severe group compared with the mild preeclampsic and normal groups. Maternal serum level of beta subunit of human chorionic gonadotropin and maternal plasma level of adenosine deaminase might be useful as markers of the severity of preeclampsia.

Key words: Preeclampsia, human chorionic gonadotropin, adenosine deaminase.

1. Introduction

Preeclampsia (PE) remains a major cause of prenatal morbidity and mortality worldwide (Harskamp et al., 2007). Early identification of pregnant women at risk for **preeclampsia** is a priority to implement preventive measures (Giguère et al., 2010). The etiology and pathogenesis of PE are not fully understood, but two important components have been identified: the role of trophoblast cells and an accelerated maternal systemic response to trophoblastic tissue (Sargent et al., 2003).

The production of human chorionic gonadotropin (hCG) by the placenta in early pregnancy is critical for implantation and maintenance of the blastocyst (Reisinger et al., 2007). Since it is postulated that PE is likely to be a trophoblastic disorder, it may be essential to investigate the pathologic and secretory reaction of the placenta to understanding the disease. Twin pregnancy and molar pregnancy produce higher levels of B-hCG and they are associated with a higher incidence of PE than uncomplicated singleton pregnancy (Long and Oat, 1987).

Adenosine deaminase (ADA) is a cytosolic enzyme, which has been the object of considerable interest mainly because a congenital defect in this enzyme in humans causes severe combined immunodeficiency disease (Franco et al., 1987). ADA participates in purine metabolism where it

degrades either adenosine or 2-deoxyadenosine producing inosine or 2'-deoxyinosine respectively. Further metabolism of these deaminated nucleosides leads to hypoxanthine. ADA could have an extraenzymatic activity through binding directly to different cell surface molecules including CD-26 (a lymphocyte activation marker), so it is regarded as a cellular inflammatory indicator. ADA presents in all human tissues with highest level in lymphoid system. It may play a central role in the differentiation and maturation of the lymphoid system (Herrera et al., 2001).

The objective of the present study is to evaluate the correlation between maternal serum B-hCG level, maternal plasma ADA level and severity of PE which may reflect a different trophoblastic severity response of the disease.

2. Patients and Methods

This study was carried out on 90 pregnant women classified into 3 groups: group 1 consists of 30 normotensive non proteinuric pregnant women; group 2 consists of 30 women with mild PE; and group 3 consists of 30 women with severe PE. Women were recruited from the Obstetrics and Gynecology Outpatient Clinic of Benha University Hospital from June 2009 to June 2010. Inclusion criteria were singleton fetus, normal fetal anatomy, non-smoker and gestational age of 24-26 weeks

assessed by ultrasonography. Women with chronic hypertension, systemic disease as diabetes mellitus, collagen disease and recent infections were excluded.

Mild PE was defined as a combination of (1) systolic blood pressure (SBP) ≥ 140 and < 160 mm Hg or a diastolic blood pressure (DBP) ≥ 90 and < 110 mm Hg on two consecutive measurement six hours apart (2) proteinuria of ≥ 0.3 g and < 2 gm per 24 hours urine specimen or > 1 and $< 3+$ on dipstick testing of two random urine samples four hours apart. Severe PE was defined as (1) SBP ≥ 160 mmHg or DBP ≥ 110 mmHg on two consecutive measurement at least six hours apart on bed rest and (2) proteinuria ≥ 2 gm per 24 hours urine specimen or $\geq 3+$ on dipstick testing of two random urine sample four hours apart. In addition, any patient with oliguria (>400 ml in 24 hours), cerebral or visual disturbances, epigastric pain, pulmonary edema, abnormal edema, abnormal platelet count or abnormal liver function profile was included in the severe PE group (ACOG, 2002).

- For -hCG estimation, the random venous 2cc blood samples were centrifuged at 2000 g for 10 minutes at 4 °C. Sera were collected and stored at -20°C until analysis. Serum level of (-hCG) were measured by enzyme immunoassay according to Ozturk, et al., 1988 using free beta-hCG ELISA Kit (purchased from IBL - Hamburg GmbH, Flughafenstr, 52A, D-22335 Hamburg, Germany) and ELISA Reader (SLT-Spectra, Mode-III, Austria).
- For ADA estimation, the random heparinized 2cc blood samples were centrifuged for 10 minutes at 3000g and the plasma was separated and frozen at -70°C until analyzed. (ADA) activity was measured spectrophotometrically (Spectronic

3000 Array, Milton-Roy, USA) in the maternal plasma using the method described by Giusti and Galanti, 1984, based on direct measurement of the ammonia produced when ADA acts in excess of adenosine.

Statistical analysis:

The data were reported as mean and standard deviation (SD). For statistical analysis, analysis of variance (ANOVA) and correlation coefficient (r) were used and p values < 0.05 were considered statistically significant. Statistical package for social science (SPSS) version 10 was used for data analysis.

3. Results

The mean maternal age was significantly higher in group 3 than in group 2 and group 1 ($p < 0.05$). The parity was lower in group 3 than in group 2 and group 1 but the difference was not statistically significant. Maternal serum -hCG was significantly higher ($p < 0.05$) in group 3 than in group 2 and group 1. Maternal plasma ADA was significantly higher ($p < 0.05$) in group 3 than in group 2 & 1 (table 1).

The maternal age, maternal serum levels -hCG and maternal plasma ADA showed a significant positive correlation with SBP/DBP and albuminuria. Parity showed significant negative correlation with SBP/DBP and albuminuria in group 2 (Table 2).

The maternal age, maternal serum levels -hCG and maternal plasma ADA showed a significant positive correlation with SBP/DBP and albuminuria. Parity showed significant negative correlation with SBP/DBP and albuminuria in group 3 (Table 3).

Table (1): Characteristics of study participants in the 3 groups

Data \ Groups	Group 1 (n=30)	Group 2 (n=30)	Group 3 (n=30)	p
Age (y)	25.4 ± 0.27	27.73 ± 0.36	31.20 ± 5.54	< 0.05
Parity	3.07 ± 0.30	2.60 ± 0.32	2.0 ± 0.32	< 0.05
-hCG (mIU/ml)	16708.67 ± 1380.1	22504.67 ± 1161.40	29306.0 ± 1283.56	< 0.05
ADA (IU/l)	8.99 ± 0.46	12.95 ± 0.69	14.95 ± 0.52	< 0.05

-hCG = maternal serum beta subunit of human chorionic gonadotropin.
 ADA = maternal plasma adenosine deaminase $p < 0.05$ = significant.

Table (2): Correlation Coefficient (r) between systolic, diastolic blood pressure albuminuria, age, parity, maternal serum -hCG, maternal plasma adenosine deaminase (ADA) in group 2.

Data \ Parameters	Systolic blood pressure (SBP)		Diastolic blood pressure (DBP)		Albuminuria	
	r	p	r	p	r	p
Age (y)	0.92	<0.05	0.53	<0.05	0.85	<0.05
Parity	-0.88	<0.05	-0.54	<0.05	-0.84	<0.05
-hCG (mIU/ml)	0.92	<0.05	0.58	<0.05	0.84	<0.05
ADA (IU/l)	0.92	<0.05	0.54	<0.05	0.85	<0.05

-hCG = maternal serum beta subunit of human chorionic gonadotropin.
 ADA = maternal plasma adenosine deaminase p<0.05= significant.

Table (3): Correlation Coefficient (r) between systolic, diastolic blood pressure albuminuria, age, parity, maternal serum -hCG, maternal plasma adenosine deaminase (ADA) in group 3.

Data \ Parameters	Systolic blood pressure		Diastolic blood pressure		Albuminuria	
	r	p	r	p	r	p
Age (y)	0.88	<0.05	0.88	<0.05	0.83	<0.05
Parity	-0.70	<0.05	-0.63	<0.05	-0.89	<0.05
-hCG (mIU/ml)	0.89	<0.05	0.94	<0.05	0.79	<0.05
ADA (IU/l)	0.91	<0.05	0.83	<0.05	0.71	<0.05

-hCG = maternal serum beta subunit of human chorionic gonadotropin.
 ADA = maternal plasma adenosine deaminase p<0.05= significant.

Discussion

The normal placenta differentiates during pregnancy with dominance of cytotrophoblast in early gestation and syncytiotrophoblast in late gestation. It is well known that cytotrophoblasts are undifferentiated stem cells and that syncytiotrophoblasts are differentiated from the cytotrophoblast (Kliman, et al., 1987).

Although the mechanism of regulation of gestational hCG remains largely unknown, it is generally accepted that hCG is secreted only by the syncytiotrophoblast (Fox, 1970). Remzi et al showed that early placental vascular damage leading to decreased oxygen supply might result in increased hCG production by hyperplastic cytotrophoblastic cells (Remzi, et al., 2000). Also, hCG production has been shown to increase when normal placental villi in organ culture were maintained under hypoxic condition. Typically the placenta is the affected tissue in PE (Correa, et al., 2007). In PE, placental pathologic examination reveals focal cellular necrosis in the syncytiotrophoblast and increased mitotic activity with cellular proliferation in the cytotrophoblast. In addition, the proliferating cytotrophoblast in severe PE is rapidly transformed into syncytiotrophoblast within 72 hour (Hoshina, et al., 1982).

In recent years, many studies have been conducted to determine the relation between maternal serum hCG levels and subsequent development of

PE. Most studies indicated that an unexplained elevation of maternal serum B-hCG is significantly correlated with the occurrence of PE (Benn et al., 1996 and Luckas et al., 1998). By contrast Morssink et al., (1997_a) and Pouta et al., (1998) demonstrated no association, while Ashour et al., (1997) showed that significant association was reached only among multiparous women.

Regarding the relation between the levels of maternal serum B-hCG and the severity of PE, Hsu et al demonstrated that a significantly raised serum B-hCG level was only associated with severe PE (Hsu et al., 1994). Long-chien et al demonstrated multiple determining factors for severe PE including elevated mid-trimester B-hCG, multiparity, advanced maternal age and high basal body mass index; BMI (Long-chien et al., 2000). This study showed a significant positive correlation between maternal serum -hCG and the severity of PE. However significant negative correlation was found between the severity of PE and parity. This agrees with Basirat et al and may suggest an earlier occurrence of pathologic changes of the placenta among women at risk for later development of severe PE (Basirat et al., 2006).

The enzyme ADA is mainly located in haemopoietic cells such as Th1 cells, monocytes and macrophages. Beside ADA, Th1 cell produce the basic proinflammatory cytokines interleukin (IL2), tumor necrosis factors & (TNF- α) and interferon- α

(INF- α). Insufficient arterial remodeling and shallow trophoblastic invasion are characteristic placental pathologies in PE (Merviel et al., 2004). An unbalanced inflammatory reaction at the placental implantation site is a proposed causative mechanism. There is biological and histological evidence supporting the existence of a proinflammatory reaction including Th1 cytokine dominance within and around the spiral arteries that separate them from trophoblast cells (Sargent et al., 2003). PE is characterized by enhanced cell-mediated immunity, thus serum ADA activity tends to increase in PE (Yoneyama et al., 2002).

Initial studies of maternal and fetal plasma ADA demonstrated a significant increase in PE patients, compared with normal pregnancy⁽²⁴⁾. Kafkasli et al demonstrated higher increase in ADA activity in placental tissue compared with maternal or fetal plasma level in both mild and severe PE. This study shows a significant positive correlation between maternal plasma ADA and severity of PE (Kafkasli et al., 2006).

It could be concluded that maternal serum - hCG and maternal plasma ADA increase in cases of mild and severe PE.

On the Invertibility Preserving Linear Maps

Mohammad Reza Farmani^{*,1}, Abdorreza Panahi¹

¹. Department of Mathematics, Saveh Branch, Islamic Azad University, Saveh, Iran.
mr.farmanis@gmail.com

Abstract: In this paper we show that the essentiality of the socle of an ideal B of the algebra A implies that any invertibility preserving linear map $\Phi: A \rightarrow A$ is a Jordan homomorphism. Specially if A is a preliminary algebra then any such Φ is an algebraic homomorphism.

[Mohammad Reza Farmani, Abdorreza Panahi. On the Invertibility Preserving Linear Maps. Journal of American Science 2011;7(6):459-462]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: Invertibility preserving, Banach algebra, Socle, Jordan homomorphism.

1. Introduction

Linear invertibility preserving maps of algebra were noteworthy from years ago, for example, the famous theorem of Glason-Kahane-Zelasco which asserts that any invertibility preserving linear isomorphism in to the scalar field is product preserving [1,14]. This problem has been discussed in different algebras previously [3,4,7,8,10,11]. Generally, A and B are two Banach algebras and we consider $\Phi: A \rightarrow B$ linear map, we know that if be a homomorphism algebra, it necessary would be invertibility preserving.

Kaplansky presented the issue as following question:

If the preserving would be invertible, is it necessarily the Jordan homomorphism? So, the main question of this paper is as Kaplansky question and we will answer it in the essential ideal of semi-simple Banach algebras.

Definition 1: the inverse of an invertible element $a \in A$ is denoted by a^{-1} and the set of all invertible elements of unitary algebra A is denoted by $Inv(A)$.

Definition 2: Let $\Phi: A \rightarrow B$, linear map between functional algebras, Φ is invertibility preserving if

$$a \in Inv(A) \Rightarrow \Phi(a) \in Inv(B) \quad (a \in A) .$$

Theorem 1: Let $\Phi: A \rightarrow B$ be a linear mapping with B commutative and semi-simple. Suppose $\varphi(Inv(A)) \subseteq Inv(B)$ and unitary maps. Then Φ is continuous and multiplicative, i.e.

$$\Phi(xy) = \Phi(x)\Phi(y) \text{ for all } x, y \in A .$$

Proof.

Let L be a multiplicative linear functional on B different from the zero functional. Then L and $L \circ \Phi$

are continuous. We show that Φ is multiplicative. It suffices to consider only the case where $B = \mathbb{C}$ since the multiplicative linear functional on B separates its points.

Thus, given $x \in A$, define $f(\lambda) = \Phi(\exp(\lambda x))$, then $f: \mathbb{C} \rightarrow \mathbb{C}$ is an entire function having no zeros since every value of the exponential function on a Banach algebra is invertible. Hence there exists an entire function with $f(\lambda) = \exp(g(\lambda))$ for all $\lambda \in \mathbb{C}$.

Moreover, $g(0) = 0$ and $\operatorname{Re}(g(\lambda)) \leq |\lambda|$ for all $\lambda \in \mathbb{C}$ and it follows from a Schwarz Lemma that $g(\lambda) = \alpha\lambda$ for some complex constant α . Thus,

$$\Phi(e + \lambda x + \frac{\lambda^2 x^2}{2!} + \dots) = 1 + \alpha\lambda + \frac{\alpha^2 \lambda^2}{2!} + \dots \quad (\lambda \in \mathbb{C})$$

Comparing coefficients, we see that $\Phi(x) = \alpha$ and $\Phi(x^2) = \alpha^2$ so $\Phi(x^2) = \Phi^2(x)$. Define $[x, y] = xy - yx$ and $x \circ y = xy + yx$. Since Φ is a Jordan homomorphism, for any $x, y \in A$:

$$\Phi(x \circ y) = \Phi(x) \circ \Phi(y)$$

$$\Phi([x, y])^2 = \Phi([x, y]^2) = [\Phi(x), \Phi(y)]^2 = 0.$$

Because B is commutative, hence $\Phi([x, y]) = 0$ so

$$2\Phi(xy) = \Phi([x, y] + x \circ y) = 2\Phi(x)\Phi(y).$$

In the above theorem, complex field and commutative is the main provision.

Example 1: Let A real Banach algebra of all continuous real-valued functions f is on $[0,1]$, we define

$$\Phi : A \rightarrow R$$

$$\Phi(f) = \int f(t)dt$$

Clearly A_m is all function of non-zero in A and $\Phi(I) = I$, so Φ is confirmed in the above theorem, whereas Φ is not isomorphism.

Example 2: Let M_n be algebra of $n \times n$ matrices on the complex numbers, transpose function, maps will be linear and invertible, while multiplicative

$$\Phi : M_n \rightarrow M_n$$

$$\Phi(A) = A'$$

because $\Phi(ZA) = (ZA)' = A'Z' = \Phi(A)\Phi(Z)$.

Remark: Example 2 shows that an onto condition is needed.

$$\Phi : M_2 \rightarrow M_4$$

$$\Phi(Z) = \begin{bmatrix} Z & Z-Z' \\ 0 & Z \end{bmatrix}$$

It is observed that

$$\Phi^2(Z) - \Phi(Z^2) = \begin{bmatrix} 0 & (Z-Z')^2 \\ 0 & 0 \end{bmatrix} \neq 0$$

In the next example, it is observed that if bijective map be invertibility preserving, semi-simple provision of algebras can not be removed.

Example 3: If Φ is bijective map and A, B Banach algebras of semi-simple, then Φ is not a Jordan isomorphism

$$\Phi : M_2 \rightarrow M_4$$

$$\Phi \left(\begin{bmatrix} W & X \\ 0 & Y \end{bmatrix} \right) = \begin{bmatrix} W & X \\ 0 & Y' \end{bmatrix} \quad (W, X, Y \in M_2)$$

In this case, Φ is unitary linear map, while

$$\Phi^2(Z) - \Phi(Z^2) = \begin{bmatrix} 0 & X(Y-Y') \\ 0 & 0 \end{bmatrix} \neq 0$$

Corollary: In 1995, Marcus-Purves showed that maps of invertibility preserving on M_n matrices are isomorphism.

2. Jordan isomorphism

In 1986, Jafarian-Souroor proved this subject on space of linear functions of $B(X)$ [7]. In 1970, Kaplansky in order to explain Theorem 1, removed commutative assumption of B . This case caused that in 1996 Kadison regarding Jafarian-Souroor's theorem being $B(X)$ semi-simple Banach algebra [7,15], tried to find answer of Kaplansky theorem through expressing following assumption on c^* -algebras in special manner.

Assumption: Suppose that A, B are two c^* -algebras with the same element of c and $\Phi : A \rightarrow B$ is bijective unitary map, then is $\Phi : A \rightarrow B$ isomorphism Jordan? Solution: While B is commutative, the first theorem proves the accuracy of above assumption.

Moreover, if B is finite of $B = L(H)$ (H is Hilbert space) or c^* -algebra, compact operator on H as be the same self-addition, the above assumption will be correct.

Also, Aupetit asserts assumption in ideal that A, B be Von algebras.

Lemma 2.1: Let A be a semi-simple Banach algebra and $a \in A$, then

(i) $a \in soc(A)$ if and only if $\|\sigma(xa)\| < \infty$ ($x \in A$)

(ii) $a \in soc(A)$ if and only if there exists $n \in N$ such that

$$\prod_{t \in F} \sigma(x+ta) \subseteq \sigma(x) \quad (x \in A)$$

for which F is the set of n -tuples of $\mathbb{C} \setminus \{0\}$.

Lemma 2.2: Let Φ be an automorphism on a semi-simple Banach algebra A , then

(i) $\Phi(soc(A)) = soc(A)$

(ii) $\Phi^{-1}(\Phi(a^2)) - \Phi^2(A), soc(A) = 0$

Proof. (i) Let $a \in A$, there exists $b \in A$ such that $\Phi(b) = a$, since Φ is spectrum preserving, then $\Phi(y) = x$ implies that

$$\sigma(\Phi(y) + ta) = \sigma(y + tb) \quad (t \in \mathbb{C})$$

so

$$\prod_{t \in F} \sigma(x + t\Phi(a)) = \prod_{t \in F} \sigma(\Phi(y + tb)) = \sigma(x)$$

therefore, $\sigma(a) \in \text{soc}(A)$ due to part 2.3. So $\Phi(\text{soc}(A)) \subseteq \text{soc}(A)$. Now we show that $\Phi(\text{soc}(A)) \supseteq \text{soc}(A)$. If $x \in A$ then there exists $y \in A$ such that $\Phi(y) = x$ and

$$\int_{t \in F} \sigma(x + tb) = \int_{t \in F} \sigma(\Phi(x) + t\Phi(b)) \subseteq \sigma(y) = \sigma(x)$$

which implies that $b \in \text{soc}(A)$ due to part (ii) of Lemma 2.1.

(ii) Let $\Phi(a) = 0$ then

$$\sigma(a + x) = \sigma(\Phi(a + x)) = \sigma(x) \quad (x \in A)$$

So $a \in \text{Rad } A = \{0\}$ due to Zernank theorem. Now the rest of proof is hold by Lemma 2.1.

Recall that every minimal left ideal of A is of the form Ae where e is a minimal idempotent. The sum of all minimal left ideal of A is called the socle of A and it coincides with the sum of all minimal right ideal of A . An ideal I of A is said to be essential it has a nonzero intersection with every nonzero ideal of A . If A is a semi-simple algebra, then I is essential if and only if $a.I = 0$ implies $a = 0$, where $a \in A$.

Example 4: Let H be Hilbert space and $K(H)$ be a compact operator in $B(H)$, then $K(H)$ is a essential ideal of $B(H)$.

Lemma 2.3: Let B be an ideal of A , and $\text{soc}(B)$ is an essential ideal, then $\text{soc}(A)$ is an essential ideal.

Proof. For every $a \in A$, if $a.B = 0$ then $a.\text{soc}(B) = 0$ which implies $a = 0$. Let $b \in B$ and bB be a minimal right ideal of B . Since $bB \neq 0$, there exists $b_1 \in B$ such that $bb_1 \neq 0$, we have $bb_1B \subseteq bb_1A \subseteq bB$. Because $bb_1B \neq 0$ and bB is a minimal right ideal in B , so $bb_1B = bb_1A = bB$.

If $a \in A$ and $bb_1a \neq 0$, we have $bb_1aB \subseteq bb_1aA \subseteq bb_1A \subseteq bB$ as well, because $bb_1aB \neq 0$ and bB is a minimal right ideal in B , then $bb_1aA = bb_1A = bA$. So bb_1A is a minimal right ideal in A , which implies $\text{soc}(B) \subseteq \text{soc}(A)$, if $a.\text{soc}(B) \subseteq a.\text{soc}(A) = 0$.

We know that a must be equal to zero, so $\text{soc}(A)$ is an essential ideal.

Theorem 2.3: Let B be an ideal of the semi-simple Banach algebra A and $\Phi : A \rightarrow A$ be a unitary linear isomorphism. If $\text{soc}(B)$ is an essential ideal then Φ is a Jordan isomorphism.

Proof. Let $\text{soc}(B)$ is essential, so $\text{soc}(A)$ is also an essential ideal, if A is unitary then Φ is a Jordan isomorphism by Lemma 2.2. If A is not unitary then $\tilde{A} = A \oplus \mathcal{C}$ is unitary semi-simple Banach algebra. Let $\tilde{\Phi}(a, \lambda) = (\Phi(a), \lambda)$ for $(a, \lambda) \in \tilde{A}$. Then $\tilde{\Phi}$ is a well defined unitary linear isomorphism. If $\text{soc}(A) = k$ and $(a, \lambda).\text{soc}(\tilde{A}) = 0$ then $\text{soc}(\tilde{A})$ is an essential ideal, since $(\text{soc}(A), 0) \subseteq \text{soc}(A, 0) \subseteq \text{soc}(\tilde{A})$ then $(a, \lambda)(k, 0) = 0$ i.e. $ak = -\lambda k$ therefore $\lambda = 0$, because $\lambda \neq 0$ implies that $-\frac{a}{\lambda}k = k$ moreover

$$\left(-\frac{a}{\lambda}b - b\right)k = 0 \text{ if and only if } -\frac{a}{\lambda}b = b \text{ for all } b \in A,$$

so $-\frac{a}{\lambda}$ is a left unit of A . Let d be left unit of A then

$$\left(-\frac{a}{\lambda} - d\right)A = 0 \Rightarrow \left(-\frac{a}{\lambda} - d\right)k = 0 \Rightarrow -\frac{a}{\lambda} = d$$

so $-\frac{a}{\lambda}$ is left unit and A is unitary which contradicts Sour hypothesis, therefore $ak = 0$. Since K is an essential ideal then $a = 0$ and Lemma 2.2 implies that

$$\tilde{\Phi}^{-1}(\tilde{\Phi}(a, \lambda)^2) - \tilde{\Phi}^2(a, \lambda) \in \text{soc}(A) = 0$$

Φ is bijective

$$\tilde{\Phi}(a, \lambda)^2 = (\Phi(a^2) + 2\lambda\Phi(a), \lambda^2) \Rightarrow \Phi^2(a) = \Phi(a^2).$$

Corollary: If $\Phi : A \rightarrow A$ is a unitary linear isomorphism on the semi-simple Banach algebra A , and A has minimal ideal then $\Phi|_{\text{soc}(A)}$ is a Jordan homomorphism.

3. Conclusion

In primitive algebras every nonzero ideal is essential, and from a well-known theorem of Herstein on Jordan homomorphisms onto prime rings it follows easily that Jordan isomorphism or an anti-isomorphism.

Decentralization of agricultural extension

Abstract: Agricultural extension is one of the main institutional components of agriculture as it promotes the transfer and exchange of information that can be converted into functional knowledge. It is better to say that extension is the instrument, which is helpful in developing enterprises that promote productivity and generate income in the present climate of change, which ultimately reduce poverty in developing as well as developed countries. Unfortunately in developing as well as low income countries agricultural extension has failed in diffusing new technology to its ultimate users and further deterioration witnessed with the passage of time. The failure of agricultural extension services for last decades is under constant pressure to be responsive to ever-growing challenges of food production. Agricultural extension is a non-formal type of education that provides advisory services by the use of educational approach in acquiring knowledge and skills to deal with the growing needs of global world. Diverse agricultural extension funding and delivery arrangements have been undertaken since the mid-1980s by governments worldwide in the name of "privatization." When agricultural extension is discussed, privatization is used in the broadest sense – of introducing or increasing private sector participation, which does not necessarily imply a transfer of designated state-owned assets to the private sector. In fact, various cost-recovery, commercialization, and other so-called privatization alternatives have been adopted to improve agricultural extension. The form and content of decentralization has dominated development discourse and public sector reform agenda in Kenya in the last two decades.

Keywords: Decentralization, Agricultural extension

Introduction:

Over the past two decades many countries have undertaken to decentralize government functions and transfer authority and responsibilities from central to intermediate and local governments, and often to communities and the private sector. Decentralization is potentially important to agricultural knowledge and information systems, but decentralization is not an end in itself, and successful decentralization strategies must address three challenges—establishing a national framework for decentralization, developing subsector approaches, and enhancing capacities of various participants for coproduction of decentralized goods and services. Agricultural extension services are under increasing pressure to become more effective, more responsive to clients, and less costly to government. Decentralization is an increasingly common aspect of extension reforms. Field extension advisory services are well suited to decentralized approaches, but a comprehensive extension system requires a range of extension support services and programs, some of which (strategy formulation, training, monitoring and evaluation, specialized technical support) are often best carried out at the central level.

The prime challenges in the traditional public extension systems enlisted as outdated, top-down, paternalistic, inflexible, subject to bureaucratic inefficiencies that results less ability to cope with the

dynamic demands of modern day agriculture (World Bank, 2002; Obaa et al., 2005). In some countries the change is occurring with its natural pace but in many developing countries these have been accelerated by structural adjustment reforms (Chapman & Tripp, 2003).

Like other developing country Pakistan is also an agrarian country, whose economy is highly dependent on agriculture having 23% share to GDP (Government of Pakistan, 2005). But still the performance of agriculture sector at the farm level remains significantly below the potential and limited due to the weak institutional formwork in disseminating agricultural technology to the farmers (Farooq, 2005). Research scientists evolving new methods and technologies to meet the challenges of new era and the farming community also has a potential and courage to adopt but the third component i.e. agricultural extension, which serves as a technology transfer vehicle and play a significant role in increasing the productivity, farm incomes and ensure food security has been very much weak since independence (Luqman et al., 2004; Farooq, 2005). The extension services in the country have not been able to achieve their goals effectively, because of a number of bottlenecks. These include weak research-extension linkages, lack of adequate resources for on-farm demonstrations, poor mobility, inadequate research and training in extension methodology and

lack of an effective system of continuing education for extension personnel at various levels (Sandhu, 1993). Among major field crops wheat, rice, cotton and sugarcane accounts for 90.4% of the value added in major crops and 37.1% of the value added in overall agriculture (Government of Pakistan, 2005). The low production of these crops depends upon a number of factors including ineffective and isolated agricultural extension system.

All over the world agricultural extension assists the rural population of remote areas to up-lift their living standard through increase in crop production. The Government of Pakistan is well aware of this fact therefore from the Day of Independence different extension and rural development programs at national level launch by her e.g. Village Agricultural and Industrial Development Programme (Village-AID), Basic Democracies System (BDS), Integrated Rural Development Programme (IRDP) and Training and Visit System (T & V). Unfortunately all these programmes were abolished one after the other because of their conventional, top down nature and inherited less effective technology transfer model (Williamson, 2002; World Bank, 2003). The last efficient extension programme was (T & V) that became ineffective due to its rigidity, top down orientation, non-responsiveness to farmers' needs, much expensive, least effective in feed back communication with farmers and un-able to meet the challenges of changing circumstances. To overcome the weaknesses and shortcomings in (T & V) system Government introduced Decentralization of Agricultural Extension reforms with the name Devolution of Power Plan to up-lift the local people's economic status through pooling all the national sources and resources at grass root level. Devolution is the complete, permanent (SPDC, 2000) and advanced form of decentralization and also helps in strengthening the functions of and empowering with more authority to the elected representatives (FAO, 2001). With the promulgation of this new system, institutional reforms have been introduced almost in all the line departments including Agricultural Extension (Luqman et al., 2004). The new system of agricultural extension, works under the supervision of district Government in which each district is managing its agricultural extension activities, where the functions of all sister organizations such as Water Management, Fisheries, Livestock, Soil conservation, Forestry, etc; are put under single manager called as Executive District Officer of Agriculture (EDO) (World Bank, 2003). The administrative changes in the setup of agricultural extension department affect the working efficiency of Extension Field Staff (EFS) in their area of jurisdiction having both positive and negative impacts (Luqman et al., 2005), while on the

other hand Farooq (2005) conducted a research study in two districts of North West Frontier Province (NWFP) and observed the difficulties faced by the extension staff in post devolution framework. The major hurdles in creating difficulties for EFS in the research area were multifarious duties, double chain command and lack of administrative staff and burden of increased paper work.

Principles in Decentralization Reform:

Decentralization takes many forms with varied mixes of fiscal, administrative, and political decentralization. Privatization, deconcentration, and delegation initiatives can complement and reinforce an overall decentralization policy, but these do not constitute, and can in some cases work against, effective decentralization (FAO, 2001).

Four requirements for successful decentralization are:

- Providing local people with substantial real influence over the local political system and local developmental activities;
- Ensuring availability of financial resources adequate for decentralized institutions to accomplish their tasks;
- Ensuring adequate administrative capacity in local units to carry out their tasks; and
- Establishing reliable mechanisms for accountability of politicians and bureaucrats to local people.

Deconcentration is nearly always the first—and necessary—step in any process of decentralization. This puts staff from central administrations in closer contact with local people, problems, and conditions and provides a channel for local interaction with government. Unfortunately, decentralization reforms frequently stop at this point with central authorities retaining control over deconcentrated administrative structures (World Bank, 2003).

Administrative decentralization, represents a more fundamental reform that replaces existing centralized structures with a new administrative structure of local government. Transfer of power to decentralized offices increases local participation in decisionmaking and allows programs to be tailored to local needs.

Political decentralization, makes decentralized bureaucracies accountable to locally elected officials and officials accountable to the people. Elections, referenda, and local participatory decisionmaking arrangements give people direct control over government programs, but short of these formal political processes, a variety of mechanisms (reflecting “participation” more than “decentralization”) can give people influence over government programs. These include: incorporating local representatives into governance and advisory

boards, client surveys, polls, and program “report cards,” and rapid rural appraisal techniques (Luqman et al., 2005).

Fiscal decentralization, is often seen as a way to reduce central government budgets by off-loading tasks a central government can no longer finance. In practice, however, decentralization is likely to result in higher costs for central budgets. Fiscal decentralization may transfer authority for expending funds, raising taxes, or borrowing, but intergovernmental fiscal transfers (IGFTs or “grants”) are usually the key means of financing decentralized programs.

Concern over local administrative capacity frequently leads central governments to impose controls that are costly to administer and that restrict local flexibility in managing funds. Experience would indicate that local governments are generally capable of assuming substantial responsibility, and decentralized programs can provide different financing packages to communities with different levels of capacity (Williamson, 2002).

Many programs are best implemented through “coproduction” or partnerships between various actors—central government, local government, private sector, civil society, and the individual—each providing the good or service for which it has a comparative advantage. Coproduction requires clarity in division of labor and clear “contracts” between different partners. (Sandhu, 1993).

Privatization, delegation, and devolution strategies complement decentralization and, like decentralization, broaden the institutional base for administration and execution of technology programs; reduce the burden on central governments for provision of services (responsibilities

in which they have been less than fully successful); and increase stakeholder participation and influence over programs. Advantages of these complementary strategies are that:

- Full privatization relieves government of responsibility for production of private goods and services with few externalities. Extension services for commercial crops grown by wealthier farmers, information on postharvest handling and processing technologies, and marketing of machinery or production inputs often fall in this category.

- Private provision of publicly financed services takes advantage of private providers’ greater efficiency and flexibility in executing programs. Government contracting of NGOs or private extension providers is a common example.

- Delegation and devolution maintains some government authority and financing, but gives implementing institutions operational flexibility and ability to specialize. Governments may delegate

extension responsibilities to research institutes or devolve responsibility for commodity extension to a commodity group (Farooq, 2005).

Decentralization of Public Sector Extension:

Public extension services are being forced to change. In the 1990s agricultural extension services were attacked for being inefficient, irrelevant, ineffective, and poorly targeted. The need for reform was obvious and national systems responded with three major strategies—privatization, decentralization, and program revitalization. Although cost reduction has been the force behind many changes, the principal objective of reforms should be an attempt to improve quality of services to clients. Decentralizing extension services, when implemented effectively, can transform extension and address a range of generic problems.

Decentralized extension brings decisionmaking processes closer to clients and makes programs more responsive to user needs. Service providers become more accountable to clients and better oversight increases efficiency of operations. Decentralization itself can introduce a new dynamism in programs and can promote diversity in service providers and program approaches, thus serving as a first step toward privatization. In addition, reforms to revitalize and privatize programs can accompany decentralization reforms, which generally involve: (World Bank, 2003).

- Administrative decentralization—moving responsibilities for extension to local levels of government;
- Political decentralization—expanding user influence on program priority setting, planning, and management; and
- Fiscal decentralization—giving financial management responsibility to local governments or requiring cofinancing from local governments and producer groups.

Extension services differ from research in two important ways that affect their potential for decentralization. First, extension advisory services (field extension services) come in direct contact with clients and provide services that have a high private-goods content. These characteristics make field extension services a much better candidate for decentralization than research, which typically has a longer-term payoff. Local producers are more willing to commit resources to pay for effective extension services from which they realize immediate direct benefits. Still, there remains a need for other extension services to address “externalities”—environmental problems, food quality or safety concerns, or social equity issues (that is, special

needs of small farmers)—that are in the public interest, but are not a priority for individual producers or decentralized institutions. This requires continued central support for extension. A second difference between research and extension is the scope and scale of programs. (Williamson, 2002).

Research institutions are generally smaller and more concentrated. Extension programs typically operate across the country, provide information on a wide range of technologies from various sources, and draw on traditional knowledge and farmer innovation to improve producer organization, management, production, and marketing functions. The broad demands on extension require strategies that incorporate a variety of approaches to providing services.

Despite the apparent suitability of extension service provision to be decentralized, they are often highly centralized. A World Bank study of 19 countries found that in the early 1990s 13 countries or regions showed almost no evidence of decentralization of extension services. Colombia, Jiangxi (China), the Philippines, and Nusa-Tenggarra-Timor (Indonesia) were relatively highly decentralized, and Poland and Tunisia showed some decentralization. The study found that:

- When extension is decentralized there is a fairly good balance in fiscal, administrative, and political decentralization;
- Political decentralization (the role of elected officials) lags other elements of decentralization; and
- NGO involvement is moderate and farmer participation is significant in extension.

Underlying these conclusions was the fact that institutional development and civil society provide important support to decentralizing extension services. (FAO, 2001).

Administrative Decentralization:

Deconcentration is intrinsic to extension services that are provided in dispersed fields and communities throughout a country. Cropping systems, markets, agroecological zones, and ethnic and cultural characteristics of farmers can vary widely within a country, and moving administration closer to field services can substantially improve program management through better understanding of local conditions. Administrative decentralization goes further by making extension programs directly responsible to local authorities. The challenge in any successful decentralization reform is that of maintaining overall program quality and coherence. Decentralized extension programs are limited if the decentralized administration lacks awareness of new technologies, sources of assistance, and extension methodologies. Although decentralized

administrations can effectively integrate local institutions, organizations, and technologies into an extension system, major benefits from formal extension often come from integrating external knowledge into the local system. Lack of coordination between local administrations can be a problem. If many localities promote a single commodity, the result might be overproduction and low prices. Similarly, separate localities might finance the same feasibility studies, training programs, or extension materials. Implementing an integrated watershed or regional development plan might prove impossible if programs in each administrative region are completely independent. Other potential problems include the lack of career opportunities for extension staff in decentralized programs, and difficulties with monitoring and evaluation when local administrative units lack ability to compare targets, results, and achievements with other areas. (Khan, 2002).

Extension program quality depends fundamentally on good linkages with other programs—specialized training for extension agents and farmers, technical backstopping by subject matter specialists and information services, other extension services (mass media, fairs), and other development programs (credit programs, market development programs, input supply).

Some of these linkages can be maintained at the local level, but many require higher level coordination to ensure efficiency and quality support.

Decentralized Governance -Introducing Accountability:

Decentralizing extension by involving farmers and local government in governance of programs can improve program accountability, increase user ownership of programs, ensure relevance to local needs, improve planning and information flows, and strengthen user capabilities. Transferring program responsibilities to locally elected officials directly decentralizes program governance and accountability to local people. Perhaps equally important are alternate mechanisms that increase user participation and influence over program content and operations. Reforms that enhance farmer influence over program governance include: incorporating farmers into governance and oversight committees; adopting participatory extension approaches; involving farmers in identifying priorities, planning, and monitoring; working through farmer groups; and using participatory evaluation and feedback mechanisms for program evaluation. Decentralizing governance holds particular promise for making extension programs (and agents) accountable to users. Farmers know whether they are receiving

valuable services and should have the power to demand good performance by their service providers. When farmers have authority to influence decisions on program funding, hiring and dismissing staff, and staff incentives, they are truly empowered to improve services. At a minimum, all extension programs should seek farmer feedback on the relevance, quality, and usefulness of extension services. (Chapman & Tripp, 2003).

A concern in decentralized extension systems is the degree to which governance mechanisms are representative of all farmers in an area. Women, small farmers, and ethnic or cultural minorities are often underrepresented in governance groups, but may be more in need of public services than those actually representing local interests. Disadvantages of farmer governance are the high up-front costs of participatory approaches, difficulties in ensuring true representation of participating groups, risk of aggravating conflicts or unduly raising expectations, and the possibility of program capture by elites (Farooq, 2005).

As the traditional view of extension as a function of government agencies gives way in the face of multiple service providers, an expanding agenda, and a better understanding of farmer information and innovation systems, decentralized governance of extension services should become both easier and more important.

Fiscal Decentralization of Extension Services:

Government inability to sustain financial support for large extension systems has been a motivation for the many reforms that attempt to reduce public sector funding, introduce private financing, or eliminate government programs that compete with the private sector. Typically, these strategies tend to decentralize extension financing. Although an objective of many decentralization reforms has been to reduce government expenditures, local governments generally have limited resources and limited ability to raise funds. Central governments therefore must usually continue financing for extension services through intergovernmental financial transfers (IGFTs), and must also finance the considerable costs of reform and local capacity development. This increases total financing requirements for extension, at least over the short term. Over the longer term, decentralizing extension services might reduce government financing requirements by: (1) increasing efficiencies through better oversight and greater flexibility in funding decisions and (2) increasing cofinancing by being more responsive, and demonstrating greater benefits, to users. Cofinancing grants (IGFTs) to local governments or farmer groups are an important

element of fiscal decentralization, but they present two significant problems: (Chapman & Tripp, 2003).

- Many local organizations lack capacity to plan, manage, and evaluate extension programs and lack the contacts and financial management capacity to procure needed services; and

- Resource-rich farmers are better able to cofinance services and capture program benefits, even if program objectives are to assist weaker elements of rural society. Still, many new initiatives are using subgrants of various types for local subprojects, and future program design can draw on this experience. Decentralization programs must address these two problems. Training and orientation, program promotion, and support services are critical to enable target clients and local organizations to take over extension responsibilities under new decentralized systems. Later, as programs are implemented, a strong monitoring and evaluation system is needed to provide management with information necessary to understand who is benefiting from the program and what real impact it is having (Farooq, 2005).

Conclusion:

Decentralize extension services where possible, with emphasis on giving users control over program planning, implementation, and evaluation.

- Provide for adequate centralized support systems for decentralized extension services, especially support for training, subject matter specialists, and production of extension materials.
- Adapt strategies to local institutional environments to accommodate country legal frameworks, political traditions, administrative structures, and social and agroecological conditions. Extension strategies can emphasize decentralization when there is already a strong political decentralization in the country, but should proceed cautiously when decentralization is not yet well established.
- Determine on a case-by-case basis whether decentralized services should be managed by local governments, community/producer organizations, or local governments in conjunction with producer/community organizations.
- Provide clear division of responsibilities between the different levels of government and other program participants.
- Develop procedures for policy formulation and priority setting in mixed systems to reconcile central government financing and policy objectives (poverty alleviation, food security, and environmental conservation) with local peoples' priorities that emerge from the decentralized program governance.
- Provide for needed fiscal transfers from central government to decentralized implementing agencies

to finance decentralized extension services, recognizing that over the short term decentralization rarely reduces requirements for central government financing.

- Structure fiscal transfers to give users maximum influence over programs and to promote institutional pluralism in service provision. This empowers users and develops capacities in a range of public and private providers, such that the most competent institutions are able to provide the services.

- Provide for extensive planning, promotion of the rationale and principles behind reforms, and training in new operational procedures before launching decentralization reforms.

- Provide for needed investments in development of local capacity (local governments, executing agencies, community or producer groups), as such implementation capacity is critical to success of decentralization reforms.

- Establish effective systems to monitor and evaluate decentralized programs, and ensure that the data are available at all appropriate levels. Central monitoring should be sensitive to equity issues and the possibility of local elites capture of programs, thus excluding services to the poor or women.

Abstract: Objectives: Excessive exposure of agrochemical male workers to organophosphate (OP) pesticides may induce morphofunctional changes in their sperms. The aim of this study was to explore sperm nuclear deoxyribonucleic acid (DNA) reaction to in vitro incubation with or in vivo chronic exposure to diazinon or diazoxon. **Methods:** Fixed volumes of every semen sample of ten healthy volunteers were incubated at 37°C for one hour with rising serial volumes of 60% of either diazinon (DZ) or diazoxon (DZO). Induced sperm morphological alterations were determined by microscopic examination of direct fresh, Papaniclaue stained and eosin-Y exclusion smears while, sperm nuclear cytotoxicity was assessed by DNA fluorometric examination. On the other hand, sperms of 20 chronic agriculture DZ/DZO spraying workers were directly examined for their quality and DNA denaturation state. **Results:** Normal human spermatozoa showed unfavorable increasing alterations in their quality and DNA integrity after their incubation with serially rising volumes of either diazinon or its oxon. Induction of sperm nuclear DNA denaturation by DZO was more severe both qualitatively and quantitatively than after DZ treated testing. Similar alterations but to lesser extent were found in sperms' DNA of chronic DZ/DZO spraying workers without exogenous OP treatment. **Conclusion:** In vivo DZ/DZO chronic exposure induced unfavorable effects in seminal quality and sperm DNA integrity but were lesser in strength than in vitro testing.

[Sherif MH El-Kannishy, Rizk M El-Baz, Soma Sh Abd El Gawad, Hamdy F Marzook, Samia A Hassan and Abdelhamid A Metwali: Sperm nuclear deoxyribonucleic acid denaturation in diazinon/diazoxon sprayer men. Journal of American Science 2011;7(6):470-475]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: diazinon, diazoxon, DNA fragmentation index, sperm chromatin structure analysis.

Introduction:

Organophosphates (OPs) are among the most world-wide used agrochemical pesticides. Among them, diazinon [O, O-diethyl O-2-isopropyl-6-methylpyrimidine 4-yl-phosphoro-thioate] is a synthetic highly toxic OP compound with broad-spectrum pesticide activities. Diazinon (DZ) spraying workers intoxication occurs through its oxon metabolite diazoxon (DZO) which inhibits acetyl cholinesterase (AChE) bioactivity resulting in accumulation of acetylcholine. This latter compound induces pathophysiological manifestations mainly at nerve synapses⁽¹⁾. In addition, non-neurotoxic OP harmful bioactivities are noted in several tissues among which are the testes⁽²⁻⁵⁾. Since DZO has alkylating and clastogenic activities, it can induce genetic, mutagenic and carcinogenic pathologies⁽⁶⁾. However, the potential toxicity of many OPs on somatic and germinal cells are not yet completely settled⁽⁷⁾.

Normal sperm nuclear DNA integrity is naturally preserved by its highly compacted structure, but it may be denatured after extensive or prolonged exposure to organophosphates⁽⁸⁾. Chromatin condensation in the sperm nucleus is a relevant factor for reproduction and a sensitive indicator of male fertility. Altered sperm chromatin structure has been reported in some OPs

exposed agriculture workers^(2,3,7-9) and experimental animals^(2,4,10). However, Salazar-Arredondo and colleagues⁽¹¹⁾ reported that, incubation of human spermatozoa with diazinon, chlorpyrifos and methyl parathion or their oxons (up to 750 micromol concentration) did not induce sperm cytotoxicity or DNA fragmentation. Moreover, the noted untoward spermatozoal cellular membranes reactions in such toxicity are related to their high content of polyunsaturated fatty acids and lack of intracellular antioxidants and nuclear DNA-repair systems⁽¹²⁾.

Organophosphate exposure can induce sperm nuclear chromatin de-condensation and cell membrane lipid peroxidation along sperm passage through the male genital tract⁽¹²⁾. Clinically, exposure to organophosphate insecticides may compromise male fertility and induce anomalies or diseases in the off springs. When the extent of DNA damage is small, the affected spermatozoa can undergo self-repair. Also the oocyte is capable of repairing damaged DNA in these spermatozoa. Alternatively, if the damage is extensive, apoptosis, fragmentation and losses of the embryos can occur^(13,14).

Aim: To explore sperm nuclear deoxyribonucleic acid (DNA) reaction to in vitro

incubation with or in vivo chronic exposure of their donors to diazinon or diazoxon.

Subjects and methods:

The subjects of the present study comprised:

(1) Twenty spraying workers in northern Nile-Delta States of Egypt, with intermittent (three times/week) DZ-DZO spraying duties for > 5.0 years.

(2) Ten healthy fertile individuals with no history of OP direct exposure. Their semen samples were used as a normal unexposed reference material and for in vitro determination of sperm vitality and DNA fragmentation index (DFI%) after incubation with rising concentrations of DZ/DZO. Normal semen should have normal quantitative and qualitative parameters⁽¹⁵⁾ and their donors fathering children.

After obtaining an informed signed consent from each participant in both groups, a semen sample per individual was collected by masturbation into a sterile container with 3-4 days abstinence before sampling. Thereafter, all semen samples were subjected to the following:

(a) Morphofunctional examination:

Each semen sample was examined within an hour of collection by using a Computer Assisted Sperm Analyzer [Weili Color Semen analysis System – ALTY – 9000, China].

(b) In vitro effect of rising DZ/DZO concentrations on sperm vitality %:

A designed volume of each ejaculate obtained from every healthy fertile individual was diluted with saline to get 50 000 sperm/ml. Then 20 µl of each diluent, which contained 1000 sperms were distributed into different tubes in two separate rows, each comprised 10 tubes. One row for DZ (60% w/v active DZ ingredient) while, the second row for DZO after its dilution by saline to obtain 60% solution. To each of the first eight tubes of either row, one of the OP compound was added in serial rising volumes of 100, 200, 300, 400, 500, 600, 700 and 800 µl. Then to all these tubes in the two rows, 0.15% DMSO (Sigma) solution was added to complete their final volumes to 900 µl. Also to each tube within the two rows, 0.6 ml bovine albumin suspensions (3.5 mg/ml) were added. All these tubes were incubated for 1.0 hr in a water bath at 37°C. Morphofunctional characteristics of the spermatozoa after their incubations were evaluated according to the WHO guidelines⁽¹⁵⁾. Also, sperm vitality% using 0.5% eosin Y was assessed and expressed as percentage by counting dye excluded sperms among 100 spermatozoa.

A negative control (tube 9) for each semen sample containing 1000 spermatozoa diluted to 900 µl with 0.15% DMSO solution and completed to 1.5 ml by 3.5 mg/ml bovine albumin was prepared without DZ or DZO addition. Then these seminal preparations were

managed as above. Also, a positive control (tube 10) containing similar constituents as in the test tubes but instead of the organophosphate, H₂O₂ (100 micromol) was added and similarly managed.

(c) In vivo and in vitro assessment of DZ-DZO toxic effects on spermatozoal nuclear DNA by sperm chromatin structure analysis (SCSA)⁽¹⁶⁻¹⁹⁾:

Within 4 hours from ejaculation, aliquots of the different semen samples, each contained 2.0 million spermatozoa were kept frozen at -70°C. On the day of DNA analysis, the stored samples were thawed in a 37°C water bath. It is established that analysis of frozen/thawed semen samples gave equivalent results to those from fresh samples.

Sperms were analyzed using FACSsort flow cytometer (Beckton Dickinson, San Jose, Canada), equipped with an argon ion laser (488nm). The flow cytometer was calibrated for each measurement session (10 semen samples) using reference frozen semen samples for flow cytometer set up and as an internal quality control, with a variation coefficient <5% and a low level sperm DNA damage (the red and green photo-multiplier yielded the same red and green fluorescence levels i.e 130/1000 and 500/1000 channels ± 5.0).

Semen samples were diluted with TNE buffer (0.01 mol Tris HCl, 0.15 mol NaCl and 1 mmol EDTA) to obtain 1000000 sperms/ ml. Then 200 µl aliquots of each diluent (containing 200 000 sperms) were mixed with 400 µl of a low pH (pH 1.2) detergent solution containing 0.1% Triton X 100, 0.15 mol NaCl, and 0.08 mol HCl and left for 30 seconds. This was followed by staining with 1.2 ml of 6 µg/ml chromatographically purified acridine orange (AO) [Polysciences, Washington, PA] in a phosphate-citrate buffer (pH 6.0). Three minutes after staining, specimens were analyzed by the flow cytometry. Measurements were performed in duplicates; each contained 5000 sperms (45 µl of the final specimen) at a flow rate of less than 200 sperms/second. The fluorochrome AO that, intercalated into double-stranded DNA (native) fluoresced green (515-530nm), while AO that intercalated into single-stranded DNA (denatured) emitted red fluorescence (<630nm).

The extent of DNA denaturation was quantified by the DNA fragmentation index (DFI) which represented the shift from green to red fluorescence i.e. the ratio of red to total (red + green) fluorescing sperms. The calculated DNA fragmentation index% (DFI%) is a reliable measure of fertility⁽¹⁹⁾.

Statistical analyses:

The Statistical Package for Social Scientists (SPSS) for windows program Version 11 (SPSS Inc., Chicago, USA) was used for statistical calculations.

In vitro DZ or DZO treated semen samples of healthy volunteers were compared by analysis of variance with t-test. Similarly, native semen of DZ-DZO spraying workers was statistically analyzed. Sperm DNA fragmentation index% (DFI%) of the in vitro DZ/DZO treated and in vivo DZ-DZO chronically exposed sprayers as well as in the native healthy untreated sperms were assessed. $P < 0.05$ values were considered statistically significant.

Results:

Table (1) shows seminogram of OP-unexposed (normal volunteers) and DZ/DZO exposed sprayers. Only 20% of patients had normal semen characteristics while, the remaining 80% had one or more seminal abnormality of the standard semen parameters.

Table (2) shows the percentage of forward motility% (viability or vitality %) of sperms. It was significantly decreased after sperms incubation with rising volumes of DZ/DZO. Also, SCSA measurements are shown in this table. Sperm DNA structure was

altered in samples obtained from the OP agriculture spraying workers.

Among the DZ/DZO sprayers, 20% of the examined semen samples present infertility potential ($\geq 30\%$ DFI percent), whereas the remaining cases were potentially subfertile ($< 30\%$ DFI percent). However, two wives suffered from miscarriage when pregnancy occurred.

In vitro testing (using sperms of OP-unexposed healthy volunteers) declared that the percentage of sperms showing DNA denaturation (fragmentation index %) was significantly higher with DZ treated ($14.0 \pm 4.0\%$ - $36.6 \pm 11.8\%$) than native untreated sperms ($10.8 \pm 3.7\%$). The degree of DNA damage increased according to the DZ concentration. DFI% (s) range after sperm incubation with DZO (14.7 ± 4.1 - $39.6 \pm 10.5\%$) was not significantly different from those incubated with DZ similar concentrations (Table 2 & Figure 1). Clinically the severity of sperm toxicity was higher among chronic sprayers with DZO than those using DZ.

With exception of seminal volumes and counts, significant positive correlations were observed between percent of other change of conventional semen quality parameters and SCSA determined DFI%.

Table (1): Semen analytical parameters (X±SD) of the two investigated groups (OP non exposed volunteers as control versus DZ/DZO spraying workers) within one hour after ejaculation.

Variables	Non exposed volunteers (n:10)	Spraying workers (n:20)
Volume (ml)	3.3±0.9	2.9±0.6
Viscosity	Normal	Less than normal
Count (million/ml)	56.3±14.8	40.5±12.1*
Progressive motility (viability) %	77.8±10.6	59.7±11.6*
Abnormal Morphology %	19.5±4.1	28.7±5.6*
Round head	8.9±1.5	14.1±2.2*

* Significant difference from normal values.

Data: mean ± SD

Figure (1): Minimal and maximal DFI% by DZ/DZO in vitro testing.

Table (2): Spermatozoa vitality % and DFI% values non exposed (native) control, DZ/DZO spraying workers and after incubation with rising volumes of DZ or DZO for one hour.

Semen donors	Sperm vitality %	DNA fragmentation index % (DFI%)
(1) Non-intoxicated healthy control (10 individuals)	77.8±10.6	10.8±3.7
(2) Chronically exposed spraying workers (20 workers; of them 4 cases had DFI% ≥ 30%)	59.7±11.6	18.0±5.6*
(3) In vitro incubation of normal semen with 60% DZ/DZO:		
100µL	DZ	61.0±11.9
	DZO	58.0±13.5*
300µL	DZ	56.9±15.1*
	DZO	46.5±11.0*
500µL	DZ	50.5±14.7*
	DZO	40.8±11.3*
700µL	DZ	44.6±13.0*
	DZO	33.1±10.6*
800µL	DZ	35.4±10.8*
	DZO	30.9±9.9*
		39.6±10.5**

* Significant difference compared to the control (p < 0.05).

** Significant difference between DZ and DZO and control (p : <0.001).

Discussion:

Organophosphates can affect spermatogenesis through altering sperm chromatin structure and DNA integrity. Increased sperm DNA denaturation in situ reflects DNA strand breaks and nuclear maturity delay^(4,6,8,10). In male reproductive system, sperm DNA susceptibility to OP denaturation and potential mutagenicity are dependent on the spermatogenic cell stage at time of exposure⁽⁵⁾. Toxicity of different OPs on somatic cells showed contradictory results and OP effects on human male germinal cells need extended investigations^(8,12).

The present study showed that, only 20% of the evaluated patients had normal semen characteristics while the remaining had one or more abnormality of the standard semen parameters (Table 1). In vitro DZ-induced cytotoxic effects on mature sperm cells were quantitatively and qualitatively less than those noted after DZO similar concentrations (Tables 1&2). This difference reflected the rate of conversion of the biologically inactive DZ to its active DZO intermediate. In this respect, it has been reported that agriculture OP spraying men had high concentrations of OP pesticides in their blood and body organs including the reproductive system^(3,5). Moreover, this later system can generate highly toxic reactive oxygen species (ROS) in situ^(20,21) which could intensify testicular dysfunction. In the epididymis, spermatozoa of OP exposed individuals are subjected to induced oxidative stress due to increased ROS and lipid

peroxidation with reduced antioxidant enzymes and glutathione^(4,6,20-23).

The present study showed that induced sperm DFI% by in vitro DZ or DZO treatment was significantly higher than that with OP unexposed control testing. These in vitro DZ/DZO effects on DFI% were dose dependent (Tables 2 and Figure 1). However, DFI% after in vitro sperm incubation with rising DZO content were higher but not significant than the corresponding DZ activity. It has been reported that injection of mice with a single dose of DZ (8.12 mg/kg) increased DFI and DFI% values due to decreased sperm chromatin condensation and increased DNA denaturation during spermatid differentiation⁽⁴⁾. On the other side, in vitro incubation of sperms with DZ/DZO for one hour was more deleterious than the corresponding intermittent chronic OP exposure of spraying workers (Table 2). This may be due to natural human biological responses such as degradation and clearance of OPs. However, Salazar – Arredondo et al.,⁽¹¹⁾ found that incubation of normal spermatozoa with DZ or DZO at different concentrations could not induce significant sperm cytotoxicity as evaluated by eosin-Y exclusion.

Chronic exposure to OP oxons can alter sperm chromatin quality and even induce its damage in agriculture OP sprayers^(3,5,7-9) and experimental animals^(2,4,10). These spermatozoal reactions were related to their high content of polyunsaturated fatty acids particularly arachidonic acid in their plasma

membranes and relative lack of intracellular antioxidants and nuclear DNA-repair systems⁽¹²⁾.

Incubation of semen samples with $\geq 700\mu\text{l}$ DZ or $500\mu\text{l}$ DZO for one hour induced $\geq 30\%$ of DFI% (Table 2) as shown by high proportion of red fluorescence (denatured single strand DNA) with concomitant low green fluorescence (native double strand DNA). So, OP oxons alter sperm DNA integrity at higher degree and faster rate than their parent compounds. In this respect, OP toxic activity varies from one OP to another. However, the toxic potential of DZO was considered of moderate severity level compared with other OP insecticides^(4,10).

Sperm axonemal protein phosphorylation induces reduction of membrane fluidity that is necessary for sperm-oocyte fusion. Oxidative stress can lead to sperm damage, deformity and eventually male infertility. The tight packaging of sperm nuclear DNA and the physiological antioxidants content in seminal plasma protect spermatozoal DNA from oxidative stress induced damage. The high frequencies of single- and double-strand DNA breaks, gene mutation and polymorphism, result in decreased semen quality and increased DNA denaturation and DNA base – peroxidation^(13,14).

Infertile men possess substantially more sperm DNA damage than do fertile men. Such damage may impact negative reproductive outcomes⁽²⁴⁾. DNA damage involves an error in chromatin remodeling during spermatogenesis, leading to generation of spermatozoa with subnormal protaminated nuclear DNA. Close relationships exist between the efficiency of chromatin remodeling and oxidative DNA damage and fragmentation in human spermatozoa⁽²⁵⁻²⁷⁾.

Conclusion:

In the present study, significant negative correlations were observed among the clinically important absolute semen quality values (sperm forward motility % and vitality %) and SCSA DFI %. Alternatively, significant positive correlation between DFI% and absolute abnormal morphology% was found.

Temperature distribution in porous fins in natural convection conditionSeyfolah Saedodin¹, Mehdi Olank²¹ Assistant professor, Department of Mechanical Engineering, Science and Research Branch, Islamic Azad University, Semnan, Iran, s_sadodin@iust.ac.ir² MS.C student, Department of Mechanical Engineering, Science and Research Branch, Islamic Azad University, Semnan, Iran, mehdi.olank@gmail.com

Abstract: This paper investigates the temperature distribution in porous fins in natural convection condition and compares it with temperature distribution in conventional fins. To formulate the heat transfer equation, the energy balance and Darcy's model used. This study is based on finite-length fin with insulated tip. The porous fin allows the flow infiltrate through it. The theory section addressed the derived governing equation. The effect on porosity parameters "S" and convection parameter in porous fin "n", and convection parameter in conventional fin are discussed. The result suggests that by increasing "S" the heat transfer increase but in some cases it has exemption. [Seyfolah saedodin, Mehdi olank. Temperature distribution in porous fins in natural convection condition. Journal of American Science 2011;7(6):476-481]. (ISSN: 1545-1003). <http://www.americanscience.org>.

1. Introduction

In the design of heat exchanger, finned surfaces are often employed to improve performance. In the other hand, for many years reduction of the size and cost of fins are the main targets of fin industries. Some engineering applications also require lighter fin with higher rate of heat transfer where they use high thermal conductivity metals in applications such as airplane and motorcycle applications. However, cost of high thermal conductivity metals is also high. Thus, the enhancement of heat transfer can be achieved by increasing the heat transfer rate and decreasing the size and cost of fin. The major heat transfer from surface to surrounding fluid takes place by convection process. Increasing the heat transfer mainly depend on heat transfer coefficient (h), surface area available and the temperature difference between surface and surrounding fluid.

Fins are frequently used in many heat transfer applications. Meyer [1] in his famous book with a simple manner describes the temperature distribution in conventional fins. But in the recent years, porous fins consider as a potential field for increasing heat transfer. The basic philosophy behind using porous fins is to increase the effective area through which heat converted to ambient fluid.

Extensive research has been done in this area and many references are available especially for heat transfer in porous fins.

1.1 Review of the literature

Kiwan [2] conducted thermal analysis of natural Convection porous fins. He grouped all the geometric and flow parameters that influence the temperature distribution in to one parameter called " s_h ". Korla [3] investigate thermal analysis of natural convection and radiation in porous fins. Abu-Hijleh [4] investigates numerically the effect of using porous fins on the forced convection heat transfer from a horizontal cylinder. Yo and Chen [5] performed a study on optimization of circular fin with variable thermal parameter. Nguyen and Aziz [6] compare the heat transfer rates from convecting-radiating fins for different profile shapes. An Analysis for Y-shaped fins for determining fin efficiency by a new approach has been demonstrated by Lorenzini and Moretti[7]. Kundu and Bhanja [8] have determined analytically the performance and optimum dimensions of T-shape fin with variable thermal conductivity and convective heat transfer coefficient. Also Kundu and Bhanja [9] investigate an analytical prediction for performance and optimum design analysis of porous fin. Mobedi and Sunden [10] study the Natural convection heat transfer from a thermal heat source located in a vertical plate fin.

In this study it is intended to use the simple approach for finding the temperature distribution in porous fin and compare it with the temperature distribution in conventional fins. The cylindrical fins attached to a vertical surface, have been used.

2. Governing equations

As shown in Fig.1 a cylindrical fin profile is considered. The dimensional of the fin are length L and the radius R. the cross-sectional area of the fin is constant.

For the conventional fin, the defining equation obtain by making an energy balance on element of the fin of thickness Δx as shown in the Fig.1.

Figure 1. Schematic diagram for the problem under consideration

Figure 1. The defining equation obtain by making an energy balance on element

Energy in left face=energy out right face+ energy lost by convection (1)

The defining equation for the energy lost by convection heat transfer is

$$q = hp\Delta x(\theta(x) - \theta_\infty) \quad (2)$$

$$\text{Energy in left face} = q_x = -kA \frac{d\theta}{dx} \quad (3)$$

$$\text{Energy out right face} = q_{x+\Delta x} = -kA \left(\frac{d\theta}{dx} + \frac{d^2\theta}{dx^2} \right) \quad (4)$$

By substitution the equations 2, 3, 4 in the equation 1, the energy balance yields

$$\frac{d^2\theta}{dx^2} - \frac{hp}{kA}(\theta(x) - \theta_\infty) = 0 \quad (5)$$

Let $\theta = (\theta(x) - \theta_\infty)$ the equation (5) becomes

$$\frac{d^2\theta}{dx^2} - \frac{hp}{kA}\theta = 0 \quad (6)$$

One boundary condition is

$$\theta = \theta_0 = \theta_b - \theta_\infty \quad \text{at } x=0 \quad (7)$$

The other boundary condition is the end of fin is insulated so that

$$\frac{d\theta}{dx} = 0 \quad \text{at } x=L \quad (8)$$

If $m^2 = \frac{hp}{kA}$ the solution can be written (9)

$$\theta - \theta_\infty = (\theta_b - \theta_\infty) \frac{\cosh[m(L-x)]}{\cosh mL} \quad (10)$$

If $\frac{\theta(x) - \theta_\infty}{\theta_b - \theta_\infty} = T$ the solution may be written

$$(11)$$

$$T = \frac{\cosh[m(L-x)]}{\cosh mL} \quad (12)$$

For the porous fin, Due to this fact that the fin being porous, It allow for the flow to infiltrate through it. In This study to simple the governing equations the following assumptions are considered: (1) length=1(m), the porous medium is homogeneous, isotropic, (2) both the fluid and the solid matrix have constant physical properties. (3) the surface radiant exchanges are ignored,(4) the temperature inside the fin is only function of x, (5) no temperature variation across the fin thickness, and (6) the interaction between the porous medium and the clear fluid can be simulated by the Darcy formulation(7).

Figure 2. Schematic diagram for the problem under consideration

Figure 2. The energy balance to the slice segment

The energy balance to the slice segment of the fin of thickness Δx , shown in Fig.2, requires that

$$q(x) - q(x + \Delta x) = \dot{m}c_p(\theta(x) - \theta_\infty) + h(p \cdot \Delta x)(\theta(x) - \theta_\infty) \quad (13)$$

In the right hand of equation, the second terms represent the natural convection around the fin and the first term represents the heat transfer lost to the fluid passing through the porous media. This fluid is induced by the buoyancy force created due to the temperature difference between the fin and the

surroundings. It should be noted that Equation (13) assumes that the fluid enters the fin at θ_∞ and leaves at $\theta(x)$.

The mass flow rate of the fluid passing through the porous material can be written as,

$$\dot{m} = \rho_v v_w 2 \pi R \Delta x \quad (14)$$

The flow in the porous medium shall be considered next to account for the value of v_w . Referring to assumption (7) above, Darcy's model gives,

$$v_w = \frac{gk\beta}{\nu} (\theta(x) - \theta_\infty) \quad (15)$$

By substitution of equations (14) and (15) into equation (13), the result is:

$$\frac{(q(x) + q(x + \Delta x))}{\Delta x} = \frac{\rho_c g k \beta 2 \pi R}{\nu} (\theta(x) - \theta_\infty)^2 + hp(\theta(x) - \theta_\infty) \quad (16)$$

If $\Delta x \rightarrow 0$, equation (16) transfer to

$$\frac{dq}{dx} = \frac{\rho_c g k \beta 2 \pi R}{\nu} (\theta(x) - \theta_\infty)^2 + hp(\theta(x) - \theta_\infty) \quad (17)$$

According to Fourier's law of conduction,

$$q = -k_{eff} A \frac{d\theta}{dx} \quad (18)$$

In this equation, A is the cross-sectional area of the fin ($A = \pi R^2$) and k_{eff} is the effective thermal conductivity of the porous fin.

Substitution Equation (18) in to Equation (17) yields,

$$\frac{d^2 \theta}{dx^2} - \frac{2 \rho_c g k \beta}{R \nu c_p k_{eff}} (\theta(x) - \theta_\infty)^2 - \frac{hp}{k_{eff} A} (\theta(x) - \theta_\infty) = 0 \quad (19)$$

By introducing the non-dimensional temperature

function, $\frac{\theta(x) - \theta_\infty}{\theta_b - \theta_\infty} = T$ into equation (19)

becomes

$$\frac{d^2 T}{dx^2} - ST^2 - nT = 0 \quad (20)$$

The constant, $S = \frac{2 \rho_c g k \beta}{R \nu c_p k_{eff}}$ and $n = \frac{hp}{k_{eff} A}$

input all the geometric and flow parameters that influence the solution of the problem into definite parameter. To solve this equation we need two boundary condition. One boundary condition here is that the temperature at the base of the fin is θ_b . Then

$$T(0) = 1 \quad (21)$$

The second boundary condition depends on the condition of the fin at the tip. The case that considered in this study is finite-length fin with insulated tip.

2. Results

The governing equation is solved numerically with curve fitting method. This method is a well-known method and has been widely used in literature.

In the finite-length fin with insulated tip, the second boundary condition at $x=L$ will be $\frac{dT}{dx} = 0$.

In this study to simplify the governing equation, assumed that $L=1$ (m). For solving the governing equation, It has been used “Maple 14” and this is the codes of solving this equation in MAPLE 14.

The variation of the dimensionless temperature is shown in figures 3, 4, 5 and 6.

For drawing the result in figure, the “MATLAB FIGURE” has been used.

It is clear that, in the Equation (20) when the $s=0$, the Equation transfer to the conventional fin equation and the governing equation becomes as same as the equation (12). In this particular condition the constant $n = m^2$. In the figures 3,4,5,6 for every figure the “n” is constant and “S” is variable.

Figure 3. The distribution of the axial nondimensional temperature along the insulated fin with $n=0.5$ and for different value of S .

Figure 4. The distribution of the axial nondimensional temperature along the insulated fin with $n=1$ and for different value of S .

Figure 5. The distribution of the axial nondimensional temperature along the insulated fin with $n=2$ and for different value of S .

Figure 6. The distribution of the axial nondimensional temperature along the insulated fin with $n=4$ and for different value of S .

The figures 3, 4, 5 and 6 indicate that increasing the value of “S” will increase the heat transfer rate from the fin base. And it is clear from these figures that as the value of S increase the fin will attain the temperature of the surrounding fluid faster. Of course the figure 5 illustrate that the heat transferring in condition $n=2$, $S=0$ more than $n=2$, $S=1$. In fact in this condition, the conventional fin has more heat transfer than the porous media fin with $S=1$. Also the situation in figure 6 is same and the heat transferring in condition $n=4$, $S=0$ more than the both conditions $n=4$, $S=1$ and $n=4$, $S=10$.

3. Conclusion

Temperature distribution of porous fin for natural convection has been performed here. A second order non-linear ordinary differential equation has been derived as the governing equation for this problem. It has been solved using the curve fitting method. It is also found that all geometric and flow parameter influencing the temperature distribution has been grouped in three parameters called “ m ”, “ S ” and “ n ”. this temperature distribution analysis was performed for finite porous fin with insulated tip. It was found that increasing S , increase the heat transfer from fin. Of course in some condition the conventional fin has more heat transfer than porous fin.

Abstract: A new synthetic fabric composed of a mixture of two biomaterials, polyamide 6.6 and polyester, was manufactured with specific tensile characters to serve in the reconstruction of the patellar ligament rupture in dogs. Twelve skeletally mature mongrel dogs with no evidence of clinical signs of lameness were used in the present study. Patellar ligament rupture was induced by severing the mid portion of the right ligament of each limb. Surgical intervention was performed by primary suturing of the severed patellar ligament ends and applying a synthetic fabric to act as a supportive internal splint. Satisfactory results were obtained concerning the tendon healing and the return to limb normal function without complications. It was found that the polyamide polyester fabric proved to be a suitable reconstructive biocompatible material that allowed primary ligament repair with adequate support by and give an excellent outcome in cases of patellar ligament ruptures in dogs.

1. Introduction

Patellar tendon rupture is a rarely reported injury in both veterinary and human medicine. In dogs it generally occurs as a result of direct trauma, or fall and was also associated with some systemic diseases (Quintero *et al.*, 2003). There are predisposing factors similar to those in the human literatures and others have not been identified (Culvenor, 1988 and Gemmil, 2003).

Recently, surgical inoculation of the new synthetic fabrics for reconstruction of biological tissues had become one of the things that attract attention, since they give very satisfactory results regarding the strengthening of living tissues (Kasten *et al.*, 2001). Different pathomechanisms have been postulated, and multiple techniques for repair have been described in the literatures (Smith, *et al.*, 2000).

Diagnosis and treatment is time sensitive and should be achieved before more complications. Current recommendations for the repair of patellar ruptures included suturing of the severed ends and the protection of the repair with an interior splint (Vasseur, 2003 and Moretti *et al.*, 2008).

Nylon leader, orthopedic wire and fascia lata have been tried (Shipov, 2001). They should accommodate the reconstruction and give enough support. Such implanted materials are applied to give strength to the cut tendon ends and act as a scaffold for the growth of the repairable tissue (Bushnell *et al.*, 2008). Many techniques have been applied for the implantation

including the transpatellar fixation, the suture anchor techniques associated with protective stainless wire, or associated with quadriceps tendon flap. (Bushnell *et al.*, 2008).

Nowadays, biomaterials and tissue engineering play an important role in the biological tissue repair to develop new approaches for augmenting and replacing damaged body parts (Kammula and Morris, 2001). When the tissue damage is so extreme, the difficulty is in finding a scaffold of special characteristics that the cells can grow and organize on (Moretti *et al.*, 2008). The key requirement of any material used in the body is that, in addition to providing mechanical support or repair, it should be biocompatible. Such materials can generally be produced either in nature or synthesized in the laboratory using a variety of chemical approaches (Vasseur, 2003).

There are many applications for biomaterials such as joint replacements, bone plates, artificial ligaments and tendons (Stupp and Braun, 1997 and Wikipedia the free encyclopedia).

Of the most important industrial polymers that produce fabrics commonly used in the medical field are polyester and polyamide (Cozma, 2000). The basic raw materials for polyester fiber production are petroleum, coal, air & water. Due to good extension, strength and functional property of polyester, it is widely used as sewing thread in the garment industries, its fibers do not shrink or extend and have very low moisture content which ranges from 0 – 0.4%. Polyester fibers

are easily cleaned and resistant to mildew, moths and insects (The Textile blog., 2010).

Polyamide 6.6 has the property of tenacity-elongation at break ranges from 8.8g/d-18% to 4.3g/d - 45%, 100%, It is elastic under 8% of extension, of melting point 263⁰c, it is chemically stable. It has a bactericidal effect and 4 - 4.5% of moisture regain and abrasion resistant. (Raghavendra *et al.*, 2004). The applications of textile materials as reconstructive devices for compensating the defects in the living tissues in the veterinary practice were previously discussed (Gadallah, El-Husseiny, 2000 and Smith, *et al.*, 2000).

The aim of the present study was to develop a specification for producing a new synthetic fabric that should be available and cheap with special characters regarding the biocompatibility and the tensile strength that acts as an appropriate internal splint for the reconstruction of the patellar tendon ruptures in dogs.

2. Materials and Methods

This experimental work was carried out on 12 dogs apparently healthy and without any apparent signs of lameness. Animals were of different weights and ages. The mean body weight was 20.3± 2.38 kg and the mean age was 18.2± 4.6 months.

All dogs were operated under general anesthesia through intravenous injection of atropine sulphate (0.05 mg/kg); diazepam (1 mg/kg); xylazine (1mg/kg) and ketamine Hcl (10mg/kg). The anesthetic depth was maintained with intravenous injection of 2.5% thiopental sodium and general inhalation anaesthesia via the semi-closed technique (Vet Surg. model 2005) induction using oxygen and nitrous oxide and maintenance with Flothan gas 1.5: 0.5: 2%, respectively. The dogs were restraint in dorsal recumbence.

Characters of the used fabric :

This work was carried out in the Textile Division at the National Research Center in Cairo. In the present study, the textile sample was synthesized from polyester material for warp and polyamide 6.6 for weft with woven structures plain 1/1, using monofilament microfibers for each of the warp and weft yarn.

Physical and mechanical tests were carried out on the warp and weft directions after conditioning the fabric for 24 hours under the standard atmospheric conditions (20±2°C temperature, 65 ± 2% relative humidity).

All samples were used raw without treatment. The fabric was tested for the following parameters: tensile strength and elongation, weight and fabric thickness. Load to failure was examined before sterilization of the implantable sample.

The tensile strength and elongation measurements of the plain structure 1\1 fabric was done at the Instron 3345[®] England. The size of the sample was 5 cm width × 20 cm length for each warp and weft directions this is in accordance with ASTM (2006) ; and the weight tests were performed on Balance the capacity of 0.001 for sample size 5 cm width × 10cm length accordance with ASTM (1996). Frazier Thickness Gauge was used for the measurement of the fabric thickness without load with capacity of 0.01 according to ASTM (1996).

Table (1): indicates the specification of the implanted fabric:

Parameters	Value
Mixing Ratio of fabric	50:50
Density of polyester	1.38
Density of polyamide	1.14
Diameter of Warp yarn	55micron
Diameter of Waft yarn	58 micron
warp yarn Count	40 dtex.
weft yarn Count	40 dtex.
Warp density	36 ends / cm
Weft density	32 picks / cm

The surgical operation:

The right hind limb of each experimental animal was prepared for aseptic surgery. The left hind limb was considered as a control. Lateral parapatellar skin incision was performed and the patellar ligament was severed transversely. The prosthetic fabric, polyamide 6.6 – polyester was twisted and introduced through a 3 mm hole drilled in the tibial tuberosity (from lateral to medial), just behind the insertion of patellar ligament. The fabric encircled the patella and passed through the musculotendinius portion of the quadriceps muscle (from medial to lateral), just proximal to the patella (Fig.1). The stifle was flexed to a normal standing angle (~135°) and the two ends of the prosthetic fabric were pulled in an opposite direction until the 2 ends of the severed patellar ligament were approximated. The two ends of the prosthetic fabric are tied together and knotted at the lateral side of the patellar ligament (Fig.2). The approximated ends of the ligament were then sutured with 2-0 polydioxanon in an interrupted suture pattern (Fig.3). Extreme flexion and extension of the operated stifle was performed to ensure a physiological smooth range of motion without failure of the stiches. The subcutaneous tissue and skin were routinely closed after thorough irrigation of the joint with sterile normal saline. Dogs were exposed to restricted activity for 2 weeks postoperatively followed by a leash walk until they were euthanized. All dogs underwent a complete physical examination, including orthopedic, neurologic

examinations, and radiographic assessment. Dogs were euthanized 6 months postoperatively for histopathology and biomechanical testing. Radiology was performed

with the limbs at dorsopalmar and lateromedial views using 60 K.V.P. and 220 m.A.s at 80 cm- F.F.D.to detect any abnormal changes.

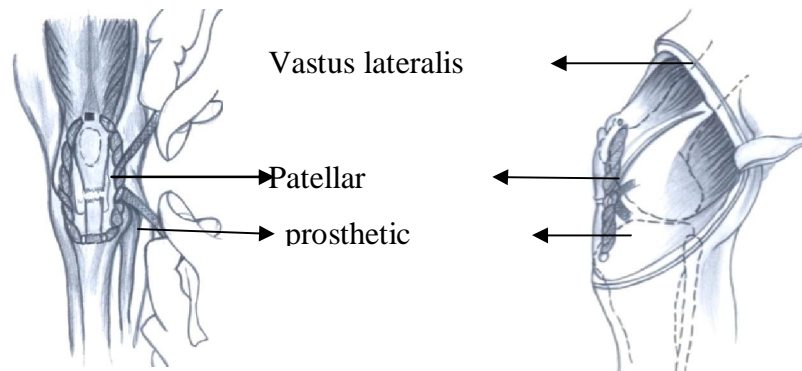

Fig.1: Diagram showing the cranial view of the stifle showing the application of the twisted synthetic fabric through the quadriceps tendon proximally and tibial tunnel distally "note the severed patellar ligament".

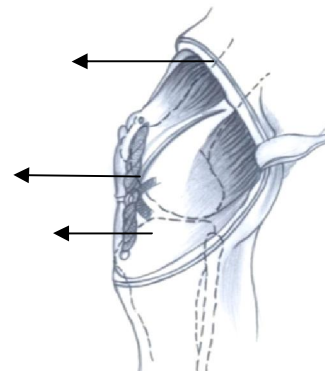

Fig. 2: Diagram showing the lateral view of the stifle showing the approximated and sutured patellar ligament after tensing and knotting the two ends of the prosthetic fabric.

Fig. 3: The prosthesis was twisted on both sides of the patellar ligament , the two ends of the fabric are tied at one side. (c) is the cut in the patellar ligament

Biomechanical evaluation:

This was carried out by collection of the specimen after euthanasia of the experimental animals, 180 days postoperatively. Samples were wrapped in saline soaked towels and immediately examined for biomechanical analyses. Biomechanical studies were carried out at The Textile Division– National Research Center, using a tensile testing machine (Instron 3345[®], England).

Biomechanical parameters were measured and were represented in table (1).The examined samples were evaluated in the operated and control groups.

Histopathological studies:

Autopsy samples were taken from the healed patellar ligaments after euthanasia, 180 days after implantation. Samples were examined macroscopically then fixed and stained with hematoxylin and eosin stains for microscopical examination (Banchroft *et al.*, 1996).

3. Results:

Clinical observations:

Experimental animals began to ambulate and bear weight with mild to moderate limping on the operated limbs within the first 2 weeks. Progressive improvement occurred after this period. No patient had re-rupture of the patellar ligament after surgery.

30 days postoperatively, there was a complete return to limb function and the operated stifles showed a limited degree of stifle flexion. A marked thickening of the periarticular soft tissues was noticed.

180 days postoperatively, animals were fully weight bearing with a full range of motion. There was an obvious reduction in the periarticular thickening. During the evaluation period (6 months), the patella was palpated as discreet, firm structure which maintained its integrity throughout the range of stifle motion in all dogs. Radiographic findings revealed, that 30 days postoperatively the femoropatellar joint showed minimal periarticular soft tissue swelling with no evidence of intraarticular degenerative changes or effusion (Fig.4), 180 days showed no evidence of postoperative intraarticular changes (Fig.5).

Fig.4: An experimental case just after surgery, Notice, the normal articular joint.

Fig. 5: 180 day's postoperation. Notice, the stifle joint was free from intraarticular changes.

Evaluation for the mechanical properties of the used textile fabric before implantation (Table 2):

Table (2): Result of load testing (M±SD).

	Load at max. (N)				Load at break (N)			
	warp	Warp twist	weft	Weft twist	weft	Weft twist	weft	Weft twist

Histopathological results:

Microscopically, complete fibrous healing appeared after 180 days post implantation which appeared in the form of dense bundles of collagen fibers. There was no evidence of infection or body rejection. Remnants of the implant were still present infiltrated and surrounded by mature fibrous connective tissue. The predominant cells were fibroblasts along with little numbers of macrophages and mast cells indicative of active matrix synthesis of collagen with the presence

Fig.15: longitudinal section in a normal case, demonstrating, long bundles of dense collagen fibers closely packed together (H&E X50).

Fig.16: longitudinal section of the patellar ligament showed dense connective tissue with foreign material in multiple rounded spaces with small focus of calcification (H&E X50).

4. Discussion

The patellar ligament in dogs transmits the contraction of the quadriceps muscle to the tibia, and causes extension of the knee. It is present to prevent the patella from being dislocated upward Gibbons *et al.* (2006): Rupture of this ligament usually occurs as a result of severe trauma, chronic local stress and local or systemic administration of steroids (Culvenor, 1988):. Adequate support and stability are essential factors for better outcome. Best treatment was achieved by primary suturing and application of an internal splint (Gemmil & Carmichael, 2003)

Massoud (2010) reported the importance of the support use of reinforcement device in cases of ruptured patellar ligament for tension regulation at the suture line. Kasten *et al.* (2001) added that, many augmentation techniques have been tried after end-to-end sutures for reinforcement such as wire cerclage or PDS cord. Reliable results were obtained and experimental cases did not sustain reruptures.

As was mentioned by Alexa and Cozma (2009) treatment of ruptured patellar ligament necessitates immediate repair with a synthetic material that allowed immediate mobilization and decreased the recovery period which improved the outcome of rehabilitation.

In the present study, A textile fabric was used for the treatment of patellar ligament ruptures. The fabric was synthesized at the Textile Division at the National Research Center which composed of a combination of two synthetic materials polyamide 6.6, a material which possesses a high tensile strength and elongation and polyester which is a strong, inert material. The prosthetic fabric was made in a special

manner to fulfill the demanded strength and flexibility for the internal support of the ruptured patellar ligament in dogs. The implanted fabric would be biocompatible within the living tissues (Bushnell *et al.*, 2008)

The structure of the prosthetic textile was composed of monofilament microfibers which gave advantage for the properties of the textile fabric to be strong enough to withstand the loads and the tensile forces to compensate the cut ligamentous tissue. The material also was not water absorbent and was resistant to the ordinary chemical and biological agents (Raghavendra *et al.*, 2004).

Twisting of the prosthetic material during the surgery was applied as 10 twists / cm in order to give success in using the material in a flexible manner and be capable of being a solid internal splint. This helped in the normal biomechanical movement of the joints (Phelps & Dormer, 1986).

Clinical results demonstrated that the operated animals were moving normally on the operated limbs after 15 days postoperatively and at the end of the experiment they were running freely without obvious signs of complications. At 30 days, all animals recovered from surgery in which animals walked and ran normally on the repaired legs. At the end of the experiment, 180 days postoperatively, the dogs were fully weight-bearing. Same results were obtained by (Kasten *et al.*, 2001 and Archer *et al.*, 2010) who stated that full range of motion was achieved at 3 months.

Our clinical and histopathological results proved that the prosthetic material did not show any signs of rejection or septic inflammatory reaction.

Clinical examination revealed the presence of local periarticular soft tissue swelling at the seat of operation which decreased gradually till the end of the experiment seen as focal swelling, this was attributed to fibroplasias and healing around the synthetic fabric. Same results were seen by Bushnell *et al.* (2006). Radiographic results, 180 days postoperatively revealed no intraarticular changes a result which advocates the use of this technique as other treatment techniques were usually accompanied by intraarticular degenerative changes (Alexa and Cozma, 2009).

Macroscopic examination after euthanasia and exploration of the seat of the operation indicated healing of the ruptured ligament ends was evident indicated by the formation of new tissue greatly resembling the original ligament. Microscopically, results proved primary ligament repair characterized by formation of bundles of dense collagen fibers running parallel to each others. At 180 days, The fabric disintegrated to remnants which appeared as foreign vacules not surrounded by inflammation or body reaction indicating biocompatibility with the body tissue. Healing by tissues greatly resembling the structure of the normal ligamentous tissue proved the efficiency of the fabric as an internal splint for immobilisation and maintaining the normal physiological function of the joint without any adverse reactions.

Biomechanical results indicated that the newly formed ligamentous tissue at the end of healing 180 days postoperatively not only a good support against the loads applied on the joint but exceeded the values of the normal tissues needed to support strenuous loads applied on the joint during extension and flexion. This was proved by finding out that, the force values needed for complete cut of the newly formed tissue were exceeding those for the normal tissue of the control group, this was a considerable result regarding the tendon reconstruction using the implant material.

On the other hand biomechanical evaluations proved that the new healed tissue possessed nearly the same tensile strength of the normal ligamentous tissue but of less elasticity. This is attributed to the new replacing tissue which is fibrous in nature and doesn't identically resemble the pure collagen type 1 of the healthy ligamentous tissue. Same results were mentioned by Bushnell *et al.* (2006).

The biomechanical tests for the textile sample, found that the values of the tensile strength for the direction of the weft is higher than that of the warp, this is attributed to the material used which is the Polyamide 6.6 with its advantage of a tensile strength and strain higher than that of polyester. It was also noticed that, the tenacity-elongation at break ranges from 8.8g/d - 18% to 4.3 g/d-45%, 100% elastic under 8% of extension for polyamide 6.6 While tenacity varies from 4.5 to 5.0 g/d for the polyester textile. It is

known that, high tenacity fiber reaches up to 8.0 g/d and extension at break varies from 20% to 30% (Raghavendra *et al.*, 2004 and The textile log. 2010).

A slight proximal displacement (patella alta) was radiographically observed in most cases which may later on predispose to patellar luxation, a point which needs more further studies.

In conclusion, we recommend the polyamide 6.6 polyester fabric as an internal synthetic supportive splint for acute patellar tendon ruptures in dogs. The product has the advantage of mechanical and biological properties in the medical field. The implant also allowed immediate rehabilitation without the need for prolonged immobilization.

Effect of Methanol intoxication on the Function of Retina of Rabbit

Alaa El-Din A. Gawad and Amal E. Ibrahim

Biophysics and Laser Unit, Research Institute of Ophthalmology

Abstract: Methanol is an ideal candidate to replace fossil fuels. However, alterations in the retinal function are primarily associated with methanol intoxication. In the present work, chronic methanol intoxication was carried out in New Zealand rabbits previously depleted of foliates with methotrexate. We analyze the effect of long-term alcohol consumption on oxidative stress parameters of the rabbit retinas and its correlation to retinal function. We show that methanol has a toxic effect on rabbit retina associated with oxidative stress. Decreases in retina glutathione concentration and increases in catalase activity in whole retina homogenate significantly correlate with ERG a- and b-wave decrease. We show also a marked change in the molecular structure and orientation of rhodopsin in cell membranes of the retina. Chronic methanol consumption induces oxidative stress in rabbit retina associated with an impairment of ERG and molecular changes of membrane proteins.

[Alaa El-Din A. Gawad and Amal E. Ibrahim. **Effect of Methanol intoxication on the Function of Retina of Rabbit.** Journal of American Science 2011;7(6):491-496]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Methanol intoxication, Retina, Rabbit, fossil fuels.

1. Introduction

Integrating methanol into our energy system in the foreseeable future would have numerous economical and environmental benefits. However, considerable toxic effects due to acute or chronic methanol exposure could limit its use.

Exposure of methanol normally occurs through inhalation, skin or eye contact, and ingestion. The response and sensitivity of various species to methanol intoxication is varied (1,2); humans show considerable sensitivity to methanol (3). Further, the amount of methanol needed to cause acute toxicity varies widely from person to person (4).

In contrast to the acute intoxication, the debate about chronic neurotoxic effects of daily low to moderate methanol exposure is not yet settled. The mammalian metabolism of methanol mainly occurs in the liver. It breaks by alcohol dehydrogenase down into formaldehyde and then to formic acid (5). The metabolism of formic acid is mediated through a tetrahydrofolate-dependent pathway (6). Clinical findings correlate better with formic acid levels, which cause the profound metabolic acidosis that is a hallmark of methanol poisoning.

Formic acid accumulation gives rise to mitochondrial damage and suppression of oxidative metabolism by inhibiting cytochrome oxidase activity, which may also lead to an increase in H_2O_2 (7-9). Interestingly, the formation and stability of reactive oxygen species, for instance OH-like radicals, either by the iron-catalyzed Fenton and Haber-Weiss chemistry is favored in the presence of an acidic pH (10,11). Moreover, the metabolic acidosis can trigger iron release (12).

The electroretinogram (ERG) is the measure of action potential produced in the retina by sufficient

light. It is a chain of electrical response in the form of graded potential evoked in each layer of the retina, from the photoreceptors to the amacrine cells. The high existence of oxygen and light in the retina even though its essential to vision but it may lead to photo-oxidative damage by means of formation of reactive oxygen species (ROS). Therefore, it is not surprising that it would possess antioxidant system (e.g. GSH, Vitamin E, Lutein and Zeaxanthin) and enzymes (e.g. catalase, glutathione peroxidase, superoxide dismutase) capable of metabolizing such foreign species (13,14).

All together, we designed this investigation to explore the effect of chronic methanol poisoning on the molecular biophysical characteristics of proteins in the retinas of rabbits. It has been used FT-IR spectroscopy as a non-invasive tool to detect the molecular changes in protein content.

2. Materials and Methods

Methanol intoxication protocol

Twenty two-month-old New Zealand white rabbits (average body weight 1450 g) fed a standard laboratory chow were divided into two groups for treatment during 7 days. Animals were individually housed in stainless steel cages with free access to food and water. They were maintained on a 12-light/dark cycle. Control and experimental rabbits received water for drinking from the polypropylene bottles.

For treatment, Methyl alcohol (HPLC grade; sigma) was diluted in sterile saline and was administrated as a 20% v/v solution. At the onset of the experiment, rabbits were injected with methotrexate (0.2 mg/kg b.w./day). The treated

animals were given 24-hrs access to a 20 % v/v solution H₂O for one week.

Electroretinogram technique:

The intoxicated rabbits were anaesthetized by 0.1 ml/kg xylazine, 50 mg/kg ketamine hydrochloride administered intraperitoneally. ERG was recorded by using three Ag-AgCl electrodes. The active electrode was a disc electrode placed at the corneal periphery. The other two electrodes were placed in the skin of the lower eyelid and in the ear, as a reference and earthed electrodes respectively. A white flash was used in this work with fixed intensity (4 lux) and duration (0.2 sec). The obtained ERG signals were amplified and delivered to a computer system with a wide band (1-100 Hz). Sampling of the ERG records were performed using a custom-made computer system. Details of the technique are found in El-Awadi (15).

Sample preparation

At the ends of experimental periods (1, 3, 5, and 7 days) all the animals were sacrificed. For each experimental period, one animal was used for ERG experiments and the fellow one was dissected. Retinas were removed quickly and placed in iced PBS solution for 1 min, blotted on filter paper, weighed and homogenized (1:9, w/v) in a glass-teflon Potter homogenizer in 0.02 M phosphate buffer pH 7.4. The homogenates were centrifuged at 15,000 x g (4°C) for 30 min to settle the organelles and their membranes. The supernatant received from homogenate and used for subsequent experiments.

Antioxidative defence enzyme activities:

Catalase was measured at 240 nm for 3 min, using the linear decrease of H₂O₂ (10 mM) at pH7.4 in 50 mM potassium phosphate buffer. Activity was calculated using the molar extinction coefficient of 0.0394 mmol⁻¹ cm⁻¹, 1, and the results were expressed as nmol H₂O₂/min/mg of protein (16). GSH concentration was measured in the supernatant. DTNB (5, 5'-dithiobis-2-nitrobenzoic acid) recycling method was used to produce a yellow compound, TMB (5-thio-2-nitrobenzoic acid), which was measured at 412 nm (17).

FTIR spectroscopy:

The absorption measurements were all performed with a Jasco-4100 Fourier-transform-spectrometer. Spectra were recorded in the range 4000 - 400 cm⁻¹ using Instrumentation and Services Laboratory, National Research Center. The absorption intensity of the peak was calculated using the base line method.

Protein assay:

Protein contents were quantified with Lowry method (18).

Statistical evaluation

The results were expressed as mean ± SEM. Statistical analysis was performed using Student's t test for unpaired data, and values from $p < 0.05$ were considered significant.

3. Results:

Figure (1) shows FT-IR spectra of rabbit retinas in the spectral region from 1900 to 400 cm⁻¹ for the periods indicated. The major IR bands of the retinal chromophores were assigned to either vibrations of the protein part or the membrane lipids. In Fig (1), the amide I (C=O stretch vibrations) band is centered around 1643 cm⁻¹ and amide II (N-H bending vibrations) at 1537 cm⁻¹. This vibration bands are characteristics for α -helical structure of rhodopsin (19). Figure (2) showed the dichoric ratio (amide II₁₅₃₇/amide I₁₆₄₃) decreases with time from 0.954 at 1-day to 0.363 at 7-day. These ratios were employed to calculate the orientation angle of rhodopsin with the membrane normal. Table (1) showed the estimated angles. The exposure of rabbit retinas to methanol for one day has no change in the orientation angle of rhodopsin. The exposure of retinas for longer time (3 and 5 days) showed a remarkable increase in the angle of orientation (31° and 57.5°, respectively). At the seventh day the angle of orientation has been markedly deteriorated.

Catalase, the enzyme that facilitates the breakdown of hydrogen peroxide to oxygen and water. Table (2) shows the activity of catalase in the retinas of methanol-intoxicated rabbits. Catalase activity was increased significantly in a time-dependent manner. The catalase activity in normal rabbit retinas was 4.39±0.93 U/mg protein. With one day of intoxication, the catalase activity increased to 5.12±0.74 U/mg protein. At 3 days post-insult, the catalase activity became 5.48±0.69 U/mg protein. By 5 and 7 days post-intoxication, the catalase activity increased to 6.87± 0.98 and 7.43±1.12 U/mg protein, respectively.

To determine the effect of chronic methyl alcohol administration on antioxidant activity, we measured GSH concentrations per wet weight of retinal cells at the corresponding periods (Table 2). In freshly isolated control retinal cells, the cytosolic GSH were 107.81±6.19 µg/g wet weight. After one day of chronic methanol ingestion, the cytosolic GSH pool was decreased by more than 11% ($P < 0.05$). The methanol ingestion of rabbits for 3, 5, and 7 days caused a significant decrease in the cellular GSH pool ($P < 0.05$). By 7 days of methanol intoxication, the drop of GSH concentration reached more than 40% (Table 2).

The traces in figure (3) illustrate a set of control and methanol-intoxicated rabbits ERGs using the flash stimulation technique. In all control animals,

well-defined ERG responses were found. The mean amplitude of a-wave = 0.22 ± 0.009 mV, and b-wave = 2.29 ± 0.2 mV. It was observed that a- and b-wave amplitudes in the ERGs were significantly reduced with respect to control for all experimental periods (1, 3, 5, and 7 days). The rate of b-wave amplitude change showed a linear decrease (Fig. 4). It was 7.5% after one day whereas this drop was ~ 22% and 27% for 3 and 5 days respectively upon intoxication (Table 3). The rate of change reached 35% on the end of the time course of experiment. On the other hand side, a-wave amplitude showed a sharp increase in the ascending side (Fig. 5). The implicit time of both a-, and b-wave showed a marked changes upon intoxication.

4. Discussion

Chronic methanol intoxication can severely damage many systems of the human body, especially severe visual dysfunction (20, 21). As in the case of many chronic degenerative diseases, increased productions of reactive oxygen species (ROS) and lipid peroxidation have even been considered to play an important role in the pathogenesis of methanol toxicity (22, 23). In the present study, chronic methanol-intoxicated rabbits have been pretreated with methotrexate, which selectively inhibits formate oxidation and binding dehydrofolate reductase, thereby depleting the animal's folate store (25). Interestingly, the formation and stability of reactive oxygen species either by the iron-catalyzed Fenton and Haber-Weiss chemistry is favored in the presence of an acidic pH (24). Moreover, the metabolic acidosis can trigger iron release (12). Therefore, we analyzed the effect of long-term methyl alcohol consumption on oxidative stress in the retina and its correlation to retinal function by ERG.

The results herein from eyes of methanol-treated rabbits show a significant decrease in the level of endogenous antioxidant (GSH), as well as an increase in catalase activity (Table 3). Methanol induced depletion of glutathione supports the hypothesis that reactive oxygen intermediates generated during the metabolism of methanol lead to glutathione oxidation and lipid peroxidation. These findings agree with previous studies that reported an alteration of oxidative stress metabolites after long term administration of methanol in liver and retina (22, 35). Hyperoxia-induced retinopathy of prematurity and ischemia-reperfusion show a depletion of retinal GSH that may become insufficient to buffer an increased release of free radicals (24).

Catalase enzyme serves as a second messenger of oxidative stress. The accumulation of reactive oxygen species giving rise to induction of the expression/activity of catalase enzyme (Table 3). Increase of the catalase activity will lead to a decrease in H_2O_2 concentration within the cell, depriving the Fenton reaction of substrate. Consequently, the formation of hydroxyl radicals through the Fenton reaction (and thus the formation of MDA) will occur at a lower rate. The induction of antioxidant enzymes to varying degrees by H_2O_2 has been reported in other systems, including rat lens (27), primary rat hepatocytes (28), or the developmentally regulated catalase of *E. nidulans* (29).

A result of free radicals action may be the modification of biologically active proteins, and damage to biological membranes. Our data suggest a quite interesting general inverse relationship between the ratio of Amide II₁₅₃₇/Amide I₁₆₄₃ and the time of

methanol poisoning (Fig. 5). The alteration of these dichroic ratios could be used as a monitor to get information about the configuration of main protein component, rhodopsin. The magnitude of changes in these spectral regions indicates significant changes in α -helix configuration of rhodopsin (30). In α -helix, the amide I dipole is close to the helix long axis whereas the amide II dipole is roughly perpendicular to it. Though localization of short chain methyl alcohol, in the headgroup region of lipid membrane (31, 32) is giving rise to disruption of lipid bilayer packing, i.e. increases membrane fluidity. The enhancement of fluidity seems to make the membrane has less steric constraints (33) and may cause changes in the orientation angle between rhodopsin and membrane normal.

ERG analysis in methanol-intoxicated rabbits revealed a significant reduction of the amplitudes of a- and b-waves (Figs. 3, 4). In fact, rhodopsin is a protein anchored in the membranes of discs-flat vesicles that fill the outer segment of rod cells. These membranes contain a high amount of long-chain polyunsaturated fatty acids (34), which make them particularly susceptible to oxidative stress. Therefore, hypothesis may directly pertain to the alterations in the ERG is that the function of the retina may be diminished by exposure to methanol and/or the byproducts of methanol metabolism (35, 36). It has also been hypothesized that persistent conditions of oxidative stress due to chronic alcohol exposure can alter the fatty acyl composition of membrane phospholipids (37, 38).

Moreover, oxidative stress in the outer rod segment is associated with double bond breaking of 11-*cis*-retinal during *cis*-*trans* isomerization. In the case of free retinal, this photochemical reaction has been reported to cause the formation of oxygen free radicals. Oxygen radicals can also cause formation of the protein peroxides (39). Changes of the primary structure of proteins cause modification in their secondary and tertiary structures.

Intellectual capital and its effect on economic performance: A Case Study in Iranian Automotive IndustryDr, Mojtab Rafiei¹, Dr Tahereh Feyzi,², Hossein Azimi,³

1 - Assistant Professor of Payam Noor University, Central Province, Iran

2 - Assistant Professor of Payam Noor University, Tehran, Iran

3 - MA student of Payam Noor University, Tehran, and teacher of Institute for Higher Education of Payam Golpayegan, Iran

Abstract: Studies have shown that in the contrary of loss productivity of traditional sources (money, land and ...), knowledge is really a source of increasing economic performance. Basically, managers of companies are forced to correct and improve production methods, marketing, innovations and ultimately increase productivity and economic efficiency by considering prevailing economic conditions constantly. One of the main ways to improve economic conditions and increase competition for successful factories which can reach to the potency of competition, is the use of creative thinking that without the recognition and protection of intellectual capital will not be possible. In this study, elements and components of intellectual capital are independent variables as human, Structural, and relational capitals. Economic performance indicators (dependent variables): profit and cash earnings are considered. Methods of research in doing is descriptive - correlation of covariance analysis of structural equation model. The results were analyzed with the Lisrel & SPSS software, and finally the relationship between intellectual capital were confirmed and it has been found that relational and structural capital directly and human capital, indirectly, impress economic performance by structural effects.

[Mojtab Rafiei, Tahereh Feyzi, Hossein Azimi. Intellectual capital and its effect on economic performance: A Case Study in Iranian Automotive Industry. Journal of American Science 2011;7(6):497-507]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: human capital, relational capital, structural capital, economics, Lisrel

1 – Introduction

Coincided with revolution of information technology and rapid development of superior technology, since decade 1990, pattern of economic growth has got fundamental change and consequently, knowledge as the most important factor, superseded of financial and physical capital in the global economy. In other words, industrial economy replaced to knowledge-based economy. In Knowledge-based economy give more Attention to knowledge and intellectual capital as the main factors of wealth production in comparison with other tangible and physical capitals. In the current competitive markets, the success of an organization depends on applying the elements of knowledge management and intellectual capital in all aspects of organizational (Chen, et al, 2006). In the knowledge-based economy, intellectual capitals, especially human capital are considered as a part of the most important component of corporate capitals and the main potential success factor of organizations, in comparison between tangible capitals, is their intellectual ability.

With the growth of knowledge-based economy significantly, we see that the corporate intangible capitals in comparison with other tangible capitals are more important to preserve and achieving sustainable competitive advantage (Tayles, 2007). Thus the business's environment of economic changes

wonderfully. In Businesses and the economy in twenty-first century, invest on information, information technology, electronic commerce, software patent of research trademark and Innovation and www and etc, that all are part of intangible capitals and intellectual capital and knowledge capitals and are beyond of evident context capitals. (Seetharaman, 2007). In summary, in knowledge-based economy, the most important capitals and company's economic factors are intangible that using of them doesn't less their value, and rather increase their value. These intangible capitals include knowledge, intellectual capital and etc, but in industrial economy the most important factors and capitals are economic and physical that using them diminishes their value. These capitals include land, machinery, monetary capitals and tangible and etc. Nowadays, the role of knowledge in business and maintain competitive advantage are discussed as a major problem in the management of all departments and organizations. All have come to believe that the knowledge is the base of competition in business and future Economy. (Yazdani, 2006).

1-2 - Statement of problem, importance and objective of research

According to the importance of the automotive industry and especially with the implementation of Article 44 of the Constitution and the tendency to the

privatization of the economy and thereafter that, dramatic increasing in the domestic economy also with willing to join the World Trade Organization and also applied prohibitions by the Western countries need to improve the economic status of the organizations approach to intellectual capital and intangible capitals to be felt as much as before. Managers of organization must get better understand the mentality and the concept of intellectual capital. They need to review products, processes and people and assessment of their knowledge and increase it. One of the main ways that plants have got succeeded to improve production methods, increasing compete with other competitors and improve the financial position, is the using of creative thinking and making innovation in system that this case without recognition and protection of intellectual and intangible capitals would not be possible. In the current situation with regard to the extent of competition and privatization and high complexity and instantaneous changes in environment, corporate managers, to deal with these changes, urgent need to identify intellectual capital levels of the organization and correct management. According to the importance of the automotive industry in the country and the importance of intellectual capital issues were considered, in this study has tried to relate investing in the main value of intellectual capital for automotive industry and the impact on economic performance of intellectual capital. Also determining of the Intellectual capitals value of these companies can affect on efficiency and increasing the economic performance of this group.

With further researcher's study at the statistical prototype, it seemed the subject of intellectual capital and intangible capitals in these companies has been ignored. Accordingly, it has prepared the researcher to do relevant research in this direction. And trying to find a model that firstly identifies the intellectual capital, introduces these basic organization's elements, determines the relationship between these elements. And secondly, determines the effect of each of these elements on the performance of employees.

The main objective of the research:

The components effect of intellectual capital on the auto motive's financial and economic performance.

Other sub-objectives:

1 - Evaluation of components of intangible capitals and intellectual capital components (human, structural and relational) among managers, experts and supervisors of active companies in Iran's automobile industry.

2 - Provide solutions and necessary recommendations to improve intellectual capital level of economic performance.

3 - Discussing the intellectual capital subjective and its relationship between organizational economic performance in order to attract the attention of senior managers of active companies in the Iran's automobile industry, to the importance of intellectual capital and intangible capitals of their organizations.

1-3 - Background and research framework

Emergence of intellectual capital statement has an interesting story. At the end of decade of sixty late AD, an Economist in the name Galbraith, during with a correspondence with his economist friend, Kalsky, speaks to Kalsky about his religion and other's religion caused by his intellectual capital that created in the sixties. For this reason that today, the appearance of intellectual capital statement can be attributed to Galbraith (Khavandkar and others, 1388, 3). The concept of intellectual capital initially, was presented by management science pioneer, Peter Drucker, in description of society after capitalism. At the end of 1990 referring to the intellectual capital and knowledge in the publications and management books and trading were very common (Bontis, 2004). By passing time, the fields of Intellectual capital management became more widespread and were also entered in fields of financial reporting and accounting organizations. Stewart (1991) in an article published in Fortune magazine, by presentation of the main motivation for the formation of another world under the title "world's intellectual capitalists" has gave more reliability to the researches in this field. Along with Stewart in Fortune magazine articles, this subject matter, has followed by his colleagues like Baruch lev from New York University, Davenport (1993) from Boston University, Bontis and his colleagues and also Lif Edvinson (1993) of the pioneers of Skandia Swedish company and other scientists. Therefore focus on intellectual capital and knowledge organizations was increased. Today, many private and governmental institutions have done extensive efforts to identify the intellectual capital of organizations and also to evaluate and comparison of them in different levels of micro and macro. For example, one of the efforts to identify and evaluation investment knowledge that has done in international level is the research that has been done in the United Nations Economic and Social businesses and their sub-units(government management and development unit),under name: measuring knowledge capitals of nations.(Rafiee, 2009). In Knowledge-based economy, the **success** of organizations depends on managing intangible capitals and intellectual capital of their organizations. To manage these capitals, we must

firstly identify and measure them and finally we able to manage those (Sanches, et al, 2008). Much emphasis and attention to intellectual capital represents the fundamental differences between companies that work in the new and old economy. In the old economy-based, market value was based on physical capitals, while the value of the new economy value is caused the application of intellectual capital of the company and knowledge. The appearance of knowledge-based economy is caused to end time of relative importance of tangible capitals and subsequently the new paradigm that much attention to the intellectual capital and knowledge is occurred. (zhou, 2007). Basic steps must be taken to our economy to become knowledge-based economy. We should learn that our organization take to deal with rivals ahead, introduce as a knowledge-based exporter, if we didn't increase our speed, fall farther and farther in this course every day. And soon, if not try we will join to the organizations that have moved toward fail. Economic activists of organizations must achieve to understand the mentality of concept intellectual capital as better as before. They must specify their hidden capitals and change them to intellectual capital and must have a specified plan to use them (Erteghaee, 2009). In this study, the meaning of intellectual capital components is: human capital, structural capital and relational capital are considered as the independent variables which of course, they have a relationship with each other. And personnel's economic performance is considered as dependent variable. it is intended to mention that the performance index in this quantitative study have been considered as profit institution and cash flow or economic indices generally. Indexes of human capital in this study include: innovation and creativity (I & C) - Education and Learning (L & E) - experience and expertise (E & E) indicators of capital structure include: systems and applications (S & P) - processes and structures (P & S) - intellectual property rights (IPRs) relational capital indicators include: agreements and strategic relationships (AA) - relationship with suppliers and customers (R. SC) - Knowledge about customers (KC). In this study, we will understand How with appropriate management intellectual capital components (human capital, structural capital, relational capital), can we improve profits and economic development of organizations and get value for organization according to a very competitive environment.

This model shows the relationship between independent & depended variables of this research. The model that human, structural and relational capitals are considered as independent variables which influence on each other, and the performance of organization with benefit index is considered as dependent variable.

Now, according to clarify the variables and model, research hypothesis are offered:

Main hypothesis: intellectual capital has significant effects on economic performance of organization.

Sub-hypothesis:

- 1 - Human capital has significant effects on economic performance of organization.
- 2 - Structural capital has significant effects on economic performance of organization.
- 3 - Relational capital has significant effects on economic performance of organization.
- 4 - Human capital and structural capital have a significant relation with each other.
- 5 - Relational capital and human capital have a significant relation with each other.
- 6 - Relational capital and structural capital have a significant relation with each other.

In fact in this study the relationship between intellectual capital components with each other, will be identified and the effect of the components of intellectual capital on economic and financial performance of organization will be measured directly or indirectly. It is important to know that in this research the meaning of relationship's effect is correlation and not casual.

2 – Methodology

This study according to its aim that it is determining of the empiric relations in the field of interaction relations between the components of intellectual capital and its effects on the financial performance of the organization, in terms of purpose is applicative and in terms of methodology (how data collection) is descriptive – correlative of covariance analysis methodology of structural equation model (path analysis).

2-1 - Gathering tools and data analysis techniques:

The most important methodology of data collection in this research is as follows:

In this study, library resources, articles, required books and also global information of Internet network are used for data collection in the field of theoretical and literature of research topic. Also, information & data collection to analyze has been done by fielded method by using questionnaires' tool. Questions (items) of questionnaire include four sections:

Part I: Human capital assessment questions: this section includes 16 questions.

Part II: Questions relating to structural capital: this section includes 18 questions.

Part III: Questions relation to relational capital: this section includes 16 questions.

Part IV: Questions relation to financial performance that includes 10 questions.

In this research, after collecting the questionnaires and extraction Replies for changing the Initial data from the questionnaires to the usable mode for using SPSS software and login the information, extracting descriptive statistics with classify the information ,and converting the classified information to frequency and statistical average and one & two-dimensional tables have been converted. And finally by using path analysis of Lisrel software the path models have been traced .and hypothesis have been tested.

2- 2 – Definition of variables and the introduction of statistical prototype.

Intellectual capital: intellectual capital is an information and applicative knowledge to create a value for company (Edvinsson & malone, 2005).

In other words, those capitals of per company that make additional value for company, but they are not touchable and seeable are named as intellectual capital. Stuart Thomas expresses that intellectual capital is a useful knowledge box for the organization. Respect to Boroking, difference between book value and market value of a company is named as intellectual capital (Shaemy Barzeky, 2005).

Practical definition of intellectual capital: intellectual capital consists of capitals and assets that companies have, but they can't easily identify and measure. These capitals have too effect on company's benefit & cost, but they are not visible. It causes to increase the importance of identification and assessment of them. These capitals and assets are called company's intellectual capital, which are converted to three parts: structural capital, human capital and relational capital (Lotfizadeh, 2006).

Human capital: human capital is very important because they are the strategic source of creativity & renewal of organization. Basis of human capital is organizational personnel's intelligence and talent. Range of human capital is limited to the knowledge that workers have in their mind. In other words, it is the most important capital for any organization because this capital is the source of creativity in the organization. This capital consists of staff proficiency, leadership abilities, experiences, ideas, risk-taking, problem solving ability, and... (Bontis, 2004).

Practical definition of human capital: human capital consists of total abilities, capabilities and personnel

competencies that can help in solving company's problem. (Shaemy Barzeky, 2005).

Relational capital: relational capital consists of factors that they organize and manage the between organization relations & surrounding environment. Relational capital is not only included relations with customer and marketing, even includes: external relations company with networks, business competitors, material suppliers, good reputation of exploitative unit, associations and trade guilds, government, governmental institutions, media and research centers (Marr, 2005).

Practical definition of relational capital: relational capital points to satisfied customers who loyal to the organization. In General, attitude of all external beneficiaries to the organization (Ghlichly and Moshbak, 1385).

Structural capital: Structural capital consists of capitals that make possible and improve the organization ability for creativity. Organization mission, vision, basic values, solutions, work systems and internal processes can be considered among these capitals. (Hajikarim, and Bathaee, 2009). Practical definition of structural capital: is the class of the company's capitals that by support human capital causes relational capital. This means, company with having procedures, systems, programs and suitable strategies can help to its personnel to achieve the ultimate goal that is costumers and beneficiaries' satisfaction. (Lotfizadeh, 2006).

This research has been done in the active companies of country's automotive manufacturers and automotive spare parts supplier. The statistical prototype is managers, specialists and supervisors. According to the main purpose of this research that it is discovery of the principle that maintained in whole community, but study the whole of community to lead a general rule, if not impossible, will be very time consuming and difficult work, so the researchers to do research get sample from the community. Sampling in this research has been classified presumably.

Sample size has been calculated by Kokaran formula as follows:

$$n = \frac{Nt^2s^2}{Nd^2s^2 + t^2s^2}$$

In this formula

T: has been considered as confidence level

N: is number of community

P and q: Is ratio of success failure of variable in community

D: is the accepted error rate by researchers.

So by following the above formula we will have:

$$n = \frac{400 \cdot 1.96 \cdot 0.31}{400 \cdot 0.04 \cdot 0.04 \cdot 1.96 \cdot 1.96 \cdot 0.31} = 219$$

N, is number of community: 400
 "t", is: 1.96
 D, (accepted error by researcher) is: 0.04

3 – Findings of research:

To summarize the answers in the questionnaire, central and dispersion parameters of mean and standard deviation of each of the questionnaire have been calculated. And by using the path analysis, hypothesis of research have been tested to determine the measure and the effect's kind and also direction of the relation between independent & depended variables. In each Equation, tree kinds of information are presented for each parameter. This information consists of:

1. Estimation the non-standard value of parameter.
 2. Standard error.
 3. The value of "t".
- Estimation of non-standard parameters shows that changing of per unit in independent variable,

if the other independent variables be fixed, how much change will be caused in the dependent variable. The direction of changing is defined by the positive or negative sign of relevant parameters. Standard error shows that the parameter's value with the how much accuracy is estimated. If the value of a parameter is divided on its standard error, "t" value will be calculated. "t" value is used in order to define whether a specific parameter in the community, has a significant differentiation with zero value. "t" value between 2 and 3 shows direct relation of the hypothesis is confirmed and the dissident hypothesis is rejected with more than 95% confidence.

For t value larger than 3, with 99% confidence hypothesis is confirmed and the dissident hypothesis will be rejected. In fact the t statistic tests the hypothesis that shows a parameter is equal to zero. (Kalantary, 102, 2008).

According to the done estimates in the model and equation by software, the results of the direct effect of values is shown for better decision making in Figure 2 and Table 1.

Figure 2: Initial Path Model for checking the direct relationship between model variables:

Figure 2, is showing the primary Path Model between variables, it means human capital (human), relational capital (relation), structural capital (structure) and economic performance (perform). The description is observed in Table 1.

Table 1: direct values of the initial path model:

Variables relationship	Estimated	Standard	Standard's	t-value	Signification	Result
------------------------	-----------	----------	------------	---------	---------------	--------

	value	value	Error		level	
Relationship between human capital & economic performance	0.16	0.14	0.10	1.56	$P > 0.5$	Disconfirmation of direct relation
Relationship between structural capital & economic performance	0.22	0.20	0.11	1.98	$P < 0.01$	Confirmation of direct relation with more than 95% confidence
Relationship between relational capital & economic performance	0.31	0.27	0.096	3.23	$P < 0.01$	Confirmation of direct relation with more than 99% confidence
Relationship between human capital & structural capital	0.56	0.52	0.051	10.91	$P < 0.01$	Confirmation of direct relation with more than 99% confidence
Relationship between relational capital & structural capital	0.43	0.40	0.051	8.33	$P < 0.01$	Confirmation of direct relation with more than 99% confidence
Relationship between human capital & relational capital	0.14	0.62	0.054	7.78	$P < 0.01$	Confirmation of direct relation with more than 99% confidence

After analyzing the initial model of research, the results of estimated values for the above relationship shows that there is no direct relationship between human capital variable and economic performance ($P > 0.05$). Therefore, in order to calculate estimated values for the final model, non-significant relationships were excluded from the model and the new model is estimated again.

Figure 3: final path model after excluding the non significant values:

One of the advantages of Lisrel software is that shows the indirect effects of an independent variable effect on the dependent variable through one or more other intermediate variable. To understand this relationship, we should note to the presented diagram of the path in the final model according to the Figure 3. This diagram shows that the relational capital variable not only affects the economic performance directly, also affects the economic performance through structural capital indirectly. On the other hand the human capital variable only affects the economic performance indirectly through structural capital. Now according to the estimates done in the final model & equations by software, the results of the indirect effects of capital values of structural & relational capital on the economic performance for better decision making are shown in Table 2.

Table 2. Results of the indirect effects of capital values of structural & relational capital on the economic performance for better decision making

Variables relationship	Estimated value	Standard value	Standard's Error	t-value	Signification level	Result
Indirect relationship between relational capital & economic performance	0.14	0.12	0.04	3.28	P < 0.01	Confirmation of indirect relation with more than 99% confidence
Indirect relationship between human capital & economic performance	0.18	0.16	0.05	3.39	P < 0.01	Confirmation of indirect relation with more than 99% confidence

Considering the analysis done by Lisrel software which existed in Table 2, it can be defined that the relational capital more over than influences on the economic performance directly, has effect through structural capital on the economic performance indirectly. And indirect effect of relational capital on economic performance will be calculated through multiplying the approximate value of relationship between relational capital & structural capital (which is equal to 0.43 as Table 1), by approximate value of relationship between structural capital & economic per (0.32) as follow:

$0.32 \times 0.43 = 0.14$ Standard error of the two variables related to indirect effect, as seen in Table 2 is equal to 0.04. "t" value related to these two variables (relational capital and economic performance) in the indirect effect is equal to 3.28, which shows estimation at the level of 1 percent is significant. Considering the analysis done by the Lisrel software as observed in Table 2, is shown that more over than relational capital, the structural capital also has effect on the economic performance indirectly. However, the effect of human capital is only indirectly. Non-standard estimation value, related to indirect effect of these two variables as observed in Table 2 is equal to 0.18. Standard error of these two variables, related to the indirect effect is equal to 0.05. "t" value related to these two variables (human capital and economic performance) in the indirect effect equals 3.39, which shows estimation is significant with 99 percent confidence.

3-1 – Hypothesis examination

Hypothesis 1 - human capital has significant effects on economic performance.

H0: Human capital has no significant effect on economic performance.

H1: Human capital has significant effect on economic performance.

Path analysis results ($P > 0.05$, $t = 1.56$, $\beta = 0.16$) show that human capital has a significant effect on economic performance directly. So H0 hypothesis is confirmed and H1 hypothesis is rejected.

Therefore the research results and outputs of Lisrel software specifies that human capital does not influence on the performance directly, rather the human capital is related to capital structure and its effect on economic performance is through the intermediate structural capital variable. It seems that the result of research is absolutely normal & logical. If the dominant structure and culture of a company aren't supportive and openly, human capital won't be able to have any maneuvers. Capital structure makes it possible to transfer the existence of knowledge from the processes, procedures, contracts and etc to individuals or groups of employees throughout training or induction. Competencies and personal characteristics that make the human capital can be detected from the capital structure. To get a profitable usage made by employees, the existence of communicational systems and operational procedures in organization are necessary to support the activities of each employee. The human capital is a source to innovation and strategic rebuilt of a company, and the value of its benefit depends on its efficient usage.

In 2004, Chen got a result by his researches that human capital, in order to be able fully achieved to its optimal performance, requires a supportive structural capital, and if structural capital have not already been invested in, human capital won't handle its responsibilities well. Researches by Kolyung & Paolong showed that higher costs in research and structure improvement causes equally staff quality and high degree of organization and thus improvement of economic performance. In another study in 2007 by Carlos Maria & Marto and their colleagues from the Mizinss University in Argentina that it was done in the country's wood industry, During their study they found out that relational and structural capital directly, and human capital indirectly affect the economic performance. In this research, relationship between performance and relational capital is 0.565, relationship between structural capital and performance is 0.455 and indirect relationship between human capital and performance is 0.27. the results of the researches done by these and many others scientists are similar to the results of this research that states human capital affects the economic

performance indirectly. Of course, scientists like Bontiss (2000) and H. Su Feng (2009) also have proved the direct effect of human capital on economic performance. From the researcher's point of view the results of the researches done in each statistical prototype, considering its special conditions might be different. In this research according to the statistical prototype requirements, the indirect effect of human capital on economic performance has been proved.

Hypothesis 2 - Capital structure has significant effects on economic performance.

H0: capital structure has no significant effect on economic performance.

H1: capital structure has significant effect on economic performance.

Path analysis results show that with more than 99% confidence ($P < 0.01$, $t = 3.57$, $\beta = 0.32$) capital structure, has significant effects on economic performance. Thus, H0 is rejected and the research hypothesis is confirmed.

In 1998, Grilichs found a similar relationship between the investment in organizational structure and organizational performance, and professed we can control the organizational effectiveness in this way. Also Cohen and Lovintal expressed that the capability of palatability of a company is the result of investment in R & D (structure). A study done by Desspande and colleagues showed that culture as one of the components of capital structure, helps people to understand their organizational performance. The results of this research in relation to the mentioned hypothesis are consistent with the results of researches such as Bontiss & colleagues (2000), Chen & colleagues (2004) and H. Su, & Feng (2009). For example, the relationship between structural capital and performance in the research of Chen and colleagues (2004) is equal to 0.733, and the effect of capital structure on the improvement of economic performance in the research of H. Su & Feng is equal to 0.16.

Hypothesis 3 – relational capital has significant effects on economic performance.

H0: relational capital has no significant effect on economic performance.

H1: Relational capital has significant effects on economic performance.

The path analysis results show with more than 99% confidence ($P > 0.01$, $t = 6.28$, $\beta = 0.47$), relational capital has significant effects on economic performance. Thus, the H0 hypothesis is rejected, and the research hypothesis is confirmed.

The results of this research in relation to the mentioned hypothesis are consistent with the results such as

Bontiss & colleagues (2000), Chen & colleagues (2004) and H. Su, & Feng (2009). For example, the relationship between relational capital and economic performance in the study of Chen and colleagues (2004) is equal to 0.798, and the effect of relational capital on the improvement of economic performance in the study of H. Su & Feng (2009) is equal to 0.11. In addition, Stewart proved in 1999 that intellectual capital through customer capital change to financial capital also expressed that relational capital depends on support of structural capital. In research done in Turkish industry by Bozbora in 2000, was determined that relational capital has direct effect on book and market value of companies. In Research done in Malaysia by Bontiss and colleagues in 2000 was determined that relational capital affects on financial performance about 20 - 30 percent. Research in 2000 done by Gaph and colleagues showed that customer satisfaction causes the improvement of organization's financial performance and it's market value.

Hypothesis 4 - human capital and structural capital have significant relationship with each other.

H0: There is no significant relationship between human capital and structural capital.

H1: There is significant relationship between human capital and structural capital.

Path analysis results show that with more than 99% confidence ($P < 0.01$, $t = 10.91$, $\beta = 0.56$) there is significant relationship between human capital and structural capital. Thus, H0 is rejected and the research hypothesis is confirmed.

The results of this study in relation to mentioned hypothesis are consistent with the results of researches such as Bontiss & colleagues (2000), Chen & colleagues (2004) and H. Su, & Feng (2009). For example, the relationship between human capital and structural capital in the study of Chen & colleagues (2004) is equal to 0.748; in study of Bontiss & colleagues (2000) is equal to 0.483 and the effect of human capital on structural capital in the study of H. Su & Feng (2009) is equal to 0.41

In addition, Balekh.Lu & colleagues in 2005 pointed to the relationship between intellectual capital components such as human and structural capital. Ross & Ross in 1997 divided intellectual capital into human, organizational and relational capital and expressed that there is strong relationship between intellectual capital components. Grilichs proved in 1998 that immaterial ownership that is considered as a subset of structural capital, can be considered as the most probable output of inventive activities. That it shows the relationship between human capital and structural capital.

Hypothesis 5 - relational capital and human capital have significant relationship with each other.

H0: There is no significant relationship between relational capital and human capital.

H1: There is significant relationship between relational capital and human capital.

Path analysis results show that with more than 99% confidence ($P < 0.01$, $t = 7.78$, $\beta = 0.14$) there is significant relationship between relational capital and human capital. Thus, H0 is rejected and the research hypothesis is confirmed.

The results of this study in relation to mentioned hypothesis are consistent with the results of researches such as Bontiss & colleagues (2000), Chen & colleagues (2004) and H. Su, & Feng (2009). For example, the relationship between human capital and relational capital in the study of Chen & colleagues (2004) is equal to 0.833; in the study of Bontiss & colleagues (2000) is equal to 0.798 and the effect of human capital on relational capital in the study of H. Su & Feng (2009) is equal to 0.75

According to the provided theories and framework by Gotery & colleagues in 2003, relation with the outside of company without the personnel who can afford this work, is very difficult.

Hypothesis 6 - relational capital and structural capital have significant relation with each other.

H0: There is no significant relationship between relational capital and structural capital structure.

H1: There is significant relationship between relational capital and structural capital structure.

Path analysis results show that with more than 99% confidence ($P < 0.01$, $t = 7.78$, $\beta = 0.14$) there is significant and positive relationship between relational capital and structural capital. Thus, H0 is rejected and the research hypothesis is confirmed.

The results of this study in relation to mentioned hypothesis are consistent with the results of researches such as Bontiss & colleagues (2000), Chen & colleagues (2004) and H. Su, & Feng (2009). For example, the relationship between relational capital and structural capital in the study of Chen & colleagues (2004) is equal to 0.858; in the study of Bontiss & colleagues (2000) is equal to 0.496 and the effect of relational capital on structural capital in the study of H. Su & Feng (2009) is equal to 0.47

4 - Results and recommendations:

The subject of this study is evaluation of intellectual capital effect on the economic performance of companies which they are covered by Mega-engine construction-developer. The main problem that caused this researcher chose this subject and test it in motioned statistical prototype was the novelty of subject and its importance in the automotive industry. Therefore, the identification and management of intangible capitals

can affect development and improvement of economic status of these companies importantly.

The main objective of this study was evaluation of intellectual capital effect on economic performance. Analysis of data from this study showed that the intellectual capital components to wit: structural capital affects economic performance, directly; relational capital affects economic performance through structural capital, directly and indirectly; and human capital affects economic performance just through structural capital, indirectly. However, the intellectual capital components relate to each other and the correlation between them is high. Providing support the structural capital, human resources play so vital and important role in the company and can be caused the improvement of economic status. The companies which have motivated forces and can maintain them, insure their financial success by high additional value created by each of these staffs, and can achieve to exclusive proficiencies and competencies in the future. To achieving this aim, organizations should employ the workers with special proficiencies and skills.

If the organization's staffs have a high level of intelligence but there is no strong systems and procedures to support the staffs activities, these people never reach the highest potential that they are able to achieve that. Capital structure is mentioned as a instrument for organization which shows how people do their works with keeping effectiveness.

Therefore, providing the lake of appropriate and high level structural capital, it is natural that human capital and also to some extent of relational capital has been removed from the scene, and company encounters with numerous problems such as disinclination of employee, low selling, low quality of products, lack of ability to compete with competitors, and in total loss of economic potency. But the organizations should know that the main problem is in the methods, procedures, processes, programs, organizational culture, infrastructures and etc which all of them are as structural capital of the organization. And by modify them, they can obviate many existed problems and almost improve them, and at the result cause the economic prosperity.

Now the main question is discussed thus: what is the way and method to improve the structural capital? The answer of this question point of the researcher view is attention to this point that structural capital is through the intellectual input of founders, Board of Directors and especially the Managing Director and executive superior managers of organizations. In other words, as human capital is related to structural capital, also structural capital dependences on human capital (although the relationship between intellectual capital

components are part of the research hypothesis which all of them were fixed) Therefore, to improve the capital structure, choosing and employing of superior managers of organization should be considered carefully by the owners, shareholders and the Board of Directors.

For managerial posts, people must be chosen who have higher university education in relevant fields, experience and sufficient expertise in management, humanities and behavioral, have necessary experience in relevant company's activities, be aware up to dated management problems. And above all caring, compassionate, undertaking and loyal to the organization and have no affiliation to the party and class. Selecting of them is based on qualification, not unofficial relations.

According to the results of data analysis, in order to enhance the intellectual capital and their relationships with each other and their effects on economic performance and growth and development in economic and improvement of financial situation of companies which active in the country's automotive industry, the following recommendations can be noted: Is proposed to achieve high levels of economic performance, managers must manage the knowledge resources, because knowledge resources expands within the collaboration network and can be a effective response to internal and external financial situations.

Solid belief and intellectual inanition "The way we work now is the best way to go" as the obstacle to development and continuous learning should change to this belief that "We always learn from others ". Because this belief causes more learning by affects thought and behavior of personnel. Perhaps the most important proposal, which could be proposed in this section, is company should be very careful in employment and utilization of force, especially in the manager posts. Company should proceed to discover and identify the managers who they have a learning mind, than these managers react about new idea and diversity in behavior and knowledge openly. And try to understand and improve of communication continuously and consider cooperation as a opportunity for development of ability and organizational resources. Other point is: training, continuing development and identify components of intellectual capital levels should not be forgotten, because the training and identification and management of intellectual capital components not only in technical aspects but also in the field of learning and participation and international knowledge and economic progress are important and essential. For making the desire learning environment, company must educate the value of learning process, to the personnel, rather than to assume, these training are unnecessary in the company. The last point,

considering that acting in the international cooperation is complex and with uncertainty, therefore it is suggested that open channels of communication which make clarification and fast data and cause more relationship between decision makers, be provided than knowledge and learning resources and intellectual capital levels will be increased and ultimately knowledge-based economy will be practical.

Effect of Length of Delay after Slaughter (LODAS) on Quality of Raw Catfish (*Clarias gariepinus*)¹Ayeloja, A. A.; ¹George, F. O. A.; ¹Obasa, S. O.; ²Sanni, L. O and ^{3*}Ajayi, A. A.¹ Department of Aquaculture and Fisheries Management, University of Agriculture Abeokuta² Department of Food Science and Technology, University of Agriculture Abeokuta³ Department of Biological Sciences, Covenant University, Ota, Ogun State

*E-mail: quietasever@yahoo.com

Abstract: The effect of delay after slaughter on microbial quality, proximate composition and sensory scores of raw catfish, *Clarias gariepinus* (Burchell, 1822) was evaluated. A total of 52 live catfish weighing 700.0 ± 7.0 g were used. Ten freshly slaughtered fish samples each were selected for organoleptic assessment at 0, 4, 8 and 12 hours post-slaughter, while three fish samples each were selected for chemical and microbial analyses. Microbial load on fish samples increased significantly ($P < 0.05$) with increase in length of delay after slaughter, LODAS. Bacteria isolated included *Escherichia coli*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Bacillus spp* and *Staphylococcus aureus*. Percent protein and ash contents of fish samples increased with increasing LODAS, while moisture content decreased and lipid was not affected. It was observed that raw *C. gariepinus* retained most of its physical attributes up to 4 hours post-slaughter. These quality attributes except colour and odour of gills, deteriorated significantly ($P < 0.05$) at every successive four-hour post-slaughter interval. Significant negative correlation existed between LODAS and sensory quality of raw fish (eyes, $r = -0.966$, $P < 0.05$; gills, $r = -0.980$, $P < 0.05$; skin, $r = -0.998$, $P < 0.01$; and odour, $r = -0.994$, $P < 0.01$). This study established that quality of raw *C. gariepinus* deteriorated with increasing LODAS and that raw *C. gariepinus* was not totally unacceptable when delayed for 12 hours after slaughter at ambient temperatures.

[Ayeloja, A. A.; George, F. O. A.; Obasa, S. O.; Sanni, L. O and Ajayi, A. A. **Effect of Length of Delay after Slaughter (LODAS) on Quality of Raw Catfish (*Clarias gariepinus*)** Journal of American Science 2011;7(6):508-512]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: *Clarias gariepinus*; microbiology; proximate composition; organoleptic assessment.

1. Introduction

Population growth is accompanied by increasing demand for food. Direct human consumption of fish reached an estimated 103 million tons in 2003 (World Fish Center, 2009). Fish and fish products constitute more than 60% of the total protein intake in adults especially in the rural areas where they are widely accepted and form a much-cherished delicacy that cut across-economic, age, religious and educational barriers (Adeleye, 2003). Fish is a rich source of essential nutrients required for supplementing both infant and adult diets (Abdullahi *et al.*, 2001), however, poor post-harvest technology (handling, preservation and processing) cause deterioration and spoilage (Kumolu-Johnson *et al.*, 2010). An estimated post-harvest loss of over 40% of total fish landings have been reported in Nigeria (Akande, 1996). Akande and Ola (1992) reported that traditionally in Nigeria, fish are left at tropical ambient temperatures (27 ± 2 °C), for several hours after harvesting and this leads to rapid quality deterioration before reaching the market, thereby calling for more attention to post-harvest handling of fresh water fish species being cultured. *C. gariepinus* was used in this study because it is an economically important freshwater fish, and enjoys wide acceptability. It is extensively cultivated in ponds but

it is sometimes under-priced (Kumolu-Johnson, 2010). The study thus aimed at assessing the effect of Length of delay after slaughter (LODAS) on microbial, chemical and organoleptic characteristics of raw *C. gariepinus* with the specific objective of determining the appropriate LODAS for premium quality raw *C. gariepinus*.

2. Materials and Methods

Collection of samples

52 live *Clarias gariepinus* were collected from the concrete tank of the Nigeria Institute for Oceanography and Marine Research (NIOMR). They were brought to the laboratory immediately for analysis.

Microbiological analysis

The fish were slaughtered using a sharp knife, gutted, washed with clean water and allowed to drip and later spread in the laboratory at ambient temperatures ($27^{\circ}\text{C} \pm 2$). Thereafter, twelve samples of *C. gariepinus* were filleted to determine their proximate composition and microbial load, Samples were collected at four time intervals including 0 hour (immediately after slaughter), 4, 8 and 12 hours after slaughter respectively. Three replicates each were

collected from each treatment for the determination of proximate composition and microbial load. The microbial count was determined using routine microbiological procedures described by Olutiola *et al.* (1991) and Fawole and Osho (1995). Identification of microbes was carried out using Bergey's Manual of Determinative Bacteriology.

Proximate Analysis

The determination of the crude protein, moisture, ash and fat contents of the raw and smoked fish were carried out in triplicates in accordance with AOAC (1995).

Organoleptic (sensory) Assessment

Forty samples (ten at each collection hour) were collected for organoleptic assessment and ten replicates each were collected from each treatment for organoleptic assessment. Sensory evaluation was carried out by a ten man-trained panel from NIOMR using a 5-point hedonic scale modified from Eyo (2001) and Tobor (1994). The following grades were allotted depending on the condition of the fish. $8 \leq 10$ = very good, $6 \leq 8$ = good, $4 \leq 6$ = fair, $2 \leq 4$ = bad and ≤ 2 = worst. Eyes, gills, skin, odour and flesh were examined for raw fish samples.

Table 1: Total Microbial Count of raw *Clarias gariepinus*

Hour	TVC (Cfu/g)	Log Cfu/g \pm SD
0	3.37×10^5	5.52 ± 0.03^a
4	3.49×10^5	5.54 ± 0.01^b
8	5.50×10^5	5.74 ± 0.02^c
12	7.31×10^5	5.87 ± 0.03^d

*Values with different superscript in the column indicates significant difference at $P < 0.05$

** Values represent pooled means vertically of triplicate determination

Statistical analysis

Analysis of variance (ANOVA) was carried out using F-test to determine the treatments level of significance. Treatments were separated using Duncan Multiple Range Test (DMRT) (Duncan, 1955) at 95% confidence value ($P < 0.05$). Correlation analysis was carried out to determine the relationship between LODAS and sensory qualities of the fish.

3. Results

Results of the microbiological study (Table1) indicated that total viable count (TVC) of raw fish samples analyzed immediately fish was slaughtered recorded the lowest TVC of 3.37×10^5 (Cfu/g). TVC

value increased significantly ($P < 0.05$) up till 12 hours post slaughter. This is in accordance with the report of Hood *et al.* (1983) that microbial load increases with duration of storage and temperature. This study established that fish left at ambient temperatures up to 8 hours post slaughter still have a TVC that falls within the maximum recommended bacterial count for good quality fish product i.e. 5×10^5 ($5.7 \log_{10}$ Cfu/g) according to the *International Commission on Microbiology Safety for Foods*, ICMSF, (1986). However, this value was exceeded by raw fish samples left at ambient temperature for 12 hours post slaughter with the value of $7.31 \times 10^5 / 5.869 \log_{10}$ (Cfu/g) yet the fish was not totally unacceptable as it had not exceeded the maximum recommended bacterial counts for marginally acceptable products which is 10^7 ($7 \log_{10}$ Cfu/g) (ICMSF, 1986). This is in accordance with the recommendation of Abdul-Raouf *et al.* (1993) that food-borne illness resulting from the consumption of any food is dependent upon a number of factors including contamination with a pathogen and the survival of the pathogen until the time of consumption at levels sufficient to cause illness. *Escherichia coli*, *Klebsiella pneumoniae*, *Staphylococcus aureus*, *Pseudomonas aeruginosa* and *Bacillus spp* where isolated from *C. gariepinus* (Table 2).

Table 3 presents the proximate composition of raw *C. gariepinus*. The highest moisture content (78.32 ± 0.50) was recorded in freshly slaughtered *Clarias gariepinus* (0 hour) and these values decreases significantly ($P < 0.05$) with increase in post slaughter intervals. The percentage protein contents of raw samples increased significantly ($P < 0.05$) with increase in post slaughter interval, this could be due to loss of moisture and an increase in dry matter content per unit of weight following sample dehydration (Omojowo, 2008). The result established that *C. gariepinus* had similar ash content between 0 and 4 hours post slaughter, followed by 8 and 12 hours post slaughter. However, hours of delay after slaughter had no significant ($P < 0.05$) effect on the lipid of raw *C. gariepinus*.

The effects of post-slaughter interval on the sensory quality of raw *C. gariepinus* are presented on Table 4. *C. gariepinus* retained most of its original freshness up to 4 hour post slaughter. The eyes were transparent, clear and protruding with a white cornea and dark pupil. The gills had bright red colour and fresh odour, while the skin was bright with shiny slime and a firm belly; and the flesh was still firm, flexible and elastic; while the odour was fresh and sea weedy. This result agrees with similar findings by Akande and Ola (1992), that African catfish, *Clarias gariepinus* retained most of its original freshness up to 3 hours. There was significant ($P < 0.05$) changes in

the condition of the eyes, gills, skin, flesh and odour of the raw fish delayed for 4 hours post slaughter interval. However, *C. gariepinus* started losing its physical attributes when delayed for 8 and 12 hours post slaughter. Similar findings were reported by Akande and Ola (1992) that deterioration was rapid in *Clarias gariepinus* delayed for 7 and 9 hours at ambient temperatures after slaughter.

Table 5 describes the relationship between LODAS and sensory quality of raw *C. gariepinus*. There was significant negative correlation between LODAS and sensory quality of raw fish i. e. eyes ($r = -0.966^*$, $P < 0.034$), gills ($r = -0.980^*$, $P < 0.020$), skin ($r = -0.998^{**}$, $P < 0.002$), and odour ($r = -0.994^{**}$, $P < 0.006$). Significant correlation existed between the sensory quality of eyes and some

physical attributes of raw such as gills ($r = 0.971^*$, $P < 0.029$), fish skin ($r = 0.948^*$, $P < 0.05$) and odour ($r = 0.975^*$, $P < 0.025$). There was also significant positive correlation between colour and odour of raw fish gills and skin ($r = 0.966^*$, $P < 0.034$), as well as odour ($r = 0.996^{**}$, $P < 0.004$). This result established a negative linear correlation between LODAS and the sensory quality of *C. gariepinus*. As sensory quality of the eye deteriorated all other sensory qualities of the fish deteriorated. Also as gills of the raw fish deteriorated by losing its brightness and freshness, the fish skin and odour also deteriorated. This agrees with the opinion of Akande and Ola (1992) that leaving fish at ambient tropical temperatures for several hours post-harvest leads to rapid quality deterioration.

4. Discussions

This study established that spoilage increased with increase in LODAS. It also established that raw *C. gariepinus* was not totally bad when delayed for 12 hours after slaughter at ambient temperatures because bacteria count have not exceeded the maximum acceptable quality. However, it should not be delayed beyond 12 hours after slaughter before processing because fish with LODAS of 12 hours have bacterial counts that had already gone beyond maximum recommended bacterial counts for good quality product. Akande and Ola (1992) recommended that raw *C. gariepinus* should not be delayed for 15 hours at ambient temperatures before processing.

Coping Behavior of Junior Physicians in Managing Conflict between Work and Family Roles

Aminah Ahmad

aminah@ace.upm.edu.my

Abstract: This study examined the extent of work-family conflict experienced by married female junior physicians and the coping behavior of the physicians in managing the conflict. The sample of this study consisted of married female physicians (with at least one child) aged 40 and below working in fourteen public hospitals in Malaysia. Data were gathered from a sample of 231 female junior physicians using self-administered questionnaires through the drop and collect method. The two major strategies used by the physicians were personal role redefinition which involved changing their own attitudes and perceptions of role expectations, and reactive role behavior which involved careful planning, scheduling and organizing their role activities, and working harder to meet all their role demands. The least frequently used strategy was structural role redefinition which entails an active attempt to deal directly with role senders and lessen the conflict by mutual agreement on a new set of expectations. Implications of the findings and suggestions for future research were discussed.

Keywords: coping behavior; work-family conflict; junior physicians

1. Introduction

The proportion of employed professional women in Malaysia increased from 6.7 per cent in 2004 to 8.3 per cent in 2009 and slightly more than half (59.4 per cent) of the total employed women in 2009 were married (Department of Statistics, Malaysia, 2010). With the increase in the number of female professionals and the need to balance the demands of their work and family lives, married female professionals are more likely to experience work-family conflict involving incompatible demands. Among professionals, men spent more time in professional work and women more time in childcare and women perceived themselves as responsible for childcare activities at home (Bergman *et al.*, 2008). This illustrates that apart from paid work, female professionals, including female physicians, are mainly responsible for work at home and thus carried a double workload. With the double workload, the female physicians are more likely to experience conflict between work and family roles. Work-family conflict is a form of interrole conflict in which the role pressures from the work and family domains are mutually incompatible, such that participation in one role makes it more difficult to participate in the other (Greenhaus *et al.*, 1985). The experience of work-family conflict among female physicians have been reported by Aminah (2010, 2008).

To ease the strain of work-family conflict, coping strategies have been used. Lazarus and Folkman (1984) defined coping as the cognitive and

behavioral efforts individuals use to manage taxing demands appraised as exceeding their personal resources. They suggest that coping has two main functions: the regulation of distressing emotions (emotion-focused coping) and doing something to positively change the problem causing the distress (problem-focused coping). Hall (1972) studied women's strategies for coping with role conflict and identified 16 strategies which were categorized into a three types of coping behavior for dealing with interrole conflict. Type I coping (structural role redefinition) involves an active attempt to deal directly with role senders and lessen the conflict by mutual agreement on a new set of expectations. One way of changing structural demands would be to relocate and share one's role tasks (house cleaning for example). Type II coping (personal role redefinition) involves changing one's personal concept of role demands received from others. It entails changing the expectations themselves. An example is setting priorities among and within roles, being sure that certain demands are always met (for example, the needs of sick children), while others have lower priority (such as lawn care). Type III coping (reactive role behavior) entails attempting to improve the quality of role performance with no attempt to change the structural or personal definition of one's roles. Implicit in coping through reactive role behavior is the assumption that one's role demands are unchangeable and that the person's main task is to find ways to meet them; this coping strategy involves a reactive orientation toward one's roles.

Other forms of coping strategies include segmentation, compensation and accommodation, where individuals limit their psychological and/or behavioral involvement in one sphere to satisfy the demands of the other (Edwards *et al.*, 2000). Boundary management work is another strategy that individuals engage in which involves principles and practices for creating, maintaining, and crossing borders between the two domains (Ashforth *et al.*, 2000; Clark, 2000).

Much of the research on coping with work-family conflict has used Hall's typology to conceptualize coping. A study of female married professionals with children in Hong Kong indicates that their major coping strategies are personal role redefinition and reactive role redefinition (Lo *et al.*, 2003). Others who have used Hall's typology include Kirchmeyer (1993) who investigated coping among Canadian managers and Matsui, Ohsawa and Onglatco (1995) among Japanese working women. Recently, Hsieh and Eggers (Hsieh *et al.*, 2010) explored the coping strategies used by North American lodging managers to resolve the conflict between their work and personal lives. They found that obtaining role support from inside role set, including support from family and employees, establishing priorities, and planning, scheduling, and organizing better were the most frequent coping strategies used by the lodging managers to resolve the conflict.

Rotondo and Kincaid (2008) studied four types of coping with work-family conflict using data collected as part of the National Survey of Midlife Development in the United States. The coping strategies studied include direct action and advice seeking (problem-focused) and positive thinking and cognitive reappraisal (emotion-focused). They found that the relationships between individual coping styles and conflict as well as facilitation were not uniform and varied depending on the source domain. Wentzel, Buys and Mostert (2009) investigated the strategies African secondary school educators use to deal with the interaction between their work and personal lives. Among the strategies reported were keeping work and personal life apart, acceptance of their teaching environment, planning ahead, and seeking for advice through communication. Niehm *et al.* (2009) examined strategies employed by American family business managers to cope with overlapping work and family demands. They found that managers of surviving businesses were more likely to make adjustments by hiring temporary help for the business or home as part of their coping strategies. Meanwhile, Somech and Drach-Zahavy (2007) identified eight coping styles that employed parents used to deal with work-family conflict, labeled as

super at home, good enough at home, delegation at home, priorities at home, super at work, good enough at work, delegation at work, and priorities at work.

Given the pertinence of work-family conflict experienced by working women and the modest attention paid to the coping strategies used to balance the demands of work and family roles among Asian women, particularly Malaysian professional women, the objectives of the present study are as follows: 1) to determine the extent of work-family conflict experienced by married female junior physicians, and 2) to examine the coping strategies used to handle the conflict using Hall's (1972) typology. Hall's typology continues to be widely used by researchers in studies of coping with work-family conflict. Therefore, the researcher adopted Hall's typology to investigate the coping strategies used by junior physicians to resolve conflicts between their work and family lives.

2. Method

2.1 Sample and Procedure

The sample of this present study consisted of married female physicians (with at least one child) aged 40 and below working in fourteen public hospitals (eleven state hospitals and three teaching hospitals) in Peninsular Malaysia. The age limit was established since physicians tend to have more work load at this stage of their career span and hence tend to experience greater work-family conflict. Data were collected from a sample of 231 female physicians using self-administered questionnaires through the drop and collect method. The questionnaire was first constructed in English language and then translated into Malay language and was validated by back-translation to ensure that both versions were equivalent. The questionnaire was administered in both the Malay and English languages and the physicians were given the alternative to choose either of the two languages.

2.2 Measurements

Work-family conflict was measured using an interrole conflict scale developed by Pleck *et al.* (1980). This scale consists of eight items based on the three most prevalent aspects of work interference with family, namely excessive work time, schedule conflict and fatigue or irritability. Responses were coded on a five-point scaled response options ranging from strongly disagree (1) to strongly agree (5). Examples of items are: "My work schedule often conflicts with my family life"; "My work takes up time that I would like to spend with my family". The reliability coefficient (alpha) of the work-family conflict scale was 0.83.

Coping was assessed using an adapted version of role-coping inventory by Hall and Hall

(1979). This inventory has 22 coping strategies or items for three types of coping -- structural role redefinition (Type I), personal role redefinition (Type II) and reactive role behavior (Type III). The response options for the items were five-point scales ranging from never (1) to nearly all the time (5). One of the items for Type II coping was deleted since it was inappropriate to the subjects based on content validation. Another item was deleted from the Type III coping scale because of lack of variance and low item-total correlation based on the reliability test via internal consistency. The inventory for this present study consisted of 20 items, 12 items for Type I, six for Type II and two items for Type III coping. The reliability coefficient (alpha) for Type I coping scale was 0.60, Type II, 0.69 and Type III, 0.74.

3. Results

Table 1 presents the characteristics of the respondents. The respondents' ranged from 25-40 years of age ($M = 32.18$, $SD = 3.56$) with 79.5% aged from 25-35. They had an average of 4.73 years of experience ($SD = 3.26$) and 69.4% had 5 years or less of experience in the present job. Majority (74.4%) of the physicians in this study had 1 to 2 children ($M = 2.08$, $SD = 1.12$). The mean score for work-family conflict on a five point scale was 3.34 ($SD = 0.81$), and Type I coping was 3.18 ($SD = 0.41$), Type II coping was 3.85 ($SD = 0.45$) and Type III coping was 3.75 ($SD = 0.66$).

Table 1: Characteristics of Respondents

Characteristic	Frequency	(%)	Mean	SD
Age (years)			32.18	3.56
	25 - 30	87	39.7	
	31 - 35	87	39.7	
	36 - 40	45	20.6	
Work experience (years)			4.73	3.26
	≤ 5	152	69.4	
	6 - 10	53	24.2	
	11 -15	13	5.9	
	≥ 16	1	0.5	
Number of children			2.08	1.12
	1 - 2	172	74.4	
	3 - 4	51	22.1	
	≥ 5	8	3.5	

In managing the work-family conflict, the Type II coping (personal role redefinition) with a mean of 3.85 ($SD = 0.45$) was most frequently used by the women whereas the least frequently used strategy was Type I coping (structural role redefinition) with a mean of 3.18 ($SD = 0.54$) (Table

2). Table 3 presents the t values for the difference in the use of coping type in managing the work-family conflict. There were significant differences in the use of Type I and Type II, as well as Type I and Type III coping. The means for Type II and Type III coping were also significantly different.

Table 2: Means And Standard Deviations Of Work-Family Conflict And Coping Types

Variable	M	SD
Work-Family Conflict	3.66	0.54
Type I Coping (Structural Role Redefinition)	3.18	0.41
Type II Coping (Personal Role Redefinition)	3.85	0.45
Type III Coping (Reactive Role Behavior)	3.75	0.66

Table 3: Differences In The Use Of Coping Types

Type of Coping	df	t	p
Type I and Type II	215	-18.53	0.00
Type I and Type III	224	-12.17	0.00
Type II and Type III	224	2.78	0.01

4. Discussions

Overall, the two major strategies used by the physicians are Type II coping (personal role redefinition) and Type III coping (reactive role behavior) to manage their conflict. Similar findings were reported by Lo *et al.* (2003) in their study among female married professionals in Hong Kong. In this present study, among the three types of coping, Type II coping (personal role redefinition) was the most frequently adopted strategy. Type II coping involves changing the person's perceptions of his or her role demands rather than attempting to change the environment. In other words, the women in this study tended to be involved less in redefining the expectations held by other people and negotiating a new set of expectations from their role senders as would be the case with Type I coping. Instead, the women tried to change the perceived role by seeing their own behavior or the external expectations in a different light. By doing so, they attempted to reduce the amount of conflict actually experienced. Compromising as a way of reducing strain and making an individual's lifestyle manageable is a common behavioral response (Skinner *et al.*, 1991). Domestic overload, for instance, may be managed through compromise by deliberately lowering standards.

The second most frequently adopted coping strategy was Type III coping (reactive role behavior). The reactive role behavior involves attempts to meet all the role demands experienced. These strategies probably present considerable strain on the women's

energies since they involve attempting to do everything demanded, rather than attempting to reduce demands. Since the assumption is that all role expectations must be met, the women engaged in careful planning, scheduling and organizing of their role activities, and working harder to meet all their role demands. The study conducted by Skinner and McCubbin (1991) found that one of the coping strategies that women in dual employed families commonly used was maximizing efficiency and organization to meet the demands of work and family roles. Although Type III coping is thought to be less effective (Hall, 1972), the attempt to be a “super mother” appears to be a common strategy among married women.

Type I coping (structural role redefinition) was the least frequently adopted coping strategy among the women. It involves redefining the expectations held by other people so that fewer conflicting demands are placed upon the person and a new set of role behaviors is expected from that person by members of the role set. Such coping requires communicating with one’s role senders and negotiating a new set of expectations which will be mutually agreed upon. This means changing the received role as opposed to changing the perceived role alone, as would be the case with Type II coping. The lack of help obtained from family members in reducing work load and resolving conflict suggests that the redistribution of roles within the family to match increased role responsibilities outside the home has not been widely practiced.

The less frequent use of Type I coping could, to a certain extent, be due to the notion that Type I coping seems more directly related to long-term conflict reduction and satisfaction than Type II or Type III coping. More convincingly, the literature on sex role socialization indicates that the universal culture, through what Bem and Bem (1971) call a non-conscious ideology, rewards more reactive, less confronting and less aggressive coping in women of all ages. A study by Long (1989) found that sex-role socialization relates to differences in coping and occupational strain among working women, while a study by Somech and Drach-Zahavy (2007) found that gender role ideology moderates the relationship between coping behaviors and work-family conflict.

Several limitations of this study should be noted. First, this is a descriptive survey research, which reports the extent of work-family conflict experienced and the coping strategies. The effectiveness of the different types of strategies used has not been addressed. Second, a significant limitation of the present investigation is the limited sample size utilized for this study. The results reported here may only be generalized to female

junior physicians meeting the selection criteria (married and aged 40 years and below) in the fourteen public hospitals in Malaysia, but any assumption of external validity beyond that is cautioned. Third, the inferences drawn from this study are limited by self-reported and cross-sectional characteristics of the data.

The experience of work-family conflict among employees suggests the need for organizations to facilitate the development of individual coping strategies through human resource development programs. Training programs could be initiated to help employees identify the effective coping strategy, and thereafter intensify the use of such strategy. The importance of family-supportive work culture which is sensitive to employees’ family needs has been emphasized by Aminah and Zoharah (2010). Facilities such as reliable dependent-care center, including childcare center, and family leave would help junior physicians at this life stage cope with the conflict more effectively, besides the individual coping strategies that they adopt. There is a need to review the ratio between physicians and patients that has a great implication on work-family conflict. The excessive work that junior physicians have to perform has been emphasized by Aminah (2010), Shaufelli *et al.* (2009) and Lingard *et al.* (2006). The working hours of physicians, the weekly frequency of on-calls and the total number of hours that physicians have to spend on on-call duties should be reassessed. Limiting on-call frequency and hours may be more likely to reduce the level of work-family conflict experienced.

Future research efforts should seek to expand this study and identify effective coping strategies for managing conflict between work and family roles. The use of qualitative research would help to further our understanding of how employees can effectively cope with work-family conflict.

Is salinity tolerance of rice lines related to endogenous ABA level or to the cellular ability for ABA synthesis under stress?

Saeed Saeedipour¹

¹Department of Agronomy, Shoushtar Branch, Islamic Azad University, Iran
saeeds79@gmail.com

Abstract: As the plant hormone abscisic acid (ABA) is involved in responses to salinity stress. We tested its putative relationship with the degree of tolerance to this abiotic stress. For this purpose we examined the responses of sensitive (IR29) and tolerant (IR651) varieties of indica rice (*Oryza sativa* L.) to a range of salinity (0 (control) and 100 mM NaCl). Shoot and root dry weight was reduced and leaf Na concentration increased in response to salinity for both cultivars with a higher extent in sensitive. Tolerance of IR29 to saline stress was generally improved by ABA treatment and leaves Na content reduced to their respective control treatment. This ABA effect was evident in IR29 with low tolerance, as their ability to recover from stress increased up to seven fold. Independent of the saline treatment, the absolute endogenous leaf ABA content in sensitive variety was significantly more than tolerant one. However, upon stress, the increase in endogenous ABA synthesis was higher in tolerant than in sensitive varieties. These data together with those obtained by using Fluridone, an inhibitor of ABA synthesis, suggested first, there was differential sensitivity to ABA in the tolerant and sensitive leaves cultivars and enhanced concentrations at tolerant levels acted primarily to maintain root and shoot growth salt stress and second, the differences in the level of tolerance to saline stress is related to their different capacity of ABA synthesis under stress conditions.

[Saeed Saeedipour. **Is salinity tolerance of rice lines related to endogenous ABA level or to the cellular ability for ABA synthesis under stress?** Journal of American Science 2011;7(6):518-524]. (ISSN: 1545-1003). <http://www.americanscience.org>.

1. Introduction

Salinization of arable land is increasing, and could possibly have devastating global effects. Over 6 % of the world's land and 20% of the world's irrigated land are currently affected by salinity (Rhoades et al. 1992; Munns 2005). In such soils, NaCl concentrations typically exceed 40 mM, and much higher values are frequently found (Munns 2005). Enhancing membrane permeability in salt stressed plants has been well documented (Hasegawa et al. 2000), resulting in Na⁺ accumulation and increasing Na⁺/K⁺, conversely reducing K⁺ in many plant species i.e. rice (Dionisio-Sese & Tobita, 1998) green bean (Yasar et al. 2006), winter wheat (Zheng et al. 2008), umbu plant (Da silva et al. 2008). From some previous studies, the results showed that rice growth and development are reduced when exposed to the salinity stress (Morsy et al. 2007; Cha-um et al. 2007; Dionisio-Sese and Tobita 1998; Shannon et al. 1998). However, the response of rice to salt stress depends on its salt tolerance abilities. During the last two decades, it has been well established that abscisic acid (ABA) is a vital cellular signal that mediates the expression of a number of salt and water deficit-responsive genes. The direct relation between stress tolerance and increased levels of ABA does not always exist. Thus, in barley and wheat changes in endogenous ABA levels have been reported to be unrelated to freezing tolerance or to cold hardening

(Kadlecová et al. 2000; Faltusová-Kadlecová et al. 2002). Among the comparisons between stress-tolerant and stress sensitive cultivars within the same species, some reports have shown higher ABA levels in tolerant cultivars, although the differences appeared in either unstressed, non-acclimated cultivars (Bravo et al. 1998) or following the stress (Chen et al. 2002; Moons et al. 1995; Zheng and Li 2000). In rice, ABA contents increased in a semi salt-tolerant variety but only marginal changes were measured in salt-tolerant and salt sensitive ones (Bohra et al. 1995). Exogenous ABA treatments prior to subjecting the plants or tissues to adverse conditions have been reported to improve tolerance to cold temperatures (Bornman and Jansson 1980; Duncan and Widholm 1987), osmotic stress (Nayyar and Kaushal 2002; Nayyar and Walia 2003), or to salt stress via soluble sugar accumulation in common bean (Khadri et al. 2007) and rice (Asch et al. 1995). In the current study we tested the hypothesis that responses to root-sourced salt stress, are coordinated by elevated ABA concentrations and probably there is tolerance a differential response of tolerant and sensitive cultivars to ABA applications .

2. Materials and methods

Plant material and growth conditions

Two rice cultivars different in tolerance of salt stress during the vegetative stages (Moradi et al.

2003) were selected for this investigation. IR65192-4B-10-3 (abbreviated as IR651) is breeding line tolerant of salt stress at both the seedling and reproductive stages, and IR29 is a cultivar sensitive to salt stress during both stages and is commonly used as a sensitive check in breeding nurseries.

This experiment was conducted in a growth cabinet with light intensity of about $700 \mu\text{mol m}^{-2} \text{s}^{-1}$ and 12 h duration, 70 % relative humidity and 29/22 8C day/night temperature. Pre-germinated seeds of each cultivar were sown in holes made on Styrofoam sheets with a nylon net bottom (Gregorio et al. 1997). Two seeds were sown per hole, with 50 holes per entry. The sheets were first floated on distilled water in 11 L plastic trays for 3 d, after which a nutrient solution (Yoshida et al. 1976) was used until the plants were 21 d old. A control treatment (nutrient solution) and the level of salt stress, 12 dS m^{-1} (100 mM) using NaCl was introduced thereafter. Four hours after imposing the salt treatment, half of the plants of both cultivars were exposed to spraying of Fluridone (50 μM) or ABA (20 μM). The youngest fully expanded leaf (leaves that had completed petioles), harvested at 0 (immediately before starting the salinity), 4, 12, 24, 48, 96 and 168 h after the start of the salt treatments for ABA measurements. Shoot and root dry matter, K^+ and Na^+ concentration of youngest fully expanded leaf measured at the end of this experiment.

The experiment was designed as 2×2 (Cultivars \times Salinity) factorials in Completely Randomized Design (CRD) with three replicates. The mean in each treatment was compared by Duncan's New Multiple Range Test (DMRT) at $p < 0.01$ and analyzed by SPSS software (SPSS for Windows, SPSS Inc., Chicago, Illinois, USA). The culture solution was renewed once with the pH adjusted daily to 5.5 by adding either NaOH or HCl.

Sodium and potassium measurements

Dried samples were ground to a fine powder. About 0.1 g was transferred to a test tube containing 10 ml 0.2 N acetic acid. Then test tubes heated in a water bath at 80 °C for 2 h. The extracted tissue was cooled at room temperature and left overnight and then filtered by using Whitman filter paper number 42. Sodium and potassium concentrations were determined by using an atomic absorption spectrometer (Perkins Elmer, Norwalk, CT, USA).

Leaf gas exchange measurement

Stomatal conductance (g_s) was made on fully expanded youngest leaf of each plant using an open system LCA-4ADS portable infrared gas analyzer (Analytical Development Company, Hoddesdon, England). Measurements were

performed with the following specifications/adjustment: molar flow of air per unit leaf area $403.3 \text{ mmol m}^{-2} \text{ s}^{-1}$, atmospheric pressure 99.9 kPa, water vapor pressure into chamber ranged from 600 Pa to 890 Pa, Par at leaf surface was maximum up to $1711 \mu\text{mol m}^{-2} \text{ s}^{-1}$, temperature of leaf ranged from 28.4 0C to 32.4 0C, ambient temperature ranged from 22.4 to 27.9 0C, and ambient CO₂ concentration $352 \mu\text{mol mol}^{-1}$.

Measurement of endogenous ABA levels

Endogenous ABA analyses were performed as described in Gómez-Cadenas et al. (2002), Frozen rice leaves of 1.5 g were finely ground in liquid nitrogen and 10 mL of 80% methanol was added together with 0.01 g of ascorbic acid and 0.01 g polyvinylpyrrolidone (PVP) to prevent oxidation reactions during extraction. The homogenate was stirred overnight at 4 °C. After centrifugation (4000 \times g, 15 min), the supernatant was recovered and adjusted to pH 8.0. The aqueous methanol was evaporated under reduced pressure at 35 °C. The residue was dissolved in 5 mL of water. Then it was frozen and thawed for three cycles. After centrifugation (4000 \times g, 15 min), the supernatant was recovered and adjusted to pH 2.5 and partitioned against ethyl acetate. Then the solution with the free ABA in ethyl acetate was collected. This process was repeated thrice. After that, the collection was adjusted to pH 8.0 and dried. The resulting dried precipitate was dissolved in 1 mL of 3% methanol containing 0.1 M acetic acid, and was filtered through a 0.45 mm membrane filter. The extract (100 μL) was automatically injected and processed by HPLC (Agilent 1100 Series, USA) equipped with a reverse phase column (4.6 \times 250 mm Diamonsic C18, 5 μm). It was eluted with a linear gradient of methanol (3–97%), containing 0.01% acetic acid, at a flow rate of 4 mL/min. The detection was run at 260 nm with a diode array detector. The retention time of ABA was 36.4 min and shifted 0.1 to 0.5 min. Quantification was obtained by comparing the peak areas with those of known amounts of ABA.

3. Results

Effect of stress on K & Na concentration with impaired ability for ABA synthesis

A different approach was used to study the implication of ABA in the mechanism of stress-tolerance. This experiment was performed with Fluridone treated, an inhibitor of ABA biosynthesis. Irrespective of Fluridone application no statistically significant differences were measured between tolerance and sensitive cultivars in Na concentration in control treatment of both cultivars investigated (Figure.2a&b). Salinity treatment increased 2 fold the

Na level in IR29 but became unchanged in IR651 with their respective control (Figure.2b). The Na accumulation in young leaves of both cultivars became more pronounced upon applied Fluridone in salinity treatment (Figure.2a&b) and cause to rapid raise of Na, 7.3 and 2.8 fold in sensitive and tolerant cultivars respectively, contrast to controls treatments). Fluridone had a dramatic effect on their response to stress in both cultivars.

Thus, when plants of both cultivars were sprayed with Fluridone, they showed higher sensitivity to a subsequent salinity stress than stressed plants that had not been sprayed with the inhibitor (Figure.2). Salt stress induced an approximate 30% increase in endogenous leaf ABA content of tolerant cultivar, while spraying with 50 μM Fluridone during the salinity treatment not only suppressed this increase but declined it more than 30% (Figure. 3).

In a further experiment, plants from tolerant and sensitive cultivars were treated with exogenous ABA and subjected to salinity (Figure.2). When plants were treated with ABA (20 μM), leaf tolerant cultivar did not change significantly their Na level response to the subsequent stress. By comparison, in IR29 plants application of exogenous ABA, lead to dramatically reduction the Na level and dropped the value to normal treatment (Figure.2b).

It has to be pointed out that the effect of ABA was totally counteracted with the inhibitor.

Regardless of the salinity, ABA or Fluridone treatments, a very similar changing pattern was observed for K concentration in leaves of both cultivars and no significant differences was observed (Figure.2c&d).

Effect of stress on endogenous ABA levels

Endogenous ABA levels of tolerant and sensitive of both cultivars were determined in order to check whether the different degree of tolerance to stress was correlated with hormone contents. Irrespective of salinity treatment, leaves ABA concentration in IR29 was higher than IR651. Endogenous ABA levels of leaves under non stress conditions varied in the range of 13.4 to 14.10 $\mu\text{g g}^{-1}\text{Fwt}$ in IR29. Compare to sensitive cultivar, the tolerant cultivar had a lower ABA concentration, and the values varied in the range of 6 to 9.5 $\mu\text{g g}^{-1}\text{Fwt}$ in control treatment. Leaves ABA content of stressed IR651 plants was significantly bigger than that of control plant throughout sampling time and the differences became more pronounced and achieved a maximum value by end of experiment (Figure. 3). Opposite to tolerant cultivar, leaves ABA levels in sensitive cultivar increased slightly but did not reach the level of statistical significance at the end of

experiment compare to their respective control treatment (Figure. 3).

Stomatal conductance and biomass accumulation

Stomatal conductance under no stress conditions was two fold in IR651 than IR29, and the differences keep constant throughout of experiment (Table 1). Salinity was significantly lowered the stomatal conductance, the rate of stomatal conductance of IR29 and IR651 plants was reduced by 50% (Table.1). Result regarding plant biomass showed inverse relationship with salinity. A general trend of decrease in dry weight of plant with salinity was noted in both cultivars. However, shoot and root weight reduction was largest in the susceptible variety compare to tolerant variety (Figure.1b&d). Fluridone application lead to drastically decline in root and shoot dry weight of both cultivars (Figure.1a&c). Regardless of salinity, shoot and root dry weight in IR651 was two fold than IR29.

4. Discussion

The plant hormone abscisic acid has been implicated in plant responses to abiotic factors causing water stress. In most studies, elevated ABA levels prior to stress, or as a first step in the response to adverse conditions, are involved in tolerance mechanisms. Under this rationale, it is to be expected that ABA increased in leaves of tolerant variety have a positive role in alleviating stress effects. In the present work differences in ABA contents were observed between sensitive and tolerant of the two varieties studied, and maybe we can ascribe their different response to stress to a different endogenous hormone level under control, non-stress conditions (Figure. 2) when plants were subjected to stress we could detect differences in ABA synthesis in varieties with respect to non-stressed controls (Figure.3). Tolerant variety seems to have a higher ability for ABA synthesis than sensitive. This agrees with reported results comparing sensitive/tolerant cultivars of different species (Chen et al. 2002; Lee et al. 1993; Zheng and Li 2000). Moons et al. (1995) reported that although salt-tolerant rice cultivars showed higher increases of ABA than the sensitive cultivars, there was not a direct correlation between absolute ABA content and degree of tolerance. Therefore, they pointed out the importance of both the rate of ABA increase as well as the absolute ABA levels. The fact that IR29 produce less ABA under stress, could explain their sensitivity response to stress (Figure.3).

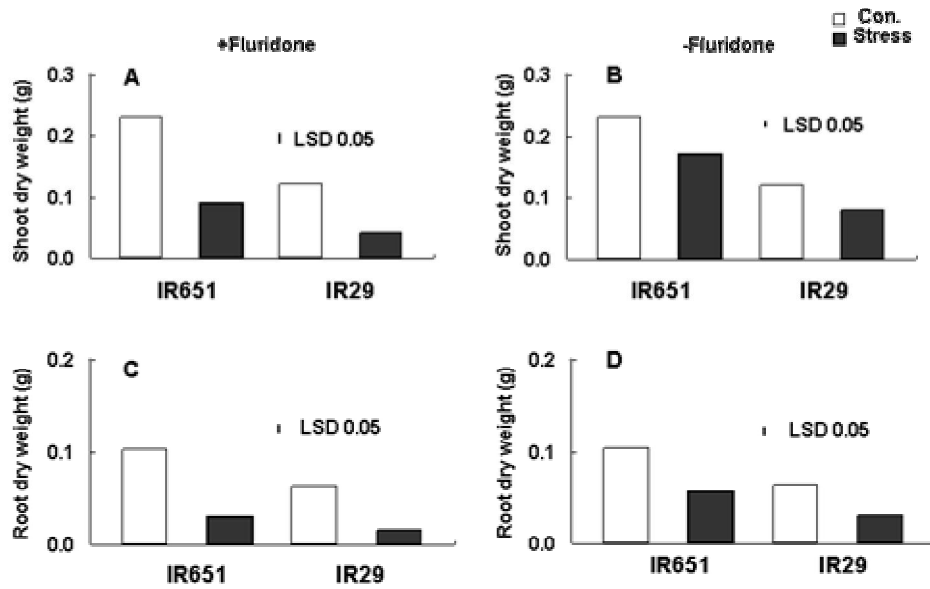

Figure 1. Shoot and root dry weight of two rice cultivars during the seedling stage under control and salt stress of 12 dsm^{-1} , with (A and C) or without (B and D) spraying Fluridone ($50 \mu\text{M}$). The data are mean values of three replications with three subsamples per replication, and vertical bars are $\text{LSD}_{0.01}$.

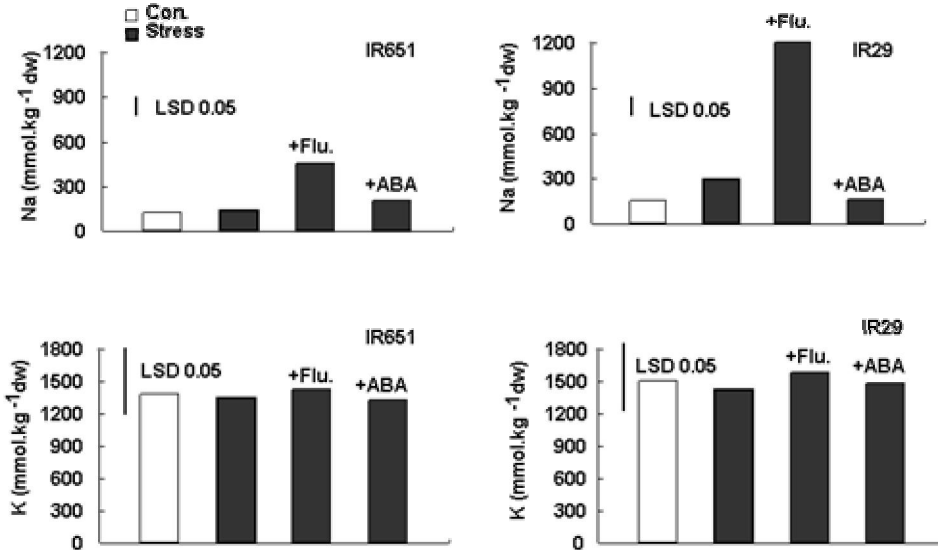

Figure 2. Na and K concentration of youngest full expanded leaf of two rice cultivars during the seedling stage under control and salt stress of 12 dsm^{-1} , with spraying Fluridone ($50 \mu\text{M}$) or ABA ($20 \mu\text{M}$). The data are mean values of three replications with three subsamples per replication, and vertical bars are $\text{LSD}_{0.01}$.

Figure 3. ABA measured on the youngest fully expanded leaf of two rice cultivars during the seedling stage under control and salt stress of 12 ds.m^{-1} . The data are mean values of three replications with three measurements per replication, and vertical bars represent \pm SE of the mean ($n=3$) where these exceed the size of the symbol. The values on the x-axis represent of hours after the start of salt stress treatment of 21-day-old seedlings. The *arrows* indicate the spraying of Fluridone.

Table1. Stomatal conductance ($\mu\text{mol m}^{-2} \text{s}^{-1}$) of rice varieties under control (0 Mm NaCl = 1.56 ds.m^{-1}) and salinity (100 Mm NaCl = 12 ds.m^{-1}) conditions.

Variety	Salinity (ds.m^{-1})	Sampling time						
		12	24	48	72	96	120	
IR29	0	0.5 \pm 0.01	0.5 \pm 0.01	0.5 \pm 0.02	0.5 \pm 0.05	0.5 \pm 0.03	0.6 \pm 0.03	
	12	0.1 \pm 0.02	0.2 \pm 0.02	0.2 \pm 0.04	0.2 \pm 0.02	0.2 \pm 0.01	0.2 \pm 0.03	
IR651	0		1.2 \pm 0.03	1.1 \pm 0.1	1.4 \pm 0.3	1.4 \pm 0.2	1.3 \pm 0.1	1.4 \pm 0.3
	12		0.3 \pm 0.03	0.8 \pm 0.04	0.7 \pm 0.1	0.7 \pm 0.1	0.8 \pm 0.1	0.7 \pm 0.04

Each value is a mean of three replicates \pm se.

Further experiments, using Fluridone, confirm the involvement of ABA synthesis in the mechanism of response to stress. Independent of the cultivar used, spraying 50 μM Fluridone, drastically

increased leaf Na concentration the tolerance and sensitive varieties when exposed to saline stress (Figure.2). However, the extent of this increment varied as a function of the tolerance level of the

varieties used. Thus, in tolerance variety the increment was of 3 fold, while in sensitive variety it reached 8 fold in their respective to control treatments (Figure.2). Thus, when plants of both cultivars were sprayed with Fluridone, they showed higher sensitivity to a subsequent saline stress than stressed plants that had not been sprayed with the inhibitor. This protective role of ABA is confirmed in the present work. While stress induced dramatically increased endogenous ABA, spraying with 50 μ M Fluridone during the salinity treatment suppressed this increase (Figure.3). We observed that an ABA treatment during saline stress nearly to 7 times reduced the leaf Na content of sensitive cultivar to recover from stress in comparison to untreated plants subjected to the same stress conditions (Figure.2). In contrast, tolerance cultivar was not affected by the hormonal treatment. In agreement with this result, Bohra et al. (1995) have also shown that exogenous ABA treatments improved tolerance to salinity in sensitive but not in tolerant rice cultivars. It is interesting to note that non-stressed barley varieties with lower ABA contents were more sensitive to freezing and responded better to exogenous ABA treatments than other varieties with higher hormone levels (Bravo et al. 1998). In fact, growth rate and leaf Na concentration of plants were significantly affected by this inhibitor (Figure.1&2), which interfere with ABA action. Similar results have been obtained by Bianco-Trinchant and Le Page-Degivry (1998) in protoplasts from different plant origin.

Our results demonstrate the importance of ABA synthesis in their tolerance to stress, tolerance variety with a higher capacity of ABA synthesis (Figure.3).

In summary, our study lead to the following conclusions: 1- The degree of stress tolerance of a given variety does not appear to be related to endogenous ABA levels under control conditions, but to the different rate of ABA synthesis under stress. 2- The fact that cells from IR651 produce more ABA when subjected to stress, could explain their better response to salinity condition. 3- The beneficial effect of exogenous ABA on the tolerance to saline stress is mainly restricted to IR29 with low tolerance (sensitive cultivar). 4- There was a different threshold irritability for ABA content, because opposite to the bigger leave ABA level in sensitive variety, more deleterious effect observed in this cultivar. 5- Regardless to present or absent of salinity treatment, IR651 shows a higher growth rate, and low accumulation of Na with a Fluridone application in contrast to IR29, suggesting that improved growth probably alleviating Na^+ toxicity by diluting, this finding consistent with Nooden (1988).

Abstract: The karyotype and chromosomal characteristics of (Chush Snow barbel) *Schizothorax labiatus* from River Jhelum Kashmir were investigated. The analysis of 80 metaphase plates revealed the chromosome number of this fish $2n=98$ and a fundamental arm number (FN) =142. The diploid complement comprised 12 metacentric pairs, 10 submetacentric pairs, 1 subtelocentric pairs and 26 telocentric pairs (24m+20Sm+2St+52t). Total length of the haploid complement equalled 157.5 μ m with a range in the length of shortest and longest chromosome between 2-8 μ m. The arm ratio and the centromeric index ranged between 1- ∞ and 0-50 respectively. No heteromorphic sex chromosomes were found. The present study is the first to describe the chromosomal characteristics of *Schizothorax labiatus* from The Kashmir Valley.

Key Words: Karyotype, *Schizothorax labiatus*, River Jhelum, Kashmir, Chromosome.

Introduction

Fishes belonging to the subfamily Schizothoracinae are widely distributed in mountain streams and lakes around Himalayan Karakorum and Hindukush Ranges, The Tibet Plateau and Central Asia (Terashima, 1984). The genus *Schizothorax* Heckel comprises many species that inhabit the reservoirs of Central Asia from Turkmenistan and Eastern Persia in the West to the far reaches of Mekong and YangtzeKiang in the East. *Schizothorax labiatus* inhabiting cold streams and rivers is distributed in the inland waters of Kashmir (Kullander *et al.*, 1999) besides Afghanistan and Pakistan. Hill-stream fish species constitute about 3.5% of the fish fauna available in India and all of them can be easily put into the threatened category on account of the adverse effect of increasing human activity (Rishi *et al.*, 1998). This fish is edible and an important species for commercial and sport fishing and has not been cytologically investigated till date.

Cyprinid karyotypes have not been without systematic implications (Joswiak *et al.*, 1980) because comparative karyology has become a useful tool in fish systematic studies (Arai, 1982; Buth *et al.*, 1991) as chromosome number and morphology shows high promise for interpreting the evolution of fishes (Uyeno and Miller, 1973) and permits the detection of changes that modified an ancestral karyotype as it evolved into new lines (Winkler *et al.*, 2004) and are useful for addressing a variety of evolutionary,

genetic and cytotaxonomic questions about animals (Kirpichnikov, 1981; McGregor, 1993). The present study was undertaken with the aim to investigate chromosomes and karyotype of *S.labiatus* to compare it to other members of the genus and generate information that can be utilized for its management and conservation.

Materials and Methods.

Live fish were obtained (6 males & 4 females) from local fishermen in the River Jhelum and transported live to the Limnology and Fisheries Laboratory of Centre of Research for Development University of Kashmir and placed into 50 l fully aerated aquarium a for several days. For karyological preparation the protocol of Thorgaard and Disney (1990) was followed. Fish received two doses of phytohemagglutinin (PHA) injections (4 μ gg⁻¹ bw), in a 20-h interval at 20 $^{\circ}$ c . Fishes were pre-treated by intraperitoneal injection of colchicine (0.05% @ 1ml/100g bw) eight hours the second dose of PHA to arrest cell division at the metaphase stage and kept alive for 2-3 hours before sacrificing. For the preparation of smears, their cephalic kidney was removed, homogenized and hypotonised simultaneously by potassium chloride 0.56% for 35 minutes at room temperature. Because of their tiny tissues, they were well mixed. Suspensions were spun at 1000 rpm for 10 minutes. Supernatant was discarded and the cells were fixed by cold fresh

Carnoy (3:1 methanol and glacial acetic acid) and refrigerated for 30 minutes. This process was repeated three times and smears were prepared on cold lamellae using splash method from 1m height and air dried for 24 h, then stained with 2% Giemsa.

Chromosomal analysis

Leica DM LS2 trinocular microscope fitted with a camera and 100x×10x oil immersion lens combination was used to scan the cells and take the photographs. Eighty well spread metaphase complements were obtained for chromosomal analysis. The chromosomes of 5 well spread metaphase complements were individually measured from photomicrographs with precision dial callipers and their centromeric indices and arm ratios were determined in order to ascribe the morphology as suggested by Levan *et al.* (1964). Using chromosomal indicators (Table II) an ideogram (Fig.2) was prepared in MS Excel 2007 software.

Results

Relatively small and high number of chromosomes was observed in *Schizothorax labiatus*. Eighty cells from the anterior kidney tissue were analysed in total. The overwhelming majority (80%) of the metaphase complements contained 98 chromosomes, though the count varied between 94-100 in a few cells (Table I). Cells not showing modal counts were probably caused by loss during preparation or by chromosomes being obscured by surrounding cell nuclei. The diploid complement (Fig.1a) comprised 12 metacentric pairs, 10 submetacentric pairs, 1 subtelocentric pairs and 26 telocentric pairs (Fig.1b). Total length of the haploid complement equalled 157.5µm with a range in the length of shortest and longest chromosome between 2-8µm (Table II). The arm ratio and the centromeric index ranged between 1-∞ and 0-50 respectively. Using chromosomal indicators, an ideogram (Fig.2) was drawn in MS Excel 2007. The chromosomal formula can be represented as: K (2n) =98= 24m+20Sm+2St+52t. Both male and female karyotypes were similar.

Discussion

Schizothorax labiatus analysed cytologically in the present study revealed a high number of chromosomes 2n=98. Species with high numbers are considered to have resulted through polyploidy from ancestral 2n= 48 or 50 (Rishi *et al.*, 1998). Large-scale genomic expansions or whole-genome duplication events have been documented in early vertebrate evolution (Friedman and Hughes, 2001; Ohno, 1970; Wang and Gu, 2000), near the base of

the phylogenetic tree of teleost fishes (Christoffels *et al.*, 2004; Meyer and Schartl, 1999; Robinson-Rechavi *et al.*, 2001; Wittbrodt *et al.*, 1998), and near the basal roots of several major teleostean clades [such as salmonids (Allendorf and Thorgaard, 1984), catostomids (Ferris, 1984; Uyeno and Smith, 1972), acipenserids (Vasil'ev, 1999) and some cyprinids (Larhammer and Risinger, 1994)]. Such genomic enlargements have been hypothesised as key factors that enable or even drive diversification in various vertebrate groups (Holland *et al.*, 1994; Meyer and Malaga-trillo, 1999; Navarro and Barton, 2003a, b; Ohno, 1970; Stephens, 1951). Chromosome counts in nearly all cyprinid polyploids occur in multiples or combinations of the most common karyotype (48-50) and tetraploids (96, 98 or 100) and hexaploids (148-150) have arisen through hybridisation (Dowling and Secor, 1997). This is well illustrated by a number of species of fish belonging to diverse orders. Buth *et al.*, (1991) noted 52 such taxa most of which belong to cyprinidae identified through karyological analysis (Dowling and Secor, 1997) and such forms are ancestral polyploids (Ohno *et al.*, 1969). Polyploidy in fishes has been associated with traits including large body size, fast growth rate, long life and ecological adaptability (Uyeno and Smith, 1972; Schultz, 1980). Since *Schizothorax* fishes are hill stream fishes, it may be that polyploidy may have resulted on account of cold temperature of their habitat. The use of thermal shocks to eggs for induction of polyploidy (Chourrout, 1988) provides support to the above assertion. The role of polyploidy in evolution and survival of fish is very important because it prevents from natural selection pressure (Oellerman and Skelton, 1990).

It is interesting that the Kashmir Valley *Schizothorax labiatus* showed diploid number similar to that recorded for other species inhabiting different geographical locations (Table III) e.g., *Schizothorax richardsonii*, 2n=98 (Sharma *et al.*, 1992; Lakara *et al.*, 1997), *Schizothoracichthys prograstus*, 2n= 98 (Rishi *et al.*, 1983), *S. kumaonensis*, 2n=98 (Rishi *et al.*, 1998; Lakara *et al.*, 1997) but different fundamental arm number which may be attributed to the intra-chromosomal changes involving pericentric and paracentric inversion, suggesting origin from the same primitive ancestor. The overall similarity in the chromosome number and morphology implies that *Schizothorax* species are very closely related in that they have not been isolated as evolving entities long enough for random chromosome changes to have taken place and become fixed, and that a particular karyotype would be selected implies an adaptive advantage for that particular configuration. This hypothesis has been suggested for chromosome

differences found in *Fundulus* (Chen, 1971) and

Rivulines (Scheel, 1972).

The latter study followed the suggestion of Stebbins (1958) in that co-adapted gene sequences in plants have become closer linked via chromosome structural rearrangements and thus is less likely to be disrupted by normal exchange events. Similar arguments for chromosome changes paralleling species evolution in frogs and mammals can be found

in Wilson *et al.*, (1974) and for other animals in White (1978). No heteromorphic sex chromosomes were found.

Cells lacking normal value (2n=94-100) were also encountered in the preparations and these probably resulted from losses during the preparation

or addition from the neighbouring cells or hypotonic overtreatment (Nanda *et al.*, 1995).

The present study is the first to describe the chromosomal characteristics of *Schizothorax labiatus* from The Kashmir Valley. The results of the study can be used for the genetic manipulation and management and conservation of the species.

Acknowledgement

The authors wish to thank the Director of the department for providing research facilities. We are also thankful to Dr. Farooz Ahmad Bhat, Assistant Professor Division of Fisheries SKAUST-K for his help in the identification of the fish and CSIR, New Delhi for providing financial assistance in the form of JRF to Farooz Ahmad.

Building Social Capital for Poverty Reduction in Rural Areas of Marvdasht, Iran

Fatemeh Allahdadi

Science and Research Branch,
Islamic Azad University, Fars, Iran
fatemeharef@yahoo.com

Abstract: Does social capital generate positive influences on poverty reduction? This question has important theoretical and policy implications for the contemporary world, especially for the developing countries. This study assesses social capital in poverty reduction in rural areas of Marvdasht, Iran. Data were collected using survey questionnaire. Results indicate that although there is strong communication and social cohesion for poverty reduction, but communities still face challenges and constraints which hinder their contributions in poverty reduction.

[Fatemeh Allahdadi, **Building Social Capital for Poverty Reduction in Rural Areas of Marvdasht, Iran**, Journal of American Science 2011; 7(6):532-535]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: social capital, poverty reduction, rural development

1. Introduction

Social capital” is a concept that tries to capture the essence of community life. The concept is based on the idea that communities work well or poorly based on the ways in which people interact. It emphasizes the social dimension of life and how it is lived in specific places (Mignone, 2003). The concept of social capital is generally associated with social participation and with networks of co-operation and solidarity (Aref, Ma’rof, & Sarjit, 2010). But other, more abstract, concepts are also associated with social capital, such as social cohesion, trust, reciprocity, and institutional effectiveness. Regardless of the context, this concept has been used productively in many areas of research. Woolcock (2001) had counted at least seven fields that had employed the concept of social capital: families and youth, schools and education, community life, work and organizations, democracy and governance, problems related to collective action, and economic development. Today, physical and mental health, immigration, and public protection could be added to that list (Franke, 2005). Hence, this paper attempted to outline the concept and level, of social capital and its limitation towards poverty reduction.

2. Literature Review

Poverty being a rural phenomenon where the majority of the people live in most

developing countries, the mechanisms to be used should target the recipients (Aref A, 2011). Poverty has been defined as the “denial of opportunities and choices most basic to human development to lead a long, healthy, creative life and to enjoy a decent standard of living, freedom, dignity, self-esteem and respect from others” (Hirschowitz et al.,2000, p. 54). Poverty can be reduced through building social capital. However, there is scant literature on social capital for poverty reduction. Empirical works on social capital, most of which are based on the experiences of Western societies, indicate that communities endowed with a diverse of social capital will achieve superior outcomes in multiple spheres such as, tourism development and community development while, communities with a low level of social capital tend to have a poor performance in these spheres. Overall, poverty can be reducing by investing in social capital. This research is guided mainly by the theoretical framework of social capital theory, and also, by empirical studies from previous work. This research contributes to providing a basis for measuring the social capital influences community's participation in poverty reduction.

To date many researchers agree that the forces of social capital influence important political and economic phenomena (Aref, 2011; Aref, 2010; Putnam, 1993; Putnam, 2000; Strzelecka & Wicks, 2010). Perceiving social

capital holistically as a resource for individuals, communities and regions, exposes complex community processes. This is because networks of relationships often have the potential to accelerate democratizing processes and local democratic cultures within their members (Strzelecka & Wicks, 2010).

How communities can offer a viable solution for poverty reduction. The researcher's answer to this question is building social capital. This answer is supported by the literature and research evidence from some filed such as families and youth, education, community life, work and organizations, democracy and governance, problems related to collective action, economic development, physical and mental health, immigration, and public protection (Aref, 2009; Franke, 2005).

2.1. Domains of Social Capital

Some experts have identified the dimensions of social capital. The common dimension of it usually is seen from the point of view of sources, scope of activity and degree of implementation. Dimension from sources of social capital including (1) civic social capital and (2) governmental (institutional social capital). From scope or area of activity, social capital can be divided into (1) bonding social capital, (2) bridging social capital and (3) linking social capital. While using the degree of implementation in society, it encompasses (1) structural social capital and (2) cognitive social capital. Social capital can be divided into levels: individual level and group level. At the level of individual social capital, we can explore interpersonal relationships, that is, ties between individuals, or social participation, the ties between individuals and groups or organizations. At the level of collective social capital, we can explore the associative dynamic by focusing on the intra organizational ties as well as ties that exist among groups and organizations, within a community and beyond a community (Franke, 2005). Based on previous study the below domains of have been chosen and measured for this case study.

Networks

Understanding the groups and networks that enable people to access resources and collaborate to achieve shared goals is an important part of the concept of social capital. Informal networks are manifested in spontaneous, informal, and unregulated

exchanges of information and resources within communities, as well as efforts at cooperation, coordination, and mutual assistance that help maximize the utilization of available resources. Informal networks can be connected through horizontal and vertical relationships and are shaped by a variety of environmental factors, including the market, kinship, and friendship (Dudwick, Kuehnast, Jones, & Woolcock, 2006).

Trust:

This dimension of social capital refers to the extent to which rural people feel they can rely on relatives, neighbors, colleagues, acquaintances, key service providers, and even strangers, either to assist them or do them no harm. Adequately defining "trust" in a given social context is a prerequisite for understanding the complexities of human relationships. Sometimes trust is a choice; in other cases, it reflects a necessary dependency based on established contacts or familiar networks for solve the community problems (Dudwick et al., 2006).

Cooperation

Cooperation is closely related to the dimension of trust and solidarity, however, the former dimension explores in greater depth whether and how people work with others in their community on joint projects and/or in response to a problem or crisis. It also considers the consequences of violating community expectations regarding participation norms (Dudwick et al., 2006).

Communication

Increasing access to information is increasingly recognized as a central mechanism for helping poor communities strengthen their voice in matters that affect their well-being and increase the quality of life (Dudwick et al., 2006).

Social Cohesion

Social cohesion are closely related to the previous four dimensions of social capital, but focus more specifically on the tenacity of social bonds and their dual potential to include or exclude members of community. Cohesion can be demonstrated through community events or through activities that increase solidarity, strengthen social cohesion, improve communication, for coordinated activities,

promote civic-mindedness and altruistic behavior, and develop a sense of collective consciousness (Dudwick et al., 2006).

Empowerment

Individuals are empowered to the extent that they have a measure of control over the institutions and processes that directly affect their well-being (World Bank 2002a). The social capital dimension of empowerment explores the sense of satisfaction, personal efficacy, and capacity of network and group members to influence both local events and broader political outcomes. Empowerment can occur within a small association or at broader local, regional, or national levels. Each level has its own importance and should be considered separately, as well as in conjunction with the others (Dudwick et al., 2006).

3. Research Methods

This study was carried out in rural areas of Marvdasht, during the period March and April 2010. Marvdasht is one of the northern cities and also counties of Fars province. The city is located 45 kilometers north of Shiraz and has an altitude of 1620 meters above the sea level. The county has an area of 3687 square kilometers. Marvdasht as a county is divided into four districts: Central, Kamfirouz, Doroudzan and Seydan. Marvdasht has a cold weather in the hilly areas and moderate climate in other regions (Wikipedia, 2011). Agriculture is the major development sector in Marvdasht (Allahdadi, 2011). This study is based on quantitative method to investigate the level of social capital in poverty reduction. The study used survey design, where a questionnaire was used to collect the data. The questionnaire was structured around a Likert scale. The respondents answered each statement based on five scales. The value of each response for these items on the questionnaire is as follows: 0 = Never, 1 = Seldom, 2 = Sometimes, 3 = Often and 4 = Always.. The respondents were 250 rural residences, where each citizen was chosen based on cluster sampling. The population of this research was rural men, above 22 years of age, who live in Marvdasht. The respondents were asked to answer these questions which were constructed to gauge their level of social capital for poverty reduction. The questionnaire was piloted tested to have its contents validated. Statements for level of social capital were tested for their validity using Cronbach's alpha. Descriptive analysis was employed to determine

the level of social capital for poverty reduction in rural areas of Marvdasht, Iran

4. Results

This study to determine the level of social capital in poverty reduction in rural areas used descriptive statistics. Table 1 reveals the mean score of six domains of the social capital including: cooperation, network, trust, communication, social cohesion and empowerment). Table 1 reveals the findings of the analysis, which show the differences between dimensions of social capital in poverty reduction (max=4, min =0). Using the mean of the total score as a standard indicator, it was found that generally social capital domains in communication and social cohesion was high whereas the level of cooperation, network, trust, and empowerment were low.

Table 1: Total scores of social capital in poverty reduction

Domains	Mean
Cooperation	1.09
Network	0.90
Trust	1.01
Communication	3.01
Social Cohesion	2.89
Empowerment	0.70

Table 1 showed the differences in the domains of social capital for poverty reduction. Using the mean it was found that the level communication and social cohesion for poverty reduction is higher than cooperation, network, trust and empowerment (3.01, and 2.98 respectively). Levels of social capital in cooperation, network, trust and empowerment, have low scores as compared to communication and social cohesion. It shows rural residence cannot cooperate with the local government and have not been empowered to influence policies and expand their opportunities in poverty reduction. Generally, the findings reveal that the level of social capital in rural areas of Marvdasht for poverty reduction is low. This means that most people are not involved in the decision-making process for poverty reduction. For rural residence to be effective in poverty reduction they should come together and interact with government organizations. Local residence should be more involved in community actions and influence decision-making processes that

affect their lives, and their communities. They need to interact with the cooperatives and foster active relationship with local organizations.

5. Conclusion

This study promises to make a significant contribution to the study of social capital in poverty reduction in rural areas of Marvdasht, Iran. The findings of this study showed that the level of social capital for poverty reduction in low, except for domains of communication and social cohesion. The findings from this study are especially valuable for establishing some conceptual and empirical baselines for subsequent studies of social capital in poverty reduction and rural development in Iran. This finding will assist social workers in understanding the barriers of building social capital in poverty reduction in Iran. Since social capital has impacts upon the way how rural development policies are implemented in each community, the central government could design relevant policies to cultivate the social capital that has positive effects on poverty policies.

Abstract: This study aims to investigate the relation between organizational structure and entrepreneurship which is of discretionary – correlational type, done by the field method among all the physical education (PE) teachers and employees of Eastern Azerbaijan's Islamic Azad Universities (n=63). Two questionnaires about organizational structure and entrepreneurship, whose reliability was achieved by the experts, and Pearson and T correlational coefficients, were used to test and analyze the data. The results showed no relation between organizational entrepreneurship and complexity but showed a negative and significant relation among entrepreneurship and formality and concentration. Eventually, no difference was observed between organizational entrepreneurship of the (male or female) teachers and employees.

Key words: Organizational structure, organizational entrepreneurship, physical education

1- Introduction

Organizations have different structures that affect on their employees' attitudes and behaviors. Organization is the process of creating organizational structure and organizational structure is a frame, referring to complexity, concentration and formality. Using organizational structure divides, classifies and conform the affairs, formally (James, 1998). Organizational structure determines communication, decision making and reporting ways and authorities' hierarchy and its recognition, reflects the whole organizational image. Considering the items that the structure determines, a good structure proportionate to the goals and needs of PE department seems necessary. Since, all decisions on planning, organizing, conforming and control get done on the structure; it should be strong enough to put into practice all those decisions.

Management art refers to provoking motivation and creating a proper environment for the employees to show their talents and capabilities (Sashkin, 1997). Nowadays, the world observes social and economical blooming and improvement in order to pave the way for improving human welfare, job conditions and lifestyle in their life and organizations (Zhou and Etzowicz, 2002).

Entrepreneurship is an important factor in improving the social and economical growth of the world, creating new job opportunities with creative and

innovative specifications. PE as a broad domain has many job potentials in itself (Green, 2007).

In today world, innovation and entrepreneurship sportive organizations are inevitable. As the birth and death of sportive organizations depends on perspectives, intuitions and abilities of their officials, their existence and consistency is also dependent on their human sources, abilities, innovation and creativity. Entrepreneurship is a process which the organization undergoes to enable the employees to play their roles as entrepreneurs and do all their personal and collective entrepreneurial duties, fast and easily (Crawell and Perhman, 2002).

Organizational knowledge and management have undergone fundamental changes during the last century. Since early 1990s, organizations have resorted to innovation to accelerate those changes and survive. So, the best way is encouraging the innovative people to turn into entrepreneurs (Nayagar and Vuuren, 2005).

Today organizations' traits are consistency, complexity and tradition breaking and they always get affected by their environment and accept changeability as a necessity.

Understanding the changes as the inevitable parts of third millennium's organizations, has increased compatibility and adaptability of them in economical – social areas (Neil et al., 2001).

One of the most important domains to be studied is entrepreneurship because entrepreneurs can provide the conditions to improve production, services and human sources, for their own specific traits. Since the previous methods are not responding to the organization needs, the organization should resort to new methods, including organizational entrepreneurship in which human resources feel themselves commitment to granting organizational goals (Thompson, 1999). One of the cases causing the entrepreneurship to improve the organization is the environment in which human sources participate committed to reach organizational goals. Here, organizational structure plays the most important role and is considered as the skeleton of the collection (Wim, 2003).

So, this subject and the way organizational structure dimensions affect on a proper environment for improving entrepreneurship should be investigated. Organizations are the fundamental parts of every society; So, proper managements should be selected for achieving every organization's aims, because it is the major factor of the organizations' progress and regression (Robbins, 1991). PE organizations have important roles in developing sportive activities, training human resources and reinforcing healthy spirit among people of the society. Managing sports and their organizations is of great importance because it can create necessary backgrounds for the growth of the country's sports. To sum up, it can be said that using suggested systems in every organization can improve its employees' participation in organizational decisions and organizational and personal performance, as well (Burton, 1998).

In a study on investigating the relation between organizational structure and entrepreneurship, Rezazadeh (2004) showed a reverse relation among complexity, formality and concentration in organizational decision making and entrepreneurship (Omid, 2008). Investigating the relation between structure, culture and technology with knowledge management strategies in work and social affair ministry, Asgari (2006) concluded the following results: In structure part, decreasing formality, concentration and accelerating communications has a relation with creating and transmitting knowledge. In other cases, the organization should have ICI substructures and the employees should get technological training (Nelson and Campbell quick, 2008).

- Omid (2008) investigated the relation between organizational structure and staff management innovation of PE department and concluded the following results:

- There is a significant relation between organizational structure and staff management innovation in PE department.
- There is no significant relation between complexity and innovation of PE departments' staff managers.
- There is a significant and negative relation among formality, concentration, and education level and staff managers' innovation in PE departments. There is also no significant relation between staff managers' job records and innovation (Nelson and Campbell quick, 2008).

In a research on the relation between cooperative management and entrepreneurship among PE faculty employees of Tehran University, Rasekh (2009) concluded a significant relation between the variables.

In a study on the relation between organizational structure and PE managers' entrepreneurship, KhalifehSoltani (2009) concluded the following results:

- There is a significant and negative relation between the structure and organizational entrepreneurship of PE organizations' managers.
- There is a significant and negative relation between complexity and entrepreneurship of the PE departments' managers.
- There is a significant and negative relation between formality and organizational entrepreneurship of PE departments' managers.
- There is a significant and negative relation between concentration and entrepreneurship in PE departments.
- There is a significant relation among age, job records and organizational entrepreneurship of PE managers (Green et al., 2008).

Abdolmaleki et al (2010) investigated the relation between entrepreneurship skills and organizational entrepreneurship and observed a significant relation between them.

Entrepreneurship' amount changed with differing gender, age, education level and job records (Nayagar and Vuuren, 2005). Khanifar et al (2010) investigated the relation between organizational structure and organizational and economical entrepreneurship in small and average companies and concluded a significant relation between them (Daft, 2006).

Investigating the organizational structure of PE organizations, Saboonchi et al., (2010) understood that PE organizational structures tend to mechanical structures. Age and organizational positions were the best predictors of organizational structures. Sex, field, age and organizational positions caused meaningful differences in organizational structures.

In a study, Bonez, Rockert and Walker (2003) showed a negative significant relation between

formal control amount and organizational employees, creativity. According to that study, lower degrees of formal control is necessary for an efficient management and improper formal control can decrease team creativity.

In a research on developing organizational performance by using effective parts and traits of organizational structure, Hunters (2002) concluded that:

- Less complicated organizational units whose managers' use cooperative management system increase organizational entrepreneurship.
 - Less organizational hierarchy and more horizontal and vertical communications among the employees provides more space for creating entrepreneurship.
 - Boner, Rockert and Walker (2003) showed a significant negative relation between formal control amount and organizational staff s creativity. Lower degrees of formal control are necessary for efficient management and improper formal control or over control can reduce team creativity (Hunter, 2002).
- Boozbora (2007) in a part of his work has recognized non-concentrated structure' s role in creating an environment which encourages its employees to produce knowledge as useful.

This study's author follows these goals in her investigation:

1. Measuring the relation between organizational structure (complexity, formality, and concentration) and entrepreneurship in PE departments of Eastern Azerbaijan.
2. Investigating the relation between demographic qualities (age, sex, degree, and job records) and organizational entrepreneurship in PE education.

2- Methodology

This study is of descriptive – correlational type done by the field method.

The statistical society was the PE employees and teachers of Eastern Azerbaijan' s universities, including 69 people. 59 questionnaires were distributed among the testees . After losing 6 questionnaires, 63 questionnaires were returned. So, sample size equaled statistical society (n=63).

3-Information gathering methods

Stephan. P.Rpbins' standard organizational structure questionnaires were used to determine the structures of PE organizations of Eastern Azerbaijan. These questionnaires included 24 questions and 3 subscales that the questions 1-7 are about complexity, 8-14 about complexity and 15-24 about sub – scale. Organizational entrepreneurship questionnaires of Rahimi (2007) included 11 questions. Both questionnaires were scored in a 5-point Likert spectrum and the answers consisted of very little, a

little, average, much and very much. (1=very little, 5 = very much)

It must be mentioned that the scores of the question 18 to 24 were reverse in a way that very little item, and very much item got the scores 5 and 1, respectively.

The reliability of Robins' questionnaire was confirmed in MS thesis of Khalifeh. Soltani in 2008 and its consistency for the subscales of complexity, formality, and concentration were 0.88,0.85 , 0.79, = 0.86 . Organizational α respectively by Kronbakh entrepreneurshipquestionnaire' s reliability was also confirmed by Rahimi in 2005, and its consistency by . $\alpha = 0.82$ Kronbakh

The author got the confirmation of 5 PE professors on the reliability of both questionnaires and calculated their consistency over 30 PE employees and teachers of Eastern Azerbaijan' s Azad universities by coefficient for organizational structure α Kronbakh and entrepreneurship; The results were 0.81 and 0.84, respectively .

Personal information questionnaire (about age, sex, education and job records) was used to gather employees and teachers' demographic qualities.

Statistical methods

To describe the study variables, descriptive statistics including mean, percentage, variance and standard deviation were used.

4- Results

According to being linear, normality variance, homogeneity and score independence that was calculated by KolmogrofSmirnoftests , deductive statistics like Pearson correlation coefficient, Spearman correlation coefficient , Umanwhitney and Kroskal and Elis were used to test research' s statistical hypotheses and following conclusions were resulted:

1. There is no significant relation between organizational entrepreneurship and complexity of organizational structure.
2. There is a negative and significant relation between organizational entrepreneurship and formality of organizational structure.
3. There is a negative and significant relation between organizational entrepreneurship and concentration of organizational structure.
4. There is no relation between organizational entrepreneurship and job records.
5. There is no relation between organizational entrepreneurship and age.
6. There is no relation between organizational entrepreneurship and sex.

7. There is no relation between organizational entrepreneurship and education level. The results showed no relation between organizational entrepreneurship and complexity; But, there is a significant relation among organizational

entrepreneurship, formality and concentration. At the end, no difference was observed between organizational entrepreneurship of man or woman staff.

Table (1): Correlation coefficient between organizational structure's sub- scales and entrepreneurship in the statistical society.

Significant level	Pearson coefficient	Number	Criteria	Row	
0.099	0.157	63	Entrepreneurship	Complexity	1
0.035	-0.711			Formality	2
0.006	-0.253**				Concentration

** Correlation is significant at $\alpha = 0.05$ (bilateral)

Table (2) :Correlation coefficient among age , job records and entrepreneurship in statistical society .

Significant level	Spearman coefficient	Criteria	Row	
0.091	0.115	Entrepreneurship	Age	1
0.202	0.121*		Job records	2

Table (3): Investigating the differences in entrepreneurship according to sex and education level in the statistical society.

Significant level	coefficient	Test	criteria	row	
0.924	U=752.500	Man whitney U	Entrepreneurship	Sex	1
0.066	482.46	Kroskalvalis			

5- Conclusion

Nowadays, innovation and entrepreneurship exertions are inevitable in sportive organizations and their growth is also dependent on innovations and abilities of their human sources.

Organizations are the foundations of present society and they need creativity and innovation proportionate to their structures. So, good management and entrepreneurship are the important factors in the growth or regression of the organizations and their economical or social improvement. During entrepreneurship, new job opportunities are created which their specifications are innovations in production or services. PE, as a broad domain, has many potential job opportunities.

No significant relation was observed by investigating the relation between entrepreneurship and complexity, using organizational structure ' sub- scales on PE staff of Eastern Azerbaijan' s Azad Universities , which this is consistent with Omidi (2001)' s results but not Rezazadeh (2004) and KhalifehSoltani (2009) ' s conclusions. It shows that organizational departments with less complexity whose managers use cooperative management have increased their organizational entrepreneurship .So, less organizational complexity is suggested to increase

cooperation of human sources in entrepreneurial activities of PE departments and organizations. The perceived result from testing the second question shows a significant and

negative relation between formality and entrepreneurship which is consistent with the studies of Omidi (2009) ,Khalifeh . Soltani (2009) , Bones , Rockert and Walter (2003) . There is a significant negative relation between formal control amount and PE staff ' s creativity and entrepreneurship in Azad Universities which this suggests less formal control for efficient management. Improper formal control or over control can decrease team creativity, self-confidence and cooperation in organizations, especially in PE organizations which need more cooperation and team work.

Increasing formality causes extra and time – consuming bureaucracies which decrease organizational utility. Decreasing formality in PE departments will be to the benefit of the organizations and managers and enables the staff to show creativity and their talents and reach organizational goals.

Testing the third question shows a significant negative relation between concentration and entrepreneurship which is consistent with Khalifeh

Soltani (2009), Linders, Anglen and Kratzer (2003)'s studies. In organizational positions with lower concentration levels, people communicate more ideas and information and represent creative attitudes. Moreover, facilitating information communication among people produces more meaningful information which is efficient in active environments. Instead, higher concentration levels lead to disruptive attitudes and prevent from creating new ideas and entrepreneurship.

To confirm these points, Boozbora (2007), in a part of his study declared that non-concentrated structure creates an environment that enables the staff to participate in spontaneous production of knowledge and entrepreneurship grounds.

Concentration in organizational decision – making increases hierarchy, vertical communication, severe control, supervision and inflexible rules that lead to a decrease in human resources cooperation especially in PE departments.

Less concentration on decision – making increases staff's discretion and cooperation in entrepreneurial activities.

No significant relation was observed between demographic qualities (age, sex, education and job records) and organizational entrepreneurship. This is consistent with Omidi (2007) and Khalifeh Soltani's studies (in the field of education level).

The results of this study and previous researches show that proper structure, complexity, formality and concentration provide the necessary grounds for PE staff's more cooperation and talent growth and improving entrepreneurship.

Abstract: Automated Visual Inspection Systems (AVIS) are becoming increasingly popular due to low cost maintenance and high accuracy. Ceramic tile factories, for example, are very much interested in these sorts of systems. This paper introduces a different strategy in ceramic tile inspection system to reveal four major problems, namely, edge curvature, thickness, size measuring and edge crack defects. It is believed that this method will cover edge curvature defects and thickness measuring of ceramic tiles in AVIS with recommending an individual algorithm for each defect based on line feature extraction techniques. In addition, it is assumed that our model makes size measuring and edge defects detection easier and more accurate rather than previous approaches. This proposed model will allow ceramic tile companies to perform quality control inspection without costly measuring tools or error-prone inspection by humans. Moreover, factories have to install and apply Flatness Control Machine (FCM) to measure the flatness curvature of ceramic tiles. This machine keeps the ceramic tiles in fixed position to investigate the upper surface only. But our strategy is independent of a specific position through inspection in various angles from top and side views. We hope that our model, which is prominent in low cost implementation, will enable companies to apply this method in different situations in their manufacturing production line systems. Hence, it will assist them to produce not only more accurate reports on defects but also permit improved manufacturing of quality products.

Keywords: Edge curvature; thickness measuring; edge defect; visual inspection; machine vision; ceramic tile

1. Introduction

Automated visual inspection in ceramic tile manufacturing and production systems have been pursued and studied during the last two decades. For example, automated system for surface inspection of tiles by Costas & Ferancesco; colour grading of textured ceramic using colour histogram by Contantinos & Josef Kittler; dynamic photometric stereo of tiles by Farooq & Smith; and automated defect detection and classification of tiles by Rahman & Mobarak (Atiqur Rahaman & Mobarak Hossain, 2009; C Boukouvalas et al., 1998; C. Boukouvalas, Kittler, Marik, & Petrou, 1999; Farooq, Smith, Smith, & Midha, 2005). Elbehiery *et al.* also stated that all parts of a producing line except those of quality control are automated (Elbehiery, Hefnawy, & Elewa, 2005).

The quality control stage which is monitored by human resources (i.e. sorting) is located in the final step. Therefore, the automated system is vital to collect the feedback of their products. With the result obtained from the quality control part, companies can understand which producing part works correctly and

which previous part does not work expectedly. Finding accurate inspection in tile manufacturing within acceptable time and cost is of significant concern to businesses, and developers and researches that have to design such systems (Yamaguchi, Nakamura, & Hashimoto, 2008).

Common defects can be divided in four groups; they are those that are related to dimension of products, surface faults, incorrect assembling and operational defects (Malamas, Petrakis, Zervakis, Petit, & Legat, 2003). The main concerns in this paper are about surface defect detection and dimensional techniques in ceramic tiles. This detection can be checked in three stages; steps prior to kilning, colouring and packing. Defected tiles that are being recognized before kilning and colouring will be rejected or will be preceded to the production chain but the continuous production cycle can be marked as a low level sorting function. Pinholes, cracks, scratches, blobs, edge defects, texture faults, spots and glaze are most common surface defects in ceramic tiles (Atiqur Rahaman & Mobarak Hossain, 2009). However, in dimension inspection, part of the

goal is finding size defect, parallel edge defect, edge curvature deviation and thickness faults.

Fundamental requirement of Automated Vision Inspection Systems in Ceramic tile (AVISC) which is shown in Fig 1 consists of illumination part, camera vision, and classification part. The camera on top of the conveyer captures the image of the tiles: while the controlling and classifying part is done by a sorting machine.

The important function in AVISC which directly influences decision making is image acquisition. Light resources, camera position, resolution of acquired image and environment properties are considered in this part (Smith & Stamp, 2000). Light resources would be fluorescent, halogen or LEDs (Z. Hocenski, Dizdar, & Hocenski, 2008; Ž. Hocenski, Sobol, & Mijakovi 2010; Mathiassen, Misimi, & Skavhaug, 2007) while recent researches have shown that compared to fluorescent and halogen lamps, noise of image captured by LED's lights is reduced to give better images (Ž. Hocenski, et al., 2010). Capturing the images with minimum noise and correct position is the aim of this part.

Fig 1. Automated Vision Inspection Systems in Ceramic tile (AVISC)

As shown in Fig1, captured images are sent to the computer for processing. Before analysing captured images, certain techniques such as noise removal, image subtraction, histogram equalization and morphological operands will be applied to reduce noise of images. Each of these techniques is applied to enhance a special problem in image analysis to detect defects more accurately. For example, *opening* and *closing* of morphological operands are equivalent or similar to reducing *salt* and *pepper* noises in black and white images while *mean* filter in convolution

category applies on colour picture to reduce salt noises.

In the production/processing stage, some methods such as edge detection, binarization, line detection and edge linking are applied to focus on obvious properties of images. Edge detection shows the borders of images and with invariant features, image understanding will be more accurate.

The final stage is post processing. Artificial Intelligent (AI) approaches are applied to simulate manner of system. Neural network, fuzzy logic, and genetic algorithm are common methods that are used in this stage. Decision which is taken is sent to the Sorting machine, where it will sort the ceramic tiles.

He Junji in 2010 introduced a length measuring method of firebricks based on machine vision technology. It is said that edge defect problems such as flatness and thickness defects are relayed by CCD sensors that need a fixed position for detection (He, Shi, Xiao, Cheng, & Zhu, 2010). We go beyond this type of approach by proposing a smarter AVISC strategy and method for ceramic tiles that detects edge defect tiles without the tile to be in a fixed position and with much low cost implementation tools and computer software.

This paper is organized as follows: in section 2, previous related works in ceramic tiles are described. In section 3, our proposed strategy that is related to edge defects detection for ceramic tiles is presented. In section 4, expected results, advantages and disadvantages of this method are mentioned. Concluding remarks are shown in section 5.

2. Related Works

The common approaches in image processing are discussed in this section. The combination of basic image processing techniques leads to creating new algorithms. Some defects are more sensitive than others. Therefore developing new approaches is challenging. We present and discuss smarter methods in two types of defects that are related.

A. Surface defects

As mentioned before, many forms of surface weaknesses exist in ceramic tiles. Some of the methods that are defined for these defects are suitable for specified faults and others are suggested for all defects (Atiqur Rahaman & Mobarak Hossain, 2009). Real time processing and correct classification percentage are proposed for AVISC criterions.

Recently, due to desirable properties of noise reduction, morphological techniques have become popular. Based on morphological operands some image processing algorithms are presented by Elbehery *et al.* (Elbehery, et al., 2005). The

practical issues that are described in this paper are based on combination of morphological operands and edge detection methods which are specified for only one defect (i.e. crack, spot or pinhole). On the other hand, they introduce an individual algorithm for most of ceramic tile defects but this method's efficiency is less than of individual algorithm.

Another approach is counting number of white pixel after segmentation part (Atiqur Rahaman & obarak Hossain, 2009). If defected tile is detected, morphological operand will be applied when the number of the defected pixel is more than the reference image.

In another work, compound of *morphological* and *Gaussian* detector is attained to take sharp point - focus on the essential features that are pertinent and ignore unnecessary features - of edges of an image in decay of stone surface point (Kapsalas, Maravelaki-Kalaitzaki, Zervakis, Delegou, & Moropoulou, 2007). In addition, in another work via *morphology* operands, small defects of fabric were found better in spatial filtered captured images (Mallik-Goswami & Datta, 2000). In most of above cases, *morphological* operands have been applied to enhance images, to remove noise and also sharpen the edges. This process is repeated in many surface defect detection applications. Some algorithms are suggested for special problems. Hocenski and Keser suggested a simple algorithm which only detects spot defect (Z. Hocenski, Keser, & Baumgartner, 2007). They mentioned that spot defects are not only one pixel but also have its geometry. Based on this property and Local Directional Derivatives (LDD), the new method of moving average with local difference (MALD) is proposed (Z. Hocenski, Keser, et al., 2007). In this method the average of surrounding pixels intensity is compared with a group of pixels to recognize the features which do not follow a similar pattern.

Compared to LDD, which is based on Sobel's edge detection method (Sobel, 1978), MALD is approximately twice faster and has better success detection in false detected. Although this method is fast, the successful rate of detected and undetected defect show weak results.

It is fairly well established that edge detection techniques are one of the fundamental processes in AVISC. Edge detection usually is done after smoothing techniques to minimize noise of the image. But due to similarity between spot and blob defects with *salt* and *pepper* noises in captured image, detecting these defects are generally difficult to recognize precisely. Convolution filters and Gaussian filters such as *median*, *mode* and *low pass* filtering are common methods for removing noise but

the *smoothing* task makes the image blurred, thus the problem is not hundred percent resolved.

Hocenski invented the *canny* image processing algorithm to detect ceramic tile defects on their surface and edge detector (Z. Hocenski, Vasilic, & Hocenski, 2007). It is an improvement by firstly using the *mean* filter to smooth the edges of the captured ceramic tile image, then the image is separated from its background by using the *histogram subtraction* technique. Finally, further refinement takes place where a low-level threshold is derived by subtracting minimum and maximum bound of histogram value.

It is said that between 3 and 3.5 times of low level is high level threshold in *canny* edge detection. The successful rate of this method is about 98%. However, the disability to detect the small amounts of texture variations of ceramic tiles is explained as depletion rather than a *defect*, since the amount is so small that it makes little difference to the overall texture of the tile (Z. Hocenski, Vasilic, et al., 2007).

Hocenski proposed a way to detect defect of edges in ceramic tiles (Z. Hocenski & Keser, 2008). The first stage is edge extraction and histogram subtraction. For better edge detection, *canny* method is chosen. Then in five angles (0, 45, -45, 90 and -90 degree), the next dot line is traced to cover the entire border of image. Finally, compared to contour descriptor of pattern tile, defected tile is detected. The result of this method is acceptable but it is time consuming to find defected tiles.

Mansoori provides a solution to this problem by presenting a *threshold* technique to detect defected edges of ceramic tiles (Mansoori, Tajik, Mohamadi, & Pashna, 2009). It is based on fuzzy logic. Thresholding is defined as a noisy task and enhancement is required to eliminate it. To reduce the noise, *radon transform* and *morphology* operands technique is applied. No faulty defect ceramic tiles curvature scan has 0, 90, -90 angles. Therefore, if any tile violates these angle conditions, it means that edge defected tile exists. In an experiment run of 300 ceramic tiles, this method achieved 98% accuracy of detection, which is acceptable for most industrial production application or systems.

B. Dimensional faults

As mentioned before, tile manufacturing companies investigate surface defects in ceramic tiles manually. Thus, human errors occur through tediousness, tiredness and carelessness. Totally, the visual inspection is not accurate, thus, it requires more work.

It is time consuming and impossible for humans to measure the length, width, thickness and edge curvature of each ceramic tile all at once. Some

ways are suggested such as using sensors or laser beam (Mattone, Campagiorni, & Galati, 2000). Based on the machine vision system for measuring firebreak, He Junji introduced a method in 2010 (He, et al., 2010). In summary, the procedure is carried out in six parts:

- Edge extracting via canny edge detection,
- Edge linking to eliminate noisy edges,
- Edge segmentation to separate lines with different curvature,
- Line fitting
- Finding *homography* matrix to convert perspective edges to direct view,
- Calculate the length of firebrick.

The stable result of this algorithm is the strong point with approximately maximum 2 millimeter error.

3. Material and Methods

In the last two decades, the focus was on visual inspection systems to look at the ceramic tiles from the top side. During this process, the Flatness Control machine (FCM) works on the thickness and edge curvature of tiles. FCM is composed of some sensors to check the flatness of surfaces. In our proposed method we suggest visual inspection model which contains two or four cameras to see the edge of tiles (Fig 2).

Assumptions

Investigation of each border of the tile is needed to have complete tile border inspection. Therefore, one camera is required for each border. It is assumed that this is sufficient, but four cameras together have undesirable effects. When two cameras are in front of each other, they can see each other as well. It is believed that finding a way with minimum noise have better performance. We recommend using two cameras for two sides of the tile (Fig2). To cover the other tile borders one solution is rotate the tile, thereby; the two cameras then inspect the two other borders. This idea seems to solve the problem, but the tile has to stop during visualising.

We suggest dividing this task in two steps (Fig 3):

- Inspect two tile borders with first and second camera
- Investigate other borders with third and fourth camera but in the next stage

Another assumption is the distance between two tiles on the conveyer. The captured image must contain only one border, otherwise size measuring and crack detection on border of tile will be influenced. Processing the border of a tile is not complex. We can use the conveyer with high speed

but the distance between the two tiles should be at a relative distance to ensure correct imaging for optimum analysis to take place. The speed of the conveyer belt can be calibrated to derive the optimum pacing. Placing of tiles and tile edges detection rates from control trial runs before the actual production consignment is inspected in normal production operation.

Fig 2. Using two cameras to inspect edges of ceramic tiles and one camera to inspect surface defects

Fig 3. While top camera investigates the surface of tile; first and second cameras inspect two borders of tile. Then, third and fourth cameras investigate other borders.

Two cameras on the sides of the tiles inspect the edge of the tiles while a camera on top investigates the surface. This strategy would control surface and edge inspection in ceramic tiles on a conveyer belt simultaneously.

Fig 4. A sample of edge tile image

As it will be shown, LED light resources and black background for image capturing are recommended. The position of camera should cover the border length of tiles. In addition, it is stated also

that 30 cm distance between tile and camera is suitable (Ž. Hocenski, et al., 2010).

An instance of a ceramic tile border is shown in Fig 4. It is believed that other defects such as spots or blobs are not accepted in ceramic tile borders. Therefore, we could use smoothing, filtering and morphological operands to cover all the edges in the defected tile.

In the next stage, we recommend using *histogram subtraction* to separate the tile from background. We suggest applying *canny* edge detector because we want to focus on line gradient and this method is the one suitable for this purpose (Atiqur Rahaman & Mobarak Hossain, 2009). Finding a suitable threshold in canny technique will have a great effect on our work to succeed. In addition, using *morphological* operand (*opening, closing*) would help to remove unwanted noises (Ze-Feng, Zhou-Ping, & You-Lun, 2006).

Fig 5. An image of the tile edge after segmentation and enhancement

Fig 6. Proposed approach diagram for edges of ceramic tiles

The surface of the *front side* of a ceramic tile is shown in Fig 5 is a good example of how to investigate for *edge* curvature defects. The edge of the tile is derived from the segmentation part and straight edges are needed for assessing no fault tiles. *Hough transform, deep-first* algorithm and straight line detection are suitable to extract the edges of tile (Lee, Koo, & Jeong, 2006). Recognizing main correctors related to edges of tile will be interpreted as a line. We recommend using a straight line as a reference line to find defected edges (Pithadiya, Modi, & Chauhan, 2010).

Four major defects are considered in our method. In feature extraction part after line detection, edge linking is needed to join edges. Fig 6 presents a flowchart of edge defect detection in ceramic tile. As mentioned before, after line detection and edge linking part, three faults (edge crack defect detection, thickness measuring and curvature defect detection) still exist. It is assumed that comparing with reference line; this will help to find these defects, while for thickness measuring parallel line detection is chosen. The final stage depends on each ratio of each edge classification part done. Four solutions are proposed for each fault based on line detection.

A. Edge curvature defect detection

According to International Organization for Standardization (ISO) rules, less than five percent deviation is acceptable for edge curvature in ceramic tiles. The area between the edge line and reference line deviation of a tile is shown in Fig 7. By attaching the lowest point of edge line to reference line, the surrounded area is actually calculated by the function in equation (1). $F(x)$ is tile border's equation line which is located between 'a' and 'b' points. In practice, equation (1) attains with summation of pixels between reference line and tile border line that is presented in equation (2). In equations (1) and (2) x presents reference line location and x_i shows the edge tile location. The summation of destination between these lines is the curvature of the tile. In addition, the maximum deviation from reference line is interesting because it shows the curvature defect.

$$D = \int_a^b F(x)dx \tag{1}$$

$$D = \sum_{i=a}^b (x_i - x) \tag{2}$$

Fig 7. a) Reference line, b) Deviation compared to Reference line

When the maximum deviation is happening edge curvature defect will be seen or while average deviation is more than usual. Fig 8 shows this distance between reference line and edge of tile in practical view. As the line detection and edge linking number of pixels that do not match with reference line is counted in order to verify threshold values. If it is above the threshold value, a fluctuated edge is recognized and the tile is declared faulty. This is specified in algorithm 1.

Fig 8. After segmentation and feature extraction, reference line is matched with the lowest point of tile in same direction to achieve deviation from reference line.

Algorithm 1:

- line extraction method
- Edge linking ($L[i,j]$)
- Match reference($R[i,j]$) line and side of tile in same direction and lowest point.

For each i and j

if distance ($R[i,j]$ AND $L[i,j]$) > Max (deviation)
defect_counter = defect_counter + 1

if distance ($R[i,j]$ and $L[i,j]$) > 0

Total_dis = distance ($R[i,j]$ AND $L[i,j]$) + Total_dis
End For each

If Total_dis > Threshold OR defect_counter > Threshold

Mark tile as a fluctuated surface tile

B. Length and width defect detection

Size measuring has been done in visual inspection systems (Elbehiery, et al., 2005). We predict that focusing on edges of tile will increase the accuracy. In our model other defects such as pinholes, cracks, scratches, blobs and texture of ceramic tiles are not seen. This property will help us to find the edges of tile without having to worry about the other defects.

Fig 9. Steps of length measuring: after vertical line extraction method, the summation of pixels from left side to right side is distance between two sides.

Algorithm 2:

- Vertical line extraction method ($L[i,j]$)
- Binarization method

For each i And j From 0 To Width/2

If Color($L[i,j]$) = White

Left_Position = $L[i]$

End If

End For each

For each i And j From Width To Width/2

If Color(i,j) = White

Right_Position = $L[i]$

End If

End For each

Tile_Length = Right_Position – Left_Position

Reference_Line_Length = Total pixel of Reference line

- Find the ratio between this Tile_Length and Reference_Line_Length

Algorithm 2 expresses the procedure of size measuring. At first, a longest virtual line between two sides of the tile is calculated. Afterward, through comparing the length size against the reference line, the acceptance of length size can be easily determined. Fig 9 shows the way that this process would be performed. Firstly, two vertical lines are fetched from the both borders of captured image so that it would be possible to count the number of pixels between them. Secondly, *binarization* task is performed to make the borders more clear. Thirdly, the total pixels spanning from the left side to right side determine the length of the ceramic tile edge. The same process is necessary for determining the *reference* line. The exact length is obtained by calculating the ratio between this line and *reference* line.

C. Edge crack defect detection

It is assumed that localizing the edges makes edge defect detection more accurate. In addition, we can combine the result of top side camera images – which is suspicious to edge crack - with that of our model to be more reassured about edge crack since defect is a group of pixels that shows unusual manner against the background (Joo, Huh, Hong, & Park, 2010). Therefore, an edge crack on surface of tile appears after straight line detection because crack edge unlike background does not have straight line.

Algorithm 3:

```

➤ Use straight line detection with PCA
For each i and j
  If R[i,j] not Match with any L[i,j]
    defect_counter = defect_counter +1
End for

If defect_counter > Threshold _ error
  Mark tile as a defected tile

```

In above code, each pixel of reference line(R) must have one pixel in edge tile (L) otherwise threshold error value will increase. Threshold error describes amounts of pixel that we want to distinct as a crack. Fig 10 shows an instance of crack edge that is achieved after straight line detection.

Fig 10a) Edge of tile that has crack, Fig 10b) edge crack is detected after applying algorithm

D. Thickness defect detection

Like edge curvature measuring that is not possible to see from top side, thickness measuring should be inspected from sides of ceramic tiles. Thickness is the distance between two sides of ceramic tiles. It should be parallel and it should not be thick or thin. As specified in algorithm 4, after line detecting we need to find two longest parallel lines in our image. Edge linking will help to find thickness measuring process. Then we count all of pixels that are out of thickness distance. If numbers of defected pixels are more than threshold value then thickness defect is observed.

Algorithm 4:

```

➤ line extraction method
➤ Edge linking ( L1[i,j] ) and ( L2[i,j] )

For each i and j
  If distance ( L1[i,j] , L2[i,j] ) NOT in Thickness_distance
    defect_counter = defect_counter +1
End for

If defect_counter > Threshold _ error
  Mark tile as a defected tile

```

Fig 11 presents theory of above algorithm. As we observed, the right side thickness is greater than that of left side which indicate the edges of two sides are not parallel.

Fig 11. Finding two lines that are not parallel and the distance between them is more than normal

3. Discussions and Result

The experiments for the four algorithms are currently undergoing rigorous laboratory tests which will be completely analyzed in a follow up paper. However, our preliminary evaluation of results using algorithm 2 for vertical line extraction method based on Prewitt and Sobel techniques, shows the fluctuation of Prewitt's method is closer to real size changes ascertained from our laboratory measurement using digital caliber. The maximum relative-error of both techniques shows an approximate deviation of 1.44%.

Since humans make mistakes, visual quality control systems in real time have become favorable recently. Because Ceramic tile companies should qualify their products, analyzing their outcome for efficiency is significant. We believe that this proposed method is suitable before and after kilning and coloring phases. These quality control surveys help to improve the process of production. They are important for preventing faulty tile production through automated feedback adjusting control system. It is also possible to recycle ceramic tiles before kilning to reduce disposal cost or profit margins. Therefore, if we predict defected tile correctly before kilning, the biscuit of each tile will return to the production line again. Even after kilning, it is more economical to reject some tiles that will not classify for "A", "B" or "C" grade sorting at

the end of production. Thus, understanding defected tile during the production is important for factories.

Human eye can detect some defects but the rest that are not recognizable by human eyes or need more accuracy should be investigated in AVIS such as size defects. Border defects of ceramic tiles are also categorized in the second group for example: shadows of ceramic tiles are seen after installation. Because workers are looking at the surface of ceramic tile from the top, so edge curvature is hidden in this kind of inspection.

It is assumed that flatness curvature in ceramic tile manufacturing spreads all over the tile surface. Therefore using two cameras is also acceptable, but for more accuracy, it is possible to expand this model to four cameras or rotate the tile for investigating other sides.

It is expected that many defected tiles that have edge faults will be found in the proposed model. Focusing on the edge of the tiles, size measuring also would be more accurate, particularly within the tolerance or threshold values set. The algorithm 2 can be made more advanced to be self-adjusting to determine more fine-grain values for "A" grade tiles. The opposite can also be true, that is, adjust the values to be more coarse-grain or larger for lower classes of tiles rejected from "A" class batches.

Advantages of this model

Most often it is expensive to use human resources while other times they are not accurate enough for visual controlling. In addition, in many cases, it is impossible to request humans to check all details such as size measuring in ceramic tile companies, because the speed of production line is more than human measuring. All of these limitations encourage companies to use other methods. Accurate method with low cost implementing and less limitation during production is becoming more popular recently.

Factories are using visual inspect systems to inspect surface defects of ceramic tiles and our model is a supplementary method that will be combined with the previous model to detect the border defects of ceramic tiles. In this paper, a method is suggested that is accurate and fast enough with lower cost implementing rather than previous methods while the quality assurance of this model has been considered. In this model we use a maximum of five cheap cameras that are using CMOS (Complimentary Metal-Oxide Semiconductor) technology as opposed to flatness control machines which use laser or CCD sensor. CMOS camera is far more economical. Besides, this model does not need another visual inspection system. Thus, the same AVISC which is used for surface defects can be applied for

determining other border tiles. Therefore, with a central computer the visual inspection will be done in different places of the production line. In previous methods, factories needed to buy FCM (Flatness Control Machine) to check other defects of ceramic tiles and usually this checking is done only at the end of production line, because it is expensive and unable to expand in networking.

Another advantage of this strategy in contrast with previous methods which need to fix position during controlling the flatness of tiles is that the ceramic tiles is located on conveyer belt and cameras investigate the tile rapidly without stalling the ceramic tile.

In a follow-up paper we will present our results from many different experiments using different sets of placement and measuring criteria.

4. Conclusion

Installing ceramic tiles with thickness and curvature defects are unpleasant. In this paper, we proposed a supplementary method to cover border defects in ceramic tile by using automated visual inspection system (AVIS). This model is able to cover border defects such as edge curvature, thickness, size measuring and edge cracks. For each defect an algorithm based on line feature extraction methods is suggested. This proposed system would cover edge defect problems more efficiently. In addition, this strategy solves the limitation of last step inspection existing in production lines which involve keeping ceramic tiles in a fixed position. Therefore, boosting the speed of quality control process will inherently increase the speed of production of tiles. Another advantage is that it is economically applicable so as to encourage factories to use this model in various parts of production lines such as before kilning, after kilning, after colouring and final sorting. This model is also flexible enough to be combined with other AVISs methods to investigate surface of ceramic tiles that reduce cost of implementation for factories due to the fact that they have to check ceramic tiles surface as a minimum requirement for quality control purposes. Thus, with the same computer and adding different cameras it will be implemented.

It is assumed, this model has the capability of covering curvature defect problems of tiles in AVIS without any dependency on CCD, flatness measuring laser sensor and fixed position limitation during quality control. By taking each border of tile, size and thickness measuring accuracy, in to account we hope that sorting and packing tiles will be improved. AVIS is a rational solution (Malamas, et al., 2003), therefore, regardless of CCD and laser sensor, this system can be implemented

economically. It guarantees factories to apply this method in different stages of production line such as before kilning, or coloring or after kilning.

Abstract: Nowadays, the issue of brand extension strategy has emerged as one of the most crucial topics for marketing management. Previous studies report extraordinarily high failure in brand extension strategies. Hence, this study presents a practical framework for evaluation of critical factors of brand extension strategy of product based on appropriate criteria and Fuzzy Analytical Hierarchy Process technique. For obtaining critical factors, the key published papers are employed to derive those initially important factors firstly, 15 factors are identified. These factors have been discussed and publicized in academic and management fields and can be summarized as three aspects and fifteen initially factors. Consequently, the proposed Fuzzy AHP approach is used to measure relative weights for evaluating these factors. The proposed methodology implemented as an actual case in the biggest automobile manufacture in Iran. Finally, the results of this study show that “Quality”, “Services after sale”, “Determining the suitable strategies in Brand field”, “Top management commitment and support” and “Advertisement” is the top five critical factors.

Journal of American Science 2011;7(6):551-558]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Brand extension strategy, Critical success factor, AHP, Fuzzy sets

1. Introduction

In today's new competitive environment, marketers endeavor to reduce marketing expenses and increase sales. Strong brands enjoying high brand strategy can help managers and policy makers to relish higher margins, less vulnerability to competitive attacks, greater customer loyalty, better customer response to communications, and more cooperation from trade and other intermediaries. In order to keep track of the strength of their brands, managers need to be able to quantify brand strategy. However, creating and holding brand extension strategy is a challenge for top managers in the organizations.

A direct branding strategy is defined as a new extension that is strongly linked to the parent brand's name, colors, and/or symbols, which appears in a prominent position in the brand name (Milberg et al., 1997). A beneficial brand extension strategy can reduce marketing expenditures (Randall, 1993) and, thus increase new product introductions' profitability (Collins-Dodd and Louviere, 1999). Furthermore, the parent brand's image can also benefit from brand extensions (Balachander and Ghose, 2003).

From a detailed examination of the literature, the concept of brand strategy cannot be uniform, owing to the difference of the perspective of the research. The authority of the United States Marketing Philip

Kotler says that (Philip Kotler, 1997; Philip Kotler, 1999). The brand is a name, a noun, a symbol or a design, or the sum of the above, whose purpose is to make their own product or service is different from other competitors. Therefore, the so-called brand strategy is just a corporate strategy, which takes the corporate brand as core competitiveness in order to obtain the difference profit and the value. Its essence is the inevitable outcome with the development of market economy to the current stage. Developing brand strategies are therefore essential in building brands. A branding strategy reflects the number and nature of common and distinctive brand identities applied to the different products sold by an organization. Devising a brand strategy involves deciding the nature of new and existing brand identities to be applied to new and existing products (Kotler & Keller, 2006; Keller, 2003). In other words, branding strategies are concerned with how brand identities are employed across the products of an organization (Keller, 2002). It is therefore not surprising that 'capitalizing on the equity in established brand names has become the guiding strategy of product planners' (Tauber, 1988). This notion is supported by Simms (2005), who identifies 82 percent of new product introductions as brand extensions.

Given the importance and popularity of brand extension strategy on the one hand, and a brand extension failure rate of about 80 per cent on the other, it is pivotal to know which factors influence brand extension success (Völckner and Sattler, 2006). Researchers have sought to identify factors related to the success of a brand extension, and the negative effect that the brand extension strategy may have on the original brand (Loken and John, 1993; Gu`rhan-Canli and Maheswaran, 1998; John et al., 1998; Martı´nez and Pina, 2003; etc). The choice of branding strategy is likely to be a key factor in the development of any line extension, but specific effects of the branding strategy have received limited attention in the brand/line extension literature (Milberg et al., 1997). The decision as to how to brand new products is thus critical. When an organization introduces a new product, it has three main choices, namely (1) it can develop new brand identities for the new product; (2) it can apply some of its existing brand identities; and (3) it can use a combination of new and existing brand identities (Kotler & Keller, 2006).

Brand extensions are among the most important and often used branding strategies (Keller 2003). They refer to the use of well-known brand names when launching new products—for example, the transfer of the Virgin brand (i.e., the parent) to a new product (i.e., the extension) such as limousine services.

Unfortunately, there are only a few studies that address for critical factors of brand extension strategies. Therefore, the motivation of this study is that although several critical success factor analyses in the field of brand strategies appear in the literature, most of them do not have any technical background. In addition, lack of theoretically empirical research in the classification factors, that are affected the successful brand strategies is existed. Many researchers have proposed using fuzzy analytical hierarchy process (FAHP) technique and this technique has become a popular and common tool in literature at least in this problem. Iranmanesh et al., (2008) applied a risk evaluation methodology to prioritize and organize risk factors in IT projects based on fuzzy analytical hierarchy process (FAHP). Azadeh et al. (2010) presented a robust decision-making methodology based on Fuzzy Analytical Hierarchy Process (FAHP) for evaluating and selecting the appropriate simulation software package. Azadeh et al. (2011) presented a decision making approach based on Fuzzy Analytical Hierarchy Process (Fuzzy AHP), Technique for Order Performance by Similarity to Ideal Solution (TOPSIS), and computer simulation to determine the most efficient number of operators and the efficient

measurement of operator assignment in CMS. Miri-Nargesi et al. (2011) proposed a fuzzy group decision making process to evaluate and select the appropriate Information System Project (ISP) based on fuzzy Analytical Hierarchy Process (FAHP).

Therefore, in this study Fuzzy Analytical Hierarchy Process is used to classify CSFs for helping decision-makers focus on those factors that provide great influence. As an advantage, the AHP enables decision-maker to handle problems in which the subjective judgment of an individual decision-maker constitutes an important role of the decision-making process. Also using fuzzy theory in this problem can reduce ambiguities and uncertainties that are inherent in the judgments of experts in the field of selection. The proposed methodology implemented in an actual case in one of the biggest Car Company (SAIPA) in Iran.

The reminder of the paper is structured as follows: Section 2 describes the proposed methodology to Brand Strategy problem based on Fuzzy AHP and presenting of all criteria that we considered; in section 3, the proposed methodology applied as an empirical illustration is provided and the results of proposed methodology are discussed. Finally, the conclusions of this work are presented in section 4.

2. Fuzzy Analytic Hierarchy Process (FAHP)

Analytic hierarchy process (AHP) is a useful method for solving complex decision-making problems involving expert judgment (Saaty, 1980). In AHP method, the multi-attribute weight measurement is calculated by pair-wise comparison of the relative importance of two factors. Traditional methods of AHP still cannot process imprecise or vague knowledge, to address such vagueness; Zadeh (1965) introduced fuzzy sets theory, to rationalize uncertainty associated with impression or vagueness. Fuzzy set theory resembles human reasoning in its use of approximate information and uncertainty in decision making; many researchers have used fuzzy theory in conjunction with AHP. The steps of the proposed methodology are as follows:

Step1: Find Criteria and Alternatives and Establish hierarchal structure

Firstly, the organization should specify the strategies and selection criteria for evaluating these criteria by interviewing the SAIPA staff and managers (through different approaches i.e. Delphi, brainstorming and so on) and reviewing the literature.

Step 2: Gather expert' judgments based on fuzzy number and establish fuzzy pair wise comparison matrix

The sample questionnaire is used to determine the priorities of the criteria using experts' opinions based on fuzzy numbers. This questionnaire along with similar questionnaire about the evaluation of the alternatives should be filled by the experts for the evaluation of the relative importance of the criteria as well as the relative performance of the alternatives. In this paper, triangular fuzzy numbers is used which is illustrated in Figure (1). Equation (1) shows the membership function of a triangular fuzzy number. Triangular fuzzy number (TFN) is usually shown with (l, m, u).

$$U(x) = \begin{cases} \frac{x-l}{m-l} & 1 \leq x \leq m \\ \frac{u-x}{u-m} & m \leq x \leq u \\ 0 & \text{Otherwise} \end{cases} \quad (1)$$

Figure 1. Triangular Fuzzy Number

The conventional AHP method, which is proposed by Saaty (1980), uses pair-wise comparisons shown in equation (2). The fuzzy judgment matrix can be defined as follows:

$$\tilde{A}^k = [\tilde{a}_{ij}^k] \quad (2) \quad \text{where}$$

$$\tilde{a}_{ij}^k = (1, 1, 1) : \forall i = j; \tilde{a}_{ij}^k = \frac{1}{\tilde{a}_{ji}^k} : \forall i \neq j .$$

\tilde{A}^k is the fuzzy judgment matrix of evaluator k, \tilde{a}_{ij}^k the fuzzy assessments between criterion i and j of evaluator k, $\tilde{a}_{ij}^k = (l_{ij}^k, m_{ij}^k, u_{ij}^k)$ n is the number of the related criteria at this level. FAHP replaces crisp a_{ij} in AHP by triangular fuzzy numbers. Because each number in the matrix shows the opinions of the experts, fuzzy number is the best solution to show expert judgments. Eigenvector method proposed by Buckley (1985) is used here to analyze the data and achieve the consensus of the experts. As is shown in equations (3-6), l, m, and n show the minimum possible, most likely and the maximum possible value of a fuzzy number,

respectively. These numbers have following characteristic:

$$\tilde{a}_{ij}^k = (l_{ij}, m_{ij}, u_{ij}) : l_{ij} \leq m_{ij} \leq u_{ij}, l_{ij}, m_{ij}, u_{ij} \in [1/9, 9] \quad (3)$$

Based on Saaty's scale (1980), the linguistic scale and corresponding triangular fuzzy numbers are illustrated in Table (1).

Table 1. The linguistic scale and corresponding triangular fuzzy numbers

Fuzzy	Linguistic scales	Scale of fuzzy
$\tilde{1}^k$	Equally important	(1, 1, 1)
$\tilde{2}^k$	Weakly important	(2, 3, 4)
$\tilde{3}^k$	Essentially important	(4, 5, 6)
$\tilde{4}^k$	Very strongly	(6, 7, 8)
$\tilde{5}^k$	Absolutely important	(7, 8, 9)
$\tilde{2}^k, \tilde{3}^k, \tilde{4}^k, \tilde{5}^k$	Intermediate values	(x- 1, x, x+ 1)
$1/\tilde{x}^k$	between two adjacent judgments	(1/(x+ 1), 1/x, 1/(x- 1))

Step 3: Calculate Consistency Rate (C.R.)

According to the analysis of Csutora and Buckley (2001), let $\tilde{A}^k = [\tilde{a}_{ij}^k]$ be a fuzzy judgment matrix with triangular fuzzy number $\tilde{a}_{ij}^k = (l_{ij}, m_{ij}, u_{ij})$ and form $A = [m_{ij}]$. If A is consistent, then \tilde{A}^k is consistent. Saaty (1980) suggested consistency index (C.I.) and consistency rate (C.R) to verify the consistency of the judgment matrix. Random index R.I. represents the average consistency index over numerous random entries of the same order reciprocal matrices. The value of R.I. depends on the value of n (the number of related criteria or alternative in decision matrices) which is shown in Table 2.

Table 2. Random Index used to compute consistency rate (C.R.)

n	1	2	3	4	5
R.I.	0	0	0.52	0.89	1.11
n	6	7	8	9	10
R.I.	1.25	1.35	1.4	1.45	1.49

Saaty (1990) provided a consistency index to measure any inconsistency within the judgments in each pair-wise comparison matrix as well as for the entire hierarchy. The consistency index (C.I.) is formulated as follows:

$$C.I. = \frac{\lambda_{max} - n}{n - 1} \quad (4)$$

where λ_{\max} is the maximum eigenvalue, and n is the dimension of matrix. Accordingly, the consistency rate (C.R.) can be computed with the use of following equation:

$$C.R. = \frac{C.I.}{R.I.} \quad (5)$$

Step 4: Test Consistency Rate (C.R.)

If $C.R. < 0.1$, the estimate is acceptable; if the consistency is not passed, a new comparison matrix must be established.

Step 5: Defuzzify each expert's Judgment using CFCS Method

The method for defuzzification used in this paper is the converting fuzzy data into crisp scores (CFCS) method introduced by Opricovic and Tzeng (2003). The CFCS method can clearly express fuzzy perception, which is based on the procedure of determining the lower and upper scores by fuzzy min and fuzzy max, and the total score is determined as a weighted average according to the membership functions (Lin, 2010). The steps of CFCS method are as follow:

1: Normalized matrix

$$xl_{ij}^k = (l_{ij}^k - \min l_{ij}^k) / \Delta_{\min}^{\max} \quad (6)$$

$$xm_{ij}^k = (m_{ij}^k - \min l_{ij}^k) / \Delta_{\min}^{\max} \quad (7)$$

$$xu_{ij}^k = (u_{ij}^k - \min l_{ij}^k) / \Delta_{\min}^{\max} \quad (8) \quad \text{where}$$

$$\Delta_{\min}^{\max} = \max u_{ij}^k - \min l_{ij}^k \quad (9)$$

2: Computing lower (ls) and upper (us) normalized value:

$$xls_{ij}^k = xm_{ij}^k / (1 + xm_{ij}^k - xl_{ij}^k) \quad (10)$$

$$xus_{ij}^k = xu_{ij}^k / (1 + xu_{ij}^k - xm_{ij}^k) \quad (11)$$

3: Computing total normalized crisp value:

$$x_{ij}^k = [xls_{ij}^k (1 - xls_{ij}^k) + xus_{ij}^k] / [1 - xls_{ij}^k + xus_{ij}^k] \quad (12)$$

4: Computing crisp value:

$$a_{ij}^{*k} = \min l_{ij}^k + x_{ij}^k \Delta_{\min}^{\max} \quad (13)$$

For all experts' judgments, Equations (6-13) should be implemented separately. After calculating the crisp value for each expert, the consistency Rate of each expert can be also calculated.

Step 6: Calculate integrated crisp values, weights and final ranking

After defuzzifying by using CFCS Method and collecting all consistent crisp judgments for all levels of the hierarchical structure, geometric average

is applied to integrate crisp values of k evaluators using Equation (14).

$$a_{ij}^* = \sqrt[k]{(a_{ij}^{*1} \times a_{ij}^{*2} \times \dots \times a_{ij}^{*k})} \quad (14)$$

$$A_{ij}^* = [a_{ij}^*] \quad (15)$$

A_{ij}^* is a aggregated crisp judgment matrix of

k evaluators, a_{ij}^* is the aggregated crisp assessments of criterion i and criterion j of k experts, $i, j = 1, 2, \dots, n$, and k is the number of experts. In the next Step, we can achieve the final weight of the alternatives using Equation (16) and then the decision can be made based on the weight of alternatives. The weights are sorted decreasingly and the first ranked alternative is selected finally.

$$w_i = \frac{(\prod_{j=1}^n a_{ij}^*)^{1/n}}{\sum_{i=1}^n (\prod_{j=1}^n a_{ij}^*)^{1/n}} \quad i, j = 1, 2, \dots, n \quad (16)$$

3. Applying the Proposed Methodology

As mentioned before, according to the decision problem presented in Section 1, in this section, the proposed methodology on an actual case in one of the biggest Car Company (SAIPA) in Iran is implemented. SAIPA is one of the few largest automobile manufacturers in the Middle East. Since 1966, SAIPA has produced different passenger cars such as SABA, SAIPA111, SAIPA 132, SAIPA 141, Rio and Xantia as well as the New Local Brand, TIBA, which is on the way for mass production. The production volume reached 520,000 vehicles in 2008 capturing more than 53% of the local market share in the passenger car segment and resulting in a turnover of more than 4.2 billion US\$.

According to the strategic plan of SAIPA, the production volume of the year 2011 will amount to 720,000 vehicles. The main factory is located on the suburb of Tehran, Iran. The company's strategy is to improve infrastructure of information system technology to continue progress pace in its competitive advantage and achieve higher market share. The brand strategy is one the important plan for this company. The company's managers have decided to implement the successful planning for their brand strategy. Therefore, when we construct the AHP model, the first element is to look for the criteria. After reviewing, the literature shows that different organizations may want to consider different criteria and strategies, but in our actual case, the management convenes a meeting to study the criteria, experts finally considered seventeen criteria.

For this problem, after some debate, the task force depicts a hierarchy structure as illustrated in Figure (2). The fuzzy decision matrices for intangible criteria and brand strategies to select the most important criteria are attained from a verbal questionnaire filled by thirty different experts who had work in IT field at the SAIPA Company and then converted to fuzzy numbers based on scales mentioned in Table (1) for Fuzzy AHP. Information about tangible criteria and brand strategies is collected documents, which were existent in the organization.

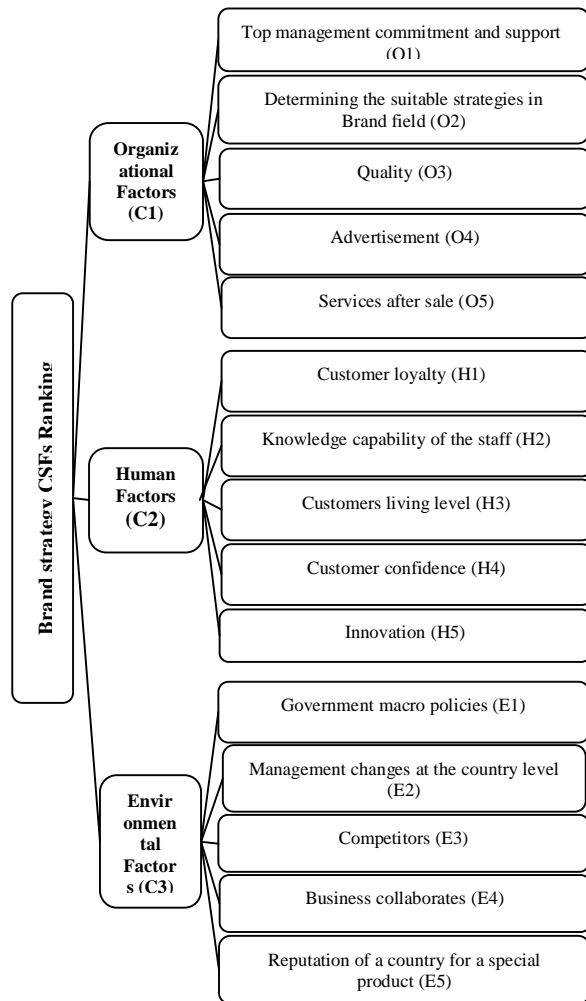

Figure 2. Hierarchy structure for Critical success factors of the brand strategies

Step1: Find Criteria and Alternatives and Establish hierarchical structure

The first step of analytical hierarchy process is to find criteria and alternatives using expert judgment and literature reviews. In this section, fifteen criteria have been identified for the problem.

These criteria are categorized into the three aspects such as Organizational, Human and Environmental. After that, decision makers will establish hierarchical structure. The hierarchical model should be able to break the existing complex decision problem into manageable components of different layers/levels. Different layers of the hierarchy structure are sketched in Figure .2.

Step 2: Gather experts' judgments based on fuzzy number and establish fuzzy pair wise comparison matrix

In this step the pair-wise comparison matrices for main and sub criteria are gathered from a verbal questionnaire filled by thirty experts in the SAIPA Company. Then these verbal pair-wise comparison matrices are replaced with correspondent triangular fuzzy numbers. For example, the integrated fuzzy comparison matrix for all evaluators of three main criteria with respect to the goal node is shown in Table 3.

Table 3. The integrated fuzzy comparison matrix for all evaluators of three main criteria with respect to the goal node

	C1			C2			C3		
	<i>l</i>	<i>m</i>	<i>u</i>	<i>l</i>	<i>m</i>	<i>u</i>	<i>L</i>	<i>m</i>	<i>u</i>
C1	1	1	1	2.97	3.71	4.37	2.21	2.72	3.21
C2	0.22	0.26	0.336	1	1	1	1.09	1.37	1.73
C3	0.31	0.36	0.45	0.57	0.72	0.91	1	1	1

Step 3: Calculate Consistency rate (C.R.)

As mentioned above in step 3 of the proposed methodology, if $\tilde{A} = [\tilde{a}_{ij}]$ be a fuzzy judgment matrix with triangular fuzzy number (e.g. data in Table (3)), to calculate consistency rate, firstly we form $A = [m_{ij}]$. Then the consistencies of fuzzy judgment matrix (Table (3)) are evaluated using Equations (4-5) and (17) is used to determine maximum eigenvalue (λ_{max}). For the data in Table (3) we have:

$$\lambda_{max} = 3.0444 \quad C.I. = \frac{\lambda_{max} - n}{n - 1} = \frac{3.0444 - 3}{3 - 1} = 0.0222$$

and CR ; 0.0383 < 0.1

Step 4: Test Consistency Rate

If judgments of the evaluators were inconsistent, we asked them to repeat the pair-wise comparison processes until the consistency index was less than 0.1. The result shows that the decision

matrix for the second level of the proposed hierarchical structure for all evaluators is consistent.

Step 5: Defuzzify each expert's Judgment using CFCS Method

After the fuzzy matrix is made and consistency test is satisfied, CFCS method is applied to carry out defuzzification (Opricovic and Tzeng, 2003). After ensuring the consistency of the data in Table (3), data in this table should be defuzzified to calculate the final weights of criteria.

Step 6: Calculate integrated matrix values, weights and final ranking

When all thirty evaluators' judgments are defuzzified and passed the consistency test, firstly Equations (14-15) are applied to calculate integrated crisp matrix. Then, in the final step, Equation (16) is applied for computing the final weights of criteria in level 1, 2 of Hierarchy. Table (4), (5) shows the aggregate crisp judgment matrix and weights of main and sub criteria in Level 1, 2, respectively.

Table 4. Aggregate crisp judgment matrix with respect to Level 1 for thirty experts

	C1	C2	C3	Weights (Ranking)
C1	1	3.654199	2.711263	0.768 (1)
C2	0.270271	1	1.39932	0.135 (2)
C3	0.369396	0.735721	1	0.097 (3)

Table 5. Aggregate crisp judgment matrix with respect to Level 2 for thirty experts (Organizational Factors)

	O1	O2	O3	O4	O5	Geometric Mean	Weights (Ranking)
O1	1	0.981412	0.612884	1.118005	0.866358	0.165	0.127 (4)
O2	1.035285	1	0.585769	2.114881	0.62912	0.176	0.135 (3)
O3	1.659517	1.742758	1	3.823217	2.007752	0.341	0.262 (1)
O4	0.913721	0.480371	0.258689	1	0.406764	0.099	0.076 (5)
O5	1.177449	1.621319	0.500993	2.501764	1	0.219	0.168 (2)

For another criterion in the level 2 the same calculations have been carried out. As a result of the calculations based on table (4), the weights of five criteria of level 2 i.e. Top management commitment and support, determining the suitable strategies in Brand field, quality, advertisement, services after sale are 0.127, 0.135, 0.262, 0.076 and 0.168, respectively. For sub-criteria in level 2 step 2 to 6 are performed. By multiplying weights of level 1 in level 2 (Sub-criteria), global weights are determined. The final rank in per environment is shown in Table (6).

Table 6. Final ranking of criteria

ID	Weights	Final ranking in each environment	Final ranking
O1	0.127	4	4
O2	0.135	3	3
O3	0.262	1	1
O4	0.076	5	5
O5	0.168	2	2
H1	0.023	4	10
H2	0.028	3	8
H3	0.014	5	14
H4	0.031	2	7
H5	0.045	1	6
E1	0.025	1	9
E2	0.02	3	12
E3	0.022	2	11
E4	0.017	4	13
E5	0.014	5	15

According to the obtained results, the third criterion (O3) has the highest weight and is the most proper brand strategies factor according to the experts' judgment. Therefore, the priorities for all criteria are in the following order: O3, O5, O2, O1, O4, H5, H4, H2, E1, H1, E3, E2, E4, H3 and E5. In order to better understanding the results of this ranking, results are sketched in Figure (3).

Figure 3. Graphical priorities of criteria

The results have clearly demonstrated that Quality is critical to succeed. Besides, the results show that another important criterion for successful brand strategy is Services after sale. In addition, determining the suitable strategies in Brand field is a vital criterion in this regard. On the other hand, Top management commitment and support is a crucial criterion. Furthermore, advertisement should be considered for succession of the brand strategies. Finally, it should be mentioned that all organization should be noted that these criteria which has important role to success the brand strategies.

4. Conclusions

A brand extension strategy in an organization has some benefits. Yet in many cases, failure rates of brand extension strategies have reported. In order to reduce the failure rate of brand extension strategies and also better understanding of the mentioned strategies, several studies have conducted. However, most of those studies as mentioned simply list factors and are lacking in the systematic efforts and technical background to classify and evaluating factors. To evaluate the priority of CSFs, MCDM method could be useful. Hence, AHP method as a MCDM technique in this problem could be applied. In this paper, a practical framework for evaluation and selecting CSFs of brand extension strategies based on fuzzy analytical hierarchy process has been applied. Applying AHP method under fuzzy environment by giving the experts opinions could lead us to realistic decision-making process. The results of this study shows that "Quality", "Services after sale", "Determining the suitable strategies in Brand field", "Top management commitment and support" and "Advertisement" is the top five CSFs. These results could be very useful in other similar cases. For the extension of this study, other fuzzy AHP methods can be used. In addition, various methods of multi-criteria evaluation such as TOPSIS and Data Envelopment Analysis (DEA), in the fuzzy environment can be applied.

Abstract: FT-IR spectroscopic technique was used to evaluate the chemical composition, lycopene, β -carotene and some adulterants (starch, allura red pigment and paprika) of tomato products as a fast technique in comparison with standard methods. The results indicated that, sensory evaluation and color parameters of Hunter measurements (L^* , a^* & b^*) represent color value but the quality of tomato natural pigment (lycopene) not identified. FT-IR spectra of adulterated tomato paste with starch showed spectral peaks at (1137 cm^{-1} and 1040 cm^{-1}) while, in adulterated paste with paprika revealed some peaks at 641 cm^{-1} for stretching (CH_2 , CH) and at 1520 cm^{-1} for vibrational stretching of ($\text{C}=\text{C}$). Ketchup was characterized with stretching ($\text{C}-\text{O}-\text{C}$) at 1279 cm^{-1} . Adulterated tomato paste with paprika characterized with total phenolic compounds (42.7 ± 2.3) and high antioxidant activity ($78.3.8\%\pm 2.9$). The effect of processing on the volatile components present in tomato paste, ketchup and adulterated tomato paste with starch or paprika has been studied by gas chromatography (GC) and gas chromatography-mass spectrometry (GC/MS). The most predominant volatiles were saturated and unsaturated 6-carbon aldehydes and alcohols. Hexanal and (*Z*)-3-hexen-1-ol, (*Z*)-3-hexenol, 5-methyl-5-hexen-2-ol and 1-hexanol were present in significant concentrations in all samples. Methyl-(2-hydroxy-3-methyl)-valerate and methyl-(2-OH)-iso-methyl valerate were generated in tomato paste with high concentration (1.0 and 4.25%), respectively.

Keywords: Fourier Transformer; Infrared Spectroscopy; Quality Assurance; Tomato

1. Introduction:

Tomato (*Lycopersicon esculentum*) is one of the most consumed fruits in the world, either as a raw fruit or as a processed product. In fact, in the entire world, tomatoes are second only to potatoes in economic importance and consumption and are used in the foodstuff industry as raw material for the production of several products such as juices, sauces, purees, pastes, and canned tomatoes. In recent decades, the consumption of tomatoes has been associated with the prevention of several diseases (Sharoni & Levi, 2006 and Wilcox et al., 2003) mainly due to the content of antioxidants, including carotenes (lycopene as well as β -carotene), ascorbic acid, tocopherol, and phenolic compounds (Periago et al., 2009). Lycopene is a hydrocarbon carotenoid, $\text{C}_{40}\text{H}_{56}$, with molecular weight 537.

Lycopene has been shown to have strong antioxidant activity; it exhibits the highest physical quenching rate constant with singlet oxygen; it induces cell-to-cell communication; and it modulates hormones, immune systems, and other metabolic pathways (Rao & Agarwal, 1999). Phenolic compounds exhibit a wide range of physiological properties, such as anti-allergenic, antiatherogenic, anti-inflammatory, anti-microbial, antioxidant, antithrombotic, cardioprotective, and vasodilator effects (Balasundram et al., 2006). Whereas

tocopherol and ascorbic acid are recognized as antioxidant vitamins and heat-labile compounds, lycopene and phenolic compounds are more resistant to thermal processing, being the main antioxidants in processed products. Related to the distribution of both compounds in tomatoes, it is recognized that the peel of tomato is richer in lycopene and phenolic compounds than the pulp (George et al., 2004).

Carotenoids are a group of pigments, varying from yellow to red in color, widely distributed in the vegetable and animal kingdoms. It is estimated that more than 100 million tonnes of these pigments are produced annually in nature, in which they serve as ancillary pigments in photosynthesis, antioxidants, membrane stabilizers, and phytohormone precursors (Fraser et al., 2007).

Monitoring quality of tomatoes is very important at all levels of the industry, including the breeding programs, the agricultural productions, and the postharvest managements as well as processing. Several different parameters such as soluble solids, dry matter, acidity, contents of sugars and organic acids are often used to assess the quality of tomatoes. Sugars and organic acids, which are responsible for the sweetness and tartness and influence on tomato flavour, are the major factors affecting consumer acceptability (Baldwin et al., 2008).

Soluble solids and dry matter are very important for the food industry, affecting processing yield of many tomato products such as pulp, paste and concentrate, which are evaporated to a definite percentage of solids (Gould, 1992). In consideration of the role played by sugars and acids contents in the definition of tomato quality, several analytical techniques have been developed to evaluate these parameters. However, traditional methods are not well adapted to on-line and require an expensive and time consuming sample preparation. Thus, the tomato production sector is interested in development of analytical method allowing simultaneous measurement of a large number of samples for routine quality control program.

The volatile compounds present in fresh and processed tomato are included in various chemical classes such as ketones, aldehydes, alcohols, esters, ethers, hydro- carbons, sulfur, nitrogen and oxygen compounds, phenols, oxygen-containing heterocyclic compounds, free acids and lactones (Linforth et al., 1994). Different methods, such as distillation, solvent extraction, head-space analysis and the solid phase micro-extraction (SPME) have been proposed to analyse volatile compounds in foods (Zhang and Pawliszyn, 1993). The SPME is a relatively new method that can be used to evaluate the volatile compounds present in the vapour and/or in the liquid phase of solid and liquid foods (Servili et al., 1998).

During processing the endogenous enzymes catalyze the formation of important compounds of tomato flavour. In fact saturated and unsaturated C6 and C9 alcohols and aldehydes, that are impact compounds of fresh tomato, are originated by lipoxygenase activity, while terpene and carotenoid derivatives can be released from odourless glycosidic compounds by glycosidase activities (Charron et al., 1995). The tomato processing includes thermal treatments applied to inactivate enzymes (blanching) or to stabilize the product (sterilization) that cause changes in sensory and nutritional characteristics of tomato derivatives due to co-oxidation reactions of carotenoids and Maillard reaction (Baldwin, 1996).

Separation and quantification of tomatoes components has been widely studied, and currently relies heavily on analysis by HPLC (Barba et al., 2006). Although reliable and accurate, this method is time consuming, requires extensive sample preparation, and uses and disposes of hazardous organic solvents. New techniques such as matrix-assisted laser desorption ionisation time-of-flight mass spectrometry, and one- and two-dimensional NMR have been successfully evaluated for profiling carotenoids in tomatoes (Fraser et al., 2007).

While relatively rapid and specific, these techniques are complex and rely on costly equipment

that limits their application to laboratory environments.

Vibrational spectroscopy, on the other hand, represents a cost effective simple alternative for the rapid profiling of carotenoids that could easily migrate to in-field applications thanks to the development of FT-IR and Raman portable devices. Rapid spectroscopy techniques for the evaluation of carotenoids have been developed, including the application of resonance Raman spectroscopy, mid-infrared (Halim et al., 2006) and near-infrared spectroscopy (Baranska et al., 2006). These novel quantification techniques could be improved with the development of a rapid and simple profiling method that can identify both components in tomatoes and their concentrations.

In the present study, the authors investigate the changes of chemical compositions and volatile components in tomato products by using GC and GC-MS. Spectroscopic techniques as FT-IR and FT-Raman used as fast methods to evaluate the chemical composition of tomato products and investigate the adulterants in tomato products.

2. Materials and Methods

Dichloromethane, sodium sulphate anhydrous, starch, gallic acid, 1,1-diphenyl-2-picrylhydrazyl (DPPH), tert-butyl hydroquinone (TBHQ), acetone, hexane, ethanol, β -carotene, allurared pigment, Folin-Ciocalteu reagent, *n*-alkanes and methanol, were purchased from (Aldrich and sigma company, Germany), standard lycopene was obtained from (Commercial Quimica Masso, S.A. Barcelona, Spain); Starch and paprika purchased from local market.

Fully matured tomatoes were procured from local market. Natural tomato juice, paste, ketchup and adulterated tomato paste with paprika, synthetic color (allura red) and starch were prepared in food technology Lab., National Research Centre as follows:

Tomato Juice and Paste

Fresh tomatoes were washed, crushed, scalded at 90°C for 5 min, and juice was obtain in the usual way after sieving and then sterilized at 100°C for 30 min, filled in bottle then cooled. The obtained tomato juice transferred to an open kettle which was heated until the concentration of the paste reached to > 25 brix, then filled in bottle and cooled (Apaiah and Barringer, 2007).

Ketchup:

The basic formulation of tomato ketchup was prepared as described by Srivastava (1982). Tomato pulp (4.7% TSS) was mixed with spices (sodium chloride, red chilies), onion and garlic pulp; heated on a low flame with constant stirring till 23%

TSS, then vinegar was added to the mixture and the ketchup was heated until the final TSS was reached. The thickening agents (starch) were pre-blended with the sugar and salt and added to the ketchup during the final stages of cooking, then hot ketchup filled in glass bottles and stored at ambient temperature (30°C) up till use.

Physico-chemical Analysis:

Tomatoes and their products were analyzed for Total Soluble Solids (TSS) using Digital Hand-held "Pocket" Refractometer; and pH was measured by digital pH meter, (Hanna, Italy). Also, Moisture, crude protein content, lipid content, and ash were estimated using AOAC (1990).

Extraction of lycopene

For extracting lycopene, 1 g of homogenized fresh or semi-dried tomato sample was weighed into a screw-top, which was covered with aluminum foil to exclude light and the lycopene from the samples was extracted using the method of Sadler et al (1990). In brief, a 25 ml mixture of hexane-acetone-ethanol (2:1:1, v: v: v) was added to the samples, which were then placed on the rotary mixer for 30 min. Agitation was continued for another 2 min after adding 10 ml of distilled water. The solution was then left to separate into distinct polar and non-polar layers and then the hexane layer was collected in a 50 ml flask.

The residual solids were re-extracted to ensure complete extraction of lycopene. The absorbance of the combined hexane layers was measured at 472 nm on UV-Vis recording spectrophotometer (UV-2100, Shimadzu) using hexane as a blank. The purity of the extracted standard lycopene was checked using its extinction coefficient ($E_{cm}^{1\%}$) of 3450 (Davis, 1976) and a standard curve was prepared. The amount of lycopene in the tomato samples was determined from this standard curve, and the results were expressed as mg/100 g.

Total carotenoid content

Total carotenoids were determined using the modified method described by Koca et al (2007). Extractions were carried out using 25ml of hexane: acetone (7:3) and 0.5 g of freeze dried sample using conditions described for antioxidant extractions. The residue was re-extracted until it became colorless. The filtrates were combined in a separating funnel and washed with 50 ml distilled water. The water phase was discarded and Na₂SO₄ (10 g) was added as desiccant. The hexane phase was transferred to a 50ml volumetric flask and brought to volume with hexane. The absorbance of this solution was then determined at 450 nm using a UV-Vis spectrophotometer. External calibration with authenticated β -carotene standards solutions (0.5 μ g/ml–10 μ g/ml) in hexane: acetone (7:3) was used to

quantify carotenoids in the solutions. Carotenoid content was expressed as β -carotene equivalents (β CE) in mg/100 g dry weight of sample.

Total phenolics content (TPC)

Total phenolics in tomato paste, ketchup and adulterated tomato paste with paprika or starch were measured by the method adapted from Spanos and Wrolstad (1990). In brief, the extracts were appropriately diluted and then oxidized with 2.5 ml of freshly diluted 0.2 M Folin-Ciocalteu reagent. This reaction was neutralized by adding 2.0 ml of 7.5% w/v sodium carbonate, and the samples were vortexed for 20 sec. The samples were then incubated at 45 °C for 15 min and the absorbance of the resulting blue color was measured at 765 nm on an UV-Vis recording spectrophotometer (UV-2100, Shimadzu). Gallic acid was used as a standard, and results were expressed as gallic acid equivalents (GAE) per 100 g fresh weight (FW). The results were corrected for the contribution of ascorbic acid to the total phenolics as described by Toor (2004).

Antioxidant activity by DPPH method

The hydrogen atom or electron-donation ability of the corresponding extracts/ fractions was measured from the bleaching of a purple-colored methanol solution of DPPH. The antioxidant activity of the extracts/fractions, on the basis of the scavenging activity of the stable 1,1-diphenyl-2-picrylhydrazyl (DPPH) radical, was determined by the method described by Gordon et al (2001). A methanolic solution (100 μ L) of the extracts/ fractions was placed in a cuvette and 0.5 ml of a methanolic solution of DPPH (50 mg DPPH/100 ml MeOH) was added. After 30 min absorbance at 515 nm was determined using a spectrophotometer (Shimadzu Co. Ltd., Kyoto, Japan), all determinations were performed in triplicate.

Instrumental Color Analysis

Color measurement (L^* , a^* , b^*) were measured using Hunter Lab. This color assessment system is based on the Hunter L^* , a^* and b^* coordinates. L^* was representing lightness and darkness, $+a^*$ redness, $-a^*$ greenness, $+b^*$ yellowness and $-b^*$ blueness (Hunter, LabScan XE - Reston VA, USA). The instrument was standardization against a White Tile of Hunter Lab Color Standard (LX No.16379): $X=77.26$, $Y=81.94$ and $Z=88.14$ before each measurement.

Infrared and Raman spectroscopy

The spectra or fingerprints of the selected samples were obtained using FT-Raman and/or FT-IR spectroscopy. The samples of FT-IR (FT-IR-6100

Jasco, Japan) were prepared by using potassium bromide disks. FT-Raman spectra were obtained using a Nicolet Raman module 32B (Madison WI, USA) and ND-YAG laser source operated at 1064 nm with a maximum power at 0.7w.

Preparation of volatile concentrate by simultaneous steam distillation-extraction (SDE)

The author used the simultaneous steam distillation-extraction (SDE) described by Shultz et al. (1977) which used the modified apparatus of Nickerson and Likens, in order to collect the volatile components from tomato products. 200 gm of tomato products was placed in 1 L round flask. The volatiles were extracted by using (DCM) and the extracts were concentrated by using rotary evaporator. The obtained concentrates were analyzed using gas chromatography and gas chromatography-mass spectroscopy.

Analysis of the volatiles

Gas chromatography

The obtained volatiles samples were thermally desorbed, using a modified injector port, directly on the front of a (DB5) (60 m x 0.32 mm i.d) fused silica capillary column, in the oven of a Hewlett-packed HP 5890 gas chromatography, and temperature increase from 45 -240°C by the rate 2°C/min. Kovat's indices were determined by co-injection of the sample with a solution containing homologous series of n-hydrocarbons (C₆-C₂₄) under the same conditions as described above. The separated components were identified by matching with NIST mass -spectral library data, and by comparison of Kovat's indices with those of authentic components and with published data (Adams, 1995). RI of each compound was calculated from the standard n-alkane retention time and the peak retention time using the following equation.

$$R. I = [Rt_x - Rt_n / Rt_{n+1} - Rt_n] \times 100.$$

Where, RI = retention indices.

Rt_x = retention time of sample.

Rt_n = retention time of n-alkane before peak.

Rt_{n+1} = retention time of n-alkane after peak.

n= carbon number of n-alkane before peak.

3.4.2. Gas chromatography- mass spectrometry (GC-MS)

Analyses were performed on An HP model 6890 GC interfaced to an HP 5791A mass selective detector (GC/ MS) was used for mass spectral identification of the GC components at (MS) ionization voltage of (70 eV. A 30 m x 0.25 mm i.d). (DF = 0.25 lm) DB wax bonded-phase fused-silica capillary column was used for (GC). The linear velocity of the helium carrier gas was 30 cm/s. The injector and the detector temperatures were 250 °C. The oven temperature was programmed from 40 to 240 °C at 4 °C/ min and held for 50 min.

Statistics

All data is reported as mean ± standard error of the mean for three replicates. One-way analysis of variance (ANOVA) was used and the least significant difference (LSD) at *p* < 0.05 was calculated (Genstat, 2000) to determine significant differences between the different fractions of tomatoes. Two-way analysis of variance was also performed to study the interactions between tomato paste and adulterated tomato samples.

3. Results and discussion

Table (1) showed the proximate gross chemical composition of tomato and their products. Fresh tomato and its juice had higher moisture content accompanied with lower other contents. Thermal concentration of tomato products caused a reduction in moisture contents (71.43 and 72.33% in ketchup and tomato paste), while adulterant tomato paste with starch led to a higher decline in moisture content (60.33%) and increment in total carbohydrate (30.5%). These results indicated that gross chemical composition unable to detect adulterant paste with paprika; on contrary adulterant paste with starch showed higher carbohydrate content.

Table (1): Chemical composition of tomato and their products.

Sample	Moisture	Protein	Fat	Ash	Carbohydrate
Tomato	92.57±1.32	1.2±0.09	0.22±0.01	1.28±0.03	4.5±0.2
Juice	93.6±1.05	0.8±0.1	0.23±0.10	1.1±0.1	4.3±0.2
Ketchup	71.43±0.6	3.0±0.25	0.5±0.02	1.4±0.01	22.7±0.3
Paste	72.33±0.55	4.4±0.30	2.4±0.2	2.73±0.25	18.5±0.15
Adulterated Paste					
Paste+paprika	71.3±0.55	4.4±0.30	2.4±0.2	2.73±0.25	18.5±0.15
Paste+starch	60.33±0.5	3.2.4±0.2	2.4±0.2	2.73±0.20	30.5±0.17

Table (2) indicated that, TSS and pH were in accepted range; and tomato ketchup records a high

value of TSS (30.3) followed by tomato paste. Also, TSS was unable to detect adulterant tomato paste.

Table (2): Total soluble solids (TSS) and pH of tomato paste, ketchup and adulterated tomato paste with starch and paprika products.

Parameter	Fresh Juice	ketchup	Tomato Paste (Control)	Adulterated Tomato paste	
				(+) Starch	(+) Red pepper
TSS	4.07	30.3	25.79	25.53	23.56
pH	3.56	3.08	3.86	3.89	3.84

Lycopene is the major carotenoid pigment found in ripe tomato fruits and responsible for their characteristic red color. Sensory and instrumental techniques are used to determine the color of food products. Data in Table (3) showed the color variation of tomato and tomato products as affected by heat treatments or by adulteration the color with

synthetic, allura red or thickener agent (starch). The highest redness value (a^*) was found in tomato paste that treated with synthetic pigments (allura red). This result indicated that, the color parameter of Hunter measurements (L^* , a^* & b^*) represent color value but the quality of tomato natural pigment (lycopene) not identified.

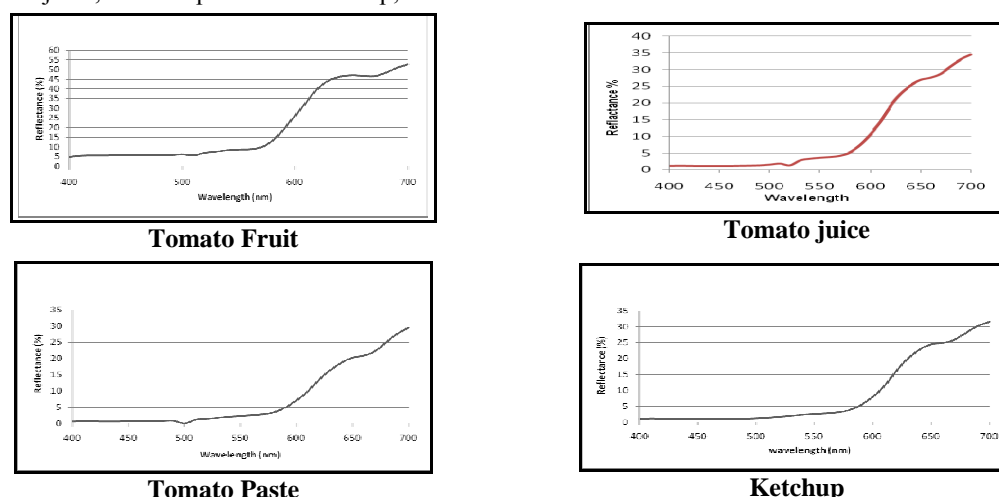

Table (3): Hunter color parameter of tomato fruits, Tomato juice, tomato paste, ketchup and adulterated tomato best with thickener agent (starch) or color agent (red pepper)

Sample	L^*	a^*	b^*
Tomato fruit	30.75 ^c ±0.116	30.9 ^d ±2.15	25.57 ^f ±1.11
Tomato pulp	46.62 ^a ±0.215	27.48 ^f ±1.09	30.03 ^b ±2.48
Tamato juice	43.63 ^b ±0.419	33.57 ^c ±0.89	26.28 ^{ef} ±0.4
Tomato Paste	27.88 ^d ±0.049	36.11 ^b ±0.23	26.98 ^{def} ±0.129
Ketchup	25.26 ^e ±0.0552	31.5 ^d ±0.12	26.98 ^{def} ±0.194
Adulterated Tomato Paste:			
Tomato Paste + starch	30.51 ^c ±0.056	34.64 ^c ±0.2	27.18 ^{de} ±0.1
Tomato Paste + Paprika	25.54 ^e ±0.045	28.3 ^{ef} ±0.024	27.98 ^{cd} ±0.067

Tomato Paste + Allura red	25.63 ^e ±0.344	36.27 ^b ±0.09	29.31 ^{bc} ±0.1
LSD at 0.05	0.586	1.43	1.45

L^* = lightness a^* = Redness b^* = Yellowness

Since lycopene is a phytonutrient, so the quality control requires the ability to measure lycopene in tomato product. Hunter color instrument was used to evaluate reflectance spectra of tomato fruits, tomato juice, tomato paste and ketchup; and

illustrated in Figure (1). The obtained reflectance spectra of tomato and their products were characterized by a sharp enhancement in 600 and 700 nm till reached 35% reflectance.

**Figure (1): Reflectance of tomato fruit, tomato juice, tomato paste and ketchup.**

Figure (2): UV-visible spectrophotometer scanning of fresh tomato juice, tomato paste and ketchup.

Table (4): Total carotenoids of tomato products.

Tomato products	Total carotenoids (mg/100g)
Tomato Juice	6.74
Tomato Paste	34.31
Ketchup	8.71

The previous results concluded that, traditional methods were not quite enough to identify adulterated products with pigments in tomato products. But, there are chromatographic methods to detect nature and synthetic pigments as Gas Chromatography (GC), Gas Chromatography-Mass spectroscopy (GC-MS) and High performance liquid chromatography (HPLC). These methods are expensive and time consuming due to their extraction technique, purification (clean up) and different types of detector. Mid-infrared spectroscopy have been frequently proposed (Rubio-Diaz et al., 2010) as alternatives to HPLC for the simple, high-throughput and cost effective analysis of tomato carotenoids. This study aimed to evaluate and detect main finger prints of tomato and their products referred to lycopene pigment, so they were measured directly as shown in Table (5) or extracted as shown in Table (3).

FT-IR spectral peaks (Table 5 & Fig 3) of all samples showed stretching OH, stretching C=C of lycopene, aliphatic CH at (3437-3426 cm^{-1}), (1635-1637 cm^{-1}) and (1410 - 1414 cm^{-1}), respectively. While the band at 1150 cm^{-1} found in fresh tomato and tomato juice; and also stretching CH_3 of polyene system (1033-1037 cm^{-1}) was detected in them. The other bands of carbohydrates were identified in ketchup only.

Moreover, UV-visible spectrophotometer (Choudhary et al., 2009) was used to evaluate natural pigment (lycopene) in tomato and their products. Tomato and their products showed three strong peaks at 450, 470 and 500 nm as shown in Figure (2). Table (4) showed the total carotenoids of some tomato products, where tomato paste was the highest carotenoids value (34.31 mg/100g) among other products. On the other hand, synthetic pigment (anthocyanine and allura red) that used to adulterate tomato products not detected by spectrophotometer method because they found as pigment salts.

Table (6) and Figure (4) showed FT-IR spectra of standard lycopene and extracted fresh tomato, tomato juice, tomato paste and ketchup. Standard lycopene was characterized with specific spectral functional bands as stretching CH symmetric and asymmetric (2921 and 2854 cm^{-1}), stretching vibration of cis-vinylene (1630 cm^{-1}), deformation CH_3 , trans-R-HC=CH-R (970 cm^{-1}). Fresh tomato, tomato juice, tomato paste and ketchup extracts showed different spectral function groups in the region (2920-2924 cm^{-1}) to (1381-1390 cm^{-1}) which attributed to stretching CH symmetric and asymmetric, stretching vibration of cis-vinylene, deformation CH_3 . While, ketchup extract was characterized with multiple trans-double bond at (920 cm^{-1}).

Figure (3): FTIR spectra of standard lycopene pigment, fresh tomato and its products.

Table (5): FT-IR assignments of fresh tomato and their products.

Assignment	Fresh Tomato	Tomato Juice	Tomato Paste	Ketchup
OH stretching	3430	3437	3425	3426

FT-IR spectroscopy was applied to identify lycopene content in adulterated tomato paste with paprika. Table (7) and Figure (5) represents the FT-IR spectra of tomato products. The strong absorption of lycopene pigment was matched with fresh tomato juice and their products as tomato paste with paprika and ketchup. Fresh tomato juice, ketchup and paste contain the following functional groups as OH stretching ($3442-3446\text{ cm}^{-1}$), $-\text{CH}_2$ vibrational symmetric, vibrational stretching $\text{C}=\text{C}$ ($1634-1640\text{ cm}^{-1}$). However, amide II, CH_2 of trans-lycopene, CH_3 attached with polyene system appeared at ($1541-1550\text{ cm}^{-1}$), ($1458-1465\text{ cm}^{-1}$), ($1385-1390\text{ cm}^{-1}$),

respectively. The CH stretching of adulterated paste with paprika showed CH_2 , C-C-H and C-OH stretching of carbohydrates (Inbaraj and Chen, 2008). The lycopene pigment was assigned with specific spectral bands with the region ($3450-960\text{ cm}^{-1}$). The 960 , 1082 , 1156 and 1444 cm^{-1} were belonged to R- $\text{CH}=\text{CH}-\text{R}$, CH_3 attached with polyene system, stretching C-C, vibrational CH_3 of lycopene molecule and vibrational symmetric of lycopene. Vibrational $\text{C}=\text{C}$, CH_2 stretching symmetrical and asymmetric were found at specific wave number at 1643 , 2856 , 2924 cm^{-1} , respectively (Irudayaraj and Tewari, 2003).

Figure (5): FT-IR spectral (cm^{-1}) assignment of lycopene, fresh tomato juice, paste + paprika and ketchup.

Table (7): FT-IR spectral (cm^{-1}) assignment of standard lycopene, and extracted fresh tomato juice, paste with paprika and ketchup

Assignment	Lycopene	Tomato Juice	Paste+Paprika	Ketchup
Stretching OH	3450	3442	3430	3446
CH_2 asymmetrical	2924	2923	---	2924

CH_3 stretching of polyene system	---	1036	---	1022
R- $\text{CH}=\text{CH}-\text{R}$ of lycopene	960	---	---	---
Stretching CCH, C-OH	---	920	---	---

Confirmation of the authenticity of a food or food ingredient is an increasing challenger for food processors and regulatory authorities. Table (8) shows the IR spectra of allura red, and adulterated tomato paste with allura red pigment. The obtained FT-IR spectra attributed to spectra of specific function groups as well as vibrational $\text{C}=\text{C}$ stretching 1631 , 1633 cm^{-1} and vibration C-C stretching at 1048 , 1063 cm^{-1} in pigment and adulterated tomato

paste with allura red pigment, respectively (Bureau et al., 2009).

Confirmation of the authenticity of a food or food ingredient is an increasing challenger for food processors and regulatory authorities. So, FT-IR spectroscopy was used to detect starch or paprika that could be added to tomato paste. Tomatoes and various product derived from processed tomatoes are the major source of lycopene, a polyenic

chromophore with trans RH-C=CHR groups, other micronutrients and carotenoids such as β -carotene are present in tomato fruit. In addition, Table (9) and Figure (6) show some difference in FT-IR spectra of tomato paste that mixed with starch or paprika.

Starch carbohydrate peaks at 1137 cm^{-1} and 1040 cm^{-1} detected in paste that mixed with starch only. While, mixed tomato paste with paprika showed specific spectral peaks located at 641 for stretching (CH_2 , CH) and 1520 cm^{-1} for vibrational stretching of (C=C).

Table (8): FT-IR assignments of adulterated tomato paste with allura red.

Assignment	Allura red	Tomato Paste with allura red
NH stretching in allura red	3444	-----
Stretching C=C aromatic	1631	1633

Total phenolic content

Polyphenolic compounds, carotenoids and lycopene are very important tomato and its products constituents, by virtue of their antioxidant activity by chelating redox-active metal ions, inactivating lipid free radical chains and preventing hydroperoxide conversion into reactive oxyradicals. Table (10) summarizes the contents of total phenolics, expressed as gallic acid equivalents (GAE), either as mg GAE g^{-1} or mg GAE/100 g^{-1} , found in the extracts. These values were obtained from the absorbance of the extracts treated with Folin-Ciocalteu reagent.

These data indicate the TPCs of the tested tomato extracts, which could strongly account for the antioxidant activities of the samples. phenolic compounds react with Folin-Ciocalteu reagent only under basic conditions ($\text{pH} \sim 10$) due to a much higher reactivity of the phenolate anion with the molybdenum-based compounds present in the reagent (Huang and Prior, 2005). TPCs of tomato paste with paprika showed highly TPCs followed with tomato paste, tomato paste, tomato paste and ketchup, respectively with (42.7 ± 2.3 , 33.1 ± 2.7 , 32.3 ± 1.8 and 29.1 ± 1.8 GAE/100 g). George et al. (2004) reported that the phenolic content in the tomato genotypes

ranged from 9–27 mg catechin equivalents/100 g; and in pulp and tomato products the phenolic content ranged from 12-32 mg catechin equivalents/100 g.

the high TPCs in tomato paste with paprika may due to lycopene, carotenoids and capsenoids contents.

Table (10): Total phenolic contents in tomato products

Samples	mg GAE/100 g ⁻¹
ketchup	29.1±1.8
Tomato paste	33.1±2.7
Tomato +paprika	42.7±2.3
Tomato paste +starch	32.3±1.8

Antioxidant activity by DPPH method

Table (11) shows the antioxidant activity of tomato products (tomato paste, ketchup and adulterated samples with starch or paprika pepper) as measured by the DPPH assay. The addition of tomato extracts and TBHQ at various concentrations (50, 100, 200, 400 µg/ ml) respectively, prevented the decolourization of DPPH reagent to different degrees. The antioxidant activity was found to increase with the increase in concentration of tomato extracts. For the all tomato extracts, the increase of antioxidant activities were significant between 50µg/ ml and

100µg/ ml ($P < 0.05$), and 200 µg/ml and 400 µg/ ml ($P < 0.01$). The free radical-scavenging of tomato paste with paprika pepper was superior to all other extracts in dose dependent manner (78.3.8%±2.9, 70.8±2.3, 69.4%±2.3 and 67%±2.4) at 400µg/ml compared to TBHQ (99.5± 0.64 % at 400µg/ ml), a synthetic antioxidant widely used in food chemistry George et al. (2004). The highly antioxidant activity of tomato paste with paprika is due to the presence of lycopene, carotenoids and capsenoids and other phenolic compounds respectively.

Table (11): Antioxidant activity of tomato paste, adulterated tomato paste with paprika or starch and ketchup by DPPH scavenging assay

Samples	50 µg/ml	100 µg/ml	150 µg/ml	200 µg/ml
Tomato paste	18.9%±2.4	27.5%±2.7	42%±2.6	70.8±2.3
Tomato +paprika	22%±3.1	39%±3.0	57.5%±2.8	78.3.8%±2.9
Tomato paste +starch	19.7%±2.2	31.2%±2.5	52%±2.3	69.4%±2.3
Ketchup	15%±1.8	28%±2.8	40%±3.1	67%±2.4

Volatile components of tomato paste, ketchup and adulterated tomato paste with starch and paprika

Table (12) shows the relative amounts of most major volatile components obtained by SDE of tomato paste and other products. Tomato volatile compounds have been widely studied and until now, more than 400 volatile components were identified (Beltran et al., 2006). Their formation is the result of different biosynthetic pathways. For instant, saturated and unsaturated C₆-C₉ aldehydes and alcohols are a secondary metabolites originating from the lipoxygenase (LOX) pathways (Russo et al., 2010), while carotenoids and terpene derivatives are originated by glycosides activities (Servilli et al., 2000). These volatiles were identified by matching their recorded mass spectra with those present in the NIST library and comparison of their retention indices (RI) relative to (C₆-C₂₄) n-alkanes with those in the literature at the same chromatographic conditions.

The most predominant volatiles were saturated and unsaturated 6-carbon aldehydes and alcohols. hexenal and (Z)-3-hexen-1-ol, (Z)-3-hexenol, 5-methyl-5-hexen-2-ol and 1-hexanol were

present in significant concentrations in all samples, and contribute a green, leafy herbaceous aroma. These compounds have been previously associated with the characteristic green, tomato fruit-like aroma released by tomato leaves and present in processed tomato products (Buttery et al., 1993).

The reduction products, (Z)-3-hexen-1-ol and (Z)-3-hexenol, were observed at lower concentrations in adulterated tomato paste with paprika and starch and absent in tomato paste and ketchup; (Z)-3-hexen-1-ol was previously reported by Buttery and Ling (1993) to form in tomato via a reductase conversion pathway. Hexanal, one of the major aldehydes in tomato flavor and identified in tomato paste with high concentration rather than other tomato products with (4.1%), also is considered to be important for fresh tomato flavor (Buttery et al., 1989).

Hexanal is a contributor to the green, fatty component of tomato aroma. Similar to the unsaturated aldehydes, it is derived from a linoleic acid breakdown pathway. 1-Hexanol provides a winey, cider-like character and is produced via bio-reduction of hexanal. Other significant aldehydes include 8- to 10-carbon enals including 2-octenal, (E)-2-nonenal, and (E, E)-2, 4-decadienal, which

contribute fatty green aromatics. After the aldehydes, the largest volatile classes of compounds identified in tomato paste, ketchup and adulterated samples with paprika and starch were esters.

Among these were butyl, iso-butylacetate, butyl acetate, methyl-(2-OH)-valerate, methylhexanoate, methyl-(2-OH)-3-methyl iso-valerate, methylbenzoate, ethyldecanoate, linallyl valerate, ethyl-(*E*)-cinnmate and iso-propyl benzoate. Aromatic esters include methyl and propyl benzoate, and ethyl-(*E*)-cinnmate. Two unique hydroxy esters were identified by matches with the mass spectral library: methyl-(2-hydroxy-3-methyl)-valerate, and methyl-(2-OH)-3-methyl valerate the latter which was only found in cooked tomato paste.

Carotenoid-derived terpene compounds comprise a third class of volatiles identified in tomatillo flavor. The oxidative decomposition of carotenoids, particularly lycopene and p-carotene, has

previously been shown to lead to the formation of terpene and terpene-like compounds in tomato flavor (Buttery et al., 1989).

Unique terpenes identified in tomatillo include a-terpinolene, terpinen-4-ol, iso-eugenol and linalool oxide (in adulterated tomato paste with paprika), syringol geraniol (in adulterated tomato samples), linalool (in ketchup and adulterated tomato with starch), cadinene, β -isoabolol, β -terpinene. Identifications of other terpene-derived tomato volatiles previously reported in processed tomato products include 6-methyl-5-hepten-2-one, while eudesmol was found in adulterated starch samples with (8.76%). The amino acid-derived volatiles including 2-phenylethanol, pyridine. These compounds play a considerable role in cooked tomato flavor and are also present in the mature green stage of tomato development (Gabriella et al., 2011).

Table (12): Volatile components of tomato paste, ketchup and adulterated samples with paprika or starch

4. Conclusion:

The study suggested using FT-IR spectroscopy as a simple and fast technique for quality assurance of tomato products. The author used FT-IR technique to investigate the presence of adulterants in tomato paste such as synthetic colorants (allura red) and thickening agent (starch). Also, tomatoes paste, ketchup and tomato paste with paprika characterized with high phenolic and antioxidant compounds. Volatile components of tomato paste, ketchup and adulterated tomato paste

with paprika and starch were affected by thermal processing.

Abstract: Hard wheat flour and durum of different extraction level (whole meal, 82% and 72%) and their pasta products were evaluated by the ordinary methods in parallel with FT-IR spectroscopy. Chemically, there was considerable difference between hard wheat flour and durum in protein and crude fiber contents. Durum whole meal, hard wheat flour (72%) and durum adulterated with hard wheat flour 72% (1:1) were used to prepare high quality pasta and adulterated pasta, respectively. Color analysis showed that, addition of hard wheat to durum increased the lightness values but decreased the redness and yellowness values. Also, pasta processed from these raw materials had the same character except lightness. Cooked pasta had no significant differences in lightness and redness values while there were significant differences in yellowness values of the cooked pasta. Sensory evaluation of pasta made from durum and hard wheat and their mixture showed that, there were significant differences between them in all sensory properties. Cooking quality of pasta revealed that, the weight of hard wheat pasta increased more than durum pasta, while, the volume of durum pasta was higher than hard wheat pasta. Cooking loss was very lower in durum pasta than hard wheat pasta. Since, wheat and their products contain different polar functional groups such as lipids, carbohydrates and proteins, FT-IR spectroscopy was used as a beneficial tool for detecting adulteration of pasta. The FT-IR results showed that hard wheat (72%) was recognized from durum (72%) by presence of two specific bands at 1420 and 1375 cm^{-1} which are nearly disappeared in durum, while durum was characterized by two absorption bands at 2857 and 1745 cm^{-1} . FT-IR spectral analysis of durum pasta and adulterated ones showed the same results of durum and wheat flour raw materials.

Keywords: Adulteration – durum – hard wheat – pasta – FT-IR – sensory evaluation.

1. Introduction

Pasta is one of popular wheat products worldwide, manufactured from special type of wheat known as durum wheat that gives the required quality of the pasta (Sisson, 2008). Most countries legislation stipulates that pasta must be made from (*Triticum durum*) semolina. Addition of common wheat is the most common adulteration in industrially made pasta. Food authenticity is a subject of serious concern to the consumers and food authorities, where correct and adequate labeling of food composition has become crucial. Besides the composition of specific foods is always a key factor in the quality of the final product (Aktas *et al.*, 2009; Gupta and Panchal, 2009; Terzi *et al.*, 2003). Different techniques have been used to determine the level of common wheat adulteration in pasta, but methods concerning sitosterol palmitate (Matveff, 1952) or water soluble proteins specific to common wheat (Resmini, 1968; Garcia *et al.*, 1969; Feillet and Kobrehel, 1972) were not specific enough or not sensitive enough. Recently, several methods had been invented to investigate adulteration of durum wheat pasta, these included near infrared spectroscopy (Cocchi *et al.*, 2006); immunoassay (Stevenson *et al.*, 1994) and polymerase chain reaction (PCR) method (Alary *et al.*

2002). Near Infrared spectroscopy is a widespread technique used in many fields of analytical chemistry including the quality control of foodstuffs (Bertrand *et al.*, 1985; Sirieix and Downey 1993; Shenk *et al.*, 2001 and Barton *et al.*, 2000). In the field of cereal analysis, NIR spectroscopy being successful in modeling many quality variables such as protein, moisture, dietary fiber contents and wheat hardness (Manley *et al.*, 2002; Osborne, 2000).

In present work, FT-IR spectroscopic technique was applied to differentiate between two Egyptian wheat varieties and to detect the adulteration of durum pasta in parallel with the common evaluation methods of chemical composition, color parameters, cooking quality and sensory evaluation.

2. Materials and Methods

Hard wheat (Sakha 93) and durum wheat (Sohage 3.) were obtained from Field Crops Department, Agricultural Research Centre, Ministry of Agriculture, Giza, Egypt. The properties of the selected samples were identified using chemophysical methods in parallel with FT-IR Spectroscopy.

The moisture, proteins, carbohydrates, fats, fiber and ash content in wheat flour and durum were

determined by A.O.A.C (1990). Color measurement (L^* , a^* , b^*) were measured using Hunter Lab. This color assessment system is based on the Hunter L^* , a^* and b^* coordinates. L^* was representing lightness and darkness, $+a^*$ redness, $-a^*$ greenness, $+b^*$ yellowness and $-b^*$ blueness (Hunter, LabScan XE - Reston VA, USA). The instrument was standardized against a White Tile of Hunter Lab Color Standard (LX No.16379): $X=77.26$, $Y=81.94$ and $Z=88.1$ before each measurement.

Cooking quality of pasta were carried out by measuring the increases in weight, volume and cooking loss after cooking according the methods of AACCC (2000). Sensory evaluation of cooked un-adulterated and adulterated pasta was evaluated as described by Hallabo *et al.* (1985).

All spectra of the selected samples were measured using FT-IR spectrophotometer 6100 Jasco, Japan. All spectra were recorded in the absorbance

mode (three replicates) from 400 to 4000 cm^{-1} using the KBr technique

All results were evaluated statistically using analysis of variance and regression analysis as reported by McClave and Benson (1991).

3. Results and Discussion

Hard wheat and durum flour of different extraction levels (whole meal, 82% and 72%) were evaluated chemically as shown in Table (1). The obtained results indicated that, there was slight difference between hard wheat flour and durum in total carbohydrate, fat and ash contents. A considerable difference between them was observed in their protein and crude fiber contents. In other word, gross chemical composition represented the nutrient contents of wheat varieties but was not suitable to differentiate between them.

Table (1): Gross chemical composition of durum and hard wheat (dry weight basis %).

Varieties	Moisture	Total Car.	protein	Crude fiber	fat	Ash

Pasta made from durum wheat of superior quality results in a bright yellow color and it retains, after cooking, firmness and absence of stickiness. Bright yellow color of pasta is an important prerequisite for customers. Table (2) shows the color attributes of raw material (durum or durum replaced with hard wheat), uncooked and cooked pasta. Data in the table indicated that addition of hard wheat to durum increased the lightness values but decreased the redness and yellowness values. This may be due to the higher content of carotenoids in durum than hard wheat. Also, pasta processed from these raw materials had the same observation except lightness, as the lightness of pasta made from wheat flour decreased than pasta made from durum. Cooked pasta had no significant differences in lightness and redness values while there were significant

differences in yellowness values of the cooked pasta. These results could be attributed to the different solubility behavior of pigments. This leads to the leaching of white and red pigments in cooking water.

Table (3) shows the sensory evaluation of pasta made from durum and hard wheat and their mixture. There were significant differences between the tested samples in all tested properties i.e. appearance, color, flavor, tenderness and stickiness. Pasta made from durum had the highest score for appearance and color. This is due to the higher content of carotenoids compared with pasta made from hard wheat. Also, pasta made from durum had the highest score for tenderness and the lowest score for stickiness. This could be attributed to the strong gluten network in durum wheat compared with hard wheat.

Table (2): Effect of replacing durum with hard wheat on color quality of pasta.

Cooking quality of pasta i.e. weight increase, volume increase and cooking loss are shown in Table (4). Data revealed that, the weight of pasta made from hard wheat increased more than pasta made from durum while, the volume of pasta made from durum was higher compared with those containing hard wheat. Cooking loss, the most

important parameter, was very lower in pasta made from durum than that containing hard wheat. These results could be related to the strong gluten network and the milling procedure that was used for durum production compared with production of hard wheat which allowed more starch to be leached out during cooking.

Table (4): Effect of replacing durum with hard wheat on cooking quality of pasta.

Sample	Weight increase	Volume increase	Cooking loss
100% Durum	122	300	2.5
75% Durum	160	255	7.5
50% Durum	191	235	7.5
100% Hard wheat	235	215	10

Differentiation between durum and hard wheat varieties can be adopted on molecular basis by using FT-IR spectroscopy. Since wheat and its products contain different polar functional groups as lipids, carbohydrates and protein, so FT-IR spectroscopy was used as a helpful tool to identify the molecular composition. Assignments of the FT-IR absorption of wheat flour varieties (Figure 1) are tabulated in Tables (5 - 6). The obtained results showed different bands arising from NH stretching of

protein, CH stretching asymmetric, amide I (C=O stretching) and amide II (C-N stretching and NH bending) at 3427 - 3393 cm⁻¹, 2929 - 2926 cm⁻¹, 1651 - 1654 cm⁻¹ and 1540-1544cm⁻¹, respectively. Furthermore, whole meal and flours (72% and 82%) of durum, and hard wheat characterized with some bands, i.e. CH bending, C-O-C stretching, C-C stretching, C-O stretching, (C6-C5-O5-C1-O1) bond of starch and ring breathing associated with absorbance at 1458 - 1454 cm⁻¹, 1157 cm⁻¹, 1080 cm⁻¹,

1019-1022 cm^{-1} , 860-857 cm^{-1} and 760-764 cm^{-1} . Differentiation between wheat varieties were detected via the presence of certain peaks at about 1420 cm^{-1} (COO^- symmetric stretching vibration) and 1373 cm^{-1} (stretching C-OH) in hard wheat and its extracts only. Assignments of FT-IR were agreed with Williams et al., 1993, Brown et al., 1993 and HRUŠKOV and ŠVEC (2009).

FT-IR spectroscopy technique was also used to evaluate the quality of pasta, where high grade pasta was manufactured from high grade wheat type (durum). High grade durum has a high price, where it is grown in cold climate and imported from abroad

so, durum could be adulterated with cheaper wheat flour. In our study, pasta was produced from 100% durum flour and adulterated durum that was replaced with 50% or 100% hard wheat flour. Careful analysis of the obtained spectra (Figure 2 and Table 7) revealed that durum pasta was characterized by presence of specific bands at 2857 cm^{-1} and 1745 cm^{-1} , which are due to CH and C=O stretching vibration, respectively. On the other hand, these absorption peaks were absent in the hard wheat pasta and appeared with very weak intensity in the adulterated pasta.

Figure (1): FT-IR spectra of durum and wheat flour 72%.

Conclusion

Chemical and color analysis separately were not sufficient to identify and differentiate between wheat varieties (hard and durum wheat) and adulterated pasta, but sensory evaluation and cooking quality were able to detect the quality variation between them. FT-IR spectroscopy was used successfully for identifying and differentiating between two Egyptian wheat varieties (durum and hard) and was able to detect the adulteration of pasta on molecular basis.

Optimizing Browning Capacity of Eggplant Rings during Storage before Frying

*Hatem S. Ali, Mostafa T. Ramadan, Gamal H. Ragab, Mohie M. Kamil and Hesham A. Eissa

Food Technology Department, National Research Centre, 12622 Cairo, Egypt

*Hamin_essa@yahoo.com

Abstract: Deterioration of fresh eggplant rings was demonstrated as a rapid increase of enzymatic browning and with an obvious browning. The effect of thermal and chemical pretreatments on enzymatic browning and frying quality of eggplant rings were investigated. Thermal pretreatment using water or steam blanching; and chemical pretreatment by dipping in different concentrations of SO₂, chitosan, carboxy methylcellulose (CMC) or sodium chloride. Changes in enzymatic browning in fresh eggplant rings during storage at 25°C for 24 hrs were investigated by determining rings colour as a capacity of browning and colour parameters. Best colour values of eggplant rings were found in SO₂ and steam blanching pretreatments; hence the quality of fresh eggplant rings was able to maintain for up to 24 hours at 25°C. The inhibitory effect of various thermal and chemical pretreatments on eggplant rings was found to decrease in the following order SO₂ > steam blanching > water blanching > coated chitosan > coated CMC > sodium chloride. Frying eggplant rings at 180°C/4 min for SO₂, chitosan or steam blanching was able to optimize the quality of eggplant rings regarding to L*, a*, C*, BI, ΔE-values and non-enzymatic browning (A_{420 nm}). The fried pre-treated eggplant rings with SO₂ or water blanching gave higher mean panel scores (7.8–8.6) in all sensory characteristics compared to other pre-treated samples.

1. Introduction:

Eggplant (*Solanum melongena* L.) is a plant of the family Solanaceae (also known as the nightshades) and genus Solanum. It bears a fruit of the same name, commonly used in cooking and frying. The fruit is capable of absorbing large amounts of frying oils. Production of eggplant is highly concentrated, with 85% of output coming from five countries. China is the top producer (56% of world output) and India is second (26%); Egypt, Turkey and Indonesia produce the remains amount. Its world production is around 32 million tons (FAOSTAT, 2009).

The quality of Eggplant attributes to violet surface without defects, and absence of seed (Cantwell and Suslow, 2009). Fruit deterioration during long term storage is associated with pulp browning caused by the oxidation of phenolic compounds. The level of phenolics has been shown to correlate with browning in different eggplant varieties (Prohens *et al.*, 2007). In addition, loss of cellular compartmentalization has been shown to accelerate browning by increasing peroxide levels and oxygen partial pressure within the tissues, and by releasing phenolics stored in the vacuoles, which can then be readily available for oxidation by polyphenol oxidases and peroxidases (Beaulieu *et al.*, 1999; Concellín *et al.*, 2004). Low temperature storage is effective for reducing browning reactions and for

delaying eggplant fruit deterioration. However, refrigeration cannot be fully exploited because eggplants are chilling sensitive and should not be stored for long periods below 7–10°C (Concellín *et al.*, 2007). Most fruits and plants originating in tropical and subtropical regions are prone to physiological injury when exposed to temperatures below 12.5°C and above their freezing point. Eggplant, as a tropical fruit has sensitivity to chilling injury (CI), is generally associated with problems in storage and processing. One of these symptoms is the darkening of seeds and pulp tissue. More severe symptoms include pitting and browning of skin or surface scald (Cantwell & Suslow, 1999). Biochemical and nutritional characteristics of fruits are changed due to the presence of brown pigments. Moreover, browning, after mechanical or physiological injury during harvest, processing or cold storage affects consumer acceptability and palatability because of unpleasant appearance and concomitant off-flavour development (Das *et al.*, 1997; García-Carmona *et al.*, 1988). In general, browning is caused by enzymatic oxidation of natural phenolic compounds, and polyphenol oxidase (PPO; EC 1.14.18.1) is a key enzyme in this degradation.

The main problem facing eggplant rings production is the quality assurance of colour, enzymatic browning and maintains palatability.

Therefore, the present study aimed to investigate the effectiveness of thermal and chemical pretreatments in maintaining the quality of fresh eggplant rings in terms of colour as a brown capacity and % inhibition during storage at room temperature (25°C) for 24 hours. The effect of frying at 180°C for 4 min on colour characteristics and sensory evaluation of pretreated eggplant rings was also studied.

2. Materials and methods

Preparation of eggplant rings:

Eggplant (*Solanum melongena* L. family *Solanaceae*) samples were obtained from local market during the fall and winter of 2011 and stored for using at 4°C. One hr prior to use, fruits were removed from the refrigerator and equilibrated to room temperature. Each eggplant was rinsed with water, peeled, sectioned to rings at least 1cm from the skin end (to exclude the effects of bruising) and exposing fresh surface.; then treated separately with chemical solutions (chitosan, CMC, SO₂ or sodium chloride) or with water or steam blanching.

Evaluation of browning capacity or brown inhibitors:

Colorimetry was performed with spectro-colorimeter (Tristimulus Colour Machine) using the CIE lab colour scale. This colour assessment system is based on the Hunter L*, a* and b* coordinates. To determine the suitability of the tristimulus reflectance procedure for evaluating browning inhibitors applied to cut surface of eggplant rings. Treatments were applied to 3 rings and 3 rings as a control, using only one eggplant fruit. Samples were dipped for 20 min in freshly prepared carboxy methylcellulose (CMC) and chitosan (0.5, 1 and 2%), NaCl (0.5, 1 and 2%), and sodium meta bisulfate (0.01, 0.05 and 0.1%). Peeled eggplant rings were thermal treated (water blanching and steam blanching for 1, 3 and 5 minutes), then the rings were drained, blotted dry with absorbent tissue and held in covered glass dishes to minimize dehydration at the cut surface for 24 hours at room temperature (25°C) during which time tristimulus reflectance measurements were carried out at intervals. Values of the tristimulus coordinates in the L*, a* and b* values were recorded at 1, 5, 10, 15, 30, 45, 60, 90, 120 and 240 min; and after 24 hours. The tristimulus coordinates were plotted against time, and the slopes of linear portions of these curves were obtained by linear regression as described by the method of Sapers and Douglas (1987).

Frying experiment process:

Fresh eggplant rings samples were dipped separately in fresh prepared CMC (2%), chitosan

(2%), NaCl (4%), or sodium meta bisulfate (0.1%) for 20 min; or blanched separately in water or steam for 3 minutes), then the rings were drained. Untreated or pretreated eggplant rings were fried at 180°C for 4 min in a controlled temperature deep-fat fryer (Philips comfort, Germany) filled with 1.5 L of purified sunflower oil (Arma Crystal Company, Egypt) enriched with vitamins A and D, and contained 1.8g saturated fat, 3.8g mono-unsaturated fat and 8.4g poly-unsaturated fatty. Oil was replaced by fresh oil after four frying batches; three eggplant rings were fried in each batch. Colour characteristics and sensory evaluation (García *et al.*, 2002 and Bertolini *et al.*, 2008) were determined in fried eggplant rings samples.

Non-enzymatic browning determination:

Non-enzymatic browning was measured spectrophotometrically by 4054 - UV/Visible spectrophotometer, (LKB-Biochrom Comp., London, England), as absorbance at 420nm using ethanol as blank according to the method of Stamp & Labuza (1983) and Birk *et al.*, (1998).

Colour determination of eggplant rings:

Fresh and fried eggplant rings colour was determined according to Hunter (1975). Colour of Egyptian fresh and fried eggplant rings was measured using spectro-colorimeter (Tristimulus Colour Machine) with the CIE lab colour scale (International Commission on Illumination) as mentioned by Hunter (1975) and Sapers & Douglas (1987).

Sensory evaluation:

Twelve trained panelists were selected for sensory evaluation of the studied pretreated and fried eggplant ring samples. Colour, flavour, taste, texture, and appearance of the fried eggplant ring samples were determined using a ten point scale (10 = excellent and 1 = bad) as described by Bertolini *et al.*, (2008). The limit of the acceptability was 5.

Statistical analysis:

The obtained results were analyzed statistically using the analysis of variance (ANOVA with two ways) and the Least Significant Difference (LSD) as described by Richard and Gouri, (1987).

3. Results and discussion

Effect of chemical and thermal pretreatments on browning of fresh eggplant rings stored at room temperature:

Browning of eggplant rings was measured by a* (green-red) and L* (lightness-darkness). A decrease in L*-value and an increase in a*-value are

indicative of browning (Monsalve, *et al*, 1993). The effect of using anti-browning agents (chemical and thermal pretreatments) on inhibiting the browning reactions during storage of eggplant rings for 24 hours at room temperature (25°C) was measured and graphically represented in Figs (1a, b). These figures illustrate the changes in the colour of eggplant rings in terms of a^* -values over 24 hours as affected by the following treatments: thermal (steam and water), SO_2 at 0.01, 0.05 and 0.1%, chitosan and CMC at 0.5, 1 and 2% and sodium hydroxide (NaCl) at 1, 2 and 4%. Figures (1a, b) showed that, chemical treatment (SO_2 and chitosan) and thermal treatment (steam and water) were able to prevent eggplant rings from browning, where lowest a^* -value (< -0.55) was obtained after storage for 24 hrs at room temperature (25°C). At the same time, browning of untreated eggplant rings (a^* -value) increased sharply to >12.38 . On the other hand, Figures (1a, b) showed that, the most effective anti-browning was found in case of using SO_2 as a chemical pretreatment, and also by using steam as a thermal pretreatments. These results explained the higher anti-browning agent of chemical and thermal pretreatments than untreated eggplant rings during storage at room temperature for 24 hrs.

From the obtained results, it could be concluded that, SO_2 (0.1%) and chitosan (2%) were the most effective chemical treatments for inhibiting enzymes, obtaining good colour and lowering non-enzymatic browning in eggplant rings during storage at room temperature.

Effect of thermal and chemical pretreatments on changes of colour characteristics of fresh eggplant rings:

Hunter colour parameters showed that, fresh eggplant rings appeared at the light green region, while pretreated samples showed clear signs of degreening during storage at room temperature (25°C). Visually, fresh eggplant rings showed a darker colour than treated rings. Degreening appeared with a rapid increase of a^* -value in eggplant rings (Figures. 1a, b). However, thermal treatment of eggplant rings inhibited the occurrence of degreening in eggplant rings during storage. Thermal, coated chitosan and SO_2 addition have a preventive effect against any changes that might occur in colour indicating a lowest - a^* value especially during the late period of storage at room temperature 25°C. Browning was observed in the control sample representing a rapid increment in a^* value within the first 4 hrs. Afterward, the colour of eggplant rings became lighter with decrement in - a^* values during storage at room temperature (Figures 1a, b). This result indicated that thermal and chemical pretreatments inhibited browning. The decrease of -

a^* values during the late period of storage could be related with sedimentation or breakdown of brown compounds.

Effect of various thermal and chemical treatments on colour characteristics of Fresh eggplant rings:

The surface colour of eggplant rings was measured with a colour difference meter (Hunter Lab colour scale). Under all tested conditions, SO_2 treatment had higher efficient values based on a^* -values than A420 measurements, where the other anti-browning behaved an opposite trend. For all tested samples the increase in the concentration of the anti-browning agents revealed increase in the inhibition efficient. Such trend is in agreement with previous studies of Janovitz-Klapp (1990), and Ozoglu and Bayindirh, (2002). The inhibitory effect of the studied anti-browning agents on eggplant rings was based on measurements at their maximum concentrations as shown in tables 1 and 2. Both tables showed a decrease at the following order $SO_2 > steam blanching > water blanching > coated chitosan > coated CMC > sodium hydroxide$. It is obvious that thermal pre-treatments of eggplant rings increased the development of red colour a^* value as non-enzymatic browning. The Hunter colour values of steam blanching samples in eggplant rings were lower than those of water blanching samples. Also, the Hunter colour value of SO_2 pre-treatment in eggplant rings was lower than that of coated chitosan, coated CMC and sodium hydroxide pre-treatments. These results indicated that the browning (redness) increased in water blanched samples than in steam blanched samples for eggplant rings. According to our results, the main colour change in untreated and pre-treated eggplant rings of thermal and chemical treatments was due to increase in browning index (BI) and a^* -value, which were in high correlation to browning measurement. Also, other colour parameters such as Hue angle and chroma indicated that heat pre-treatment caused a slight colour change. Heat treatment (blanching) showed that, water blanching had a BI lower than that of steam blanching on eggplant rings. But, BI values in SO_2 samples were lower than those of coated chitosan and coated CMC samples as shown in Figure (7b). These results are in good agreement with those of Janovitz-Klapp *et al* 1990; and Ozoglu and Bayindirh (2002). Generally, pre-treatments of coated chitosan, coated CMC and sulfiting improved the colour of eggplant rings (Figures 2b-7b). Sulfur dioxide has been shown to be effective for preventing browning by combining with carbonyl groups. From the above mentioned results, it could be concluded that, the pretreated eggplant rings with sulfites (SO_2) had the best colour values (a^* and BI) and lower enzymatic browning

compared to the other pre-treatments, as shown in Tables (1 and 2). The optimum conditions of thermal and chemical pre-treatment for improving the quality of eggplant rings (inhibition enzymatic browning - good colour) were found in case of using steam and water blanching for 5 min, SO₂ (0.1 ppm), chitosan (2%), CMC (2%) and sodium hydroxide (4%), as seen in Figures (1a, b - 7a, b).

Effect of thermal and chemical pretreatments on % Inhibition of browning in fresh eggplant rings

As shown in Table (1 and 2), thermal (steam and water), SO₂ addition and coating with chitosan reduced enzymatic browning of fresh eggplant rings, and chemical pretreatments at high concentration were more effective than thermal pre-treatment. Enzymatic browning of untreated fresh eggplant rings was about hundred fold higher than that of chemical and thermal treated rings. On the other hand, addition of 0.1% SO₂ and 2% coated chitosan increased inhibition percentage to 100 and 78%, respectively.

Table (1): Effect of thermal pretreatments on the percentage inhibition of enzymatic browning in eggplant rings

Samples	% Inhibition	Standard Deviation (n=3)
Untreated sample	0.00	1.05
Water 1min.	90.77	15.87
Water 3 min.	90.77	23.05
Water 5 min.	97.09	8.87
Steam 1 min.	77.79	7.75
Steam 3 min.	95.67	11.46
Steam 5 min.	100	15.09

Table (2): Effect of Chemical pretreatments on the percentage inhibition of enzymatic browning in eggplant rings

Samples	% Inhibition	Standard Deviation (n=3)
Untreated sample	0.000	1.18
0.5% chitosan	50.00	6.52
1% chitosan	62.50	8.12
2% chitosan	78.03	9.44
0.5% CMC	53.03	8.17
1% CMC	66.67	7.28
2% CMC	68.56	9.57
0.01% SO ₂	48.48	6.78
0.05% SO ₂	98.48	3.68
0.1% SO ₂	100.0	4.97
1% NaCl	9.47	10.19
2% NaCl	32.95	9.35
4% NaCl	49.62	13.46

High temperature of thermal pretreatments inactivated enzymatic browning, which confirmed the observation of Va'mos-Vigya'zo (1981), who reported that PPO enzymes are destroyed at 80°C although they are relatively heat labile. These inhibitory effects of thermal (steam and water) and chemical (SO₂ and coated chitosan) pretreatments on enzymatic browning were related with the prevention of PPO enzyme activity. Browning is mostly the result of the activity of PPO enzyme acting on phenolic compounds to produce dark coloured

polymers when sugarcane is crushed to release the juice (Vickers *et al.*, 2005).

Effects of thermal and chemical pretreatments on colour characteristics and non-enzymatic browning (A_{420nm}) of fried eggplant rings.

The surface colour of fried eggplant rings was measured with a colour difference meter, using the Hunter Lab colour scale. The Hunter colour values of fried eggplant rings were determined immediately after frying. Changes in L* values were inversely proportional to the changes in a* values of

the Hunter colours. Absorption at 420 nm, the CIE L*, a*, b* colour parameters, hue angle, chroma and BI were found to be suitable indicators for the brown pigment formation because of non-enzymatic browning after processing, as seen in Table (3). The a* values and BI for SO₂, NaCl and steam-treated fried eggplant rings were low in contrast to high values for untreated and other treated fried eggplant. The CIE a* and colour parameters like hue angle (H*), chroma (C*), browning index (BI) and non-enzymatic browning (A_{420nm}) of fried eggplant samples had the lowest values in SO₂ treated samples compared with the untreated and other treated samples in fried eggplant, as seen in Table (3). Also, it was generally found that steam blanching, NaCl and SO₂ treatments improved the colour of fried

eggplant rings. However, SO₂, NaCl and steam blanching samples had the high increase in colour as optical density (A_{420nm}) compared with the untreated and other treated samples in fried eggplant. The increase in colour (browning as A_{420nm}) could be attributed to the reaction occurred between amino groups and active carbonyl groups (Maillard reaction) after thermal treatments (blanching). From the above mentioned results, it could be concluded that the pretreated eggplant rings with sulphites (SO₂), NaCl and steam blanching have the best colour values and higher nonenzymatic browning as compared with the other treatments of fried eggplant, as seen in Table 3. The results are in accordance with those of Janovitz-Klapp *et al.* (1990) and Ozoglu and Bayindirh (2002).

Table (3): Effect of chemical and thermal pretreatments on colour characteristics of fried eggplant rings.

Samples	L*	a*	b*	ΔE	C*	H*	BI	NEB (A _{420nm})
Untreated	45.70 ±3.0	9.0 ±0.8	19.69 ±1.0	54.23 ±2.4	21.66	65.36	127.06	5.64 ±1.1
SO ₂ 0.1%	46.48 ±2.6	8.49 ±0.7	18.19 ±1.3	50.90 ±2.0	20.07	64.98	113.34	7.05 ±1.0
Chitosan 2%	49.63 ±5.0	9.25 ±1.6	20.99 ±2.2	52.30 ±3.6	22.94	66.22	123.15	6.75 ±1.6
CMC 2%	49.50 ±1.1	9.10 ±0.6	21.14 ±1.1	52.42 ±1.7	23.02	66.71	124.05	6.51 ±0.8
NaCl 4%	56.04 ±6.3	7.21 ±1.6	22.88 ±2.5	48.64 ±3.4	23.99	72.51	110.89	9.21 ±2.1
Water 3min	46.44 ±5.2	8.61 ±1.0	19.45 ±3.2	53.21 ±1.6	21.27	66.12	121.78	5.99 ±0.8
Steam 3min	43.95 ±5.4	6.87 ±0.7	16.68 ±2.3	51.40 ±2.9	18.04	67.61	106.38	6.51 ±1.4

Effects of thermal and chemical pretreatments on sensory evaluation of fried eggplant rings:

Sensory attributes are of great importance to measure consumer attitudes and their influence on food choice and acceptability. The colour of fried food is the first quality attribute used to judge acceptability of fried products. A two-way ANOVA after frying process of the variables influenced by the pre-treatments, panelists and frying process is shown in Table (4). Flavour scores differ significantly after frying process, where a positive correlation was noticed between the flavour score of pretreated samples. The obtained result represents the statistical analysis of colour, odour, taste, texture and appearance of fried eggplant rings with thermal and chemical pre-treatments. Fried eggplant rings of different pre-treated samples were differed

significantly ($P < 0.05$). The fried pre-treated eggplant rings with SO₂ and water blanching gave higher mean panel scores (7.8–8.6) in all the sensory characteristics than other pre-treated samples. Texture and appearance of Fried eggplant rings characterized with their higher scores in pretreated steam blanching for 3 min. On the contrary, the untreated fried eggplant sample and that pre-treated with CMC and NaCl had lower scores in all sensory characteristics. This may be due to protein breakdown and dehydration on eggplant surface. In generally, frying had a positive influence on acceptability of colour, flavour and texture acceptability of eggplant rings. Moreover, all sensory scores of samples were in acceptable range (greater than 5). These results agreed with those of Perez & Albisu (2002) and Gonulalan *et al.* (2003).

Table (4): Effect of chemical and thermal treatments on sensory evaluation of fried eggplant rings.

Fried eggplants rings	Colour	Taste	Flavour	Texture	Appearance
Fried eggplant (control)	8 ^{AB} ±1.2	7.1 ^B ±1.05	7.8 ^B ±0.97	8 ^{AB} ±0.1	6.7 ^C ±1.3
Treated with Chitosan 2%	6.3 ^C ±2.1	7 ^B ± 1.2	6.2 ^C ±0.97	7 ^B ±1.2	7.6 ^B ±1.1
Treated with CMC 2%	5.6 ^D ±3.2	5.7 ^D ±3	5.7 ^D ±3.1	5.8 ^D ±2.7	5.6 ^D ±2.8
Treated with SO ₂ 0.1%	8.1 ^A ±1.1	8 ^A ±1	8.6 ^A ±0.5	8.4 ^A ±0.7	8.2 ^A ±1.1
Treated with NaCl 4%	5.4 ^D ±2.3	5.9 ^D ±2.8	7.1 ^B ±1.7	6.8 ^C ±2.2	6.1 ^D ±3.2
Treated with Water 3min	7.8 ^B ±1.4	7.8 ^B ±1.4	7.8 ^B ±1.4	7.6 ^B ±1.7	7.8 ^B ±1.4
Treated with Steam 3min	6.2 ^C ±0.8	7 ^B ±0.7	6.8 ^C ±0.7	7 ^B ±0.5	7 ^B ±0.5

4. Conclusion:

Using SO₂ or steam blanching pretreatments as a pretreatment for eggplant rings were able to optimize the quality of eggplant rings during storage at room temperature for 24 hrs. Frying eggplant rings at 180°C/4 min for the previous pretreatments of SO₂, chitosan and steam blanching were able to optimize the quality of eggplant rings regarding to L*, a*, C*, BI, ΔE-values, non-enzymatic browning (A₄₂₀ nm) and sensory evaluation.

hishamwb@yahoo.com

Abstract: Background: Asthma is a leading cause of chronic illness in childhood. Respiratory tract infections with viruses and mycoplasma pneumonia are considered the most common triggers of asthma in all age groups. Recently Chlamydia pneumonia infection has been suggested to play a role in pathogenesis of asthma. **Objective:** The aim of this work was to evaluate the possible role of Chlamydia pneumonia in the development or aggravation of childhood bronchial asthma. **Patients and Methods:** This study included 50 asthmatic patients divided into 2 groups; group (1) composed of 20 new wheezier who denied previous wheezing and were evaluated during initial wheezing episode, group (2) composed of 30 chronic asthmatic children who had recurrent episodes of/or persistent wheezing. Also 20 healthy children were included as a control group. Qualitative estimation of Chlamydia pneumonia infection in nasopharyngeal swabs using polymerase chain reaction (P.C.R) technique was done to all cases and controls. **Results:** In the new wheezier group 8 cases (40%) were Chlamydia pneumonia PCR (+ve), in the chronic asthmatic group 9 cases (30%) were PCR (+ve), while in the control group only 2 cases (10%) were PCR+ve. The infection rate of Chlamydia pneumonia among patients were 17 (89.5%) and among controls 2 (10.5%) with a statistically significant difference ($P = 0.041$) between patients and controls. There was an increase in asthma severity and severity of exacerbation in PCR+ve than in PCR-ve patients for C. pneumonia but it didn't reach statistical significance. Also there was a significant increase in PCR+ve males (58.8%) than PCR+ve females (41.2%), while there were no significant statistical difference between PCR+ve and PCR-ve patients as regards age, residence, seasonal variation, atopic manifestation and family history of atopy. **Conclusion:** The incidence of C. pneumonia infection among new wheezier and chronic asthmatics is high pointing to its possible role as a triggering factor for asthma in new wheezier and continuation of symptoms in spite of proper treatment plan in chronic asthmatic children.

[Nisreen El-Abiad, Wagdi M.Hanna, Amira Ahmed, Hisham Waheed and Olfat Shaker. Chlamydia Pneumonia Infection and Possible Relationship to Childhood Bronchial Asthma. Journal of American Science 2011; 7(6):593-599].(ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: Chlamydia pneumonia, Childhood asthma, polymerase chain reaction.

1. Introduction:

Chlamydia are intracellular bacteria that cause infections of the respiratory tract, which is a major clinical problem (Asquith et al., 2011). It is an obligate intracellular parasite with discrete cell wall that is similar to those of gram negative bacteria, it contains both RNA and DNA. It spreads through person to person by droplet and outbreaks of infection have been reported in families, schools, military barracks and nursing homes (Niedzwiadek et al., 2000).

Asthma is a chronic inflammatory airway disease characterized by variable airway obstruction and bronchial hyper responsiveness. There are many factors affecting the development and severity of childhood asthma such as genetic predisposition, atopy, environmental factors, obesity, diet, socioeconomic status, and infectious triggers (Annaqur et al.,2007). It is a leading cause of chronic illness in childhood, responsible

for a significant proportion of school days lost. It is the most frequent admitting diagnosis in children's hospital and result nationally in 5 to 7 lost school days/year/child (Martin et al., 2001).

Chlamydia pneumonia has been associated with asthma. It has also been suggested that Chlamydia pneumonia infection may lead to lung remodeling in a subset of asthmatic patients. Although there is no specific symptoms in Chlamydia pneumonia infection, this infection should be suspected in any child with prolonged wheezing for proper diagnosis and treatment (Hahn and Peeling, 2008).

The development of polymerase chain reaction (PCR) test for diagnosis of respiratory tract infection has highlighted the importance of this infection in acute exacerbation of asthma (Johnston et al., 1995).

Aim of the work: Was to investigate the relationship between C. pneumonia in school age children and bronchial asthma. We tried to determine whether previously asymptomatic children presenting

with first ever broncho-spasm would have PCR+ve criteria compatible with Chlamydia pneumonia infection. Another aim was to determine whether patients with established chronic asthma would have C. pneumonia infection.

2. Patients and Methods:

This study was carried on 50 children with reactive airway disease. Their ages ranged from 6-14 years, they were (19) males and (31) females. All cases were selected from Asthma and Allergy Clinic, Children's Hospital, Cairo University. Patients were divided into two groups; group I: new wheezier; a group of 20 children each of whom denied previous wheezing and were evaluated during the initial wheezing episode. All patients in this group reported that wheezing began after an acute respiratory tract illness (described as rhinitis, pharyngitis, bronchitis or pneumonia). Group II: chronic asthmatics; a group of 30 children (who had recurrent episodes of/or persistent wheezing) and who met the American Thoracic Society (ATS) criteria for reversible airway obstruction. All patients in this group were examined during an exacerbation (had prolonged respiratory symptoms and wheezes in spite of proper treatment plan). Also 20 healthy children (age and sex matched) were included as a control group. Cases with chronic illness as chronic liver or kidney disease or diabetes were excluded from the study. All cases and controls were subjected to: thorough medical history and clinical examination, peak expiratory flow rate (PEFR), skin allergy testing, routine laboratory investigations including; CBC, urine and stool analysis, total serum IgE using the IMx micro particle enzyme immunoassay (MEIA) the quantitative measurement of IgE in human serum, chest x-ray and qualitative estimation of Chlamydia pneumonia infection in nasopharyngeal swabs using polymerase chain reaction (P.C.R) technique: the DNA was extracted then PCR was performed using specific primer set which amplifies a 437 bp fragment and consists of the following primers: forward primer HL-1 (5'-GTTGTTTCATGAAGGCCTACT-3') and reverse primer HR-1 (5'-TGCATAACCTACGGTGTGTT-3'). The PCR products (20µl) were analyzed by electrophoresis

on a 2 % agarose gel stained with ethidium bromide.

Data was analyzed on an IBM compatible computer using SPSS win version 11 statistical package. Numerical data were described in terms of means, standard deviation, median, minimum and maximum. Nominal data were expressed by frequency distribution and percentage. Chi square test was used to compare groups for categorical data. Mann whitney test was used to compare two groups for numerical data. If P-value is less than 0.05, it is considered to be significant and if it is less than 0.001, it is considered highly significant.

3. Results:

The study patients consisted of 50 children with reactive airway disease. Their ages ranged from 5-14 with mean age of (9) years, and were 19 males (38%) and 31 females (62%).

The characteristics of the studied children as regards age, sex, serum IgE, absolute eosinophilic count (AEC) and atopy are shown in table (1). Table (2) shows comparison of selected data (age, severity of exacerbation, atopy, used inhaled corticosteroids, AEC and IgE) between C. pneumonia PCR-ve (12 case) and PCR+ve (8 cases) in new wheezier. No significant statistical difference could be found between the two groups.

Table (3) shows comparison of selected data between C. pneumonia PCR-ve (21 cases) and PCR+ve (9 cases) in chronic asthmatic patients. No significant statistical difference could be detected between the two groups.

Our results show that there is a significant statistical difference between patients and control group as regards percentage of patients with Chlamydia pneumonia infection using PCR technique for diagnosis, where we have 17 (89.5%) PCR+ve cases in patient group and only 2 (10.5%) PCR+ve cases in control group (P = 0.041) (table 4).

Our results also show that infected boys represent 58.8%, while infected girls 41.2%, with significant difference between both sex, being more in males (P = 0.029) (table 5).

As regards PEFR, there is a significant statistical decrease in PCR+ve than in PCR-ve patients (P= 0.035) (table 5).

Figure 1 shows results of polymerase chain reaction (PCR) of Chlamydia infection.

Table (1): Characteristics of study groups

Characteristic	New wheezier	Chronic Asthmatics	Control
	n=20	n=30	n=20
Age (yr.) mean \pm SD	9.00 \pm 2.90	9.33 \pm 2.34	8.45 \pm 1.57
Range	6-14	6-14	7-12
Sex	4 (20%)	15 (50%)	9 (45%)
Female	16 (80%)	15 (50%)	11 (55%)
Mean serum IgE (IU/L)	364.70 \pm (239.88)*	421.97 \pm (315.02)*	68 \pm 11.2
Mean absolute eosinophilic Count (cells/mm ³)	302.18 \pm 224.91	492.70 \pm 493.45	137 \pm 58.1
Atopy@ atopic	15 (75%)*	22 (73.3%)*	0 (0.0%)
Non atopic	5 (25%)	8 (26.7%)*	20 (100%)

* Significant difference compared to control (P<0.001).

@ Atopy defined as +ve skin prick test reaction to at least one of tested allergens (Dreborg, 1987).

Table (2): Comparison of selected data between Chlamydia pneumonia PCR(-) and PCR(+) patients in new wheezier group.

Data	PCR(-)	PCR(+)	P-value
	(12)	(8)

4. Discussion:

Asthma is a major health problem, it is the most common chronic childhood disease, it affects an estimated 5 to 10% of population and as such it is a major health care issue in most countries (Timothy, 2000).

Respiratory tract infection is considered one of the common risk factor. Infections with viruses such as respiratory syncytial virus, para influenza virus, influenza A and B virus, corona virus, adenovirus and rhino virus have been identified in 10% to 60% of children and adults with asthma. Another atypical respiratory pathogen, Chlamydia pneumonia, has been established as an important cause of acute

respiratory infection in 1% to 11% of children as well as adults (Specjalski, 2010).

In our study we investigated the relationship between C. pneumoniae in school age children and bronchial asthma. First we tried to determine whether previously asymptomatic children presenting with first ever broncho-spasm would have PCR+ve criteria compatible with Chlamydia pneumoniae infection. We found (40%) of those children (new wheezier) to have evidence of C. pneumoniae infection diagnosed by PCR technique.

Our findings are in agreement with the results of Zaitso, (2007) who found that C. pneumoniae infection triggers asthma in wheezy infants. Also Mostafa and Arnout, (2000) found that (27.3%) of

children with first ever wheezing and with objective measure of obstructive airway disease, had evidence of acute *C. pneumonia* infection diagnosed by serological criteria.

On regular follow up of the new wheezier at allergy clinic (87.5%) of children with first ever-wheezing episode and PCR+ve for *C. pneumonia* subsequently developed chronic persistent asthma based on clinical data and PEFr regular measurements, this provide evidence that acute wheezing illness due to *C. pneumonia* infection can develop into chronic asthma in previously asymptomatic individuals. In accordance with our observation Sato et al.,(2007) found *C. pneumonia* IgM- positive results in 48.4% of patients with asthma. Also Hahn and Mc Donald, (1998) found persistent *C. pneumonia* infection diagnosed by cultures of nasopharyngeal secretions after clinical resolution of acute respiratory illness and during development of chronic asthma symptoms.

Another aim of our study was to determine whether patients with established chronic asthma would have *C. pneumonia* infection. Nine of thirty (30%) children with established asthma were PCR+ve for *C. pneumoniae*. This result are in agreement with a study done by Agarwal and Chander, (2008) found IgG anti Chlamydia antibody-positively rate in the patients with bronchial asthma(80%) was significantly higher in all age groups than that in the healthy age and sex matched controls(59%).Also Thrumerelle et al., (2003) confirmed that persistent features of childhood asthma was more frequently associated with atypical bacterial infection (*C. pneumonia* and mycoplasma pneumonia). Bestou et al., (2003) showed the presence of anti Chsp 10 (children heat shock protein 10) antibodies in adult onset asthma (73%). In contrast to our results Dejsomritrutai et al., (2009) could not support the speculative theory that *C. pneumonia* is a cause of bronchial asthma, they found no difference between asthmatic and control as regards *C. pneumonia* specific IgA, IgG and IgM in the sera.

Investigators suggested that the immune response to organism might play a pathological role in asthma. *C. pneumonia* infects the human bronchial tree causing ciliary's dysfunction and epithelial damage. It also generates inflammatory cytokines, production of *C. pneumonia* IgE, and capacity during re infection to produce T cell mediated immune pathogenic disease considering this association between immune response to *C. pneumonia* and asthma symptom frequency, it seems logical to suggest that *C. pneumonia* infection may act as a cofactor, possibly rendering asthmatic children more

susceptible to other stimuli such as allergens or viruses or both (Hironos et al., 2003).

In our study there was no significant difference between PCR-ve and PCR+ve patients as regards age distribution, residence, seasonal variation, atopic manifestation and family history of atopy. This is in concordance with that of Kercksmiar ,(1998).

Sex distribution of our asthmatic patients was 38% males and 62% females, we found a significant statistical difference between males and females as regards PCR+ve for *C. pneumonia* (more in males). This difference may be secondary to other factors such as the increased ability to produce IgE, airway caliber that has a clear gender difference, or the possibility of inherited vulnerability of boys than girls to the injurious effect of aeroallergens. In quite similarity to this result Kaledy et al., (2001) showed that prevalence of antibodies to *C. pneumonia* was more common in males than in females, a difference that increased with age.

As regards asthma severity and type of medication, we followed the National Heart, lung and blood institute classification. There was an increase in asthma severity and severity of exacerbation in PCR+ve than in PCR-ve patients for *C. pneumonia* but it didn't reach statistical significance. Liberman et al., (2003) reported that Chlamydia pneumonia is not responsible for acute exacerbation of bronchial asthma. On the contrary Thrumerelle et al., (2003) and Niedzwiadek et al., (2000) reported that persistent Chlamydia pneumonia infection has occurred more frequently in-patient with moderate and severe asthma than in ones with mild asthma, also persistent clinical features were more frequently associated with atypical bacterial infection. This conflict in the results between studies can be attributed to the fact that serological test is not accurate way to diagnose Chlamydia. The only accurate way is by identification of organism by polymerase chain reaction which is known to be almost 100% sensitive and specific. Using PCR technique, one is able to detect the presence of *C. pneumonia* organism either due to acute infection, re infection or chronic infection (Shi et al., 2003).

In our study we didn't find significant statistical difference between PCR+ve and PCR-ve patients for *C. pneumonia* as regards total eosinophilic count. This can be attributed to the fact that eosinophilic count in sputum and markers of eosinophil degranulation (such as eosinophil cationic protein) can reflect the disease severity rather than blood eosinophilic count (Pifferi et al., 2001).

In the current study there was significant statistical difference between PCR+ve and PCR-ve for *C. pneumonia* as regards the median values of PEFr, this reflected increase severity of airway

obstruction in PCR+ve patients. Ten Brink et al., (2001) suggested that *C. pneumonia* infection might promote the development of persistent airflow limitation in patients with non atopic adult onset asthma. In contrast Strachan and Carrington (2000) showed a lack of significant association between COPD and level of *C. pneumonia* antibody titer of IgE and IgA.

Inhaled steroids have now become the main stone of chronic asthma treatment (Barnes, 1997). In our results, there was no significant statistical difference between PCR+ve and PCR-ve patients for *C. pneumonia* as regards use of inhaled corticosteroids. In contrast Black et al., (2000) reported high titer of antibodies to *C. pneumonia* in asthmatic being treated with high dose inhaled steroids. This difference may be attributed to steroid dose and duration of therapy.

It is worth to mention that the present study failed to find any peculiar clinical or laboratory characteristics distinguishing PCR+ve asthmatic patients from PCR-ve ones. In quite similarly to our results, Patel et al., (2010) diagnosed *C. pneumonia* in 33% of their studied asthmatics, with no significant difference in clinical signs, symptoms or laboratory data between patients with and without *C. pneumonia* infection.

5. Conclusion:

We can conclude that incidence of *C. pneumonia* infection among new wheezier and chronic asthmatics is high pointing to its possible role as triggering factor for asthma in new wheezier or continuation of symptoms in spite of proper treatment plan in chronic asthmatic children. We recommend that children with chronic asthma, not well controlled with conventional anti-asthma therapies, must be evaluated for *C. pneumonia* infection especially by PCR technique. Also it seems appropriate to do the test during the earlier stages of asthma onset especially if it begins during or after acute respiratory illness and once infection is verified proper antibiotic must be given.

Corrosion inhibition of lysine as basic amino acid on 316L stainless steel in 0.5 M H₂SO₄ solution**Azza El-Sayed El-Shenawy**Department of Chemistry, Faculty of Science (Girls), Al-Azhar University, Cairo, Egypt
Dr.azza2010@hotmail.com

Abstract: The corrosion inhibition of 316 L stainless steel in 0.5 M H₂SO₄ by lysine was investigated using open-circuit potential measurements, potentiodynamic polarization measurements and scanning electron microscopy (SEM) techniques. The open circuit potentials were measured in the absence and presence of different concentrations of lysine. It was found that the open circuit potential becomes more positive with increasing the concentration of lysine. Potentiodynamic polarization measurements showed that the presence of lysine in acidic solution affects mainly the cathodic process and decreases the corrosion current to a great extent and shifts the corrosion potential towards more negative values. Results revealed clearly that lysine is a good cathodic type inhibitor for 316L stainless steel in 0.5 M H₂SO₄. The maximum inhibition efficiency of lysine was achieved at (7 x 10⁻² M). Analyses of the surface by SEM confirm these results.

[Azza El-Sayed El-Shenawy, Corrosion inhibition of lysine as basic amino acid on 316L stainless steel in 0.5 M H₂SO₄ solution. Journal of American Science 2011; 7(6):600-605]. (ISSN: 1545-1003).

Keywords: Corrosion; inhibition; lysine; amino acid; steel; M H₂SO₄

1. Introduction:

Stainless steel have found very wide applications both in modern chemical industries and other places [1]. Since aggressive acid solutions are widely used for industrial purposes. The use of organic inhibitors in acidic solutions is very common, particularly in view of the high corrosion rate [2-9]. Amino acids are attractive as corrosion inhibitors because they are nontoxic, relatively easy to produce with high purity at low cost, and are soluble in aqueous media. A number of studies involving amino acids and their derivatives on the corrosion inhibition of iron and its alloys has been carried out [10, 11]. Most of the natural amino acids are the alpha amino acids which contain carboxyl and amino groups bonded to the same carbon atom. It was shown that the inhibition action of some organic compounds is based on adsorption phenomenon [12].

The object of this study is to investigate the inhibition effect of lysine on 316L stainless steel in acidic media.

2- Experimental

The analysis of the 316L stainless steel electrode is given in Table (1).

Table (1): The chemical composition of 316L stainless steel electrode (Wt %)

Element	Si	Cr	Ni	Mo	Mn	Fe
Weight %	0.56	17.28	10.57	2.62	1.14	67.83

Circular electrode with working surface area of 1.76 Cm² were used. Experiments were carried out

in 0.5 M H₂SO₄ solutions in absence and presence of different concentrations (5 x 10⁻³ – 7 x 10⁻² M) of lysine.

Diamino monocarboxylic acid (Basic amino acid)
α, ε-diamino caproic acid (lysine).

All aerated test solutions were prepared from distilled water at room temperature (25 ± 1°C) and analar reagent chemicals. Freshly polished electrodes were used for each run. Platinum electrode and standard calomel electrode (SCE) were used as counter and reference electrodes. The solution volume was fixed at 100 ml in all experiments. The open circuit potentials of the metal immersed in the test solutions were measured using the electronic multimeter (type ES cord-EDM – 2116). The polarization measurements were run on a computerized potentiostat (Radiometer model volta Lab 40) and Volta Master 4 software. Potential scan rate in all experiments was 2 mV/s. The morphology of stainless steel surface before and after immersion in the test solutions was examined by scanning electron microscope (JEOL-JSM- 5500 LV).

3- Results and Discussion**3.1. Open-circuit potentials measurements**

Open circuit potentials (OCP) were measured in the absence and presence of different concentrations (5 x 10⁻³- 7 x 10⁻² M) of lysine in 0.5 M H₂SO₄.

Fig. 1 represents typical curves of OCP variation with time for blank acid and inhibited solutions. Steady state potential is shifted either in the positive direction in the presence of lysine. The OCP shift in the noble direction, suggests the formation of a passive film that acts as a barrier for metal dissolution and reduces the corrosion rate by reducing the driving force of the cathodic reaction

and increasing the thickness of more stable complex compound (Fe-lysine).

On introduction of lysine into the acid solution, the potential shift and attainment of a stable OCP become more noble values than those observed in the blank acid. This can be attributed to the formation of a protective layer of lysine on the stainless steel surface.

Fig. 1. Variation of the open circuit potential of 316 L stainless steel with time in 0.5 M H₂SO₄ containing different concentrations of lysine.

3.2- Liner Polarization

Fig. 2 shows the effect of lysine concentration on the polarization curves of 316 L stainless steel electrode. Corrosion parameters in the absence and presence of inhibitor obtained from curves are given in Table 2. Generally with increasing inhibitor concentration, the corrosion current density and corrosion rate decrease and polarization resistance increases (Table 2). From the results, it is found that, with increasing inhibitor concentration, E_{corr} shifts to more negative values are observed and it indicates that these inhibitors have been adsorbed to cathodic areas and act as cathodic inhibitor. Thus, the amino acid presents in its protonated form in acidic solution. Such protonated form is expected to be highly attracted to the cathodic sites on the metal surface [13].

Protonated form

The following equation was used to the calculated inhibition efficiency (IE) from polarization measurements[14]:

$$IE = \left(1 - \frac{i}{i_o} \right) \times 100$$

Where i and i_o are the corrosion current densities obtained by extrapolation of the cathodic and anodic Tafel lines in inhibited and uninhibited solutions, respectively.

Table (2): Corrosion parameters, and inhibition efficiency IE for 316L stainless steel in 0.5 M H₂SO₄ solution in the presence of different concentrations of lysine.

Conc. M	$E_{\text{corr.}}$ (mV)	$I_{\text{Corr.}}$ mA/cm ²	Tafel slope		R_p Ωcm ²	Corrosion rate(mm/y)	IE%
			B_a	B_c			
Blank	-336.4	0.1300	160.8	-163.9	-208.38	1.520	-
5×10^{-3}	-341.8	0.1158	138.9	-135.6	-108.59	1.354	10.9
1×10^{-2}	-342.2	0.0904	114.5	-126.0	30.86	1.057	30.46
7×10^{-2}	-356.3	0.0558	102.8	-119.1	100.83	0.6521	57.07

Fig.2. Cathodic and anodic polarization curves for the effect of different concentrations of lysine on the potentiodynamic behaviour of 316L stainless steel in 0.5 M H₂SO₄ solution.

The inhibition efficiency increases as the inhibitor concentration increases and reaches maximum values of 57.07% at 7×10^{-2} M. Generally with increasing inhibitor concentration, the corrosion current density

and corrosion rate decrease as shown in Fig. 3 (a and b).

Fig. 3. Effect of lysine concentration on I_{corr} .(a), and on corrosion rate (b) of 316L stainless steel electrode in 0.5 M H_2SO_4 solution.

It is clear from the potentiodynamic polarization experiments that, the presence of lysine decreases the corrosion rate, i.e. the value of I_{corr} decreases. Particularly, the cathodic reaction is inhibited to larger extent than the anodic reaction. Since the transfer of oxygen from the bulk solution to the stainless steel/solution interface will strongly affect the rate of oxygen reduction, it can be inferred that the adsorbed layer behaves as a cathodic inhibitor to 316L stainless steel corrosion by retarding the transfer of O_2 to the cathodic sites of the 316L stainless steel surface.

The cathodic peaks observed at -750 mV, which increase in number by increasing the concentration of lysine.

3-3- The inhibition mechanism

The adsorption mechanism for a given inhibitor depends on such factors, as the nature of metal corrosion medium, the pH and the concentration of the inhibitor as well as the functional groups present in its molecule [15]. The corrosion inhibition process is based on the adsorption of the amino acid molecules on the active sites and/or deposition of the corrosion products on the alloy surface [16,17]. Thus it is possible to suggest that at low concentration, the amount of lysine in the solution was insufficient to form a compact complex with the metal ions, so that the resulting adsorbed intermediate was readily soluble in the acidic environment. As the concentration is increased, more lysine molecules become available for complex formation, which subsequently diminishes the solubility of the surface layer, leading to improved inhibiting effect [15].

The increase in efficiency of inhibition with concentration indicates that more lysine molecules are adsorbed on the metal surface at higher concentration, leading to greater surface coverage. The reduced effectiveness is observed at low inhibitor concentrations, including the relatively small molecular area of lysine. It is generally accepted that the first step in the adsorption of an organic inhibitor on a metal surface usually involves the replacement of one or more water molecules adsorbed at the metal surface [18].

$$\text{Inh}_{(\text{sol.})} + x \text{H}_2\text{O}_{(\text{ads.})} \rightleftharpoons \text{Inh}_{(\text{ads.})} + x \text{H}_2\text{O}_{(\text{sol.})}$$

The inhibitor may then combine with freshly generated Fe^{2+} ions on the stainless steel surface, forming metal - inhibitor complex⁽¹⁸⁾:

The adsorption behaviour of various amino acids on 316L stainless steel surface was investigated [19]. These investigations suggest that the acidic and basic amino acids are adsorbed through two electrostatic interactions of two ionized groups in the amino acid with 316L stainless steel surface. However, it has been reported that the number of –OH groups on the stainless steel surface is nearly the same regardless of the crystal forms of the metal oxide on the surface and thickness of the passive films [20,21]. The calculated configurations for the basic amino acids such as lysine and arginine show that the symmetric axis of $-\text{NH}_3^+$ groups and the guanidine groups of the basic amino acids are directed to O^- . Such orientations of the anionic and cationic groups of the acidic and basic amino acids were quite consistent with those indicated by the results from FT-IR analyses [19].

Fig. 4. SEM images of 316L stainless steel surface at 200 magnification, (a) polished surface, (b) stainless steel surface after immersion 2 hr in 0.5 M H_2SO_4 solution without lysine, (c) stainless steel surface after immersion 2 hr in 0.5 M H_2SO_4 containing 5×10^{-3} M lysine, (d) stainless steel surface after immersion 2 hr in 0.5 M H_2SO_4 containing 7×10^{-2} M lysine.

3-4- SEM analysis

The surface morphology of 316L stainless steel studied by scanning electron microscopy (SEM), surface was observed after 2 hs of immersion in 0.5 M H₂SO₄ at room temperature before and after addition of inhibitor corrosion (lysine). Fig. 4a shows the polished surface of 316L stainless steel before being exposed to the testing environment, it was observed as a uniform surface along with the presence of dark spots. Fig. 4b shows the SEM image after immersion in 0.5 M H₂SO₄ (Blank solution) without lysine, showing presence of small number of pits. These results is in agreement with Refaey *et al.* [22]. These results show that, the pitting corrosion of 316L stainless steel depends on the acid concentration. The increase of H₂SO₄ concentration leads to increase of pitting potential towards the more positive direction, i.e. decrease of the pitting corrosion [22]. SEM investigations of the 316L stainless steel surface, data showed that the surface was covered with a lower pit density for H₂SO₄ [22]. Fig. 4 (c and d), shows the stainless steel surface protects after adding lower and higher concentration (5×10^{-3} & 7×10^{-2}) of lysine, respectively. It is observed that, the protective film is thicker in case of higher concentration of lysine than in case of its lower concentration. These results are in agreement with the above discussion.

4- Conclusion

From the above studies, it can be concluded that:

- 1- Lysine is a good cathodic inhibitor for corrosion of stainless steel in 0.5 M H₂SO₄ solution.
- 2- Corrosion inhibition efficiency of lysine increases with increasing its concentration and reaches a maximum value at 7×10^{-2} M.
- 3- Corrosion inhibition by lysine takes place by adsorption of the inhibitor on the metal surface and formation of a protective layer (Fe-lysine complex film) on the metal surface.
- 4- The SEM images confirm the inhibitive character of lysine and the degree of inhibition increases with increase in concentration.

Abstract: Neonatal period is the most hazardous period of life because of various problems/ diseases which a neonate faces. There is great overlap between the risks associated with morbidity and mortality in the perinatal and neonatal periods. The present study aimed to identify the profile and risk factors for neonatal mortality among neonates admitted to neonatal intensive care unit (NICU) in pediatric Assiut University Hospital (AUH). A prospective study was conducted in NICU of pediatric AUH. Study population included all neonates admitted to NICU over a period of one year. The data collected included detailed antenatal and natal histories, details of clinical examination, primary diagnosis, progress during the hospital stay and outcome. The outcome measure was in-hospital death. Survival was defined as the discharge of a live infant from the NICU. Differences between deceased and survived neonates were estimated by the chi-square test and t-test. The association between risk factors and neonatal mortality were estimated by relative risk. The significance level used was p-value of less than 0.05. A total of 990 neonates were included in the study, of which 582 neonates (58.8%) died during their hospital stay. The mortality rate decreased with the increase in birth weight, as well as gestational age. Respiratory distress was the commonest primary diagnosis (94.5%) among all admitted neonates, followed by very low birth weight (VLBW) (36.7%), congenital malformations (8.2%), and infections (4.4%). Significant risk factors ($P < 0.05$) associated with neonatal mortality were: vaginal delivery, multiple births, low Apgar score at 5 minutes, neonatal respiratory distress, prematurity, and low birth weight (LBW). It is concluded that majority of the causes of neonatal mortality are preventable. Surveillance programs for neonatal death should include preventive actions and interventions for the perinatal period. Focused initiatives for quality improvement may also be necessary.

[Eman M. Mohamed, Asmaa M. A. Soliman, Osama M. El-Asheer. Predictors of mortality among neonates admitted to neonatal intensive care unit in pediatric Assiut University Hospital, Egypt. Journal of American Science 2011; 7(6):606-611]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: mortality, neonates, admission, neonatal intensive care unit.

1. Introduction:

Neonatal death is a serious concern, both in the developing and developed worlds. While infant mortality rates have been decreasing steadily all over the world, changes in neonatal mortality have been much slower^(1,2).

Accurate documentation of fetal and neonatal deaths enables analysis of change in perinatal death rates over time and assessment of their preventability. It is recommended that such audit should occur both regionally and nationally⁽³⁾.

Neonatal period (0 to 28 days of life) is the most hazardous period of life because of various problems/diseases, which a neonate faces. A large majority of newborn babies do not develop any serious problem or difficulties and require only minimal care, which can be provided by the mother if properly supervised by a health worker. High risk mothers are likely to give birth to preterm or low birth weight babies who suffer a large number of problems⁽⁴⁾. Majority of the causes of neonatal morbidity are preventable⁽⁵⁾. Some of the newborns in developing countries have an impaired growth right

during their intrauterine life, reflecting the nutritional status of the mother⁽⁶⁾. About 42% of the infant deaths in our country occur within first 28 days of life⁽⁷⁾. Prematurity accounts for majority of high risk newborns as they face a large number of problems⁽⁸⁾.

Neonatal morbidity and mortality is on increase day by day due to lack of the available resources in developing countries. This can be reduced by proper and timely intervention⁽⁹⁾.

A considerable share of these deaths results from avoidable causes, which means that interventions could have been effective. However, reducing neonatal mortality is hindered by the complex and close relationship between biological and social factors, and by the coverage and quality of health services during prenatal care, delivery and neonatal period.⁽¹⁰⁾ For better neonatal care and prevention of the preventable causes of neonatal morbidity and mortality, this study was conducted in neonatal intensive care unit (NICU) in pediatric Assiut University Hospital in order to identify the profile and risk factors for neonatal mortality among admitted neonates.

2. Subjects and Methods

A prospective study was conducted in neonatal intensive care unit (NICU) in pediatric Assiut University Hospital (AUH), Assiut city, Egypt. Study population included all neonates admitted to NICU over a period of one year. The outcome measure was in hospital death. Survival was defined as the discharge of a live infant from the hospital.

The indications for admission in NICU in pediatric AUH are preterm birth or premature (<37 weeks of gestation), respiratory distress, infections, congenital malformations, birth asphyxia, multiple births, VLBW (<1500), and others.

Data collected included detailed antenatal and natal histories; gestational age, gender, birth weight, single or multiple births, presence of meconium-stained amniotic fluid and type of delivery (vaginal or caesarian section). In addition, data included maternal variables as parity, history of abortion, obstructed labor, bleeding and antenatal morbidity. Apgar scores at 5 minutes, details of clinical examination, primary diagnosis and progress during the hospital stay, and outcome were recorded. Data were obtained from hospital records and oral communication with the attending physicians, as well.

All data were revised, coded and subjected to computer entry and analysis. Statistical analysis was performed using statistical package for social sciences (SPSS) version 11. Descriptive statistics (frequency and percentage) were used to present distribution of study population. Differences between survived and deceased neonates were estimated by the chi-square test and t-test. The association between risk factors and mortality were estimated by relative risk (RR) and their corresponding 95% confidence interval (CI). The significance level used was P-value of less than 0.05.

3. Results

A total of 990 neonates fulfilled the inclusion criteria of the study; of which a total of 582 (58.8%) babies died during the hospital stay. Most neonatal

deaths (n=449, 77.1%) occurred during the first week after admission to NICU. Premature neonates (n = 768) constituted 77.6%, and very low birth weight (n = 363) constituted 36.7% of all neonates admitted to NICU during the period of the study. Mean birth weight of survived neonates was significantly more than that of deceased ($2.37\text{kg} \pm 0.77$ versus $1.64\text{kg} \pm 0.76$, $p < 0.0001$). (data not in table).

The mortality rate decreased with the increase in birth weight as well as gestational age. None of the neonates below 27 weeks gestational age survived, and 96.1% of those weighing less than 1000g died (Table 1).

Primary causes of mortality are summarized in table (2). Common causes of mortality in LBW neonates (<2500g) were respiratory distress and prematurity, and both of them decreased as the birth weight increased. Among those with normal birth weight, common causes of mortality were respiratory distress (90.4%), prematurity (27.7%), congenital malformations (26.5%), hypoglycemia (14.5%), infections (8.4%) and brain insult due to hypoxia (8.4%).

Table (3) shows a comparison between premature and full term neonates as regards primary cause of death. Among premature neonates the most important was respiratory distress syndrome (97.9%). Among full term, in addition to respiratory distress (82.9%), other important causes were congenital malformations (21.6%), hypoglycemia (10.8%), infections (9.0%) and brain insult (8.6%).

Maternal and fetal variables were compared between the survived and the deceased neonates (Table 4). Risk factors significantly associated with mortality were twin pregnancy (RR 1.36), vaginal delivery (Vs. caesarian) (RR 1.22), and low Apgar score at 5 minutes (RR 1.30).

Table (5) shows relative risk of various morbidities. The risk factors most closely associated with neonatal mortality were respiratory distress (RR 1.92), prematurity (RR 1.84), low birth weight (RR 2.0), and very low birth weight (RR 2.02).

Table (1): Distribution of neonates admitted to NICU by birth weight and gestational age

Birth weight (g)	Gestational age (weeks)														Total	Mortality No. (%)
	25-26		27-28		29-30		31-32		33-34		35-36		≥ 37

Haemolysis and blood diseases	17 (4.2)	5 (0.9)	0.001	0.38 (0.18 – 0.83)

4. Discussion:

A considerable variation of mortality rates across NICUs was found. In our study, we documented a very high mortality rate of 58.8%, compared to other studies reporting mortality at NICUs. This may be contributed to higher percentages of preterm and LBW which are the commonest predisposing factors of neonatal mortality. In addition, it is notable that our study was conducted in a university hospital, which serves exclusively the public health sector and is the reference center for high risk pregnancies in the whole governorate. Furthermore, complicated deliveries are usually referred after many failed trials at the primary level with poor equipment and less experienced staff. Other studies have documented a mortality rate varying from 23% to 37%^(11,12,13,14). Most of these studies were Indian. A wide variations in the mortality rates was found among NICUs in a Brazilian study (10 – 48%)⁽¹⁰⁾. A large Canadian study investigated mortality rates for infants admitted to 17 NICUs (n = 19,265), and reported a very low overall mortality rate of 4%. Variations in mortality rates are important, as they would reflect variations in quality of care⁽¹⁵⁾.

Prognosis depends not only on birth weight and gestational age, but also on other perinatal factors and

physiological conditions of the individual infants, in particular, disease severity in the first hours of life⁽¹⁾.

Birth weight and 5-min Apgar score were found to be independent predictors of neonatal mortality and had similar accuracy in discriminating the groups of newborns at high risk for death. While Apgar score can be somewhat inaccurate due to subjective evaluation, birth weight provides a more precise measurement for screening neonates at risk of dying. The cutoff value of 2,500g for birth weight achieved the best performance for predicting neonatal death with sensitivity higher than 70%. Birth weight has been widely recognized as a powerful predictor of infant death, alone or in conjunction with other potential risk variables^(10,16).

In the present study, the mean birth weight of newborns admitted to the NICU was 1,944g ± 842g. The risk of dying was found to decrease with the increase in birth weight and gestational age. Apgar score was found to be a significant variable in the study. The mean Apgar scores at 5 min were significantly lower in the deceased group.

Results of several studies conducted in developing and developed regions have found gestational age as a powerful predictor of neonatal mortality^(15,17). The present study showed that preterm newborns had higher risk of dying (RR, 1.84) compared to full term newborns.

A national study of perinatal/neonatal mortality confirmed the suspicion that Egypt has transitioned in to a different epidemiological model where immediate complications of delivery and prematurity have become more significant contributors to neonatal mortality than infection. The study documented that prematurity and respiratory distress contributed to 57% of deaths while infection represented only 7% of neonatal deaths⁽²⁾. This was in agreement with our study.

We found that congenital anomalies caused 7.6% of neonatal deaths in accordance with the national study, but in contrast to others in developed countries. Wong *et al.*⁽³⁾ found that congenital malformations (29.6%) represented the commonest cause of neonatal deaths despite of thorough antenatal and early termination of pregnancy in presence of major congenital malformations. On the other hand respiratory distress caused only 9.6% of neonatal mortality. The same was reported by Sankaran *et al.*⁽¹⁵⁾. These differences in pattern of neonatal mortality may be due to marked advances in the developed countries concerning neonatal mechanical ventilation and management of preterm neonates together with dealing properly with neurological sequels of hypoxia and routine use of surfactant in respiratory distress syndrome. All these factors caused regression of respiratory distress and prematurity as main contributors to neonatal deaths.

A number of antenatal and intrapartum factors have been reported in the literature to be significantly associated with perinatal and neonatal deaths. In the present study, only maternal risk factors found to be significantly associated with mortality of neonates were multiple births and vaginal delivery. Maternal factors found to be significantly associated with neonatal mortality were history of abortion, bleeding per vagina and failure to give steroids antenatally at least 24 hours prior to childbirth^(1,18).

Forssas *et al.*⁽¹⁹⁾ found that among maternal predictors of perinatal mortality are: in-vitro fertilization, previous stillbirth, higher maternal age, maternal diabetes, lower socioeconomic status, smoking during pregnancy, and first birth. They also conclude that excess mortality due to maternal risk factors occurred mainly through their tendency to cause LBW. However, the excess mortality associated with low socioeconomic status and diabetes was mediated by other mechanisms in addition to LBW.

Our study showed that the risk factors most closely associated with neonatal mortality in NICU were respiratory distress (RR, 1.92), prematurity (RR, 1.84), low birth weight (RR, 2.00), and very low birth weight (RR, 2.02). Female gender, multiple births,

vaginal delivery, and low Apgar score at 5 minutes also posed neonates at higher risk of mortality.

Locatelli *et al.*⁽²⁰⁾ showed that smaller gestational age and birth weight, female gender, low five-minute Apgar score and failure of steroid administration were independent predictors of survival.

Chen *et al.*⁽²¹⁾ found that, with multiple logistic regression analysis, only low birth weight and intraventricular haemorrhage grades were the significant predictors of unfavorable outcomes.

Brito *et al.*⁽¹¹⁾ showed that very low birth weight infants with birth weight less than 750g, less than 29 weeks gestational age and CRIB (clinical risk index for babies) scores above ten had higher mortality rate.

Some limitations of the present study should be addressed. Data were restricted to infants admitted to NICU and hence did not cover deaths of those who did not reach any specialized care. Combining data on NICU deaths with data on deaths occurring in other settings should yield information on predictors of neonatal deaths for all infants born in the community, which may be helpful for those counseling pregnant women. In this sense, further studies should assess suitable algorithms useful for screening all neonates. Moreover, there was a lack of refined clinical information on disease severity, a potential confounder. These data are not recorded on a standardized basis in NICU thus they could not be used as a source of data. Therefore, some clinical information on pregnancy and delivery is out of the scope of this study.

In conclusion, most NICU deaths occurred within the first few days after admission. Respiratory distress, low birth weight, prematurity, congenital malformations were the major causes of neonatal admission to NICU in our study. Low birth weight, respiratory distress, and prematurity were the conditions which posed the admitted neonates at higher risk of death.

The strong association between NICU mortality rates on the hand and low birth weight and prematurity on the other indicates the importance of antenatal care, prevention of preterm deliveries and transfer of mothers with high risk pregnancies to tertiary-level perinatal centers before delivery as the uterus is the best incubator for a premature baby.

The results of the present study suggest that surveillance programs for neonatal death should include preventive actions and interventions for the delivery period. Focused initiatives for quality improvement may also be necessary. Development of strategies aimed at addressing these issues is a key to further reduction of NICU deaths.

Spousal violence against Egyptian women and its impact on reproductive indicators

Eman M. M. Monazea and Ekram M. Abdel Khalek

Public Health and Community Medicine Department, Faculty of Medicine, Assiut University, Egypt
habeba2002eg@yahoo.com

Abstract: Domestic violence against women is increasingly recognized as a global problem. It poses a direct threat to women's health and has serious reproductive health consequences. The study aims to identify the relationship between women exposure to spousal violence and some reproductive health indicators. Data from the 2005 Egyptian Demographic and Health Survey (EDHS) were secondary analyzed for 5,613 ever-married women aged 15-49 years. The results revealed that more than three in ten women had an experience with any form of spousal violence. Fertility was higher among women have experienced violence than among women who have not (mean number of children ever born was 3.4 ± 2.1 versus 2.9 ± 2.4). Total family planning need was higher among women who have experienced violence than among women who have not. Self reported prevalence of sexually transmitted infections was higher among women who have ever or recently experienced violence than women who have not (21.4%, 26.1% versus. 18.5%). It is concluded that marital violence is related to various negative reproductive health outcomes. Violence against women is a vicious circle that needs to be broken. Actions must be taken to make women and men understand that violence against women is not legitimate or acceptable and that everybody pays a high price for it.

Key words: Domestic violence – intimate partner- reproductive indicators- health impact

1. Introduction:

Violence against women has been acknowledged worldwide as a violation of basic human rights (United Nations General Assembly, 1991; Pan American Health Organization, 2001). The term “domestic violence” is usually used to define violence exerted toward the woman by a family member (most commonly the husband or the intimate male partner) (Crowell and Burgess, 1996). Violence against women has become a top priority on the agendas of many international health organizations. The Pan American Health Organization has estimated that women lose an average of 1 out of 5 days of healthy life during their reproductive years because of violence (Castro and Vand Ruiz, 2003).

Domestic violence not only poses a direct threat to women's health, but also has adverse consequences for other aspects of women's health and well-being and for the survival and well-being of children (Kishor and Johnson, 2004). Exposure to psychological assault and physical assault demonstrated significant influence on wives' participation in contraceptive decision-making (Chapagain, 2005). Women who reported physical or sexual violence by a partner were also more likely to report having had at least one induced abortion or miscarriage than those who did not report violence (WHO, 2005).

Women who are coerced into sex, or who face abuse from partners are less likely to be in a position

to use contraception. Therefore, they more exposed to unintended pregnancy than others. Women who have experienced a sexual assault often fear pregnancy and delay medical examination or health care (Glander *et al.*, 1998). Research reveals an association of violence and higher fertility, although the direction of causality remains unclear (Ellsberg *et al.*, 1999). Up to 40% of women attending for pregnancy termination have experienced sexual and/ or physical abuse at some stage of their lives (Allanson and Astbury, 2001).

A review of over 50 population-based studies performed in 35 countries prior to 1999 indicated that between 10% and 52% of women around the world report that they have been physically abused by an intimate partner at some point in their lives, and between 10% and 30% that they have experienced sexual violence by an intimate partner. Between 10% and 27% of women and girls reported having been sexually abused, either as children or as adults (WHO, 2005).

In the developing countries, large-scale studies have been conducted, between 10 and 69 per cent of women report they have been physically abused by an intimate partner in their lifetime (UNFPA, 2005).

According to Egypt Demographic and Health Survey, 2005, almost half of ever-married women in the reproductive ages have experienced violence at some point since they were 15 years and around one in five reported experiencing violence in the 12

months preceding the survey. The main perpetrators are husbands and physical violence is the most common form of violence (El-Zanaty and Way, 2006).

In Egypt as elsewhere around the world, wife beating is related to various negative health outcomes. Diop-Sbibé *et al.* (2006) found that thirty-four percent of women in their study were ever beaten by their current husband, while 16% were beaten in the past year. Ever-beaten women were more likely to report health problems necessitating medical attention as were women beaten in the past year compared to never-beaten women. Regarding reproductive health, higher frequency of beating was associated with non-use of a female contraceptive method, while antenatal care (ANC) by a health professional for the most recent baby born in the past year was less likely among ever-beaten women.

As domestic violence against women is increasingly recognized and discussed, this study used the available information of EDHS, 2005 about the association between intimate partner violence and reproductive health, which is currently lacking, and can be used to advocate for improved programmatic and policy efforts to address the problem.

Aim of the study:

This study aims to identify the relationship between women exposure to spousal violence and some reproductive health indicators.

2. Material and Methods

Data from the 2005 Egyptian Demographic and Health Survey were secondary analyzed for 5,613 ever-married women aged 15-49 who responded to both the main questionnaire and a special module on women's status. EDHS 2005 used a multistage sampling technique. Survey questionnaires were administered face-to-face by female interviewers. The overall response rate to EDHS-2005 for eligible women was 99.5% in all areas.

The DHS Household Questionnaire collects data on sex, age, education, residence, household possessions and household access to various amenities such as toilet facilities, water and electricity. The DHS Women's Questionnaire collects data for women age 15-49 years on a variety of characteristic, including age, education, marital status, parity, contraceptive use, employment and empowerment status, as well as their husbands' occupation, education.

Domestic violence section was administered to women in the subsample of households (one-third of households). One eligible woman was selected randomly from each of the households in the subsample to be asked the domestic violence section.

Weights were incorporated into the calculations to account for the sampling design.

Statistical analysis:

Data analysis was performed using SPSS version 16. Descriptive statistics were calculated. Then cross tabulations and chi-square were performed for categorical data. T-test was used for numerical data. Missing values were excluded in analysis. The 0.05 level was chosen as the level of significance and 95% confidence interval.

According to the experience of violence, women were categorized into the following four groups: ever-experienced violence, experienced violence in the past 12 months preceding the survey (recent violence), ever-experienced violence but not in the past year and never experienced violence.

For assessment the extent to which marital violence affect reproductive health of women, indicators of women's reproductive health were examined for women reported experiencing spousal violence. These indicators included measures of women fertility and their fertility planning status, the occurrence of non-live births, contraceptive use and the self-reported prevalence of sexually transmitted infections. It also included women's access to maternal health care. The analysis of contraceptive use and self reported prevalence of sexually transmitted infections was restricted to currently married women because some of the variables were more appropriate for them. The study examined women's physical health through two measures of nutritional status: body mass index (BMI) and anemia status.

Anemia level was detected based on the measured hemoglobin (gm/ dL) for non-pregnant women: Mild: 10-<12, Moderate: 7- < 10, Severe: < 7 and any anemia: < 12, while for pregnant women: Mild: 10-< 11, Moderate: 7-<10, Severe: < 7 and any anemia < 11.

3. Results

Table (1) presents selected background characteristics of the women in the research sample. Most of them were rural Moslem women and did not work for pay. About 40% of women had complete secondary or higher education.

The percentages of women ever-experienced any form of violence were 35.9% among ever-married women. The rates of experience of recent violence in the year preceding the survey were 20.7%. The most common type of violence was physical violence, followed by emotional form and the least one was sexual form (Table 2).

As shown in Figure (1), pregnancy did not protect women from being abused by their husbands.

Among women who had ever been pregnant, 5% of ever-married women have experienced physical violence during pregnancy by their husbands.

Table (1): Background characteristics of women in the EDHS 2005 domestic violence sample

Background characteristics	Ever-married women	
	No.	%
Current age:		
15-19	251	4.5
20-29	1871	33.3
30-39	1876	33.4
40-49	1614	28.8
Marital status:		
Married	5240	93.4
Divorced/separated	158	2.8
Widowed	215	3.8
Religion:*		
Moslem	5318	94.7

Fourth	1226	21.8
Highest	1192	21.2
Total number of women	5613	

* There were 6 missing values

Table (3) shows the mean number of children ever born to ever-married women by age group and the ever-experienced of violence. Results revealed a significant association of violence and higher fertility, as ever-married women who have ever-experienced violence have a higher mean number of children ever born (3.4 ± 2.1) than women who have never experienced violence (2.9 ± 2.2), $P= 0.000$. Also, the table shows that the mean number of births in all age groups tends to be higher for women who

have experienced violence than for women who have not.

Women who have experienced violence were less likely to say that their last birth was wanted when it was conceived (72.3%), compared with women who have never experienced violence (79.6 %, $P= 0.000$), (Table 4).

The result revealed that women who have experienced violence were more likely to be currently using contraception than women who have not experienced violence. About 63% of women who have ever-experienced violence and 63.3 percent of women who have experienced violence in the past year were currently using contraception comparing with 56.1% among women who never experienced violence (Figure 2).

Table (5) shows that women who have spousal violence tend to have higher total need for family planning than women who have not experienced violence. presents that the percent of total need for family planning was 76.8% and 75.3% among women who have experienced violence ever and in the past year, respectively compared with 67.2% among women who have not experienced violence ($P < 0.05$). Also, the table shows that women who have ever-experienced violence have a higher unmet need for limiting births (10.8%) than women who have never experienced violence (6.4%). Despite the higher current contraceptive use rate among women who have experienced violence, the higher need is also manifested in higher unmet need.

Table (6) presents women's access to antenatal care (ANC) and average number of antenatal care visits they made for the last baby born in the last 5 years. Women who have experienced spousal violence received ANC for 64.9% of last births compared to 74.9% among women who never experienced violence ($P < 0.05$). The percent of women who made more than 4 ANC visits was 84.4% among women who have experienced violence compared to 87% among women who not abused. The table also shows that the percentage of last births delivered with the assistance of a medical professional was 70.6% among women who have experienced marital violence compared to 78.6% among women who never experienced violence. The percentage of births delivered by Caesarian section was lower for women who were abused (17.7%) than for women who were not abused (23.8%).

Table (7) shows that women who have ever-experienced spousal violence were more likely to have had a non-live birth (26.7%) compared with women who have never experienced violence (22.5%). The difference was statistically significant ($P= 0.000$).

The EDHS survey asked all women whether they had a sexually transmitted infection in past year; figure (3) shows how this self-reported prevalence of sexually transmitted infections varies by the violence status of women. The proportion of women reporting a sexually transmitted infection was higher among women who have recently experienced violence (26.1%) than among those have ever-experienced violence (21.4%) and those have never experienced violence (18.5%), $P=0.000$.

Table (8) shows that the percentage of obesity among women who have ever-experienced violence was significantly higher (49.5%) than among women who have never experienced violence (45.3%), $P<0.05$. On the other hand, there was no statistically significant association between anemia and the experience of violence (Table 9).

Table (2): Prevalence of different forms of spousal violence among ever-married women age 15-49, EDHS 2005

Forms of violence	Ever-married women aged 15-49 years			
	Ever-experienced violence		Experienced violence in 12 months preceding the survey

Infecund/ menopausal	103	14.6	97	8.6	386	11.4
Total need for family planning³	541	76.8	852	75.3	2281	67.2
Total no. of women	704		1131		3394	

N.B.: All bivariate relationships are statistically significant based on the chi-square test.

¹ Unmet need for spacing includes: pregnant women whose pregnancy is mistimed, amenorrheic women whose last birth was mistimed and non-users who are neither pregnant nor amenorrheic and who either want to delay the next birth at least two or more years, are unsure whether they want another child or want another child, but are unsure when to have the birth. Unmet need for limiting includes: pregnant women whose pregnancy is unwanted, amenorrheic women whose last child was unwanted; and nonusers who are neither pregnant nor amenorrheic and who want no more children.

² Met need includes women who are currently using contraception.

³ Total need for family planning represents the sum of unmet need and met need. It also includes pregnant and amenorrheic women who became pregnant while using contraception.

Table (6): Access to antenatal and delivery care for the last child born according to whether the mother has ever-experienced spousal violence or not EDHS 2005

4. Discussion

There is often a culture of silence around the topic of domestic violence, which makes the collection of data in this topic particularly challenging. So data from the 2005 Egyptian Demographic and Health Survey were secondary analyzed. Violence against women is now recognized as a priority issue in many international agencies and local non-governmental organizations (NGOs) around the world. Women in Egypt face a myriad of problems and inequities, and domestic violence is one of the most serious health problems. In the present study the researchers examined the impact of spousal violence on reproductive health of Egyptian women from a nationally representative sample of ever-married women.

Prevalence of different types of domestic violence

Prevalence studies with samples of representative populations are relatively new in developing countries (UNICEF, 2000). Data from developing countries was, however, generally lacking (García-Moreno *et al.*, 2005; Ntaganira *et al.*, 2008; Silverman *et al.*, 2008). There are very few studies concerning domestic violence in Middle-Eastern countries where religion plays an important role in shaping society, the results of which indicate that in countries such as Egypt, Palestine, Israel and Tunisia at least one out of three women is beaten by her husband (Haj-Yahia, 2002; Douki, *et al.*, 2003).

The present study revealed that about one third of the Egyptian women ever-experienced any form of marital violence and one fifth of them experienced a recent violence in the year preceding the 2005 DHS survey. The most common type of violence was

physical violence, followed by emotional form and the least one was sexual form. Bakr and Ismail (2005) found that out of 509 women attending out-patient clinics in Ain Shams University Hospitals, Cairo, 89.8% had experienced one or more episodes of spousal violence and about 34.2% had been beaten by their husbands. In a multi countries study conducted by WHO physical and sexual violence against women was strikingly common. In every setting except Japan, more than a quarter of women in the study had been physically or sexually assaulted at least once since the age of 15 years (García-Moreno *et al.*, 2005). Silverman and his colleagues (2008) found that one third of married Indian women (35.5%) reported experiencing physical intimate partner violence with or without sexual violence from their husbands. In a study conducted in Sudan, the prevalence of physical abuse by husbands reported by the women was 80% (Ahmed and Elmardi, 2005).

On the other hand, the present findings were higher than the result found by Kocacik and his colleagues in Turkey (2007) as 27.5% of studied women have experienced domestic violence by their husbands. Also, American National Violence against Women Survey found that 22% of surveyed women experienced intimate partner violence and reported that they were physically assaulted by a current or former spouse; 1.3% reported experiencing such violence in the previous 12 months (Menard, 2008).

Although pregnancy is often thought of as a time when women should be protected, among women who had ever been pregnant, it was found that 5% of women have experienced physical violence during pregnancy by their husbands. This similar with WHO findings about 5% of the women reported exposure to physical violence during pregnancy. In most study locations, between 4% and 12% of women who had been pregnant reported being beaten during pregnancy (WHO, 2005). This result is much lower than that reported by women in EDHS (1995) as 32% were beaten during pregnancy (El-Zanaty *et al.*, 1996). In a household survey, it was found that pregnant women are about two thirds more likely to be beaten than women who are not pregnant. Violence is cited as a pregnancy complication more often than diabetes, hypertension or any other serious Complication (CDC, 1998). Each year over 300,000 pregnant women in the U.S. are battered by the men in their lives, often the father of their child (Gazmararian *et al.*, 2000). In a study conducted on pregnant women in Rwanda, 35% reported intimate partner violence in the last 12 months (Ntaganira *et al.*, 2008).

Impact on Reproductive health

Experience of violence has long-term negative health consequences. These effects can manifest as poor health status, poor quality of life, and negative outcomes for women and children health high use of health (Campbell, 2002). Women who have ever-experienced domestic violence are less likely to have had a birth that was wanted at the time of conception than women who have never experienced violence and also related with higher rates of ever use of contraceptive methods. Intimate partner violence has been noted in 3–13% of pregnancies in many studies from around the world, and is associated with detrimental outcomes to mothers and infants (Campbell, 2002). Sakar (2008) has reported that physical violence on pregnant women increases the risk for low birth weight infants, pre-term delivery and neonatal death and negatively affects breast feeding postpartum.

The findings from this study confirm that marital violence is associated with negative reproductive health outcomes. The findings reveal an association of violence and high fertility. The direction of the relationship is unclear- whether increased fertility leads to violence or violence leads to high fertility. However, the relationship may work in the opposite direction when there are more children in a household; there is less income per capita as insufficient resources may lead to exacerbated levels of stress for the husband, which may lead to violence (Martin *et al.*, 1999). DHS 2005 data show that fertility of women who have experienced violence was higher than that of women who have not. Women experienced violence had a higher mean number of children ever born (3.4 ± 2.1) than women did not (2.9 ± 2.4). Women who are subjects to partner violence may be less able to control their fertility than other women (Kishor and Johnson, 2004).

The analysis revealed that women who have ever experienced violence were significantly less likely to have had the last birth that was wanted at the time of conception than women who have never experienced violence (72.3% versus 79.6%). The hypothesized lack of sexual autonomy among abused women suggests that abused women should be at a greater risk of having a mistimed as well as an unwanted birth. Diop-Sbibé and other researchers (2006) found that wife beating was associated with non-use of female contraceptive methods. Forty percent of pregnant women who have been exposed to abuse report that their pregnancy was unintended, compared to just eight percent of non-abused women (Hathaway *et al.*, 2000). The results of Stephenson *et al.*, 2008 demonstrate a clear relationship between a woman's experience of physical violence from her husband and her ability to achieve her fertility

intentions. Women who have been sexually abused are more likely to have had their partner stop them from using contraception. Salam *et al.*, (2006) found that abused women used contraception significantly less than non-abused women. One study of 474 low-income adolescent mothers found that 66% of abused women had experienced birth control sabotage, versus 34 % of non-abused women (Outlook, 2002).

In most sites, women who reported physical or sexual violence, or both, by a partner were significantly more likely to report having had at least one induced abortion or miscarriage than those who did not report violence, with the association being stronger for induced abortions than for miscarriages (WHO, 2005). The studies show that women with past or current history of abuse had a significantly higher incidence of spontaneous abortions and neonatal deaths. The greater the severity of the acts of aggression, the higher the proportion of women with multiple abortions (Diniz and d'Oliveira, 1998). Saifuddin and his colleagues (2006) found the risks for perinatal mortality were more than two-fold higher among births to mothers who experienced such violence. Fetal deaths have also been associated with the experience of domestic violence during pregnancy in India (Jejeebhoy, 1998).

In this study, antenatal care for the most recent baby born in the past five years was less likely among women experienced violence. The postulated negative relationship between marital violence and antenatal care visits was supported. In Egypt, Kishor and Johnson (2004) found that mothers who were abused received ANC for only 32% of births, compared with 41% of births mother who were not abused. In other study, there was no difference in the use of antenatal services by abused and non-abused women who had had a live birth in the 5 years preceding the interview. However, in urban Bangladesh, Ethiopia, and provincial United Republic of Tanzania, women who were ever physically or sexually abused by their partner were significantly less likely to have attended an antenatal service for the most recent live birth (WHO, 2005).

Our findings revealed that exposure to marital violence related to increases sexually transmitted infections that is consistent with demonstrated by Silverman *et al.*, 2008. Women in violent situations are less able to use contraception or negotiate safer sex, and therefore run a high risk of contracting sexually transmitted diseases and HIV/AIDS. According to a study by Harvard University, one in three teens tested for STIs and HIV/AIDS have experienced domestic violence (Family Violence Prevention Fund, 2009). Women disclosing physical violence are nearly three times more likely to experience a sexually transmitted infection than

women who don't disclose physical abuse (Coker, 2000). Studies have hypothesized that women who suffer physical violence are less likely to be in a position to negotiate safe sex or condom use with their husbands. There is also evidence that men who admit perpetrating violence on their wives also admit multiple partner sexual relations and non-use of condoms. Data reveal that abusive men are more likely to engage in extra-marital sex and have symptoms of STIs, thereby placing their wives at risk of acquiring infection (Verma and Collumbien, 2003; Salam *et al.*, 2006).

Research suggests that the risk of severe obesity is higher among abused women, particularly women who have experienced abuse in childhood (Williamson *et al.*, 2002). Our results revealed that women who have experienced violence were significantly more likely to be abused (49.5%) than women who have never experience violence (45.3%). In India, women who have experienced violence (34%) to be underweight (Kishor and Johnson, 2004). As regards the prevalence of anemia, the study did not provide support for significant positive relationship between women experience of violence and their anemia status. However, Kishor and Johnson (2004) found that in India, women who have experienced violence were more likely (41%) to be underweight. Also, the prevalence of anemia was more between women who have recently experienced violence (57%) and women who have never experienced violence (51%).

This study has some limitations. The EDHS 2005 was cross sectional design and purely quantitative. Such design may provide an indication of the prevalence rate of domestic violence but it is inappropriate for measuring the incidence rate. Also, causality and ordering of the events are uncertain. The other limitation is that the data were derived from women self-reports and, therefore, are liable to all self-report bias.

5. Conclusion

This study concluded that violence against women is alarming, and highlight the urgent need for government and civil society to address the issue and end this scourge that hinders progress toward Egypt's development goals. Violence against women is a vicious circle that needs to be broken. Experience of violence results in negative outcomes for women and children health.

The main recommendations are summarized as the followings:

- Include the subjects of domestic violence in population education, which target the

public at large as well as specific subgroups of the population and using different communication strategies.

- Actions must be taken to make women and men understand that violence against women is not legitimate or acceptable and that everybody pays a high price for it.
- Make use of the regional broadcasting TV and Radio to raise public awareness on the health and social consequences of domestic violence. The message has to be clear and scientific and agreed upon by religious people.
- Provision of health services and counseling places to help the abused women. This could be integrated into the existing maternal and child health services.
- Additional studies focusing extensively on domestic violence against women are needed to emphasize health, psychological and social dimensions of this problem.

Physicochemical and Sensorial Quality of Semolina-Defatted Guava Seeds Flour Composite Pasta

Ahmed M.S. Hussein*, Mohie M. Kamil and Gamal F. Mohamed

Food Technology Department, National Research Centre, Dokki, Cairo, Egypt

*a_said22220@yahoo.com

Abstract: Guava seeds flour (≥ 40 mesh) characterized with its higher contents of crude fiber, fat and lowest moisture if compared with semolina flour. Farinograph parameter indicated that, water absorption, arrival time and dough weakening increased and stability decreased by increasing supplementation level of guava seeds flour compared to semolina flour. Supplemented pasta with guava seeds flour (10 & 20%) characterized with its higher volume than control pasta; and cooking loss not affected with replacement of 10% if compared with control pasta. Sensory evaluation showed that, stickiness, appearance, flavor and tenderness not affected with replacing level up to 30%, 20% and 10%, respectively, while color of different replacement level affected. Chemically, supplemented pasta with guava seeds flour caused an acceptable gradual increase in moisture, protein, fat, ash and crude fiber; and decrease in carbohydrates. Guava seeds flour characterized with its higher essential mineral if compared with semolina. FT-IR spectra of guava seeds flour showed two specific bands at 3417 cm^{-1} , 1040 cm^{-1} and 1746 cm^{-1} for stretching (OH), stretching (C-O) and stretching (C=O). While, pasta of 100% semolina was characterized with bending (CH) at 1421 cm^{-1} and stretching (C-C) at 1081 cm^{-1} .

Keywords: Guava seeds - pasta – supplemented flour – high fiber pasta - Farinograph.

1. Introduction:

Guava (*Psidium guajava*) is one of the most widely processed fruit in many parts of the world. Guava juice and nectar are the most popular bottled fruit beverages in Egypt. The pulp (88 g/100 g of fruit weight) is used for juice production, but seeds (12 g/100 g of fruit weight) are discarded. One of the most common problems in food processing industry is the disposal of the sub products generated. This “waste material” produces ecological problems related to the proliferation of insects and rodents, and an economical burden because of transportation to repositories. Therefore, strategies for the profitable use of these materials are needed. Kanner *et al.*, (2001), Melo *et al.*, (2008), and Norshazila *et al.*, (2010) found that, Guava wastes have high antioxidant potential, because they are rich in compounds that can delay oxidation; and also, Packer *et al.*, (2010) concluded that Guava peel and seeds extracts are effective in retarding lipid oxidation in processed chicken meat at concentration of 60 mg total phenolic compounds/kg of meat. Opute (1978) and Aly (1981) reported that guava seeds contained 9.0% lipids which consisted almost of neutral compounds (triglycerides). Habib (1986) found that the chloroform methanol extracted lipids amounted to 9.1% on a dry weight basis and contained 12 fatty acids which are similar to that of cotton seed oil. The protein content of guava seeds was 9.73% on dry matter basis and consisted of 15 amino acids of which arginine, glutamic acid, aspartic acid, glycine

and leucine presented 67% (Adsule and Kadam, 1995). Several researchers studied the possibility of utilizing guava seeds waste, where Shams El-Din and Yassen (1997) used guava seeds as an additional source of fiber in cookies; they found that, using 9% guava seed meal gave an acceptable, but comparatively inferior product. They found that, increasing the ratio of guava seeds meal caused a decrease in water absorption, dough development time and stability; and increased dough weakening. They found also that, adding guava seed meal to wheat flour improved volume, specific volume, diameter, and thickness of the cookies after baking. While, Abd El-Aal, (1992) studied the optimum conditions for preparing protein isolates from ground, defatted guava seed flour that could be used as a value added products.

Guava seeds gave coarse particle after milling, difficult to be applied at industrial scale. This research is consider as an attempts towards preparing fine ground fractions that could be used to add a nutritive value and cooking quality to pasta.

2. Materials and Methods

Materials:

Guava seeds were washed, dried (air oven at 55°C), defatted (hexane) and milled using Quadrumat Junior flour mill. Milling process was carried out three times to obtain three fractions by sieving through ≥ 40 , < 40 & < 20 meshes. The first fine

fraction (≥ 40 mesh) was mixed with semolina at 10, 20 and 30% replacement levels.

Methods:

Pasta samples were prepared according to AACC (2000) using a lab pasta machine (Matic 1000 Simac Machine Corporation, Milano, Italy). Pasta hydrated for 15 min under atmospheric air, dried in a cabinet dryer at 70°C for 10 hrs (Berglund *et al.*, 1987). , then cooled at room temperature, packed in polyethylene bags and kept at room temperature for analysis.

Cooking quality of pasta were carried out by measuring the increases in weight, volume and cooking loss after cooking according the methods of AACC (2000).

Analytical methods

Moisture, ash, crude protein, fat and crude fiber contents of semolina, guava seeds mill and pasta were determined according to the methods outlined in AOAC (2000), while carbohydrates were calculated by difference as mentioned by Tadrus (1989).

Minerals contents (calcium, magnesium, sodium, potassium, copper, zinc, Manganese and iron) of guava seeds mill fraction 1, semolina, and their blended pasta products were determined using Perkin Elmer 2380 Atomic Absorption according to the method of AOAC (2000).

The spectra of semolina, guava seeds mill fraction 1 and pasta replaced with 10% guava seeds mill fraction 1 were obtained using FT-IR spectroscopy. The samples of FT-IR (FT-IR-6100 Jasco, Japan) were prepared by using potassium bromide disks.

Rheological properties of the doughs were determined using a Farinograph according to AACC (2000).

Color quality of Processed Products:

The color parameter of semolina, guava seeds mill and pasta were evaluated using Hunter, Lab Scan XE, Reston VA., calibrated with a white standard tile

of Hunter Lab color standard (LX No. 16379) $x = 77.26$, $y = 81.94$ and $z = 88.14$ ($L^* = 92.43$, $a^* = -0.88$, $b^* = 0.21$).

Cooked pasta was organoleptically evaluated by ten panelists for its appearance (10), color (10), flavor (10), tenderness (10) and stickiness (10) as described by Hallabo *et al.*, (1985).

The obtained results were evaluated statistically using analysis of variance as reported by McClave & Benson (1991).

3. Results and discussion

Chemical composition of guava seeds and semolina:

Three fractions of guava seeds (≥ 40 , < 40 & < 20 mesh) were prepared as a fiber source. Figure (1) showed the percentage of each fraction referred to guava seeds. The obtained guava seed fractions and semolina were evaluated chemically as shown in Table (1). The obtained three fractions of guava seeds contained the highest crude fiber, fat and lowest moisture compared to semolina, where, the crude fibers of fractions (1), (2) and (3) were 17.18, 10.98 and 20.19%, respectively, while it was 0.7% in semolina. These results are in agreement with those reported by Uchoa *et al.*, 2009.

Figure (1): Flour fractions percentage of guava seeds.

Table (1): Chemical composition of semolina and fractions of guava seeds flour (dry weight basis).

Samples	Moisture	Protein	Fat	Ash	Crude fiber	Carbohydrate
Semolina	11.22± 0.5	13.86± 0.2	0.2± 0.01	0.82± 0.05	0.7± 0.06	76.32± 3
Fraction (1)	6.52± 0.4	16.91± 0.1	5.02± 0.19	1.65± 0.1	17.18± 0.3	59.24± 0.4
Fraction (2)	5.71± 0.3	11.07± 0.1	2.6± 0.08	1.19± 0.1	10.98± 0.2	74.16± 0.5
Fraction (3)	3.75± 0.4	5.2± 0.1	1.02± 0.05	0.64± 0.1	20.19± 0.2	72.95± 0.6

Preliminary study on the palatability of the three fractions of guava seed flours showed that, fraction 2 and 3 were unaccepted for their roughness like sand (< 20 & < 40 mesh), but fraction 1 (≥ 40 mesh) was accepted for its lower granule size. Rheological study was carried out to select the best replacement level of guava seeds flour fraction 1 with semolina to produce high fiber pasta. Farinograph parameters of semolina and different blends of semolina with guava seed flours (10, 20 and 30%) illustrated in Figure (2). The obtained results indicated that, water absorption, arrival time and

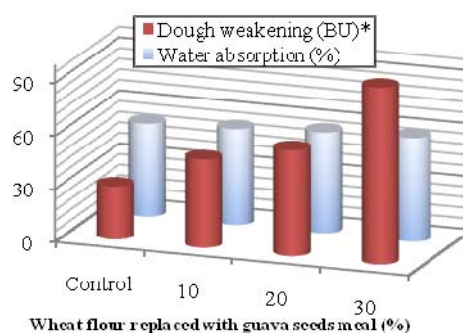

Wheat flour replaced with guava seeds meal (%)

AT = Arrival time DDT = Dough development time
DS = Dough stability

Figure (2): Farinograph parameters of semolina dough as affected by replacement level of guava seeds meal fraction (1).

Cooking quality of pasta prepared by partial replacement of semolina with deferent levels of fraction 1 is shown in Table (2). Data revealed that, the volume (swelling %) of high fiber pasta (10 & 20%) increased if compared with control pasta (semolina 100%), while weight decreased in all replacement levels of guava seeds fraction 1 if compared with control pasta sample. This result indicated that, increasing fiber level led to decrease weight of cooked pasta. Cooking loss (represent loss of solids in cooking water) was evaluated and

dough weakening increased and stability decreased by increasing the level of fraction 1 compared to control (semolina 100%). The increasing water absorption is mainly due to the strong water-binding ability of fibers. The longer dough development time and lower dough stability could result from the dilution of gluten and the difficulty of mixing fibers and semolina homogeneously. Such results were in agreement with those obtained by Jinzhou, *et al.*, (2002), Gomez, *et al.*, (2003) and Yaseen & Shouk (2007).

presented in Table (2). Results showed that, there was no significant difference in cooking loss of control pasta and replaced pasta with 10% guava seeds flour, while increasing replacing level led to increase cooking loss of pasta. The undesirable effect of guava seed flour on cooking loss may be due to the dilution of gluten, and the interaction between gluten and fiber that allowed starch to be leached out during cooking. Such results were in agreement with those obtained by Yaseen & Shouk (2007)

Table (2): Effect of replacing semolina with guava seed flour on cooking quality of pasta at three levels of replacement.

Pasta Sample	Weight increase (%)	Volume increase (%)	Cooking loss (%)
Control (Semolina 100%)	330	300	8
Replacing level of guava seeds meal fraction (1)			
10 (%)	287.5	350	8
20 (%)	262.5	320	10
30 (%)	250	250	12

Table (3) showed that, there were significant difference in color parameter of uncooked pasta as

affected with replacing level of semolina with guava seed flour, where increasing replacing level from 10,

20 and 30% led to a decline in lightness (L*) to 78.22, 72.47 and 68.29; respectively; and at the same time, redness and yellowness were increased. Table (3) showed that, cooking pasta caused significant decrease in lightness (L*) and increase in redness (a*), where uncooked control pasta (100% semolina) were 86.56 (L*) and 1.38 (b*), while cooked control

pasta decreased to 66.17 (L*) and 0.237 (a*). Also, increasing replacing levels of guava seeds flour caused significant increase in darkness, where lightness (L*) decreased to 53.64, 49.60 and 49.40; and redness increased to 4.32, 4.71 and 5.02 at replacement levels 10, 20 and 30%, respectively.

Table (3): Effect of replacing semolina with guava seeds meal fraction (1) on color quality of uncooked and cooked pasta.

Pasta	Uncooked Pasta Sample			Cooked Pasta Sample		
	L*	a*	b*	L*	a*	b*
Control	86.56 ^a	1.83 ^b	18.68 ^d	66.17 ^a	0.237 ^d	12.51 ^c
10 %	78.22 ^b	2.46 ^b	21.36 ^c	53.64 ^b	4.32 ^c	15.19 ^{ab}
20 %	72.47 ^c	5.06 ^a	23.02 ^b	49.60 ^c	4.71 ^b	14.95 ^b
30 %	68.29 ^d	5.96 ^a	23.97 ^a	49.40 ^c	5.02 ^a	15.59 ^a
LSD at 5%	2.807	2.084	0.599	2.196	0.2	0.581

Influence of replacing semolina with different levels of guava seeds flour to pasta was also evaluated sensorial. Table (4) revealed that, appearance of control pasta not affected significantly with increasing replacing levels of guava seeds flour up to 10 or 20%; while flavor and tenderness not affected significantly with replacement level 10%. But, color of different replacement level affected significantly if compared with pasta of control sample, this result is confirmed with the previous color parameter (L, a & b) of Table (3), where

darkness was increased with increasing replacement of guava seeds flour. Also, the obtained color result agreed with Kordonowy & Young (1985), who stated that color of control spaghetti ranked higher than those of replaced bran spaghetti. Stickiness is one of the most important characteristics in judging pasta quality. The obtained sensorial results indicated that, stickiness not affected significantly, where control pasta was 8.3, while replaced pasta with different levels of guava seeds flour ranged between 8.4 - 7.6.

Table (4): Effect of replacing semolina with guava seeds meal fraction (1) on Sensory quality of pasta.

Cooked pasta Sample	Appearance (10)	Color (10)	Flavor (10)	Tenderness (10)	Stickiness (10)
Control (Wheat flour 100%)	8.5 ^a	9.2 ^a	8.3 ^a	8.4 ^a	8.3 ^a
Replacing level of guava seeds meal fraction (1)					
10	7.8 ^a	7.7 ^b	7.7 ^{ab}	8.6 ^a	8.4 ^a
20	7.1 ^{ab}	6.4 ^c	6.4 ^{bc}	7.3 ^b	8.2 ^a
30	6.2 ^b	5.3 ^c	5.9 ^c	7.7 ^{ab}	7.6 ^a
LSD at 5%	1.234	1.181	1.335	0.998	1.124

LSD = least significant differences at 5% level.

There is no significant difference between two means (within the same property) designed by the same letter.

Table (5) indicated that, pasta containing guava seeds flour caused an acceptable gradual increase in moisture, protein, fat, ash and crude fiber;

and decrease in carbohydrates as a replacement of guava seeds flour level increased.

Table (5): Effect of replacing semolina with guava seeds meal fraction (1) on gross chemical composition pasta.

Pasta Samples	Moisture (%)	Protein (%)	Fat (%)	Ash (%)	Crude fiber (%)	Carbohydrate (%)
Control	11.0	12.5	0.5	0.82	0.76	85.42
Replacing level of guava seeds meal fraction (1)						
10	11.50	12.90	1.05	1.02	2.26	82.77
20	11.70	13.22	1.52	1.12	3.65	80.49
30	12.00	13.50	1.95	1.22	4.86	78.47

Moreover, chemical active groups that represent the fingerprints of the studied semolina, guava seeds flour and their blends were identified using FT-IR. Table (6) and figure (3) contained the FT-IR spectral bands of the previously mentioned samples. The broad band around 3417-3351 cm^{-1} is the characteristic absorption peak of hydroxyl group of lipid in guava seeds at 3417 cm^{-1} and stretching (OH and NH) in wheat flour and their blends with guava seeds flour. Stretching (CH_2) asymmetric vibration was identified as weak absorption peak at 2926-2928 cm^{-1} .

Stretching (CH_2) symmetric vibration (2856 cm^{-1}), stretching carbonyl group (1746), Bending

(CH_2 at 1375 cm^{-1}) and stretching (C-O) of ester (1040 cm^{-1}) peaks were identified in guava seeds powder only and that attributed to its lipid content.

The absorption spectral bands at 1654-1652 cm^{-1} and 1541-1540 cm^{-1} that corresponding to the carbonyl group of amide I and amide II (stretching C-N with bending N-H), respectively (Chen *et al*, 2008 and Goormaghtigh *et al*, 1996). The major peaks corresponding to carbohydrate content were located in the range 1157—1159 cm^{-1} (stretching C-O-C) , 1019 cm^{-1} (stretching C-O) and 860 cm^{-1} (stretching C-O-C-O) these results in agreement with Kacura'kova' *et al.*, (2001).

Table (6): FT-IR spectra and assignments of Semolina, guava seeds flour fraction 1 and semolina replaced with 10% guava seeds flour fraction 1.

Assignments	FT-IR spectra (cm^{-1})		
	Guava seeds flour	Pasta of 100% Semolina	Pasta of 10% Guava seeds flour
Stretching (OH) vibration	3417	---	---
Stretching (OH and NH)	---	3351	3383
Stretching (CH_2) asymmetrical	2926	2928	2926
CH_2 stretching symmetrical	2856	---	---
C=O stretching of ester	1746	---	---
Amide I (C=O amide)	1653	1652	1654
Amide II (C-N stretching with NH bending mode)	---	1541	1540
CH bending of lipids	---	1421	---
Bending (CH_2)	1375	---	---
stretching (C-O) of ester	1238	---	---
stretching (C-O-C) of carbohydrate	1159	1157	1158
stretching (C-C) of carbohydrate	---	1081	---
C-O stretching of ester	1040	---	---
c-o of carbohydrate stretching	---	1019	1019
C-O-C stretching	---	860	860

Figure (3): FT-IR spectra of guava seeds flour, control pasta sample (100% semolina) and pasta of 10% guava seeds flour.

Magnesium, calcium, potassium, iron, copper and zinc are considered as essential elements to human being. Table (7) showed that, guava seeds flour fraction 1 characterized with its higher mineral

contents if compared with semolina. So, replacing guava seeds flour improved the minerals content of the blended flour, especially at a higher replacement level.

Table (7): Effect of replacing semolina with guava seeds meal fraction (1) on minerals content of pasta (dry weight basis).

Minerals (mg/100g)	Guava seeds Fraction 1	Control (Semolina 100%)	Replacing level of guava seeds meal fraction (1)		
			10 %	20 %	30 %
Magnesium	158.65	104.61	122.19	128.62	148.35
Calcium	172.36	53.00	83.55	111.32	128.43
Potassium	895.0	102.0	202.32	268.34	326.49
Iron	11.71	1.31	2.03	3.37	6.19
Copper	1.379	0.11	0.18	0.26	702.74
Sodium	750.86	630.18	650.76	680.26	702.74
Manganese	1.38	0.53	0.66	0.75	0.91
Zinc	1.84	0.33	0.46	0.62	0.81

Conclusion

From the previous results, it could be concluded to use guava seeds flour fraction 1 (≥ 40 mesh) to produce pasta characterized with its lower content of carbohydrate and at the same time increasing its availability with essential minerals, crude fiber and protein. FT-IR spectroscopy was used as beneficial instrument to detect the chemical composition of food matrix.

Preparation of Layer Nano-Silicate/Alumina Castable Composites

M. Khoeini, H. Rastegar, H.R. Hafizpour

Department of Materials Science, Saveh Branch, Islamic AZAD University, P.O. Box 39187-366, Saveh – Iran. Hamid_hafiz@alum.sharif.edu

Abstract: The effect of adding nano scale particles on rheological and mechanical properties of ultra low cement alumina castables was investigated. After clay purification by mechanical methods and obtaining nano-silicate layers materials, the characterization was conducted by using XRD. Then, the produced nano-silicate particles were added to the ultra low cement Alumina castable containing microsilica and reactive Alumina. Mechanical and rheological properties of castable were studied before and after firing at 1500 °C. The results showed that d-spacing between nano-silicate layers was about 1.2 nm. Flow ability of the castables showed an increase of 5%, indicating decreasing the presence of some filler materials such as microsilica and reactive Alumina. Finally XRD results of fired samples indicated the existence of mulite as a desired phase in the samples.

Keywords: Layer nano-silicate; Alumina castable; Rheology; mulite phase

1. Introduction

The advantages of monolithic refractories are the main driving force for increasing researchers in this area which have shown great progress. The development of low and ultra low-cement castables (LCC & ULCC) started in the late 1970s. Low and ultra low-cement castables are relatively new class of refractories. They offer various advantages over conventional refractory bricks in terms of application rate as well as cost and flexibility, making them attractive to all other industrial users [1-5]. Also, they have the great advantage of setting and hardening quickly at room temperature so they can be used for building structures as well as for patching and coating bricks. Also, they offer various advantages over conventional refractory bricks in terms of application rate as well as cost and flexibility, making them attractive to all other industrial users [6-9].

Although, Evaluation of optimum amount and proportion of micro silica to reactive alumina for using in castables yields appropriate properties such as flowability and formation of desired mulite phase, but determination of the optimum ratio is one of the main scientists encountering difficulties.

From other hand the application of nano materials in refractories researchers have recently started which might end in unexpected results. It has been indicated that by replacing a part of these cements with nano scale particles, physical and mechanical properties of these materials have improved.

Successful performance of these castables during the installation and their high-temperature properties have been attributed to the ability of fine and ultra fine particles to fill in the voids between

aggregates, resulting in the higher packing density [2,3]. Due to reduced cement content and higher packing density, the water demand in high-alumina castables is decreased remarkably. Therefore, both LCC and ULCC reinforced with nano clay exhibit better physical properties than the conventional medium-cement castables [1-4, 10]. Using nano particles in castables have also investigated in a limited extend. Most of the studies have been focused on self-flowing and electrical conductivity properties, for example [11,12]. In the present work, some modified nano clay was added in one kind of ULCC castable. The influence of adding nano particles to low cement alumina castables on the flowability, cold compression strength and formation of the desired mulite phase was then evaluated and compared with ULCC conventional castables.

2. Experimental procedure

The local sodium bentonite with the mean particle size of 75 μm was used which its chemical component is shown in Table (1).

To modify the clay, a suitable modifier of (γ) - 3-aminopropyltrimethoxysilane of Sigma Aldrich was used. XRF method (Oxford-ED2000) was used for chemical analysis. After that, the clay was purified using a 2-inch Hydrosyclon apparatus. To do so, the suspension with 3 percent solid in distilled water was prepared and passed through cyclone in 1.5 Kg/cm² pressure. Montmorillonite particles with less than 6 microns were dried for using in modification process. In order to have modification after clay dispersion in distilled water, suspension with 3 percent solids was prepared and different percents of modifier materials ranging from 10 to 40 percent were used. The

mixtures were heated at 80°C for 6 hours. Then, the products were washed with distilled water and dried. The method of intercalation of samples was studied using X-ray diffraction (XRD system, model Brocker).

The ULCC alumina castable was composed with Chinese bauxite ($\text{Al}_2\text{O}_3 > \%88$), high alumina cement (Secar 70), reactive alumina, micro silica, poly propylene fibers ($<75\mu\text{m}$) which their chemical composition are shown in Tables 2, 3 and 4 respectively.

2.1. Sample preparation

In this research, castables were prepared from a kind of bauxite as a basic mixture (according to table. 5).

Table 5. Chemical compounds of provided Castables

Sample Cod	Castable Mixture					T.P.P
	bauxite	reactive Alumina	micro Silica	High Alumina Cement	Nano Clay	
Castable with micro silica & reactive alumina A1	86	7	4	3	-	0.12
Castable with nano clay A2	86	-	-	3	11	0.12

Castables with different particle size distributions were prepared using the Andreassen equation with n-values equal to 0.28 and maximum aggregate size of 4.75 mm. A part of castable mixture with 5wt.% water prepared and its flowability was measured by flow table (ASTM C 230). The other part poured into the moulds with vibration. After demoulding, the samples were cured for 24 h at room temperature and cured samples were dried at 110 °C for 24h. Then, they were fired at various temperatures of 1000, 1250 and 1500°C, for 2 h. Then samples were tested for cold crushing strength (C.C.S) and bulk density. Also samples were characterized for phase investigation by XRD method.

3. Results and Discussion

The results of previous research [13-15] show that conventional clay by applying a suitable purification and modification process can be used in the formulation of nanocomposites. As it is shown in XRD studies (Fig.1), most of the detrimental impurities such as Quartz, Cristobalite, Calcite, Gibbsite and Feldspar were mainly separated from

clay and the final product is clay with sodium Montmorillonite as a major phase.

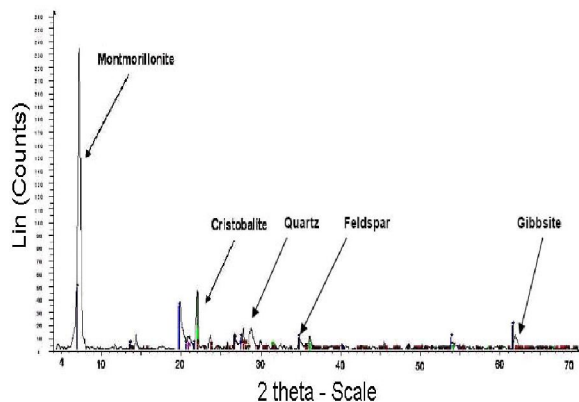

Figure 1. XRD spectrum, local pure sample

Based on Fig.2, it is obvious that interlayer spacing of 12.43Å in unmodified samples was increased to 20.43Å after modification. As it has been mentioned in the literature, the replacement of Mg with Al in Montmorillonite induces negative load in crystal which can be neutralized with sodium ions or similar ions in nature [13].

Figure 2. XRD peaks vs. Weight% of silane (For 10 to 40 wt.%)

As it is shown in the modification process, the organic compounds are placed between clay layers and the interlayer spacing was increased as a result of this process. 40 wt.% silane was selected as the optimal percent for modifier material in modification process. Using fine materials in ULCC and LCC castables causes improvement in flowability. Also, formation of suitable phases enhances compression strength and high temperature properties. Fig. 3 shows the comparison of the flowability of alumina

microsilica castable (AMC) and nano clay castable (NCC).

Figure 3. The comparison of AMC and NCC castable flowability

The test results revealed that the best flow was obtained for NCC castables because nano clay particles are finer than micro silica and reactive alumina as the matrix of castables.

The comparison of the effect of nano clays with microsilica and reactive alumina on castables fired in 1000, 1250 and 1500 °C is shown in fig. 4. Results indicate that NCC samples have higher strength in comparison with samples containing microsilica and reactive alumina. Based on this result, by using nano clay particles, desirable mulite phase is obtained at lower temperatures.

Figure 4. The comparison of the effect of nano clays with microsilica and reactive alumina on castables fired in 1000 °c, 1250 °c and 1500 °c

3.1. Phase investigation

Fig.5 shows X-Ray diffraction pattern of NCC and AMC castables in 1000 °C. As can be seen in fig. 5 the desirable mulite phase has higher intensity for NCC in comparison with AMC castables. As mentioned before, this phase has an important role in improving the mechanical strength and thermal shock resistance of the refractory. In NCC castables mulite forms from one material (nano clay) uniformly but in AMC castables this phase forms from two materials

(reactive alumina and microsilica). So, if these fine materials don't distribute uniformly in aggregates, formation of the desired mullite phase does not occur. Mullite ($3\text{Al}_2\text{O}_3-2\text{SiO}_2$) rarely occurs as a mineral in nature. It is a characteristic, strong and thermodynamically stable product in the high-temperature solid-state reaction between silica (SiO_2) and alumina (Al_2O_3) [11,12]. Mullite has recently become a candidate as a high-temperature structural material because of its good chemical stability and excellent physical properties [12]. In low and ultra low cement concretes (LCC and ULCC), fine silica and alumina powders, contained in their matrices, lead on firing to form in situ mullite in the bond phase as a network of needles at 1300°C . The elongated needle-like mullite crystals grow and lock the structure to create a strong refractory bond system so improving the mechanical properties of the castable and strengthening the microstructure of the binding matrix [4,5].

Figure 5. X-Ray diffraction pattern of NCC and AMC castables in 1000°C

4. Conclusion

The rheological and mechanical properties of nano clay castables were investigated and compared with conventional ultra low cement castables. Results indicated that as the modifier percent was increased from 10 to 40 percent, interlayer spacing was increased from 12.43 \AA in unmodified sample to 20.43 \AA after modification. Also, 40 Wt. % silane was selected as the optimum percentage of modifier material in modification process. Flowability of NCC castables improved about 5 % in comparison with AMC castables. Mechanical properties of NCC castables in high temperature are better than AMC castables. Finally, Using nano clays in castables lead to increasing of the desired mullite phase in fired samples.

elma3dawi@yahoo.com

Abstract: Crystallization of calcium sulfate dihydrate ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$) in sodium chloride solutions at different supersaturation ($\delta = 1.2-2$), $\text{pH} = 3$, ionic strength ($I = 0.5 \text{ M}$) and at 80°C was studied. The influence of aluminum and magnesium nitrates having very low concentrations ($10^{-7} \text{ mol dm}^{-3}$) on the rate of crystallization at different supersaturation was investigated. The rate of crystallization was found to be dependent of the stirring rate suggesting diffusion mechanism. The addition of Mg^{+2} or Al^{+3} retarded the rate of crystallization to an extent proportional to their amounts present. Furthermore, the retardation effect was enhanced as the supersaturation decreases. The results also revealed that the increase in both pH (3 –10) and crystallization temperature ($20 -80^\circ\text{C}$) brought about an increase in calcium sulfate crystallization rate.

[N. S. Yehia, M. M. Ali, K. M. Kandil and M. M. El-Maadawy. **Effects of some parameters affecting the crystallization rate of calcium sulfate dihydrate in sodium chloride solution.** Journal of American Science. 2011;7(6):635-644]. (ISSN:1545-0740). <http://www.americanscience.org>

Keywords: Crystallization; Growth from solutions; Additives; Calcium sulfate; Inhibitors, metal ions

1. Introduction

Calcium sulfate is frequently encountered both in nature and in industry [1–5]. It is also the most unwelcome scalant in the production of oil and gas, in water cooling systems and in hydrometallurgical processes [6]. Crystallization of calcium sulfate dihydrate (gypsum) is of importance in view of its applications in a number of industrial and environmental precipitation processes. There are three main forms of calcium sulfate: calcium sulfate dihydrate or gypsum ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$), calcium sulfate hemihydrate ($\text{CaSO}_4 \cdot 0.5\text{H}_2\text{O}$), and anhydride (CaSO_4). The solubility of different forms of calcium sulfate dihydrate normally decreases by increasing temperature [7].

The crystallization of calcium sulfate could be initiated in presence of foreign substances or dust particles [8]. Earlier, many authors have studied the growth of seed crystals of gypsum in supersaturation solutions [3, 9–12], the crystallization of gypsum on other crystal surfaces [13], and the precipitation on heated metal surface [14]. The factors that govern this mechanism of precipitation and dissolution of the sparingly soluble salts are therefore of considerable interest, especially the influence of anions and cations which may exert a marked effect on the rate of precipitation, either through adsorption or by lattice substitution [15].

Calcium sulfate appears as an undesirable by-product in many industrial processes, mostly as scale. This results from the ubiquitous presence of the calcium ion in natural ores and is linked to the common use of sulfuric acid in industrial processing.

Phosphoric acid (H_3PO_4) is produced by two commercial methods: wet process and thermal process. Wet process phosphoric acid is used in fertilizer production. Thermal process phosphoric acid is of a much higher purity and is involved in the manufacture of high-grade chemicals, pharmaceuticals, detergents, food, and beverage products and other nonmanufacture of phosphate fertilizers products.

In a wet process, phosphoric acid is produced by reaction sulfuric acid with naturally occurring phosphate rock. The phosphate rock is dried, crushed, and then continuously fed into the reactor along with sulfuric acid. The reaction combines calcium from the phosphate rock with sulfate, forming calcium sulfate ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$), commonly referred to as gypsum. Gypsum is separated from the reaction solution by filtration. Phosphoric acid (H_3PO_4) is mainly produced by the dihydrate (DH) process, in which phosphate concentrate is leached with sulfuric acid (H_2SO_4). The reaction is fast; it takes from 2 to 10 minutes. However, the crystallization of the formed gypsum ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$) extends from 2 to 8 hours [16].

Gypsum is either found in nature as a mineral or precipitated from aqueous solutions, as well as from the hydration of calcium sulfate hemihydrates. On the other hand, large quantities of gypsum are produced as a by-product in the production of phosphoric acid from calcium phosphate rock Eq.1

Attack of naturally occurring phosphate ores by sulfuric and/or phosphoric acid solution is the basic process for producing phosphoric acid and inorganic phosphorus fertilizers, such as superphosphate. In the wet production process, the raw phosphate ore is converted into phosphoric acid and calcium sulfate by adding solutions of sulfuric and phosphoric acids in the reactor [17]. These acids are introduced simultaneously or successively [16].

The effect of Al^{3+} and Mg^{2+} ions on calcium sulfate dihydrate (gypsum) crystallization under simulated conditions of phosphoric acid production is studied. The results showed that Al^{3+} decreases the induction time at all supersaturation ratios from 1% to 2% compared with the Mg^{2+} which increases the induction time at all supersaturation ratios. The growth efficiency increases up to 41% with addition of 1wt% Al_2O_3 and decreases by increasing Al_2O_3 content to 3wt% [18].

In contrast, the presence of 1-2 wt% MgO inhibited the crystallization process of gypsum at all supersaturation ratios. Surface energy is increased in the presence of 1% Al_2O_3 and decreased with 1 wt% MgO compared with the baseline. Nucleation rate is decreased in the presence of 1 wt% Al_2O_3 and increased with 1 wt% MgO compared with baseline. The mean diameter of the formed crystals is increased and that of the fine crystals less than 20 mm is decreased in the presence of 1% Al_2O_3 and increased in the presence of 3 wt% Al_2O_3 compared with the baseline. On the other hand, mean diameter of the formed crystals is decreased and that of the fine crystals less than 20 mm is increased in the presence of MgO. Interestingly, the majority of the formed crystals are clusters with 1 wt% Al_2O_3 and needle-like type with MgO and baseline [18].

The presence of aluminum in phosphoric acid has a positive influence on the crystal habits, size, and consequently filterability [16, 19]. Aluminum is said to promote regular crystal growth in all directions by yielding much thicker crystals. This reduces the surface to volume ratio of the crystals and hence improving the filtration rate [20–22].

Budz et al. [23] showed that aluminum reduces the nucleation and growth rates of gypsum but promoted the agglomeration of the smaller crystals. In case of magnesium, it is believed that magnesium ions hinder the gypsum filtration by either increasing the viscosity of the filtrate or affecting the gypsum crystal size [16 and 19].

However, wet process phosphoric acid could be produced from high MgO phosphate rock by accepting a weaker filter acid, higher filtration temperature, and thinner gypsum cake thickness [24 and 25]. Li et al. [26] showed that the presence of magnesium ions alone decreased the crystal size of gypsum crystals. On the other hand, Lin et al. [27] showed that the presence of Mg and Fe together during the reaction of calcium monohydrogen phosphate with sulfuric acid at 60°C increased the width of gypsum crystals.

The present work aims at studying the crystallization of gypsum under conditions simulating the production of phosphoric acid with and without addition of $Al(NO_3)_3$ and $Mg(NO_3)_2$ using pure chemicals.

2. Materials and Methods

2.1. Materials

Calcium chloride $CaCl_2$ and sodium sulfate Na_2SO_4 (BDH, England) were used to prepare seed crystals. Hydrochloric acid HCl (MERCK, Germany) was used to adjust pH. Aluminum Nitrate $Al(NO_3)_3$ and magnesium nitrate $Mg(NO_3)_2$ (FLUKA, Switzerland) were used as a source of aluminum and magnesium ions, respectively. Sodium chloride NaCl from El-Nasr Pharmaceutical chemicals (ADWIC, Egypt) was chemical reagent grade. All solutions were prepared with deionized water of high quality (conductivity < 0.1 μS cm⁻¹). A closed thermostatic double-walled vessel of 300 cm³ was used for all the experiments. The experiments were performed in the temperature range of 78–80 °C, and the systems were mechanically agitated with a flat-bladed stirrer at a constant rate (250 rpm).

2.2. Preparation of polycrystalline calcium sulfate dihydrate

Calcium sulfate dihydrate crystals were prepared by precipitation from calcium chloride and sodium sulfate solutions, as described previously by Lui and Nancollas [28]. The obtained solid was aged at least for one month before being filtered to obtain the dry crystals that were used in crystal growth experiments. The crystals were identified as gypsum by X-ray powder diffraction (Shimadzu XD-3 diffractometer) and IR analysis by scanning electron microscopy. The crystallization of calcium sulfate dihydrate carried out under various conditions was done in a thermostatted double-walled Pyrex glass vessel of 500 mL capacity and were adjusted to the required temperatures by circulating thermostatted

water through the outer jacket. Stemming was effected using a variable-space magnetic stirrer with a Teflon stirring bar. Nitrogen gas was first bubbled into a solution of the electrolyte at the temperature of the reaction for saturation with water vapor and then into the reaction vessel throughout the duration of the experiment.

2.3. Supersaturated solutions of calcium sulfate dihydrate

Supersaturated solutions of calcium sulfate dihydrate were prepared by the addition of thermostatted known volumes of calcium chloride solutions followed by careful addition of the appropriate amounts of sodium sulfate solutions in the cell which adjusted to the required ionic strength (0.5 M) with sodium chloride solutions. The reaction vessel was fitted with a Teflon cover with holes for the electrodes and sampling. At the beginning of the experiment, the pH of the supersaturated solutions was adjusted to the desired value (3) by the controlled addition of hydrochloric acid standard solutions. The pH of solutions was measured using a combination electrode (Jenway 3330) standardized before and after each experiment with NBS primary standard buffer solution.

The mineralization reactions were initiated by inoculation with dry seed crystals in the reaction vessel. The crystallization rate followed conductometry with time using Jenway 3330. The degree of supersaturation maintained at constant levels by the simultaneous addition of ionic species. Inhibitor solutions were also introduced as titrants in order to compensate for dilution effects. In addition, samples were periodically withdrawn and filtered at the reaction temperature through Millipore filters (0.22 μm), prior to solution and solid-phase analysis. The data confirmed that the lattice-ion and inhibitor concentrations were constant to within 1%.

For the calcium sulfate dihydrate crystallization growth experiments, the seed crystals of calcium sulfate dihydrate were prepared by a dropwise addition of 500 cm^3 of a 0.6 mol dm^{-3} CaCl_2 solution to 500 cm^3 of a 0.6 mol dm^{-3} Na_2SO_4 solution with a continuous magnetic stirring at 70°C over a period of 2 hours. The crystals obtained were filtered through a 0.22 mm membrane filter and washed repeatedly with deionized water until becoming free of NaCl. Then, the crystals were dried in an electric oven at about 105°C overnight.

3. Results and discussion

The concentrations of free ionic species in the solutions were computed by successive approximations for the ionic strength, I , as described previously [29] using activity coefficients calculated

from the extended form of the Debye–Hückel equation proposed by Davies [30]. The rate of precipitation, R , may be expressed in terms of the degree of saturation by Eq. 2:

in which m is the number of moles precipitated in

$$R = dm / dt = R_s d^n \dots (2)$$

time t , R a rate constant, n the effective order of reaction, and s proportional to the number of growth sites available on the seed crystals. The degree of saturations is defined in terms of ionic products and solubility products for the calcium sulfate dihydrate salt as in Eq. 3

$$d = \frac{(IP)^{1/2} - K_{SO}^{1/2}}{K_{SO}^{1/2}} \dots (3)$$

where the ionic products, IP , and the solubility product, K_{SO} , are expressed in terms of the appropriate activities of the ionic species $[(Ca^{2+})(SO_4^{2-})]^{1/2}$ at time t and at equilibrium, respectively.

The degree of supersaturated (δ) of the solutions, which is defined as the ratio of the activity products divided by the thermodynamic solubility product of the mineral (K_{sp}), is

$$d = \left\{ \frac{[(Ca^{2+})(SO_4^{2-})]^{1/2}}{K_{sp}} \right\} - 1, \dots (4)$$

where parentheses denote activities of the respective ions and K_{sp} is the thermodynamic solubility product of the precipitating solid. The activity coefficients of divalent cations and anions were assumed equal and were obtained using the extended Debye-Huckel equation as proposed by Davies: [30]

$$-\log f_Z = 0.5115 Z^2 \left\{ \frac{I^{1/2}}{(1+I^{1/2})} - 0.3 I \right\}, (5)$$

where " f " are the activity coefficients for the Z valent ions and I is the solution ionic strength. The value of K_{sp} was calculated as a function of temperature by means of the following relationship obtained by Marshall and Shlusher [31] for calcium sulfate dihydrate in aqueous solutions from 0 to 110°C.

Crystal growth experimental conditions are summarized in Table 1 in which $[Ca]_i$ and $[SO_4]_i$ are the total molar concentration of calcium and sulfate, respectively. Typical time plots of the amount of gypsum per moles precipitate, calculated from the titrants addition.

$$\log \left(K_{sp} \right) = 390.9619 - 152.6246 \log T - \frac{12,545.62}{T} + 0.0818493 T \dots (6)$$

Table (1): Crystallization of calcium sulfate dihydrate crystals, $T_{ca} : T_{so2} = 1 : 1$ at $T=80$ °c, $pH = 3$, $I = 0.5$, and $\delta = 1.32$.

Stirring speed: 300 rpm for experiments (a), 500 rpm for experiment (c) and 250 for all others.

The results cited in Table 1 show that the rate of crystal growth of calcium sulfate dihydrate was proportional to the mass of seed crystals used to initiate the reaction. The suggestion of a predominantly diffusion mechanism over a range of relative supersaturations may also be supported by the observed dependence of the experimental rate of precipitation on changes in fluid dynamics, as shown in Table 1 (compare experiments a, b and c), which

conclude that the reaction is a mass transfer limited [32]. A similar mechanism for the crystal growth of calcium sulfate dihydrate has been observed [32 and 33].

The effective order of reaction was determined from the slope of typical plots of $-\log R$ against $\log \delta$, as depicted in Figure 1 which confirms a first-order dependence upon relative supersaturation ($n = 1$) in Eq. (2).

Fig (1): Plots of Log R against Log δ .

Additives play an important role in the theory of crystallization and dissolution. Recently, it is found that the presence of metal ions in the reaction medium inhibited the rate of precipitation of calcium sulfate dihydrate. The effects of Al^{3+} and Mg^{2+} on the rate of crystallization of calcium sulfate dihydrate crystals were studied. Previous studies showed that Al^{3+} ions promote the agglomeration of small crystals of calcium sulfate dihydrate, and high Al^{3+} ions (about 3wt% Al_2O_3) increase the viscosity of the medium and inhibit the crystallization growth rate [34,35], and Mg^{2+} also retarded the crystallization rate.

3.1. Effect of concentration of the inhibitors concentration Al^{3+} and Mg^{2+} inhibitors on the crystallization process

The effect of magnesium and aluminum ions upon the rate of crystallization of gypsum in sodium chloride solution was studied at 80°C ; stirring speed of 250 rpm, weight of seed crystals of gypsum 50 mg at solution ($\text{pH} = 3$), and a relative supersaturation ($\delta = 1.32$) results obtained are illustrated in Figure (2).

It is clear from Figure (2) that the addition of a very small amount of Al^{3+} or Mg^{2+} ions retarded the rate of crystallization to an extent proportional to the amount added. The decrease was, however, more pronounced in the case of Al^{3+} ion. In fact, the presence of 10^{-6} mol% decreased the crystallization rate to 71% and 37% for Al^{3+} and Mg^{2+} , respectively.

The presence of Al^{3+} ions may increase the viscosity of the filtrate resulting in retarding the crystallization of calcium sulfate dehydrate rate much more than Mg^{2+} [16 and 19].

The mechanism of Al^{3+} in retardation of the rate of crystallization of calcium sulfate dihydrate has been studied via carrying out the crystallization process at 80°C , $\text{pH} = 3$, $I = 0.5 \text{ mol dm}^{-3}$, and $\delta = 1.32$ in the presence of $10^{-7} \text{ mol dm}^{-3}$ $\text{Al}(\text{NO}_3)_3$ as a source of Al^{3+} ions. Calculated volumes of CaCl_2 , Na_2SO_4 , NaCl and $\text{Al}(\text{NO}_3)_3$, respectively, are added in the same order. After the end of reaction, the solution was filtered and the produced solid was characterized using XRD and SEM techniques.

Figure (3) shows both of the diffractograms of solid left after the formation of calcium sulfate in absence of Al^{3+} ions and the diffractogram of calcium sulfate in presence of a known amount of ($\text{Al}(\text{NO}_3)_3$ $10^{-7} \text{ mol dm}^{-3}$).

It is seems from Figure (3) that all diffractonal picks of calcite were detected in the diffractogram of the solid produced in absence of any inhibitors while the addition of $\text{Al}(\text{NO}_3)_3$ inhibitors at the beginning of the crystallization process led to the formation of Na_2SO_3 as a major phase and NaAlCl_4 as a minor phase.

SEM microscopic investigation of different solid left after the crystallization process in absence and in presence of $\text{Al}(\text{NO}_3)_3$ was carried out. The obtained SEM images are illustrated in Figure (4)

Fig (2) :Effect of Mg^{2+} and Al^{3+} on the rates of crystallization of calcium sulfate dihydrate crystals at $\delta = 1.32$, $I = 0.5 \text{ mol dm}^{-3}$, and 50 mg seed.

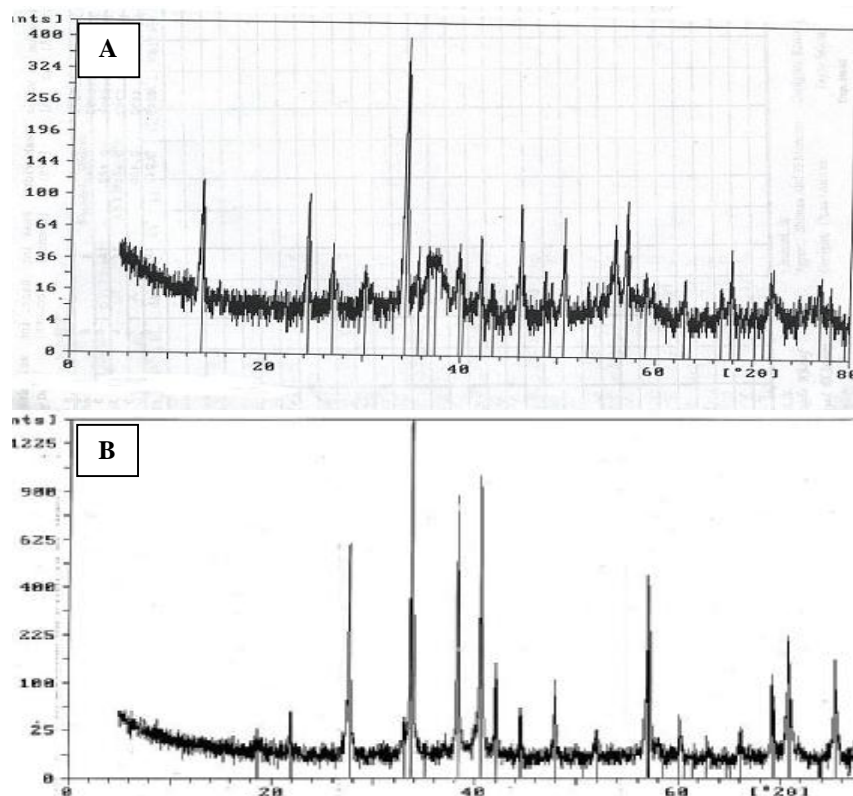

Fig (3): XRD analysis of calcium sulfate dihydrate (A) in absence of Al^{3+} (B) in the presence of 10^{-7} M of $\text{Al}(\text{NO}_3)_3$.

Fig (4) Scanning electron micrographs of calcium sulfate dihydrate (4a) in absence of Al^{3+} (4b) in the presence of 10^{-7} M of $\text{Al}(\text{NO}_3)_3$.

Scanning electron micrographs of the produced solid in the presence of $\text{Al}(\text{NO}_3)_3$ shows that only the crystals of Na_2SO_3 appeared, which means that NO_3^- ions reduce SO_4^{2-} ions to SO_3^{2-} ions in the presence of NaCl , so NaAlCl_4 and $\text{CaSO}_4(\text{aq})$ are produced.

3.2. Effect of supersaturation degree (δ) on calcium sulfate dihydrate crystallization rate

To investigate the effect of supersaturation degree (δ) on calcium sulfate dihydrate crystallization rates in sodium chloride solution, the crystallization

of calcium sulfate in absence and in the presence of Al^{3+} ions was investigated at different degrees of supersaturation from 1.2 to 2.0. The other parameters were fixed at an ionic strength solution (I) of 0.5 mol dm^{-3} , reaction temperature of 80°C , stirring speed of 250 rpm, and weight of seed crystals of gypsum of 50 mg at solution ($\text{pH} = 3$). The experimental results are given in Figure (5) as a relation between degree of supersaturation and calcium sulfate dihydrate crystallization rate.

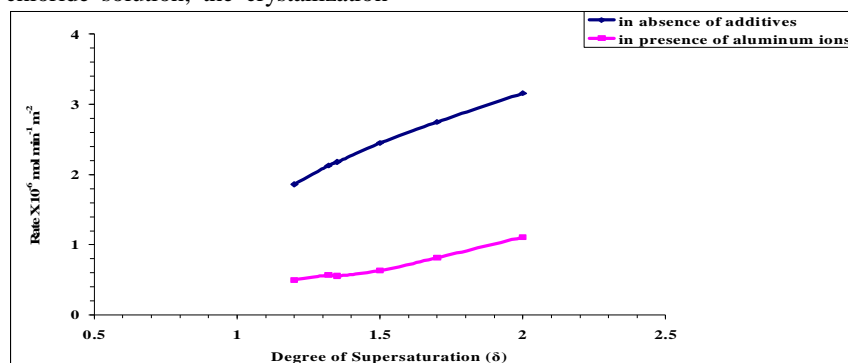

Fig (5): Effect of supersaturation degree (δ) on the rate of crystallization of calcium sulfate dihydrate crystals at $\text{pH}=3$, $T = 80^\circ\text{C}$, $I = 0.5 \text{ mol dm}^{-3}$, and 50 mg seed in absence of inhibitors and in presence of Al^{3+} inhibitor.

From the figure, it is clear that, as the degree of supersaturation increased from 1.2 to 2.0, the gypsum crystallization rate increased from 1.86 to $3.16 \text{ mol min}^{-1} \text{ m}^{-2}$ in absence of inhibitors and from 0.5 to $1.11 \text{ mol min}^{-1} \text{ m}^{-2}$ in presence of Al^{3+} inhibitor. The order in the presence of Al^{3+} ions was found to be equal to ($n=1$), which suggests diffusion mechanism.

3.3. Effect of pH on calcium sulfate dihydrate crystallization rate

The effects of solution pH on the crystallization growth of calcium sulfate dihydrate in

the absence and in the presence of Al^{3+} ions were studied at different pH range (3–10). Other experiments conditions were fixed at a reaction temperature of 80°C , stirring speed of 250 rpm, weight of seed crystals of calcium sulfate dihydrate 50 mg at ionic strength ($I = 0.5 \text{ M}$), and a relative supersaturation ($\delta = 1.32$). The experimental results are plotted in Figure (6) as a relation between pH and the rates of crystallization of calcium sulfate dihydrate crystals.

Fig (6) Effect of pH on the rate of crystallization of calcium sulfate dihydrate crystals at $\delta = 1.32$, $T = 80^\circ\text{C}$, $I = 0.5 \text{ mol dm}^{-3}$, and 50 mg seed in absence of inhibitors and in presence of Al^{3+} inhibitor.

From the above figure, it is clear that with the increase of pH from 3–7, the calcium sulfate dihydrate crystallization rate slightly increased from about 2.09 to 2.3 mol min⁻¹ m⁻² in absence of inhibitors and from 0.57 to 0.72 mol min⁻¹ m⁻² in presence of Al³⁺ ions. This means that pH over a wide range (3-7) does not affect the calcium sulfate dihydrate [36, 37, and 38]. Further increase in solution pH from 7 to 10 led to increase the calcium sulfate dihydrate rates crystallization from 2.3 to 2.6 mol min⁻¹ m⁻² and from 0.72 to 1.4 mol min⁻¹ m⁻² in absence and in presence of Al³⁺ [38,39, and 40]. This may be due to the increase in degree of deprotonation [41 and 42].

3.4. Effect of ionic strength (I) on calcium sulfate dihydrate crystallization rate

The effect of ionic strength of the crystallization medium on the calcium sulfate dihydrate crystallization rate in sodium chloride solution is studied; several experiments are carried out in absence and in the presence of Al³⁺ ions at different ionic strength from 0.1 to 0.5 M. The other parameters are fixed at reaction temperature of 80°C, stirring speed of 250 rpm, weight of seed crystals of gypsum 50 mg at solution (pH = 3) and a relative supersaturation ($\delta = 1.32$). The experimental results are given in Figure (7) as a relation between ionic strength and the rates of crystallization of calcium sulfate dihydrate crystals.

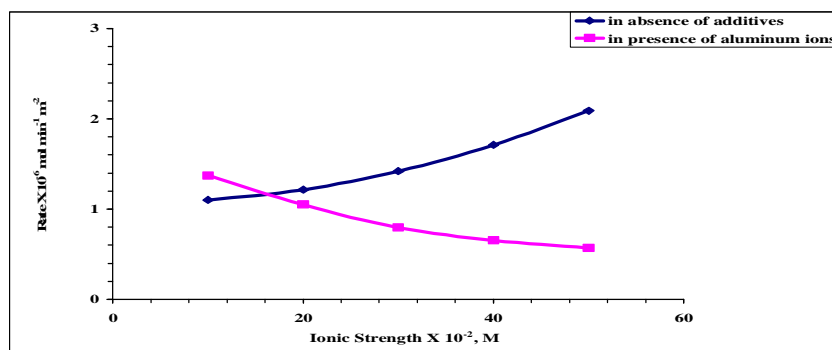

Fig (7): Effect of ionic strength (I) on the rate of crystallization of calcium sulfate dihydrate crystals at $\delta = 1.32$, pH=3, T = 80 °c and 50 mg seed in absence of inhibitors and in presence of Al³⁺ inhibitor.

From the figure, it is clear that as the ionic strength increases from 0.1 to 0.5 M, the calcium sulfate dihydrate crystallization rates increased from about 1.1 to 2.09 mol min⁻¹ m⁻² in absence of inhibitors while it decreased from 1.3 to 0.57 mol min⁻¹ m⁻² in presence of Al³⁺ ions. This means that, the effect of ionic strength on the rate of crystallizations indicates that the reaction is ionic in its nature.

3.5. The effect of temperature on Calcium sulfate dihydrate crystallization rate

The rate of crystallization of calcium sulfate dihydrate is studied in absence of inhibitors and in the presence of Al³⁺ ions at temperature range of 20 to 80°C. The experimental results are given in Figure (8) as a relation between temperature and the rates of crystallization of calcium sulfate dihydrate crystals.

Fig (8) Effect of temperature on the rate of crystallization of calcium sulfate dihydrate crystals at $\delta = 1.32$, pH=3, I = 0.5 mol dm⁻³ and 50 mg seed in absence of inhibitors and in presence of Al³⁺ inhibitor.

Figure (8) shows clearly that by increasing the temperature from 20 to 80 °C, the rate of crystallization increases from 0.8 to 2.09 mol min⁻¹ m⁻² in absence of inhibitors while it increases from 0.12 to 0.57 mol min⁻¹ m⁻² in presence of Al³⁺ ions. The growth rates of calcium sulfate dihydrate crystals markedly increase with the increase in the growth temperature.

According to Arrhenius equation, the activation energies of calcium sulfate dihydrate in (Ea₁) and in presence of Al³⁺ ions (Ea₂) could be calculated at constant $\delta = 1.32$, $I = 0.5 \text{ mol dm}^{-3}$ and 50 mg seed by plotting relation between ln K against 1/T as shown in Figure (9).

Fig (9) Arrhenius plot, for rate of crystallization of calcium sulfate dihydrate crystals at $\delta = 1.32$, pH=3, T = 80 °C, I = 0.5 mol dm⁻³ and 50 mg seed in absence of inhibitors and in presence of Al³⁺ inhibitor.

From the figure, the activation energies of calcium sulfate dihydrate in absence of inhibitors (Ea₁) and in presence of Al³⁺ ions (Ea₂) were calculated and found to be equal to 13.76 and 23.14 KJ/mol. These activation energies agree with the reported activation energy for the seeded crystals growth of calcium sulfate dihydrate in salt-free solutions at a relatively lower temperature [43].

4. Conclusions

The analysis of the results shows that the presence of Al³⁺ and Mg²⁺ ions in the reaction medium inhibited the rate of precipitation of calcium sulfate dihydrate (gypsum). The degree of inhibition depends on the concentration of metal ions and degree of saturation. Precipitation is inhibited and a precipitation rate is decreased in the following order: Al³⁺ > Mg²⁺. Complete inhibition of precipitation of gypsum was not found in any concentration of these metal ions and degree of saturations.

The inhibition of these metals was found due to reduction of NO₃⁻ ions of SO₄⁻² ions to SO₃⁻² ions. This reduction occurs only in the presence of NaCl solution. The degree of inhibition of Al³⁺ ions (as an example of inhibitors) increases in acidic medium, lower ionic strength, higher degree of supersaturation, and lower temperature.

Abstract: *Cynodon dactylon* regarded to possess various medicinal properties as an anticancer, antidiabetic, anti-inflammatory and antioxidative agent, but there are a few studies on its antibacterial effects. The aim of the present study was the evaluation of the antibacterial activity of *Cynodon dactylon* on 100 Multi Drug Resistant isolates of *S. aureus*, *A. baumannii*, *P. aeruginosa*, *Klebsiella* and *E. coli*. *Cynodon dactylon* samples were collected from the fields of North West of Iran. Plant roots were cut, and powder was prepared. Powdered roots were extracted by maceration at room temperature for 72 hours. Bacterial isolates were collected from clinical specimens from different wards of educational hospitals in Urmia, Iran during a 12 months period. The susceptibility of isolates to *Cynodon dactylon* root extracts was determined using a broth microdilution method. Considering to the wide application of ciprofloxacin in treatment of bacterial nosocomial infections, the antibacterial effects of ciprofloxacin on isolates also determined. All the multi- drug resistant bacterial isolates were sensitive to different concentrations of *Cynodon dactylon* root hydroalcoholic extract, the most sensitive bacterial isolates to *Cynodon dactylon* root extracts were *P.aeruginosa* isolates, however 69% of isolates were resistant to ciprofloxacin. Results demonstrate that this herbal drug could represent a new source of antimicrobial agents, for the control of hospital acquired infections. However, more adequate studies must be carried out to verify the possibility of using it for fighting these bacteria in human body infections.

1. Introduction

Cynodon dactylon family Poaceae is considered as a sacred herb (Balasubramanian, et al, 2008). It has been used in the folk medicine of many countries. It has been regarded to possess various medicinal properties as an antidiabetic agent in traditional system of Medicine. The aqueous plant extract is used as anti-inflammatory, cardioprotective diuretic, antioxidative, anti-emetic and purifying agent (Singh et al., 2007). Anticancer potential of *C. dactylon* in experimentally induced colon carcinogenesis in rats has been demonstrated before (Albert-Baskar and Ignacimuthu, 2010). Also it has been demonstrated that the Fresh juice of *Cynodon dactylon* (Bermudagrass) has DNA protective activity and immunomodulatory properties (Mangathayaru et al, 2009). The plant posses antimicrobial, and antiviral activity (Singh et al., 2007) and has also been used to treat urinary tract infection, calculi and prostatitis. Balasubramanian et al also showed that

the Oral administration of plant extract of *C. dactylon* to be highly effective in preventing of white spot syndrome virus (WSSV) infection (2008). It also has significant application in treating dysentery, dropsy and secondary syphilis (Singh et al., 2007). *Rhizoctonia* sp. (Cy064), an endophytic fungus in the leaf of *Cynodon dactylon* used locally for treating hepatitis and metabolites were extracted from this fungus has anti-*H. pylori* effects (Ma et al, 2004).

Resistant Gram-positive pathogens, such as *Staphylococcus aureus* have become a serious problem in the medical community. *Staphylococcus aureus* is an organism with several virulent factors and resistance mechanisms at its disposal. It is also a significant cause of a wide range of infectious diseases in humans. *S. aureus* often causes life-threatening deep seated infections like bacteremia, endocarditis and pneumonia (Kanafani and Fowler 2006).

Acinetobacter baumannii is a gram-negative opportunistic bacillus. It is found in many hospital environments and can be colonize in human body in the hospital environments. The combination of its environmental colonization and its very high resistance to antimicrobials renders it as a successful nosocomial pathogen. The MDR strains of *A. baumannii* often spread to cause outbreaks throughout hospital wards. *A. baumannii* cause a wide range of clinical complications, such as pneumonia, septicemia, urinary tract infection, wound infection, and meningitis, especially in immunocompromised patients (Nordmann, 2004).

P. aeruginosa is an opportunistic pathogen found as part of the normal flora of the human skin (Larson and Ramphal, 2002). In immunocompromised host, *P. aeruginosa* can colonize and infect the burn and wound sites, it can rapidly disseminate from the wounds into other organs via the bloodstream and can produce severe infections such as endotoxic shock (Dale et al., 2004). Antibiotics are generally ineffective against most serious infections especially burn wounds infections by *P. aeruginosa*, treatment of these infections is frequently complicated by antibiotic resistance, a problem that is increasing in the recent years. *Klebsiella* sp. is a group of gram negative rods and they can cause different kinds of infections especially in a hospital setting. They are resistant to numerous antibiotics. Their resistance to antibiotics restricts the choice of antibiotics for therapy (Keynan and Rubinstein, 2007). Hospital acquired urinary tract infections account for 35-45% of the nosocomial infections (Kamat et al, 2009). *E. coli* is the main agent of this disease. Antibiotic therapy is the gold standard of treatment of such infections; however, long-term therapy may result in many side-effects and cause selection of resistant bacteria. So, we need new treatments that could replace antibiotic therapy (Jazani et al 2007).

In respect of high resistance of nosocomial isolates of mentioned bacteria to antimicrobials, introducing of the new antimicrobial agents against these kind of microorganisms is one of the most important goals in treatment of such infections (Perez et al., 2007). In this study we evaluated the antibacterial activity of *Cynodon dactylon* root on 100 Multi Drug Resistant isolates of *Staphylococcus aureus*, *Acinetobacter baumannii*, *P. aeruginosa*, *Klebsiella* and *E. coli*.

2. Material and Methods

Extract preparation: *Cynodon dactylon* samples were collected from the fields of Salmas road (Iran) and identities were confirmed by the

Botanist. Plant roots were cut, chopped and dried and powder was prepared. Powdered roots were extracted by maceration at room temperature for 72 hours. The hydroalcoholic extracts were combined and concentrated to yield a dried powder. This hydroalcoholic extract was kept in refrigerator for all experiments (Garjani et al, 2009).

Bacterial strains and culture media: A total of 100 isolates of *Staphylococcus aureus*, *Acinetobacter baumannii*, *Pseudomonas aeruginosa*, *Klebsiella* and *E. coli* (20 isolates from each kind) were collected from clinical specimens of different wards of educational hospitals in Urmia, Iran during a 12 months period between April 2006-2007. The isolates were further processed by the standard methods to identify as the *Staphylococcus aureus*, *Acinetobacter baumannii*, *Pseudomonas aeruginosa*, *Klebsiella* and *E. coli* isolates (Baron and Finegold, 1990). The susceptibilities of isolates to different antibiotics were tested using agar disk diffusion method and Multidrug resistant isolates was selected for further experiments. Isolated bacteria were maintained for long storage on skimmed milk medium (BBL) by adding 10% glycerol in -60°C, cultures were maintained for daily use on Nutrient agar (BBL) slants on 4°C. The Muller Hinton Agar (MHA) and Muller Hinton Broth (MHB) medium (Pronadisa) were used for detection of antibiotic resistance of isolates. *Acinetobacter calcoaceticus* PTCC 1318, *Enterococcus faecalis* ATCC29212, *Pseudomonas aeruginosa* ATCC27853, *Pseudomonas aeruginosa* PAO1, *E.coli* ATCC25922, *Klebsiella pneumoniae* ATCC10031, *Staphylococcus aureus* PTCC1112 and *Staphylococcus aureus* ATCC25923 have been used as reference strains.

Determination of antimicrobial activity of *Cynodon dactylon* root extracts: The susceptibility of isolates to *Cynodon dactylon* root extracts was determined using a broth microdilution method based on CLSI guidelines. Minimum Inhibitory Concentration (MIC) and Minimum Bactericidal Concentration (MBC) of *Cynodon dactylon* root extracts for isolates were determined in Muller-Hinton Broth (MHB; Oxoid) medium (Jazani et al, 2009) (Papadopoulos et al., 2006). 10 mg of *Cynodon dactylon* root powder was dissolved in 1000 µL of Dimethylsulfoxide (DMSO, Sigma). The initial concentration of *Cynodon dactylon* root powder in the first tube contains MHB was 500 µg/mL. This was used to prepare serial doubling dilutions over the range 500-3.9 µg/mL. 1.5×10^6 inoculums of the isolates were added to each concentration in MHB. A tube containing growth medium without *Cynodon dactylon* root extracts and an un-inoculated tube were used as a positive and negative growth control respectively. Antibacterial activity was measured by

determining MICs and MBCs. The MIC was the lowest concentration of essential oil that resulted in a clear tube. Ten microlitres from each tube was spot-inoculated onto Nutrient Agar (NA) and incubated overnight at 37 °C to determine the MBC. The highest dilution that inhibits bacterial growth on nutrient agar after overnight incubation was taken as MBC (Baron and Finegold, 1990),(Papadopoulos et al., 2006). Experiments were performed at least three times and the modal value selected.

Determination of antimicrobial activity of ciprofloxacin: Considering to the wide application of ciprofloxacin in treatment of bacterial nosocomial infections, the antibacterial effects of ciprofloxacin on isolates also determined and the effectiveness was compared with *Cynodon dactylon* root extracts. Ciprofloxacin powder was kindly provided by Exir pharmaceutical company, Tehran, Iran. The pure content of active ciprofloxacin was 96% in the provided powder. For determining of the bacterial isolates sensitivity to ciprofloxacin, classic broth dilution susceptibility test were used (Sahm and Weissfeld, 2002). MIC and MBC of isolates to ciprofloxacin were determined. The initial concentration of antibiotic in the first tube was 500µg mL⁻¹, this solution was diluted serially in 8 steps. 1.5×10⁶ inoculums of the isolates were added to each concentration of ciprofloxacin in MHB. A tube containing growth medium without ciprofloxacin and an un-inoculated tube were used as a positive and negative growth control respectively. *In vitro* resistance was defined as MBC of 4 or more µg mL⁻¹ for bacterial isolates (Chaudhry et al., 1999).

3. Results

A total of 100 multi-drug resistant isolates with nosocomial origin of gram negative and gram positive bacteria were collected from clinical specimens submitted to the educational hospital clinical microbiology laboratories of selected hospitals in Urmia, Iran. The Sensitivity of bacterial isolates to *Cynodon dactylon* root hydroalcoholic extract has been shown in Figure 1.

Also the MIC and MBC of *Cynodon dactylon* root hydroalcoholic extract against standard bacterial strains has been shown in Table 1.

The Sensitivity of bacterial isolates to ciprofloxacin has been shown in Figure 2. 69 isolates (69% of all isolates) were resistant (MBC ≥ 4 or µg mL⁻¹) and the other isolates were sensitive to ciprofloxacin (MBC ≤ 4 µg mL⁻¹) (Figure 2).

Figure 1: Antibacterial activity of *Cynodon dactylon* root hydroalcoholic extract against 100 nosocomial isolates of multi drug resistant gram negative and gram positive bacteria. Pa: *Pseudomonas aeruginosa*, Ec: *E. coli*, Ab: *Acinetobacter baumannii*, Kl: *Klebsiella Sp*, Sa: *Staphylococcus aureus*. MIC: Minimum Inhibitory Concentration, MBC: Minimum Bactericidal Concentration.

Table 1: The MIC and MBC of *Cynodon dactylon* root hydroalcoholic extract against standard bacterial strains.

Standard Bacterial isolates	<i>Cynodon dactylon</i> root hydroalcoholic extract(µg/mL)
<i>Acinetobacter caluaceticus</i> PTCC 1318	MIC= MBC=125
<i>Enterococcus faecalis</i> ATCC29212	MIC= MBC=250
<i>Pseudomonas aeruginosa</i> ATCC27853	MIC= MBC=250
<i>E.coli</i> ATCC25922	MIC= MBC=125
<i>Klebsiella pneumoniae</i> ATCC10031	MIC=125, MBC=250
<i>Staphylococcus aureus</i> PTCC1112	MIC= MBC=250
<i>Staphylococcus aureus</i> ATCC25923	MIC= MBC=125
<i>Pseudomonas aeruginosa</i> PAO1	MIC= MBC=250

4. Discussions

Antibiotics are generally ineffective against most serious infections by multi drug resistant bacteria, treatment of these infections is frequently complicated by antibiotic resistance, a problem that is increasing in recent years, so introducing of the new antimicrobial agents against these kinds of bacteria is one of the most important goals in treatment of such infections. However there are limited studies on investigation of the antibacterial effects of *Cynodon dactylon* root extract on multi drug resistant bacteria.

C. dactylon is used in traditional medicine as an anti-inflammatory, diuretic, anti-emetic and purifying agent, and to treat dysentery (Artizzu et al, 1996).

White spot disease is one of the major causes of severe mortality in farmed black tiger shrimp all over the world. The antiviral activity of extract of *C. dactylon* on white spot syndrome virus (WSSV) in black tiger shrimp has been shown by in vivo testing after oral administration previously (Balasubramanian et al, 2008).

Artizzu et al reported that the essential oil of the aerial parts of *C. dactylon* did not exhibit antimicrobial properties, but agropyrene one of the compounds of this essential oil exhibited weak activity against *Candida albicans*, *Saccharomyces cerevisiae*, *Staphylococcus aureus* and *Bacillus subtilis* (1996), however in the present study we examine the root of the plant for antimicrobial effects.

Parekh et al (2005) reported that the aqueous extracts of *C. dactylon* was inactive against some of defined bacterial strains, while methanol extracts could inhibit only *S. epidermidis* and *B. subtilis*, however they mentioned that successful prediction of plant compounds from is largely dependent on the type of solvent used in the extraction procedure. water as the solvent is used with more frequency in compare with organic solvent (for example methanol), but organic solvents provide more consistent antimicrobial activity compared to those botanical compounds extracted in water (Parekh et al, 2005), in this research we also use organic solvent (hydroalcoholic extraction method) for evaluation of the antibacterial activity of the *C. dactylon* root.

Srinivasan et al (2001) prepared an extract from leaves, flowers and bulb of the *C. dactylon* and examined its antimicrobial activities against 10 different strains of fungi and gram positive and gram negative bacteria, however they didn't find any antimicrobial effects for this extract, however they didn't use the root of the plant for preparing this extract. In this research we used only the root extract of the *C. dactylon* for determining the antibacterial effects (Srinivasan et al, 2001).

Punitha et al (2008) isolated *Vibrio harveyi* from the wounds of the infected fish, and determined the *in vivo* and *in vitro* antibacterial activity of *C. dactylon* on this bacterium. In the challenge experiments of the fish with this isolate, the control group had the highest and fastest mortality, however survival rate was significantly increased in the group fed with this herb, Also different kinds of organic solvent extracts of the *C. dactylon* showed antibacterial effects on this bacterial isolate (Punitha et al, 2008), this finding is in agreement with our findings in showing the antibacterial effects of *C. dactylon*.

It has been previously demonstrated that *A. fumigatus* residing in *C. dactylon* is a versatile producer of new and bioactive metabolites, also it has been shown that these metabolites have antifungal effects on *C. albicans*, *T. rubrum* and *A. niger* (Liu, et al., 2004).

The antibacterial effects of the *Rhizoctonia* sp., an endophytic fungus in the leaf of *C. dactylon* has been shown previously (Ma et al 2004). This finding is also in agreement with our data, because we didn't any efforts for isolating the endophytic fungus from the surface of the roots of this plant, so the antibacterial effects of the *C. dactylon* has been observed in this research may be at least in part due to endophytic fungi living as Symbiotic microorganisms on the surface of this herbal plant.

Also two new metabolites from the endophytic fungus *Chaetomium globosum* residing inside the root of *C.dactylon* have been isolated recently. These Compounds showed antimicrobial activity against the gram-positive bacteria. This finding is also in agreement with the hypothesis that the antibacterial effects has been showed in the present study can be attributed to the Symbiotic fungi living on the root of *C. dactylon* (Ge et al, 2010).

In contrast with the results obtained by Parekh et al (2005), the findings of this study indicate that *C.dactylon* root hydroalcoholic extract had a significant antibacterial effect on all multi-drug resistant isolates of gram negative and gram positive bacteria. These difference may due in part to the different extractions methods used in these studies, moreover Parekh et al(2005) sterilized the extracts by autoclave at 121 °C and 15 lbs pressure, this procedure may destroy bioactive compounds in the extract, however in our study we use 0.45 µ filters for sterilizing of the *C.dactylon* root hydroalcoholic extract.

In the present study all the multi- drug bacterial isolates were sensitive to different concentrations of *C.dactylon* root hydroalcoholic extract, the most sensitive bacterial isolates to Bermudagrass root extracts were *P. aeruginosa* isolates(Fig 1), Also *A.calcuaceticus* PTCC 1318, *E.coli* ATCC25922 and *S.aureus* ATCC25923 were the most sensitive strains among the standard isolates (MIC= MBC=125) (Table 1), however clinical isolates showed high resistance to ciprofloxacin (Fig 3). In the present study results showed that the *C.dactylon* root hydroalcoholic extract possessed antibacterial effect against all multi-drug resistant bacterial isolates, furthermore, beside the confirmation of the popular use, the obtained results demonstrate that this herbal drug could represent a new source of antimicrobial agents, for the control of hospital acquired infections. However, more adequate studies must be carried out to verify the possibility of using it for fighting these bacteria in human body infections.

Abstract: Veterinary holds a great and long experience among the Turkish people like the other nations especially in folkloric literature and the part of literature which has prolonged among the villagers and conserved its own existence but its terms have not registered in their written forms. In a glimpse over the terms like rabies, enterotoxaemia, foot and mouth disease, contagious agalactia and lots of other disease put an apparent persistence on its long experience among native Azerbaijani people (Iran) in its veterinarian aspect. We try our best to have a good clarification over these terms.

[Jalal Shayegh, Peyman Mikaili, Aghil Nedaei, Alireza Lotfi. Golden Words in the History of Veterinary Medicine among Azerbaijani people. Journal of American Science 2011;7(6):651-653]. (ISSN: 1545-1003).

1. Introduction

The first signs of the relationship of animals and human beings are found in the rock-carvings in caves (Menges, 1968). The question of "who has trained the animals for the first time?" can not be completely answered. It seems that each tribe of human beings has to make a kind of companionship with the animals in order to draw on animals in support of their needs and life styles. Meanwhile the Turkish people can not be considered as an exception. The close association with animals before settling down and taking up agriculture made them proficient horsemen and warriors (Heyat, 2001).

Several Turkish leaders in history provided precious input to veterinary medicine. Tamer lane (13th century A.D.) who was a Turkish king, was a horse breeder, and at first made his efforts in pathology publishing on necropsies performed at his dead horses (Tadjbakhsh, 1993).

The appreciation of animals among these people has had a great impact on Turkish literature, especially on folkloric literature, the literature that deals with the life styles and the traditional behavior of people (Tadjbakhsh, 1993). The availability among the people of traditional terms in a great variety, going beyond the authority in comparison with their scientific equivalents, sounds whimsical.

These terms based on clinical signs and pathological lesions are not passed down in written form. This paper tries its best to elucidate some of these valuable terms in use among Azerbaijani people in northwest Iran and still persisting with them.

2. Material and Methods

These words are a part of many words collected by the authors and some students of Veterinary Department of their University from different vicinities of Azerbaijani provinces (Ardabil, East and West Azerbaijan) of Iran in four years. For this purpose, we prepared a questionnaire including information about the word or meaning of the word related to veterinary medicine. Then, students were sent to different regions of Azerbaijani provinces. After filling out the questionnaire by student and native vets, they were collected and put into alphabetical orders.

In the next stage, the abovementioned collected materials were matched with available related literature for original meanings and spelling, etymological and veterinary meaning analysis.

3. Results and Discussion

The authors had the opportunity to bring together over 400 terms that born reference to Azerbaijani native culture and could analyze some of them using available literature. Followings are some examples of these analyzed words.

Rabies:

Agglutinated language is said of a language that forms words by joining together simpler words or word elements, each of which correspondents to a particular element of meaning. If the Sumerian language is not considered as an agglutinate language and its mention of rabies as mad dog or uridim is not considered as a common property of the agglutinates

(Halloran, 2006), the first mention of rabies in Turkish texts (Turkish Agglutinates) can be found in the encyclopedia of Mahmoud Kashgari (1072 AD) entitled *Divan-u Lugat-it Türk* (Kashgari, 2004). The term قوتوز (gutuz) means 'mad cow' as the term ایت قوتوز (gutuz it) means rabid dog or mad cow in this dictionary (Kashgari, 2004). In other Turkish dictionaries such as Sanglax (Astarabadi, 18th century AD) and Suleyman Efendi (16th century AD) the term gutuz is available too (Astarabadi, 1995; Bukhari, 1920). Nowadays, the term gutuz that has been changed into قودوز (guduz) in Azeri Turkish and also is available in Ottoman Turkish (kutuz) (Behzadi, 1996; Olğun, 1979). In Azerbaijan (Iran), the term guduz is also used among the villagers.

Among these people there is an expression which is considerable in the view of veterinary medicine. The sense of this expression, used for cunning people is as follows: قورد ییب قودوز اولوب (Gurd yiyib guduz olub) that is 'He has eaten the wolf and has become rabid!' (Farahmand, 2003). This shows that the people of Azerbaijan were aware of a reservoir for this disease in wolves. The role of wolf in transferring of the disease is noticeable in Azerbaijan.

Enterotoxaemia:

Two forms of enterotoxaemia, caused by B and D types of *Clostridium perfringens* have been found in this region (Quinn, 2003). This is not only confirmed by epidemiological studies, but also the native vocabularies, current in this region, point to these different diseases. The disease related to D type (lamb dysentery), is called چرلتمه (çərlətmə), meaning disgusting odour (Behzadi, 1996).

This name is associated with the smell, caused by diarrhea. The other name, سو آما (su-alma), indicates ascites and water collection in cavities of the body. In the villages around Tabriz, capital of Azerbaijan (Iran), the word اوره گی سو آما (ürəgi-su-alma), exactly means hydropericarditis and is the pathological sign of this disease (Quinn, 2003). The disease, related to B type (overeating disease) is called دلجه (dəlicə) which means 'mad', indicating the neurological signs of this disease.

Foot and Mouth Disease:

There is a term in Dədə-Gurgud historical stories (13th century AD) as اویسل (oysel) picturing salivation sign (Ergin, 2000; Deda-gurgud, 1979). Although we can not identify this disease with this sign as foot and mouth disease, but today's writers and poets translate it to دبابخ (dabbax) (Qarachorlu, 2003). Dabbax is a famous native word, meaning foot and mouth disease in Azerbaijan. It seems that this word is composed of two stems (dab+ax or ag). Dab

or Tab corresponds to the equivalent word for 'disease' in the Sumerian dictionary and to 'scar' in *Divan-u Lugat-it Türk* (Halloran, 2006; Kashgari, 2004). Besides in other Turkish manuscripts this word means foot print (Clauson, 1972). Dab signifies the scars of the cattle with foot and mouth disease. Ag (ax) is a suffix that makes "dab" as a noun (Farzane, 1979). In Turkey, the native people believe that this disease is brought around by the wind, and this implies the awareness of the Turkish people of the air-born nature of transmission of the disease, long years ago (Dinçer, 1967).

Contagious agalactia:

Contagious agalactia has various names in Azerbaijan (Iran). Among these words یل بوز (yel-boz) is highly valuable in comparison with the other froms the aspect of veterinary medicine. Yel, mainly used for 'wound', has been known to be used for arthritis, too (Behzadi, 1996; Olğun, 1979). This word denotes, therefore, one of main signs associated with this disease (Quinn, 2003). Boz, another part of this compound word, means gray, pertaining to conjunctivitis in eyes of sheep with this disease, which can be turned into grayish (Behzadi, 1996; Quinn, 2003). If we compare yel-boz with agalactia, it turns out that the Turkish words are more catching than their Latin equivalent which consists of two terms: 'a' (without) and 'galactia' (milk) pertaining only to only one of the disease signs.

4. Epilogue

Such terms in Turkish traditional texts and the native culture of Turk regions are widespread. Study of these terminological questions makes one curious about the working of the human mind. It can provide a deep and respectful view on the different cultures of the world that are the common heritage of mankind. It is an obligation of man to take care of this heritage.

Acknowledgements:

All the students having helped the authors in compiling this paper. With special thanks to Kamal Shayegh for his help in preparing this paper and to the villagers holding this valuable vocabulary in their minds.

The Effects Of Long Term Physical Activity On The Changes In The Rates Of In Apo Proteins A And B In Nonathlete

Karim Salehzadeh¹, Yousef aghdami¹, Morteza Jourkesh²

¹Department of Physical Education, Azerbaijan University of Tarbiat Moallem, Tabriz, Iran; ²Department of Physical Education and Sport Science, Shabestar branch, Islamic Azad University, Shabestar, Iran

Abstract: The Present study aims to evaluate the effects of a one-year-long volleyball practice on the changes in the rates of Apo proteins A and B in the blood serum of non-athlete men. In order to do so, 30 subjects were selected randomly from among non-athlete male students and then were divided into two control and experimental groups. The experimental group on average aged 23 ± 2 . Their average height was 172.2 ± 3 cm and the average weight was 69.6 ± 3.1 kg. On the other hand, the control group aged on average 22 ± 2 and their average height and weight were 170.3 ± 3.8 cm and 69.3 ± 2.7 kg. The experimental group went through a one-year-long volleyball exercise program in which they had to practice for 90 minutes three times in a week. The control group did not have any special practice. The covariance analysis was used to probe the rates of Apo A and B and analyze the data. The rates of Apo proteins, measured before the test in both groups, were taken as the covariate to correct the groups' mean, increase the test's precision and lessen the error risk. The test results revealed that in the experimental group a one-year-long sport exercises has meaningfully changed the level of Apo A in the blood ($P= 0.01$). There was not a significant difference in the rates of Apo A in the posttest measurements in both groups ($P= 0.01$). The amount of Apo B was also meaningfully different in pre and posttest in the experimental groups but the changes in the rates of Apo B in both control and experimental groups did not differ meaningfully. [Karim Salehzadeh, Yousef aghdam, Morteza Jourkesh. **The Effects Of Long Term Physical Activity On The Changes In The Rates Of In Apo Proteins A And B In Nonathlete.** Journal of American Science 2011; 7(6):654-662]. Keywords: Long-Term Physical Activity; Apo Protein A; Apo Protein B; Non-Athlete.

1. Introduction

The proteins in the body of lipoproteins are called Apo lipoproteins or Apo proteins (Espinosa-Larranaga, F, et al., 2005). Lipoproteins are composed of so-called lipid proteins which are constructed by free cholesterol, Strifiet cholesterol, triglycerides, phospholipids and quartet lipids (Ernst J. Schaefer, 2002). Although Apo proteins take the minimal amount of 1% of Shilomicrones, they make nearly 60% of the high density HDLs. One or more types of Apo lipoproteins exist in each lipoprotein (L. Holme, et al., 2007). The major Apo protein in the HDL is called A and the major one in the LDL is called B (Martin, R et al., 2002). One of the important prognostic factors in cardiac diseases is the Apo proteins A and B ratio. This ratio must not fall below 0.5 (Mercedes R. 2009). Apo protein A for example acts as the cofactor for the lisitin-cholesterol asile transferaze enzyme (Mestek, M. L. 2009 and Parish S, et al., 2009). It also takes the role of the lipid carrier proteins like Apo protein D in carrying HDL and finally acts as ligands connecting lipoproteins to receiving molecules on the cells in different tissues such as Apo protein B100 and E for LDL receivers and Apo protein A1 for HDL cellular receivers (Durheim, M. T, et al., 2008).

Nowadays cardiovascular diseases are killing many people for they have inactive lifestyles and bad

nutritional habits (Haram, P. et al., 2009). Different studies have revealed that the decrease in Apo protein A and increase in Apo protein B rate is the main cause of cardiovascular diseases (Parish, S et al., 2009). Thus, the rate of Apo protein A is an anti risk factor and its comparison to Apo protein B is a risk factor. This risk is larger in non athletes but about Apo protein B it is the opposite (Kodama, S et al., 2007 and Durheim, M. T et al., 2008). Nicklas, B. et al., (2009); Arthur S. (2009); Amy E. (2009) and other scholars' findings show that Apo protein B in the men and women's blood serum decreased meaningfully after a period of stamina practices.

Miller et al. (2006) and Espinosa et al. (2005) studied the amounts of HDL lipoprotein and Apo proteins A and B after long aerobic exercises. They found that in elder women, the HDL and Apo protein B decreased significantly in the subjects' blood however the Apo protein A did not have a big change. Parish et al. (2009), Green J. et al., (2005) and Kodama (2007) investigated athletes and non-athletes and revealed that in spite of other studies' findings, the rate of HDL and Apo protein A in athletes' body was larger than non athletes. Tokmakidis (2003) studied the effect of aerobic and stamina exercises on the rate of Apo protein A and HDL and concluded that their rate increases in both groups (William E. et al., 2003). In

another study by Slentz on active and inactive students, it was found that the amount of Apo protein B decreases significantly in active students after undergoing a long-term practicing (Slentz C. A. et al., 2007). On the other hand, Amy E. et al., (2008) and William et al. (2003) found that the variables do not show a big difference in both men and women after a long-term aerobic exercise. These different and sometimes paradoxical results can be found in many studies. Results achieved by Green J. et al. (2005) and Haram P. et al. (2009) are good examples of this paradox. Fahlman (2002) found a significance fall in the amount of Apo protein B of the subjects after a long stamina exercise (Fahlman Boardly J. and Gerontol Aboil 2002). However Fontana et al. (2007) studied risk factors of cardiovascular diseases in an aerobic exercising period and found no meaningful difference between rates of Apo proteins A and B. Approving this, Von (2004) did not find a meaningful difference in the Apo protein A and B's changes (Von Stengel, Simon 2004). In spite of huge amounts of studies conducted in the field and the paradoxical conclusions they have drawn and the critical view toward exercise programs, the need for further investigation is felt even more greatly for there are still unclear points waiting to be clarified. Hence, the present study aims to find the answer to this question that if a popular long-term physical activity in a sport like volleyball affects the changes in the Apo proteins A and B's rates in blood serum of non-athlete men.

2. Material and Methods

Subjects

This study was a semi-experimental one conducted with one control and one experimental group. The subjects were 30 non-athletic men aged between 21 and 25 chosen through physical activities questionnaire to add to their homogeneity. They were divided into two groups of control and experimental.

Exercising protocol

The exercise in the present study included a one-year-long volleyball exercising done three times in a week. The sessions were each 90 minutes. Sessions' exercises had a definite pattern of length and difficulty (table 1). These exercises began with 8 minutes of stretches, and went on with 12 minutes of aerobic running with a 70% vo_2 max severity, 7 minutes of muscles' warm up, 18 minutes of volleyball skills' practices, 40 minutes of a game and finally 5 minutes of recovery activities. It should be noted that all these activities were done between 4 and 6 p.m. on odd days in an indoor stadium.

Blood Sampling

48 hours before sampling, some proper advice including having no breakfast, no medicine, and no physical activities was given to the subjects. 24 hours before the beginning of the exercising period and 24 hours after the final session, 10cc venous blood was taken by sterile exam tubes having EDTA¹ anticoagulant. They had not eaten anything for 17 hours. The temperature in both pretest and posttest location was 23 to 25 degrees centigrade and after sampling was done, specialists took the samples to the Pasteur laboratory.

Measuring Tools

Statistical Analysis

Descriptive statistics was used to analyze the data and reach the mean and standard deviation but in order to compare the Apo proteins A and B for the difference in the pretest amount and to compare Apo proteins A and B in the posttest in control and experimental groups, the covariant analysis was applied. The rates of Apo proteins measured in both pretest and posttest were considered as the covariates to decrease the error, improve the mean of groups and increase the precision. The statistical model used was as follows:

$$Y_{ij} = B_0 + B_1 X_{ij} + T_i + E_{ij} \quad i = 1, \dots, a, \quad j = 1, \dots, n$$

Y_{ij} = observing j in group i X_{ij} =

pretest Apo protein variable μ_x (covariate) T_i =

B_0 = width from the source T_i =

fixed effect of i (pretest) (posttest)

B_1 = functionality coefficient (regression coefficient)

E_{ij} = random risk

Total average equals $\mu = B_0 + B_1 \mu_x$ and the groups average is $\mu = B_0 + B_1 \mu_x + T_i$ where μ_x is the mean of covariate X.

In order to evaluate the difference in Apo protein rates in both pretest and posttest, pendent sample method was used. Since the pretest and posttest samples were not dependant from each other, i.e. the subjects were those who were tested before and after the test, the changes in Apo protein rates in both control and experimental groups were tested through a multi regression model. The grouped variable was considered as a binomial variable with 0 and 1 for control and experimental groups. The multi regression model used is as follows:

$$Y_i = B_0 + B_1 X_{1i} + B_2 X_{2i} + B_3 X_{1i} X_{2i} + E_i$$

Considering Apo proteins A and B, mg/dl, B_0 , B_1 , B_2 and B_3 regression parameters and Apo proteins in pretest X_{1i} and the X_{2i} number assigned to groups beside 1 for experimental group and 0 for the control one and the mutual effect of Apo proteins on pretest X_{2i} and X_{1i} and the random error E_i and the evaluated

¹ Ethylene Diamine Teta Acetic Acid

regressions for the experimental group which is $E(y_i) = (B_0 + B_2) + (B_1 + B_3)X_{1i}$ and is $E(y_i) = B_0 + B_1X_{1i}$ for the control group.

Table 1. Volleyball exercises program of a session, three times a week for one year.

Cholesterol, triglyceride, and LDL-HDL-VLDL were measured by an auto analyzer set (Co BAS miRAS) using photometric method. This set was made by Roche in Switzerland. The measurement was done by diagnostic laboratory gates of Pasteur Laboratory. Spectrophotometric method with Randox was used to identify Apo proteins A and B by an auto analyzer set (RA1000) made in England.

exercise	stretches and flexibility	aerobic running	muscles warm-up	skills' practices	game of volleyball	recovery	the whole session
length of session (minutes)	8	12	7	18	40	5	90
severity of exercise (HR max)		70%					

3. Results

The descriptive data for the subjects are presented in table 2. on the other hand other tables show the relationship between Apo proteins A and B in the subjects of both experimental and control groups.

Table 2. least square means of Apo protein A in control and experimental groups accompanied by standard error and P value.

Group	Apo protein A Lsmeans(mg/dl)	Standard Error	P-Value
Control	119.783	1.1185	<0.0001
Experimental	127.951	1.1185	

Table 3. least square means of Apo protein B in control and experimental groups accompanied by standard error and P value.

Group	Apo protein B Lsmeans(mg/dl)	Standard Error	P-Value
Control	108.438	1.0256	0.0006
Experimental	102.362	1.0256	

The difference between two groups in the amount of Apo protein B based on P=0.0006 is meaningful.

Table 4. Means, standard error, t value and P-value of differences of pre and post trial values of Apo proteins in experimental group.

Variable	Mean(mg/dl)	Standard Error	T Value	P-Value
(Apo protein A 1- Apo protein A0)	6.06666	1.9284	3.15	0.0071
(Apo protein B 1- Apo protein B0)	-4.80000	1.1514	-4.17	0.0009

Table 5. Means, standard error, t value and P-value of differences of pre and post trial values of Apo proteins in control group.

Variable	Mean(mg/dl)	Standard Error	T Value	P-Value
(Apo protein A 1- Apo protein A0)	-2.06666	0.98786	-2.09	0.0551
(Apo protein B 1- Apo protein B0)	-2.60000	0.70912	3.67	0.0025

Apo proteins A and B amounts in pretest and posttest of experimental group.

Table 6. comparison of $\frac{B}{A}$ ratio in both control and experimental groups.

Subjects	test phases	Apo B/A ratio	Changes in Apo B/A ratio	meaningful difference
experimental group	pretest	95%		
experimental group	posttest	86%	9.3% decrease	
control group	pretest	79%	3.4% increase	12.7% is not meaningful
control group	posttest	83%		

Apo protein A

The P value for B_1 , B_2 and B_3 were meaningful ($P < 0.05$) and the regression slope was not similar in two groups.

The estimated regression for Apo protein A in control group was:

$$\text{Apo A} = 16.153 + 0.850413(\text{Apo A}_0)$$

The estimated regression for the experimental group is as follows:

$$\text{Apo A} = 52.7027 + 0.61753(\text{Apo A}_0)$$

Figure 1. The changes in Apo protein A in both experimental groups dependent on initial Apo protein measurements in two pretests.

Apo protein B

The P value for B_1 and B_2 were meaningful in $P < 0.05$, but for the B_3 that was not meaningful. The regression slope for different groups were different and the estimated regression on Apo protein B in the control group is as follows:

$$\text{Apo B} = 11.20778 + 0.9112599(\text{Apo B}_0)$$

The estimated regression in the experimental group is as follows:

$$\text{Apo B} = 2.9028 + 0.983645(\text{Apo B}_0)$$

Figure 2. Apo protein B changes in both control and experimental groups dependent on initial Apo protein measurements in the pretest

Figure 3. Comparison of Apo protein A changes in both control and experimental groups

Figure 4. Comparison of Apoprotein B changes in both control and experimental groups

4. Discussion

Different studies in modern countries have revealed that Apoproteins A and B ratio is an important factor in estimating the risk of cardiovascular diseases (Miller G. et al., 2006; Konstantinos et al., 2009). Several methods have been used to change this ratio and the most important one is physical activities. However different studies have reached different conclusions. Each of these studies have focused on a specific sport. Green et al., (2005) studied 24 weeks of cycling with 50 and 80 percent of Vo_{2max} on the ratio of

Apoproteins $\frac{B}{A}$ and reached similar results (Green J. et al., 2005).

Despite the results of the above-mentioned study and other similar ones demonstrate that regular physical activities increase the HDL and decrease LDL and VLDL. the increase in HDL hinders cholesterol sedimentation in blood vessels (O'Donovan, G and et al., 2005; Jacobs et al., 2006; Durham et al., 2008; Haram et al., 2009; Jenkins et al., 2009; Konstantinos et al. 2009; Michael L et al., 2009). As the HDL raises, Apoprotein A being a major part of it raises as well (Press et al., 2003; Sharma, A et al., 2003; O'Donovan, G et al., 2005; Michael L. Mestek., 2009; Parish S et al., 2009) LDL triglycerides catabolize as the lipoprotein lipase enzymes begin activity through Apoprotein A on the blood vessels. Accordingly, as the Apoproteins increase by physical activities, catabolism of LDL and VLDL triglycerides grows (Tall, A, 2002; Sharma, A et al., 2003; Von Stengel, Simon 2004; Stefan Branth et al., 2006; Parish S et al., 2009). Most of the studies conducted approve the positive role of physical activities and show that they affect the increase in Apoprotein A and decrease in Apoprotein B meaningfully. In spite of these findings, some other studies have rejected them (Green J. et al. 2005; Espinosa-Larranaga F. et al. 2005; Miller G. et al. 2006; Fontana L. et al. 2007; Kodama S. and et al. 2007; Parish S. et al. 2009). In order to clarify a bit more on the topic and considering the fact that many people have turned from individual sports to ball games to block the risk of cardiovascular diseases, the present study have studied the effects of a long-term volleyball exercise on the changes in the Apoprotein A and B rates in non-athlete men. the results reveal that these activities do not change the Apoprotein A's amount in non-athlete subjects ($P=0.01$). The difference in the control and experimental groups' Apoprotein A is not meaningful ($P=0.01$). on the other hand, comparison of Apoprotein B in both control and experimental group in pretest and posttest shows a meaningful difference ($P=0.01$). This meaningful difference in the pretest and posttest of control group have been caused by the one-year-long volleyball exercises in which many factors

including nutrition, physical activities and heredity are also important. As it can be seen, this exercise may change the Apoprotein rate slightly in the subjects in experimental group in pretest and posttest. Although this slight increase in the amounts measured in the pretest and posttest is equal (+6.06666), in the control group this rate shows a little fall (+2.60000). This difference in the mean of the subjects in both control and experimental groups have made the $T=3.15$ and $P=0.0071$ so it can be inferred that the change in the Apoprotein A rate has been sufficient in the experimental group and it can be defined and thus it is meaningful. the findings of the present study are in complete concordance with the findings of Green (2005); Haram et al. (2009); Jacobs et al. (2006); O'donovan et al. (2005); Parish et al. (2009); Arthur S. Leon (2009); Micheal et al. (2009); Von Stengel (2004); Slentz et al. (2007); Nicholas et al. (2009); Metsios et al. (2008) and disagrees with findings of Espinosa et al. (2005); Fahlman (2002); Haram et al. (2009); Kodama (2007); Fontana et al. (2007); Amy E. et al. (2008) and William et al. (2003). The present findings show that although the rate of Apoprotein has changed in the experimental group significantly, analyzing the results on Apoprotein B present no meaningful differences in both control and experimental groups in the pretest and posttest ($P=0.01$). In this group Apoprotein B has decreased significantly (-4.8000) and this decrease may have huge effects on the cardiovascular diseases' risk factors and reduce them (Fahlman, 2002; William, E et al., 2003; Von Stengel, Simon., 2004; O'Donovan, G. et al., 2005; Stefan Branth et al., 2006; Miller, G. et al., 2006; Fontana, L et al., 2007; L.Holme, A., 2007; Yourka D Tchoukalova et al., 2008). Thus it can be said that these activities had a meaningful effect on the Apoprotein B rate in the subjects under study. Overall it is proved that the Apoprotein B to A ratio is a prognostic factor in cardiac muscles' defects (Green j et al., 2005; Miller. G et al., 2006; Parish S et al., 2009; Jenkins et al 2009). In the subjects of the control group

this ratio $\left\{ \frac{\text{pretest}}{\text{posttest}} = \frac{0/79}{0/83} \right\}$ had a 0.43 raise and in

the subjects of the experimental group $\left\{ \frac{\text{pretest}}{\text{posttest}} = \frac{95}{86} \right\}$ had a 9.3% fall. The difference in the B/A ratio was 12.7%, which was a huge difference, compared to the standard difference, and may be the cause of a big risk. It can be concluded that activities like the ones tested here cannot be supposed as the hindering factors against cardiovascular diseases risk factors (Miller. G et al., 2006; Kodama, S et al., 2007; Amy E. Griel et al., 2008; Parish S et al., 2009). However, a huge fall can be seen for Apo protein B (Table 6), and findings of this research are in concordance with Michael et al.,

(2009); Parish et al., (2009); Arthur S. Leon, (2009); Metsios et al., (2008); Jacobs et al., (2006); Haram P. et al., (2009); and do not concord with the findings of Von, (2004); Green (2005); Parish S. et al., (2009); Miller et al., (2006). It should be noted that beside long-term physical activities, other factors like nutrition, sessions' number in a week, length and severity of exercises, caloric cost, smoking and medicines which were not controlled are of high importance in decreasing the amount of Apo protein B (Lee, I-M et al., 2003; [Eisenmann JC.](#), 2004; Fontana, L et al., 2007; Annie Motard and et al., 2008; Mercedes R. Carnethon, 2009). It is highly important for the caloric cost of individuals, amount of fat in the body, heredity, personal exercising methods are among the factors affecting amount of Apo proteins A, and B in both pretest and posttest levels and influence the research results (Sharma A. et al. 2003; [Tokmakidis SP](#), [Volaklis KA](#), 2003; Metsios, G.et al.,2008; [Parish S](#) et al.,2009; Mestek, M.L. 2009; Michael L. Mestek,2009). Overall conclusion can be drawn from this study that even if a one-year-long physical activity in the form of a three-session volleyball exercise increases Apo protein A rate meaningfully, higher increase may have a huge role in safety from cardiovascular diseases. Besides, these exercises may decrease the amount of Apo protein B meaningfully and bring the Apo protein B to Apo protein A ratio to the standard one. Accordingly, in both cases it can be said that biochemical, physiological, and physical shape is in a way that can be effective on cardiovascular condition and reduce the risk of diseases (Lee, I-M et al., 2003; William, E et al., 2003; Miller G et al., 2006; Slentz, C et al., 2007; Yourka D Tchoukalova et al., 2008; Parish S et al ., 2009; Michael L. Mestek, 2009). Changing lifestyles from an idle and static one to a more dynamic and active one may increase the energy usage (Martin R. et al., 2002; Jenkins et al. 2009; Parish S. et al., 2009; Mercedes R. Carnethon, 2009) and help have a healthier heart. Finally, it should be noted that there are many factors affecting the amount of Apo protein A and B as cardiovascular risk factors, and more studies are needed to clarify more on these factors and identify mechanisms of changes in Apo proteins A and B.

Relationship Between Geopotential Height Anomalies Over North America and Europe and the USA Landfall Atlantic Hurricanes Activity

Yehia Hafez

Department of Astronomy, Space Science & Meteorology, Faculty of Science, Cairo University, 12613, Egypt
d_hafez@hotmail.com

Abstract: The present paper investigates the relationship between geopotential height anomalies at level of 500 hpa over North America and Europe, and the USA landfall Atlantic hurricanes activity. The decadal data of the number of hurricanes by category which stroked the mainland USA for each decade through the period (1851-2006) are used through the present study. The daily NCEP/NCAR reanalysis data composites for geopotential height at 500 hpa level over North America and Europe for the period of (1949-2006) are used too. Hurricane datasets and anomalies in geopotential height are analyzed and correlated together. The results revealed that there are significant positive correlations between the anomalies in geopotential height over North America and East Europe simultaneously, and existence of Atlantic hurricanes of category 3 that strike USA. In addition to that, significant positive correlations between the anomalies in geopotential height over North America and existence of major hurricanes (category 3, 4 and 5) that landfall USA is found too. However, significant negative correlations between the anomalies in geopotential height over North Atlantic and existence of all USA Landfall Atlantic Hurricane categories are existed else category 1. In general one can conclude that anomalies in geopotential height at 500 hpa level over North America and Europe are control the USA landfall Atlantic hurricanes activity.

[Yehia Hafez. Relationship Between Geopotential Height Anomalies Over North America and Europe and The USA Landfall Atlantic Hurricanes Activity. Journal of American Science 2011;7(6):663-671]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Atlantic hurricanes; Geopotential height anomalies; North America; USA

1. Introduction

The USA landfall Atlantic hurricanes activity and its causes had been challenged in several scientific literatures (e.g., Elsner et al., 1999; Gray 2001; Goldenberg, et al., 2001, Landsea 2005; Mann and Emanuel 2006; Elsner 2006 and 2008; Asbury et al., 2006; Trenberth and Shea 2006; Vecchi and Knutson 2008 and Hafez 2008). However, increases in key measures of Atlantic hurricane activity over recent decades were believed to reflect, in large part, contemporaneous increases in tropical Atlantic warmth (e.g., Emanuel, 2005). Some studies (e.g., Goldenberg et al., 2001) had attributed these increases to a natural climate cycle termed the Atlantic Multidecadal Oscillation (AMO); while other studies suggest that climate change may instead be playing the dominant role (Emanuel, 2005; and Webster et al., 2005). Also, the global warming arguments had been given much attention by many media references to recent papers claiming to show such a linkage. Despite the global warming of the sea surface that has taken place over the last three decades, the global numbers of hurricanes and their intensity have not shown increases in recent years except for the Atlantic, Klotzbach (2006). In addition to that, processes affecting hurricane development over the North Atlantic like the El Nino Southern Oscillation (ENSO), the stratospheric Quasi-Biennial Oscillation (QBO) and Sea Surface Temperatures

(SSTs) were discussed. Global coupled climate model simulations cannot answer directly the question on enhancement of hurricane activities (or its absence) under increased greenhouse gas concentrations because of their too coarse resolution. Therefore large-scale quantities that affect hurricane formation were investigated in a future warmer climate. However, more frequent or more intense hurricanes were expected from an increase in the local SST, from more latent heat flux from the ocean to the atmosphere, from more westerly winds in the tropical stratosphere that reduces the occurrence of strong easterly phases of the QBO and from a more moist-unstable stratification of the atmosphere. However, a stronger vertical wind shear similar to the difference between El Nino and La Nina events suggested fewer hurricanes in the northern Atlantic. Also a more dry-stable atmosphere would lead to fewer hurricanes (Gray 1984; and Arpe and Leroy 2008). Meanwhile, the USA landfall of major hurricanes Dennis, Katrina, Rita and Wilma in 2005 and the four Southeast landfall hurricanes of 2004 (Charley, Frances, Ivan and Jeanne) raised questions about the possible role that global warming played in these two unusually destructive seasons (Klotzbach and Gray 2008). In fact, Hafez (2008) found that blocking systems over the Northern Hemisphere played a great role in USA landfall of strongest hurricanes Katrina, Rita and Wilma in 2005 season

and also in the activity of hurricane Andrew 1992. Hafez (2009) gets a model for extratropical cyclone Klaus that developed over the North Atlantic Ocean and invade southern France and northern Spain on January 2009. He found that, Azores high played a great role in developing of cyclone Klaus. However, recently, Klotzbach (2010) found that the large-scale equatorial circulation which known as the Madden-Julian Oscillation (MJO) impacts on tropical cyclone activity in several basins around the globe. Large differences in frequency and intensity of tropical cyclone activity were seen; both in the tropical Atlantic as well as in the northwest Caribbean and Gulf of Mexico depended on the MJO phase. Coherent changes in upper- and lower-level winds and relative humidity are likely responsible for these differences. In the present work, author will try to uncover the key for answer the following question, what is the actual response that controlling of USA landfall Atlantic hurricanes activity.

2. Data and Methods

The decadal data of number of hurricanes by category which stroked the mainland USA for each decade through the period (1851-2006), Updated from Blake et al., 2005, are used through the present study. The daily NCEP/NCAR reanalysis data for geopotential height at 500 hpa level over North America, North Atlantic Ocean and Europe for the period of (1949-2006) (Kalnay et al., 1996) are used too. This data set obtained from the NOAA - CIRES, Climate Diagnostics Centre (CDC) through the Web Site (<http://www.cdc.noaa.gov>). For the purpose of the present study, it is liable to divide the area of study to four zones. First zone, zone A, is the North America (100° W- 20° W) latitudes and (60° N – 30° N) longitudes. Second zone, zone B, is the North Atlantic Ocean (20° W – 00° E) latitudes and (60° N – 30° N) longitudes. Third zone, zone C, is the West Europe (00° E – 40° E) latitudes and (60° N – 30° N) longitudes. The last one, zone D, is the East Europe (40° E – 60° E) latitudes and (60° N – 30° N) longitudes. In the present work, these datasets are analyzed using of anomalies methodology and linear correlation coefficient techniques, Spiegel (1961).

3. Results

3.1 Analysis of geopotential height over 500 hpa over North America and Europe in the period (1948-2006)

Through the present study, time series analysis of datasets of geopotential height of 500 hpa level for the period (1948-2006) for four distinct zones over North America and Europe is done. For the purpose of study these zones are (zone A, zone B, zone C, and zone D). The results revealed that for zone A, (North

America), geopotential height varies from year to year with minimum value (5627 m) in year 1976 and maximum value (5675 m) in year 2005. Maximum values of geopotential height are existed through the period (2001-2005). Figure 1a illustrates these variations. for zone B, (North Atlantic Ocean), geopotential height values varies rapidly from year to year with minimum value (5635 m) in year 1960 and maximum value (5730 m) in year 1978. Figure 1b shows these variations. Zone C, (West Europe), characterized by dramatically increases in geopotential height values through the period (1981-2006) rather than the period (1948-1980) with maximum value (5710 m) in year 2005. Figure 1c shows this dramatically variation. In addition to that, through zone D (East Europe) two maxima and two minima of geopotential height are existed. The two maxima are (5718 and 5722 m) for years of 1952 and 2005 respectively. Meanwhile two minima (5638 m) for years 1956 and 1973, see Figure 1d.

3.2 Analysis of geopotential height anomalies over 500 hpa over North America and Europe through period (1948-2006)

In this section, geopotential height anomalies over 500 hpa over North America, North Atlantic Ocean, West Europe and East Europe through (1948-2006) period are analyzed. For zone A, it is clear that geopotential height anomaly values vary from year to year around its mean value (5649 m). With maximum value (+27 m) existed on year 2005. Meanwhile, the minimum value (-20 m) recorded on year 1976 through the study period as it is shown in Figure 2a. There is a positive anomaly trend exist from year 1964 until 2005. See the black straight line in Figure 2a. In addition to that, for zone B, the geopotential height anomaly values vary dramatically from year to year around its mean value (5685 m). Maximum anomaly value (+35 m) existed on year 1978. The minimum value (-50 m) observed on year 1960 through the study period as it is illustrate in Figure 2b. It is clear that, through the first half period of study, from year 1948 to 1980, there is a negative anomaly trend. Meanwhile, there is a positive anomaly trend exist for the second half of the study period from 1981 to 2005 year. The trend is shown by black straight line in Figure 2b. The Analysis for zone C revealed that the mean value is (5678 m) for this zone. The maximum anomaly value (+32 m) is observed on year 2005 and the minimum value (-30 m) occurred on year 1965 as it is clear in Figure 2c. Positive trend occurred from year 1969 to 2005. As clear from black straight line trend in Figure 2c. For the last zone D, it is record the highest maximum anomaly value for all zones (+ 50 m) on year 2005. Meanwhile (-36 m) is the minimum value on 1973. However, the

mean value is (5673 m) for this zone, see Figure 2d. Positive trend is observed from year 1960 to 2005 as it is clear from black line shown in Figure 2d. The results of the analysis of geopotential height anomaly through the period (1948-2005) for four zones revealed that there exist positive trends in anomaly values almost of the study period with highest maximum values on year 2005 except for North Atlantic Ocean, zone B.

3.3 Analysis of the decadal timeseries for USA landfall Atlantic hurricanes activity

Through this section, data of the decadal number of Atlantic hurricanes by category that stroke the mainland USA through the period (1851-2006) were analyzed using of timeseries analysis. The category of Atlantic hurricanes obtained according to the Saffir- Simpson scale of hurricanes. The Saffir-Simpson hurricane Scale is a 1-5 rating based on the hurricane's present intensity, Zebrowski and Judith (2005). The results revealed that, hurricanes for category 1 varies from decade to decade with maximum number of 10 hurricanes occurred through the two decades (1901-1910) and (1911-1920). Meanwhile, with minimum number 3 hurricanes existed two times on (1961-1970) and (1991-2000). The average number of category 1 is 7.1 h/d (hurricane/decade) see Table 1 and Figure 3a. In addition to that, the trend of Atlantic hurricanes of category 1 that stroke USA is a negative trend through the period of (1851-2006), Figure 3a (red line). For category 2, it is found that the maximum number recorded is 9 h/d on (1881-1890) and minimum number is 1 h/d for decade of (1951-1960). The average number of category 2 is 4.7 h/d with negative trend, Figure 3b. The same numbers, like category 2, occurred for category 3 but for the decades (1941-1950) and (1861-1870) respectively but with average number is 4.8 h/d, see Table 1 and Figure 3c. The trend of category 3 variation with time is a positive trend through the period of study, Figure 3c (red line). It is noticed that, for category 4 there are several decades without any existence of episode of hurricanes. The maximum number is 4h/d occurred on the two decades of (1891-1900) and (1951-1960). See Table 1 and Figure 3d. The average number of category 4 is 1.2 h/d, with a very little negative trend, see Figure 3d (red line). The existence of category 5 hurricanes is very little, whereas the maximum number is 1 h/d during the period of study. It is occurred only three times for (1931-1940), (1961-1970) and (1991-2000) decades. Its average number is 0.2 h/d, as it is clear from Table 1 and Figure 3e. In general there exist a positive trend of category 5, see Figure 3e (red line). For all categories (1, 2, 3, 4 and 5), analysis shows that, maximum

number is 24 h/d while minimum number is 12 h/d for the two decades (1941-1950) and (1971-1980) respectively, within average value is 17.9 h/d and negative trend through the period of study, see Table 1 and Figure 3f (red line). Major hurricanes of categories (3, 4 and 5) has 10 h/d as a maximum number and 1 h/d is a minimum number occurred on (1941-1950) and (1861-1870) decades respectively. The average number of it is 6.2 h/d with a slightly positive trend through the study period, as shown in Table 1 and Figure 4.

3.4 Relationship between geopotential height anomalies over North America and Europe and the USA landfall Atlantic hurricanes activity

Decadal data of geopotential height anomalies over North America and Europe and the USA landfall Atlantic hurricanes activity through the period of (1951-2006) has been correlated through this section. Table 2 illustrates the location for four distinct zones over North America and Europe. Table 3 shows the values of correlation coefficient between geopotential height anomalies over North America and Europe and the USA landfall Atlantic hurricanes activity. The correlation coefficient analysis revealed that there are significant positive correlations between the anomalies in geopotential height over northern America and Eastern Europe simultaneously and existence of Atlantic hurricanes of category 3. There are significant positive correlations between the anomalies in geopotential height over northern America and the existence of major hurricanes (3, 4, and 5) that strike USA. In addition to that, there are significant negative correlations between anomalies in geopotential height over northern Atlantic and existence of major and all Atlantic hurricane categories that strike USA except category 1.

4. Discussions

Almost of the previous studies of Atlantic hurricanes activity is referred it to global warming or to increase of SST in tropical region of the Atlantic Ocean, or ENSO conditions. The results of the present study uncovered that the anomalies in geopotential height values at 500 hpa over North America, North Atlantic, West and East Europe are controlling the activity of Atlantic hurricanes that landfall USA. Whereas, there are significant relationship between the existence of positive anomalies over North America and east Europe simultaneously and occurrence of category 3 hurricanes. In addition to that there are outstanding negative relationship between Atlantic hurricane of all categories that strike USA except category 1 and anomalies in geopotential height at 500 hpa levels which existed over the North Atlantic Ocean zone.

Major hurricanes have been strongly correlated to positive anomalies in geopotential height over North

America simultaneously with negative anomalies over north Atlantic region. In particular, in year 2005.

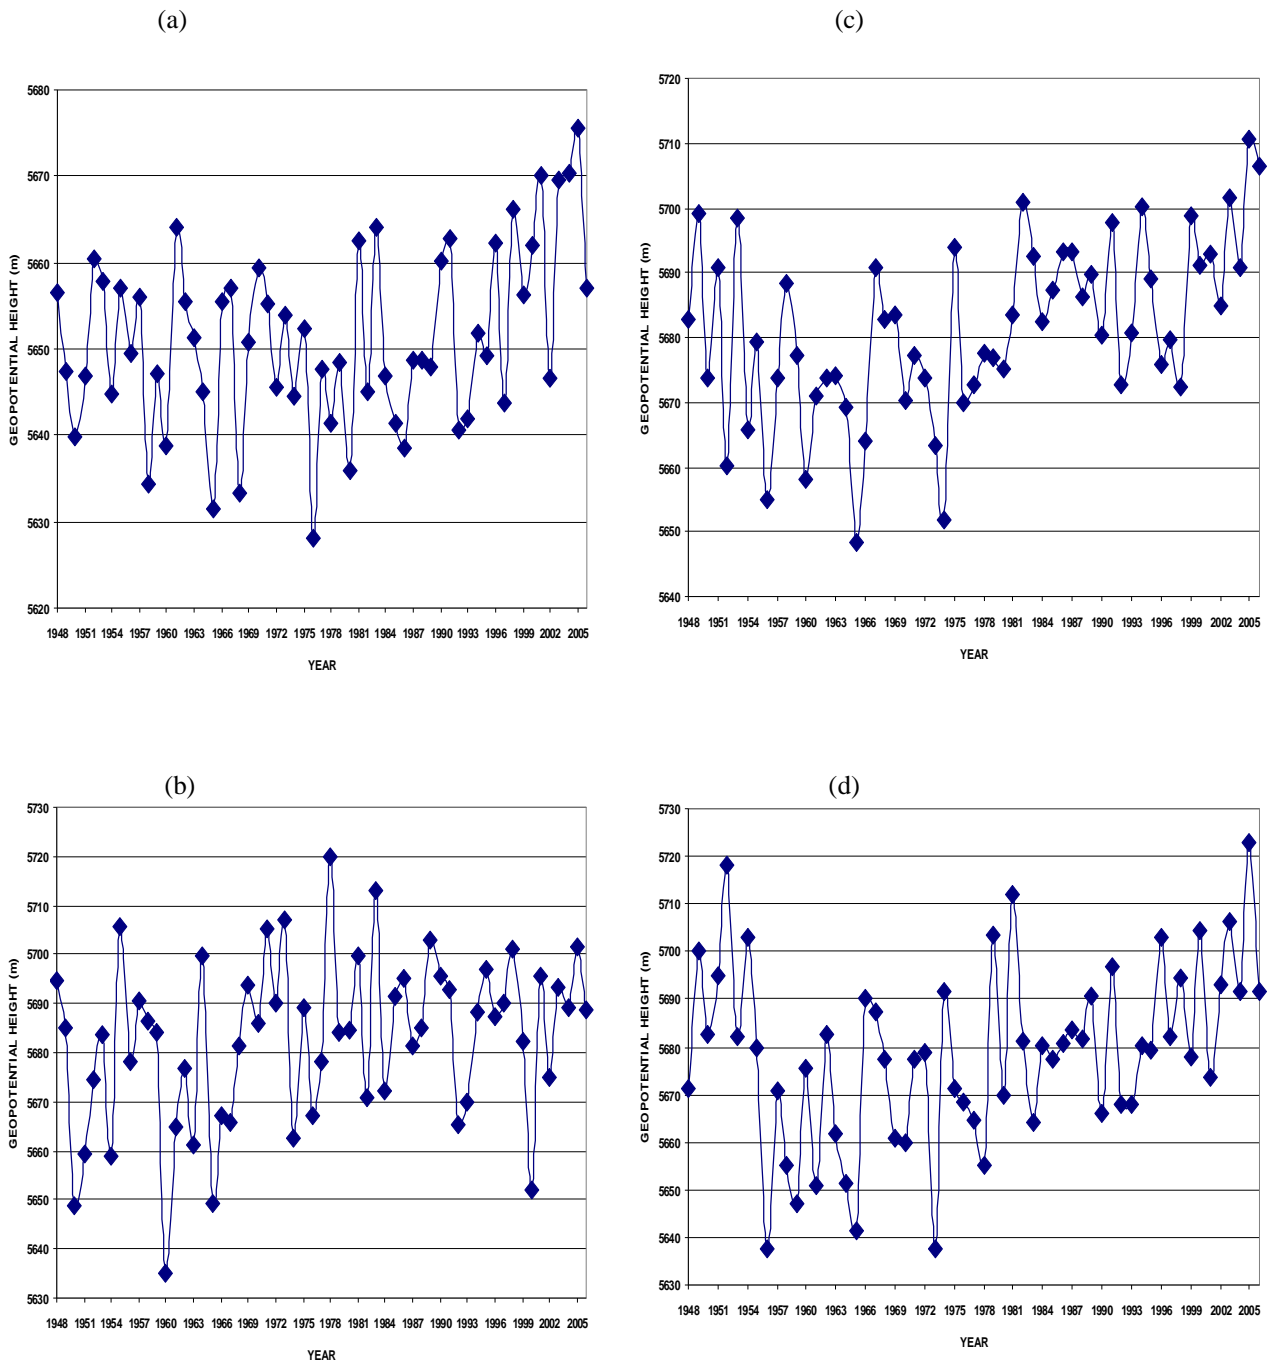

Figure 1. Time series of geopotential height at 500 hpa level for North America , North Atlantic, West Europe, and East Europe, four zones A, B, C and D respectively, through the period (1949-2006).

Abstract: In order to study the effects of applying the micronutrients zinc, manganese, and boron, and to compare the effects that incorporating them in the soil and spraying them on the crop on seed oil and protein contents and percentages, a study was conducted based on the factorial design with the two factors of incorporating these micronutrients in the soil and spraying them on the crop, in 16 treatments and four replications (a total of 64 trials), in 2009-2010 in Dasht-e-Naz in Sari of northern Iran. The treatments were as follows: T1=control, T2=Zns, T3=Mns, T4=Bs, T5=Zns, T6=Zns+Bf, T7=Zns+Mnf, T8=Zns+Znf, T9=Mns, T10=Mns+Bf, T11=Mns+Mnf, T12=Mns+znf, T13=Bs, T14=Bs+Bf, T15=Bs+Mns, T16=Bs+Znf. Results obtained showed that the highest seed oil percentage (25.03%) was achieved by spraying zinc on the crop, and that the biggest seed oil yield (359.31 Kg.h) was obtained by applying manganese to the soil. Results of the comparison of the means indicated that the highest seed protein content (36.12%) was achieved by spraying boron on the crop, and the greatest seed protein yield (545.54 Kg.h) was obtained when manganese was added to the soil. These results also showed that the largest number of total pods per plant (71.05), and the biggest seed yield (152.9 g.m⁻²) were achieved by applying manganese to the soil. In the comparison of the interaction effects of the data, it was also shown that, although the highest seed oil percentage belonged to the spraying of zinc on the crop, yet the greatest seed yield among all the treatments (170.7 g.m⁻²) was that of the treatment of adding manganese to the soil plus spraying zinc on the crop, in which the greatest number of pods per plant (77.87) and the highest seed protein yield (631.1 Kg.h) and the highest seed oil yield (284.5 Kg.h) were obtained.

[Abed vahedi. The Effects of Micronutrient application on soybean seed yield and on seed oil and protein content. Journal of American Science 2011;7(6):672-677]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Boron, manganese, oil, protein, soybean, zinc

1. Introduction

Excessive application of macronutrient fertilizers, such as nitrogen and phosphorus, the fact that micronutrients are not used in crop production in Mazandaran, and also the calcareous nature of soils in the fields of eastern Mazandaran, have resulted in micronutrient deficiencies. Study of the trend of fertilizer application in the past decade reveals that more than 90 percent of the fertilizers applied during this period were nitrogen and phosphorous fertilizers, with the ratio of N, P, K, and S fertilizers to fertilizers containing micronutrients being 100, 68, 4.5, and 0.065, respectively (Malakooti and Tehrani, 1999). Studies carried out in east Mazandaran showed that deficiencies of these elements are one of the limiting factors in achieving the maximum seed yield and seed oil and protein yield and percentages in the prevailing crop growing conditions (Assadi and Mahmoodi, 2001). Undoubtedly, the optimal application of plant nutrients has a significant role in increasing the yield and quality of soybean and its oil. Zinc deficiency is one of the most important and widespread micronutrient deficiencies in the world, and it reduces the yield of crop plants (Grewal et al., 1997; Cakmak, 2000). Soybean is sensitive to boron

deficiency (Victor et al., 1990); and boron is very influential in soybean seed formation and in increasing its seed oil content (Grant and Baily, 1992). Soybean is also very sensitive to manganese deficiency, a prevalent condition in neutral or alkali soil with high pH, and this deficiency results in short plants having yellow leaves. Manganese deficiency also has a negative influence on soybean seed oil content. Alley et al., (2008) reported that adding manganese sulphate to the soil and spraying it on the crop resulted in an increase in manganese absorption and in seed and oil yield of soybean.

Since Mazandaran is the center of soybean production in the north of the country, studying the effects of micronutrients on the qualitative features of soybean seed, such as the oil and protein yields and percentages, is very important. Therefore, this study was conducted in the region of Dasht-e-Naz to investigate the effects of applying the microelements zinc, manganese, and boron (and to compare the effects of the methods of applying them –i.e., incorporating them in the soil or spraying them on the crop) on the seed oil percentage and seed oil and protein yields.

2. Material and Methods

This study was carried out on the basis of the factorial experimental design with the two factors of adding the micronutrients to the soil and spraying them on the crop, with 16 treatments and 4 replications (a total of 64 trials). The treatments were as follows: T1=control, T2=Zns, T3=Mns, T4=Bs, T5=Zns, T6=Zns+Bf, T7=Zns+Mnf, T8=Zns+Znf, T9=Mns, T10=Mns+Bf, T11=Mns+Mnf, T12=Mns+Znf, T13=Bs, T14=Bs+Bf, T15=Bs+Mns, and T16=Bs+Znf. On the basis of the soil test carried out, the required amounts of the micronutrients, including zinc (40 Kg of zinc sulphate per hectare), manganese (30 Kg of manganese sulphate per hectare), and boron (10 Kg of boric acid per hectare) were added to the soil before seeding. In the spraying treatments, zinc and manganese (0.3 %) and boron (0.2 %) were sprayed at the start of stem elongation and at flower bud formation. At harvest, samples of the plants were taken from each plot and the yields and yield components of the different plots were statistically analyzed. After harvest, seed samples were sent to the soil and water laboratory of the Mazandaran Agriculture and Natural Resources Research Center for the determination of the percentage oil and protein contents.

3. Results

Oil Percentage

Results of the analysis of the variance of the data showed that the effects of the different levels of applying the micronutrients to the soil, the effects of the different levels of spraying the micronutrients on the crop, and the interaction effects of adding the micronutrients to the soil and spraying them on the crop on seed oil percentage were significant at the one percent probability level (Table 1). Results of the comparison of the means indicated that, among the treatments of applying the micronutrients to the soil, the highest seed oil content (23.99%) was obtained when boron was added to the soil, and that this treatment had a statistically significant difference with the others. In the treatments of adding manganese and zinc to the soil, the oil percentages observed were 23.5 and 22.73%, respectively, which were higher than that of the control (22.23%) (Table 2). These results also showed that, among the spraying treatments, the highest seed oil percentage (25.03%) was achieved when zinc was sprayed on the crop, and this treatment had a statistically significant difference with the others. The lowest seed oil percentage was observed in the control (21.69%) (Table 3). Results of the comparison of the means also indicated that the highest seed oil percentage (28.5%) was obtained when zinc was sprayed on the crop, and that the least seed oil content (17.5%)

belonged to the treatment of adding manganese to the soil plus spraying boron on the crop (Fig 1).

Oil Yield

Results of the analysis of the variance of the data showed that the effects of the different levels of applying the micronutrients to the soil, the effects of the different levels of spraying the micronutrients on the crop, and the interaction effects of applying the micronutrients to the soil and spraying them on the crop on seed oil yield were significant at the one percent probability level (Table 1). Results of the analysis of variance indicated that, among the treatments of adding the micronutrients to the soil, the highest seed oil yield (359.32 Kg.h) was obtained when manganese was added to the soil, and that this treatment had a statistically significant difference with the others. The treatments of adding zinc and boron to the soil came second and third with 321.85 and 293.39 Kg.h, respectively, while the least seed oil yield belonged to the control (249.64 Kg.h) (Table 2). These results indicated that, among the treatments of spraying the micronutrients on the crop, the highest seed oil yield (317.71 Kg.h) was achieved when manganese was sprayed on the crop, and that this treatment had a statistically significant difference with the others. The least seed oil yield (255.29 Kg.h) belonged to the control (Table 3). Results of the comparison of the mutual effects of the data showed that the highest seed oil yield (284.5 Kg.h) was obtained by adding manganese to the soil plus spraying zinc on the crop, and that the lowest seed oil yield (137.89 Kg.h) belonged to the control (Fig 2).

Seed Protein Percentage

Results of the analysis of the variance of the data indicated that the effects of applying different levels of the micronutrients to the soil, the effects of spraying different levels of micronutrients on the crop, and the mutual effects of adding the micronutrients to the soil and spraying them on the crop on seed protein percentage were significant at the one percent probability level (Table 1). Results of the comparison of the means showed that, among the treatments of adding the micronutrients to the soil, the highest seed protein percentage (35.67%) was obtained when manganese was added to the soil. The treatments of adding zinc to the soil and the control came second and third with 35.45 and 35.09 percent, respectively, while the lowest seed protein percentage (32.73%) was observed in the treatment of adding boron to the soil (Table 2). These results indicated that, among the treatments of spraying the micronutrients on the crop, the highest seed protein percentage (36.12%) was achieved when boron was sprayed on the crop, while the lowest seed protein

percentage (32.24%) belonged to the treatment of spraying zinc on the crop (Table 3). Results of the comparison of the mutual effects of the data showed that the highest seed protein percentage (37.21%) was obtained by spraying zinc on the crop, while the least seed protein percentage (27.2%) was observed in the treatment of adding boron to the soil plus spraying boron on the crop (Fig 3).

Protein Yield

Results of the analysis of the variance of the data showed that the effects of applying different levels of the micronutrients to the soil, the effects of spraying different levels of the micronutrients on the crop, and the mutual effects of adding the micronutrients to the soil and spraying them on the crop on the protein yield were significant at the one percent probability level (Table 1). Results of the comparison of the means indicated that, among the treatments of adding the micronutrients to the soil, the highest protein yield (545.54 Kg.h) was obtained when manganese was added to the soil. The treatments of adding zinc and boron to the soil came second and third with 501.97 and 400.28 Kg.h, respectively, while the control had the least protein yield (397.06 Kg.h) (Table 2). Results of the comparison of the means showed that, among the treatments of spraying the micronutrients on the crop, the highest protein yield (528.43 Kg.h) was observed when zinc was sprayed on the crop, while the lowest protein yield (395.11 Kg.h) was that of the control (Table 3). Results of the comparison of the mutual effects of the data indicated that the highest protein yield (631.1 Kg.h) was observed by adding manganese to the soil plus spraying zinc on the crop, while the lowest protein yield (276.8 Kg.h) was obtained by adding boron to the soil plus spraying it on the crop (Fig 4).

Total Number of Pods per Plant

Results of the analysis of the variance of the data indicated that the effects of adding different levels of the micronutrients to the soil, the effects of spraying different levels of the micronutrients on the crop, and the interaction effects on the total number of pods per plant were significant at the five percent probability level (Table 1). Results of the comparison of the means showed that, among the treatments of adding the micronutrients to the soil, the largest total number of pods per plant (71.05) was obtained when manganese was added to the soil, and that this treatment could statistically be placed in one group with the treatment of adding zinc to the soil (in which the total number of pods per plant was 66.79). The treatment of adding boron to the soil and the control, with 57.04 and 55.14 pods per plant, respectively,

could statistically be placed in one group, as well (Table 2). These results also indicated that, among the treatments of spraying the micronutrients on the crop, the largest total number of pods per plant (68.33) was observed when zinc was sprayed on the crop, which could statistically be placed in one group with the treatment of spraying manganese on the crop (in which the total number of pods per plant was 65.81). The lowest total number of pods per plant (56.64) was that of the control (Table 3).

Results of the interaction effects of the data also indicated that the largest total number of pods per plant (77.87) among all the treatments was obtained by adding manganese to the soil plus spraying zinc on the crop, and that this treatment was statistically in one group with the treatment of adding manganese to the soil plus spraying it on the crop (in which the total number of pods per plant was 72.37). As was the case in the number of pods on the main stem, the lowest total numbers of pods per plant were observed in the treatment of adding boron to the soil plus spraying it on the crop and in the control with 42.77 and 44.43 pods per plant, respectively (Fig 5).

Seed Yield

Results of the analysis of the variance of the data showed that the effects of applying different levels of the micronutrients to the soil, the effects of spraying different levels of the micronutrients on the crop, and their mutual effects on seed yield were significant at the one percent probability level (Table 1). Results of the comparison of the means indicated that, among the treatments of adding the micronutrients to the soil, the highest seed yield (152.9 g.m⁻²) was obtained by adding manganese to the soil. The treatments of applying zinc and boron to the soil came second and third with 141.6 and 122.3 g.m⁻², respectively. The lowest seed yield (112.3 g.m⁻²) belonged to the control (Table 2). These results also showed that, among the treatments of spraying the micronutrients on the crop, the highest seed yield (146.3 g.m⁻²) was obtained when zinc was sprayed on the crop, with the treatments of spraying manganese and boron on the crop coming second and third with 138.5 and 126.6 g.m⁻², respectively. Other researchers, such as Maftoon and Karimian (1988), Darajeh et al. (1991), and Cakman, I (2000), have reported similar results. The lowest seed yield (117.7 g.m⁻²) was that of the control (Table 3).

4. Discussions

Results of this study showed that, although the highest oil percentage (28.5%) was achieved by spraying zinc on the crop, yet the highest seed yield (170.7 g.m⁻²) among all the treatments was obtained by adding manganese to the soil plus spraying zinc on the crop, and that this treatment had the largest number of pods per plant (77.87), the highest seed protein yield (631.1 Kg.h), and the largest oil yield (284.5 Kg.h). Therefore, the treatment of adding manganese to the soil plus spraying zinc on the crop can be considered the best among all the treatments studied.

Effects of Water Infiltration to Soil in Increasing Yield and Water Use Efficiency in Peanut

Ali Abdzad Gohari^{1*} and Ebrahim Amiri²

^{1*,2} Department of Agriculture, Lahijan Branch, Islamic Azad University, Lahijan, Iran.
aag_aligohari@yahoo.com

Abstract: An experiment was conducted to evaluate the Effects of water infiltration to soil in increasing yield and water use efficiency in peanut in Astaneh Ashrafiyeh, North of Iran. A was studied split-plot in a complete random block plan with 3 replications in the 2009 crop year. Irrigation management included no irrigation (dryland) and irrigations with 6, results of this research indicated that average final infiltration was 9.4 (cm/day) and the highest biomass, pods and seeds values for the 6 days irrigation management were 9453, 4093 and 2345 (kg/ha), respectively. The highest water use efficiency based on biomass, pods and seeds in the 6 days irrigation treatment were 2.88, 1.24 and 0.71(kg/m³). Volumetric moisture variations in different depths indicated that the moisture content in upper soil layers such as 0-20 cm and 20-40 cm was less than those of 40-60 cm and 60-80 cm layers which was due to water absorption in the first and second layers by the plant.

1. Introduction

Surface irrigation is one of the oldest irrigation methods in which water is distributed as an open flow throughout a field. In fact, influenced by the gravity, water flows and moisturizes the whole surface of the field or part of it (Sohrabi and Paydar, 2009). Infiltration is considered as one of the important parameters for designing irrigation systems based on which irrigation management and planning is done (Sohrabi and Behnia, 2007). At the beginning, the infiltration rate is high, but in the long-run, it gradually decreases until it reaches an approximately constant rate. Hence, the infiltration rate is of great significance in terms of irrigation because it is a determining factor for storing a certain amount of water in the soil. Final soil infiltration is the permeability which the soil shows in long durations. Moreover, during early stages, soil moisture is more effective on the infiltration rate. When air becomes stuck between the wetting front and the confining layer, its pressure increases and in turn, reduces the infiltration rate (Sohrabi and Paydar, 2009).

Peanut is a perennial shrub of the pea family and has a main straight root. It is cultivated in tropical and semi-tropical regions and is quite rich in terms of its oil quality and protein content [3]. This crop is used for its oil and also as a dry nut by human beings (2002). At the moment, drought is one of the limiting factors of the yield in plants such as peanut (Reddy *et al*, 2004). Thus, certain planning for water consumption level and how to optimize it should be done (Deming *et al*, 1999; Reddy *et al*, 2004). Bingru

and Hongwen (2000) believe that supplying sufficient water for a plant during its growth and development and prior to the occurrence of adverse effects of water stress are very important for physiological processes inside a plant. In their study results, Li *at al*. [8] showed that under recommended complete irrigation conditions and supplementary irrigation programs, plants would have higher yields compared with those without any irrigation. Also, Lai and Katul (2000) reported that under water deficit conditions in the soil, the plant's physiological characteristics and root density at different layers are of great significance. For example, as stress occurs in surface layers, roots in lower layers are more effective and efficient in terms of water absorption. By examining eleven peanut cultivars under stress and unstressed irrigations, Songsri *et al*. (2009) concluded that drought stress results in the reduced efficiency of seeds' water consumption. Improved efficiency is usually accompanied by consuming water under limited water resources conditions and helps increase the yield. Furthermore, by studying four peanut cultivars under stressful and unstressed conditions, Vorasoot *et al*. (2003) concluded that under the latter conditions, pods had higher yield than in the former. El-Boraei *et al*. (2009) studied the effect of alternative irrigation with 1, 2 and 3 days intervals and obtained results revealed that peanuts irrigated on a daily basis had the highest yield. In their researches on peanut cultivars, Songsri *et al*. (2008) and Haro *et al*. (2008) observed that under complete irrigation conditions, the total biomass was more than in the water stress condition. The present

research was done with the purpose of studying the effects of infiltration on increased yield and water consumption efficiency of peanut in Astaneh Ashrafiyeh in the north of Iran.

2. Material and Methods

This experiment was done in Astaneh Ashrafiyeh in the north of Iran situated at 37°16' and 46°56' with an average altitude of 3m [above the sea level], based on the studied split-plot in a complete random block plan with 3 replications in the 2009 crop year. Meteorological data were obtained from the respective stations in Astaneh Ashrafiyeh (Table 1). Prior to tillage, in order to determine physical and chemical properties of the soil, samples were taken from different parts of the field (Table 2). Each experimental unit was 6×2.5m in dimensions consisting of 7 rows. Irrigation management included no irrigation (dryland) and irrigations with 6, 12 and 18-days intervals. At first, the field went under a complete tillage on May 5, 2009 and followed by creating ridges and furrows, cultivation of NC₂ variety seeds started. Prior to cultivation, the seeds were disinfected in 2:1000 carboxin thiram as a fungicide (Craufurrd *et al*, 2002). Crop management operations included weeding (to control weeds) and side dressing around the root. Harvest was done on September 20, 2009. Surface irrigation method used in this research was of the ridges and furrows system type where the distance between the ridges was 80 cm with the distance between plants in each ridge being 30cm. Soil moisture content was measured using a TRIME-FM model TDR device in 0-20 cm, 20-40 cm, 40-60 cm and 60-80 cm depths based on moisture volume percentage during the growth period in different irrigation managements at 4 spots and in the center of each plot. Water level for each irrigation was determined based on soil moisture Deficit up was to 60 cm deep (effective root depth) in each plot. Then, 6, 12 and 18 days intervals irrigation managements were applied in the field.

Consumed water level during the growth period was determined through measuring the amount of irrigation water and the precipitation level. In order to measure the amount of Water for irrigation for each experimental unit, a contour was used. For 6, 12 and 18 days irrigation managements, 8, 4 and 3 irrigation frequencies were considered, respectively in which 328, 300 and 264 mm water was consumed. In order to measure the infiltration rate in the field, the Double cylinder method was used. To determine the total biomass (dry matter) at maturity, after excluding two rows on both sides in each plot, 12 plants were randomly selected. Then, pods, leaves and stems were placed in a 70°C oven for 48 hours. When dried, initially, mature pods' weight for each plant was

measured by the ratio of mature pods weight to the number of mature pods per 12 plants.

To estimate seed and pod yields, after the exclusion of two rows on the sides, mature pods and seeds were weighed using an accurate laboratory scale. Calculation of efficient water consumption rate based on total biomass, seeds and pods was done through the values of the total biomass and produced weeds and pods (kg) divided by the amount of the consumed water (m³) (Andrade *et al*, 2002). For variance analysis and the comparison of mean values (Duncan test, probability level of 5%) and in order to draw relevant diagrams, *MSTATC* and *Excel* software were used.

3. Results

Results from this research showed that after 130 minutes of measurement, infiltration intensity reached the constant rate of 0.39 (cm/h) which was equal to 9.4 (cm/day) (Fig 1). It seemed that the infiltration process depended on the physical properties of the soil surface, initial distribution of water in soil prior to irrigation and the flow of water on and in the soil (Rashidi and Seyfi, 2007). Mean values of the cumulative infiltration [D] (cm) and average infiltration intensity [i] (cm/h) as a function of time [t] (min) indicated that the infiltration rate was high at the beginning and then decreased with the passage of time until it reached a constant rate (Fig 1). Accuracy of water advance and depth infiltration equations will have significant effects on the success of irrigation design and management

(Sohrabi and Behnia, 2007). Results from the volumetric moisture changes of different depths revealed that the moisture content in upper soil layers such as 0-20 cm and 20-40 cm was less than those of 40-60 cm and 60-80cm layers which was due to the absorption of water in the first and second layers by the plant. In all depths, without-irrigation management and 6 days irrigation management led to the minimum and maximum moisture contents, respectively in superficial depths during the growth period which was attributed to using more water for irrigation. However, in lower layers, the moisture content of 6 and 12 days irrigation managements were close to each other (Fig. 2). Moisture variations in different layers along with water level in irrigated layers at different times suggested that before applying water stress, moisture conditions were equal in all layers. However, as stress was applied, the upper layers lost their moisture. These layers affected the continuation of the plant's growth such that for the existing roots, water was not absorbable. By studying the moisture rate in soil depths (30, 60 and 90 cm) under stress and irrigation conditions for peanut, Songsri *et al.* (2008) observed that moisture content difference in surface layers was quite apparent, while in lower layers this difference for irrigation managements was negligible in a way that moisture rates were corresponding during the growth period. Results showed that irrigation management had a significant effect ($P<0.01$) on the seed yield (Table 3) and the 6 days irrigation treatment had the highest seed yield ($M=2345$ kg/ha) compared with other treatments (Table 4). By studying the effect of drought stress on peanut, Vorasoot *et al.* (2003) and El-Boraei *et al.* (2009) concluded that under stress conditions, the yield decreases. Results from their research showed that irrigation management had a significant effect ($P<0.01$) on the pod yield (Table 3) and that the highest pod yield ($M=4093$ kg/ha) was that of the 6-days irrigation management. Also, in his research, Abou Kheira (2009) revealed that drought stress during different peanut growth stages caused a significant decrease of seed and pod yields. Irrigation management was an indication of the insignificance of the total biomass at the probability level of 1% (Table 3) and that the total biomass of the 6 days irrigation treatment ($M=9453$ kg/ha) was the highest relative to others (Table 4). This research confirmed the findings of Songsri *et al.* (2008). In their results, the total biomass of the irrigation condition was more than that of the stressful condition. Also, Haro *et al.* (2008) studied two peanut cultivars under stressful and irrigation conditions for two years and concluded that the total biomass under stressful conditions was 34 to 67% less than under irrigation conditions. Water shortage is usually accompanied by reduced

accumulation of aerial organs and the production of photosynthesis substances which seemed to be due to reduced absorption of nutrients and the production and transfer of processed substances. It is likely that increased dry matter production in the 6 days irrigation management causes the extension of the leaf surface. Water use efficiency in the irrigation management based on total biomass, seeds and pods was significant ($P<0.01$) (Table 3). In the 6 days irrigation treatment for the total biomass, pods and seeds, this efficiency was 2.88, 1.24 and 0.71kg/ha, respectively (Table 4). Results obtained from the study conducted by Songsri *et al.* [10] showed that drought stress resulted in the reduced efficiency of the seeds water consumption from 1.69 (kg/ha) under unstressed conditions to 0.98 (kg/ha) under stressful conditions in different peanut cultivars.

4. Discussions

In general, results of this research indicated that average final infiltration was 9.4 (cm/day) and the highest biomass, pods and seeds values for the 6

days irrigation management were 9453, 4093 and 2345 (kg/ha) respectively. The highest water use efficiency based on biomass, pods and seeds in the 6 days irrigation treatment were 2.88, 1.24 and 0.71(kg/m³). Volumetric moisture variations in different depths indicated that the moisture content in upper soil layers such as 0-20 cm and 20-40 cm was less than those of 40-60 cm and 60-80 cm layers which was due to water absorption in the first and second layers by the plant. Hence, irrigation time should be reduced so that by compensating the infiltration reduction, water consumption efficiency would increase. In the present experiment, it can be concluded that by applying irrigation managements and providing sufficient water during sensitive growth stages of peanut, economizing the consumed water, maximum seed yield and water consumption efficiency could be achieved. Also, applying deficit irrigation treatments during early growth stages would increase exploiting valuable water resources without any adverse effects; hence, the stability of agricultural systems could be improved.

Abstract

Lavender has been used as a medicinal plant and to treat several diseases. Knowledge of moisture desorption isotherms is useful in food dehydration and drying. The equilibrium moisture content for *Lavandula officinalis* L. flowers were measured by using the gravimetric static method with water activity ranging from 11% to 85% and three temperatures of 30, 40 and 50°C. Five mathematical models (modified Henderson, modified Oswin, modified Halsey, modified Chung – Pfost and GAB equations) were used to fit the experimental data of desorption. The modified Halsey model was found to be the best model for describing desorption isotherms curves.

1. Introduction

Lavender is an important medicinal plant of the Labiatae family. Linalool and linalyl acetate are the main component of lavender oils. The relationship between Equilibrium Relative Humidity (ERH) and Equilibrium Moisture Content (EMC) is normally defined by Moisture sorption isotherms (Soysal and Öztekin, 1999). Moisture desorption isotherms help us to determine the maximum moisture that the plant can be allowed to lose during drying. Since all the agricultural products are generally hygroscopic, it is important to determine their equilibrium moisture content for drying, storing, mixing and packaging operations. Having different physical and chemical structures, agricultural crops demonstrate different EMCs under similar conditions (Ahmadi Chenarbon et al., 2010). Medicinal and aromatic plants are used extensively in food, cosmetic, and pharmaceutical industries for the production of spice, essential oils and drugs (Soysal and Öztekin, 2001). Due to their high moisture content and vulnerability to microorganisms, it is very important to provide optimum drying and storage conditions in order to prevent quality spoilage. EMC is defined as the moisture content of hygroscopic material in equilibrium with a particular environment in terms of temperature and relative humidity (Soysal and Öztekin, 1999). In practice, the result of moisture exchange between the product and the surrounding air yields a relative humidity which is known as the Equilibrium Relative Humidity (ERH) (Silakul and Jindal, 2002). The common technique for measuring sorption properties is the static method. This method benefits from the ability to maintain constant conditions (Arnosti et al., 1999; Barrozo et al., 1994). Temperature and relative humidity of the environment

in which samples are placed, are adjusted. When sample mass attains a constant level, sample moisture content is measured and adopted as the Equilibrium Moisture Content (EMC) value. Several empirical and semi-empirical equations have been reported to provide a correlation for the sorption isotherm values of agricultural and food products, including aromatic and medicinal plants (Belghit et al., 2000; Park et al., 2002). However, no single equation is comprehensive enough to predict the relationship between the EMC of agricultural and food products and the relative humidity over a wide range of temperature (Lahsasni et al., 2004; Park et al., 2002). The objective of this study was to determine the desorption isotherms of *Lavandula officinalis* L. flowers at relative humidity and temperature levels ranging from 11 to 85% and from 30 to 50°C, respectively. Five popular models (modified Henderson, modified Oswin, modified Halsey, modified Chung – Pfost and GAB equations) in the literature were fitted to the experimental data in order to verify their adequacy to describe the EMC of the *Lavandula officinalis* L. flowers (Chung and Pfost, 1967; Halsey, 1985; Oswin, 1946).

2. Materials and Methods

2.1. Experimental procedure: The *Lavandula officinalis* L. fresh flowers used in desorption experiments have been grown in the Institute of Medicinal Plant of Iran in 2010. After harvesting, the flowers were cut from stems immediately. 1g (± 0.0001) samples of fresh flowers for desorption experiments were weighed and placed into the glass jars. The equilibrium moisture content of *Lavandula officinalis* L. flowers were determined by using the static gravimetric method at 30, 40 and 50°C. These temperatures are

often used for drying of medicinal plants. In this method, seven saturated salt solutions (LiCl, CH₃COOK, Mg Cl₂, K₂ CO₃, NaNO₂, NaCl and KCl) with relative humidities ranging from 11 to 85% were used

to maintain relative humidities in the jars (Greenspan, 1976). Table1 gives the equivalent relative humidities for the selected salt solutions at three temperatures.

Nomenclature			
C ₁ , C ₂ , C ₃ , C ₄	equation coefficients	RSS	Residual Sum of Square

Ta	absolute temperature. K	df	degrees of freedom
R	universal gas constant, kJ/kmol k	EMC	Equilibrium Moisture Content
R ²	determination coefficient	d.b	dry basis
ERH	Equilibrium Relative Humidity (decimal)	m	Number of samples
i	sample number		

Table1. Saturated Salt solutions and Equilibrium Relative Humidities at different temperatures

Salt type	Equilibrium Relative Humidity (ERH)		
	T=30°C	T=40°C	T=50°C
LiCl	0.113	0.112	0.111
CH ₃ COOK	0.216	0.204	0.192
MgCl ₂	0.324	0.316	0.305
K ₂ CO ₃	0.432	0.432	0.433
NaNO ₂	0.643	0.616	0.597
NaCl	0.751	0.747	0.744
KCl	0.836	0.823	0.812

Samples were weighted every three days until constant weight was reached. Crystalline thymol was used in the jars to prevent microbial spoilage. Constant weight was reached after about 3 weeks in different levels of temperature and relative humidities. The moisture content of each sample was determined in a drying oven at 105°C for 24h (Anon1996; AOAC, 1990).

2.2. Data analysis: Five models, namely, modified Henderson, Oswin, Halsey, Chung – Pfof and GAB equations were used for correlating and defining the relationship between the equilibrium moisture content data and relative humidity at three temperatures (Table 2).

Table 2. Mathematical relationships applied for desorption modeling of *Lavandula officinalis* L.

Model name	Model expression	References
Modified Henderson	$EMC = \left(-\frac{1}{c_2(T+c_2)} \ln(1 - ERH) \right)^{1/c_3}$	(Thompson <i>et al.</i> 1968)
Modified Halsey	$EMC = \left(\frac{-\exp(C_1+C_2T)}{\ln(ERH)} \right)^{1/C_3}$	(Iglesias and Chirife 1976)
Modified Oswin	$EMC = (C_1 + C_2T) \left(\frac{ERH}{1-ERH} \right)^{1/C_3}$	(Brooker <i>et al.</i> 1974)
Modified Chung-Pfof	$EMC = \frac{1}{c_2} \ln \left(\ln(ERH) \frac{(C_2-T)}{c_3} \right)$	(Chung and Pfof 1967)
GAB equation	$EMC = \frac{C_2 C_3 (ERH)}{[1-C_2(ERH)][1-C_2(ERH)+C_2 C_3(ERH)]}$	(Van den Berg and Bruin 1981)

C₂ and C₃ in the GAB equation were determined by using the following equations (Arabhosseini *et al.*, 2005).

$$C_2 = C_4 \exp\left(\frac{C_6}{RTa}\right) \tag{1}$$

$$C_3 = C_5 \exp\left(\frac{C_7}{RTa}\right) \tag{2}$$

Nonlinear regression analysis was used to estimate the constants of models in desorption experiment (Chen, 2002; Peleg, 1993). Mean relative deviation (MRD), determination coefficient (R^2), residual sum of squares (RSS), and standard error estimation (SEE) were used to evaluate the fitting quality of models.

$$SEE = \sqrt{\frac{\sum_{i=1}^m (EMC - \overline{EMC})^2}{df}} \tag{3}$$

$$MRD = \frac{1}{m} \sum_{i=1}^m \frac{|EMC - \overline{EMC}|}{EMC} \tag{4}$$

$$RSS = \sum_{i=1}^m (EMC - \overline{EMC})^2$$

3. Results and discussion

3.1.Experimental Results: Fig.1, 2 and 3 illustrates desorption isotherms of *Lavandula officinalis* L. flowers obtained at various water activities for three temperature levels of 30, 40 and 50°C. As shown, S- shaped curves were found for all three temperatures similar to the most biological products (Ait Mohamed et al., 2005; Kouhila et al., 2002; Lahsasni et al., 2003). On the other hand the full range of water activities and temperatures had a significant effect on EMC and with decreasing temperature in a constant relative humidity, the EMC was increased (Fig.1-3). Such behavior may be explained by considering the excitation state of molecules. At high temperatures, molecules are in an increased state of excitation, leading to weaker attractive forces. This in turn, results in a decrease in the degree of water sorption at a given relative humidity with increasing temperature (Kouhila et al., 2002).

3.2.Fitting of the desorption models to equilibrium moisture data: Desorption curves of *Lavandula officinalis* L. were fitted to five isotherm models. The results of non- linear regression analysis at the three temperatures are listed in Tables 3 and 4. As inferred from the tables, parameters were found to be temperature dependent for all the models. The modified Halsey equation provided the best fit to experimental data of desorption isotherms with the maximum $R^2 = 0.99$ and the lowest MRD = 0.101and SEE=0.081, respectively.

Figure 1. Desorption isotherms data of *Lavandula officinalis* L. flowers at 30°C and fitted curve of the Halsey model

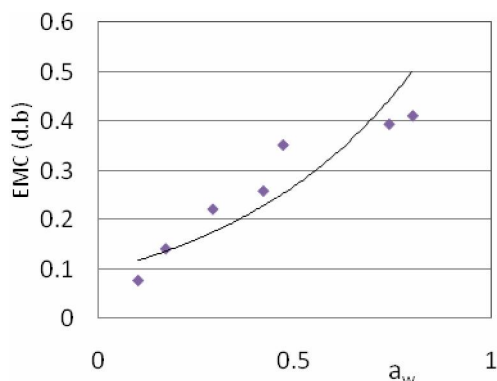

Figure 2. Desorption isotherms data of *Lavandula officinalis* L. flowers at 40°C and fitted curve of the Halsey model

Figure 3. Desorption isotherms data of *Lavandula officinalis* L. flowers at 50°C and fitted curve of the Halsey model

4. Conclusions

Moisture desorption curves of *Lavandula officinalis* L. flowers were obtained at three temperatures (30, 40, 50°C) and relative humidity levels ranging from 11 to 85%. Statistical analysis was used to determine the best equation for predicting the desorption curves of *Lavandula officinalis* L. flowers. Halsey equation was the best fit with lowest error.

Blood Utilization for Elective Surgeries at Main University Hospital in Alexandria, Egypt

Samaa Z. Ibrahim, Heba M. Mamdouh, Amal M. Ramadan

High Institute of Public Health, Alexandria, Egypt.

Abstract: This study aimed to determine the efficiency of blood ordering and transfusion practices for patients undergoing elective surgical procedures and to assess the compliance with the international blood transfusion clinical practice guidelines. Auditing of blood bank registers for patients who underwent elective surgical procedures was done at the Main University hospital in Alexandria governorate. The total number of adult patients who had elective surgery for which requests for cross matching were made was 4844; of them only 1788 patients were transfused. A total of 13389 units of blood were cross-matched, but only 3373 units were transfused. Only 25.2% of total blood cross matched was utilized, leaving 74.8% unutilized. The overall C/T ratio was 3.9, the overall %T was 36.9% and the overall TI was 0.69. The overall percentage compliance with Scottish Intercollegiate Guidelines was 27.7%. Institution-specific blood ordering schedules and protocols should be formulated to reduce exposure to transfusion and to screen for high-risk patient. Ongoing audit and monitoring of blood ordering and transfusion practices in the hospital are essential for improving the ordering, distribution, handling and administration of blood components.

Key words: blood ordering practices, transfusion practices, utilization indices

1. Introduction:

Increasing demand for blood and blood products together with rising cost and transfusion associated morbidity led to a number of studies in the late 1970s reviewing blood ordering and transfusion practice [1]. Moreover, in recent years there has been an increased emphasis on the potential hazards of transfusion as well as evidence supporting the use of lower transfusion thresholds [2].

Since the introduction of blood transfusion into clinical practice, its appropriate use has been the subject for debate. It has been reported that only 30% of cross-matched blood is used in elective surgery. Therefore, awareness of the hazards of blood transfusion is becoming more obvious due to the expansion of various aspects of blood transfusion services and the increased understanding of transfusion science in recent years [3].

Blood transfusion plays a major role in the resuscitation and management of surgical patients, but surgeons most of the times over estimate the anticipated blood loss thereby, over-ordering blood. Moreover, a number of studies in many countries of the world have shown over ordering of blood by surgeons with utilization ranging from 5-40 % [1].

Many units of blood routinely ordered by surgeons are not utilized but are held in reserve and thus are unavailable for other needy patients. This can impose inventory problems for blood bank, loss of shelf life and wastage of blood [4]. In South Africa for example, 7-10% of blood is wasted annually

because of over-ordering of blood [1]. Also reports from different parts of the world revealed an unintentional misuse of the blood bank services causing a great burden on its resources, namely wastage of blood, reagents and manpower [3].

Wide variations in transfusion practice exist between countries and institutions and even between the individual clinicians within the same institution [5]. Blood use audits in Scotland show that, large variations also exist among individual practitioners or operating teams within a hospital [6].

Variations in rates of transfusion may be due to many factors, including differing opinions on the threshold level of hemoglobin below which a patient needs blood transfusion, differences in surgical and anesthetic techniques, differences in case mix, pre-operative anemia, and lack of availability of transfusion protocols. This may reflect uncertainty about the relative benefits and risks of transfusion and the different perceptions of the value of minimizing blood loss and subsequent transfusion [6]. Moreover, many surgeons prescribing blood are unaware of recommended published guidelines for transfusion practice and still adhere to historical practice and not evidence [7].

In nineteenth a study conducted in Kuwait reported that, only 28.3% of cross matched blood for elective surgery was actually transfused. In addition, it documented monthly mean wastage (\pm SD) of 45 (\pm 13) blood units due to the absence of a blood ordering policy. It was estimated that, a technician

can cross-match three units per hour. This results in wastage of 54.5% of technician working time, leading to an average blood bank annual loss of US \$25,000.00 for one 120-bed department of surgery [8]. This can be decreased by simple means of changing the blood cross- matching and ordering schedule depending upon the type of surgery performed [4]. Moreover, implementation of the recommended maximum surgical blood-order schedule and introduction of type and screen for eligible surgical procedures is considered as a safe, effective and economic solution to preoperative over-ordering of blood [9].

A careful assessment of the risks and benefits of blood transfusion is essential for a good patient outcome. In addition, it is essential that the utilization of blood and blood products be rationalized and they are saved for critical situations. Appropriate placement of blood requests according to a planned schedule most often averts the consequences of indiscriminate ordering of blood. This requires streamlining blood ordering schedule keeping in view the blood bank resources, time, as well as money [10]. Based on available evidence, institution-specific protocols should screen for high-risk patients including advanced age, low preoperative red blood cell volume, preoperative antiplatelet or antithrombotic drugs, complex procedures where blood conservation interventions are likely to be most productive for this high-risk subset [11].

Studies assessing blood ordering and transfusion practices couldn't be traced in developing countries especially Egypt. Therefore, the aim of this study is to determine the efficiency of blood ordering and transfusion practices for patients undergoing elective surgical procedures and to assess the compliance with the international blood transfusion clinical practice guidelines.

2. Material and Methods

A. Study Setting:

The study was conducted at the surgical departments pertaining to Main University hospital in Alexandria governorate. It is multi-specialty 1700 bed hospital; of which, 700 surgical beds pertained to thirteen surgical departments performing about 10500 major elective adult surgical procedures per year.

B. Study Population:

Adult patients who underwent elective surgical procedures over a period of 1 year from July 2009 to June 2010 were included in the study.

C. Sampling Design:

Retrospective audit of blood bank registers was performed which covered all adult patients who

underwent elective surgical procedures in all surgical departments pertaining to the study hospital and for which cross matching was requested during the study period. Overall, a total of 4844 records were included in the study.

D. Data Collection Methods:

Data were collected using review of registers technique. Blood ordering and transfusion practices for elective surgical procedures in the surgical departments pertaining to the study hospital were assessed according to certain indices including; Cross match to Transfusion ratio, Transfusion Probability, and Transfusion Index [12-13]. These indicators were computed using the following equations;

1- Cross match to Transfusion ratio (C/T ratio) =

$$\frac{\text{No. of units cross matched}}{\text{No. of units transfused}}$$

2- Transfusion Probability (%T) =

$$\frac{\text{No. of patients transfused}}{\text{No. of patients cross matched}}$$

3- Transfusion Index (T I) =

$$\frac{\text{No. of units transfused}}{\text{No. of patients cross matched}}$$

Scottish Intercollegiate Guidelines Network recommended cross match to transfusion ratio (C/T ratio) for evaluating blood transfusion practices [6]. According to this guideline, C/T ratio shouldn't exceed 2:1. In the present study, compliance with these guidelines was assessed to evaluate blood utilization practices at the selected hospital. The percent of blood cross-matched that was utilized was

calculated as =
$$\frac{\text{No of units transfused}}{\text{No of units cross matched}} \times 100$$

E. Statistical Analysis:

Data were statistically analyzed using Statistical Package for Social Science (SPSS) version 11.5 (SPSS Inc., Chicago IL, USA). Frequencies were calculated for all variables and Pearson's Chi-Square test was used to assess the statistical significance of difference in blood utilization between surgical departments pertained to the study

3. Results

The number of adult patients who had elective surgery and for which crosshatching was requested totaled 4844 patients. Male patients constituted the higher percentage (54.2%). The mean age of patients was 42 years with the highest percentage of patients was within age group "from 40 to less than 50" (31.8%), while the lowest percentage was within age group "60 years and more" (7.1%). Neurosurgery was the department of the highest admission rate (29.0%).

On the other hand, renal-transplant and otolaryngology were the departments of the lowest admission rates (0.1% and 2.7%, respectively).

Table 1 shows that, among a total 4844 patients, only 1788 patients were actually transfused. Neurosurgery was the department of the highest number of both patients cross matched (28.9%) and patients transfused (26.0%). On the other hand, renal-transplant was the department of the lowest number of both patients cross matched (0.06%) and patients transfused (0.16%). Blood utilization was 100% only in renal-transplant department, where the number of patients cross matched and the number of patients transfused were equal (3 patients).

As shown in Table 2, a total of 13389 units of blood were cross-matched, however, only 3373 units were transfused. Neurosurgery was the department of the highest number of both blood units cross matched (30.1%) and blood units transfused (28.2%), while renal-transplant was the department of the lowest number of both blood units cross matched (0.1%) and blood units transfused (0.2%).

Only 25.2% of total blood cross-matched was utilized. The highest percentage of blood cross matched was utilized in Renal-transplant department (56.2%), while Urology-endoscopy was the department of the lowest percentage of blood cross matched that was utilized (9.4%).

The highest percentage of blood cross matched was utilized in Renal-transplant department (56.2%), while Urology-endoscopy was the department of the lowest percentage of blood cross matched that was utilized (9.4%), as shown in Figure 1.

Data from table 3 revealed the blood utilization indices in different surgical departments of the selected hospital. In relation to C/T ratio, urology-endoscopy was the surgical department of highest the C/T ratio and renal-transplant was the department of the lowest C/T ratio (1.7) with overall C/T ratio of 3.9. The overall %T was 36.9%, ranged from 100.0% in renal-transplant department to 15.7% in Urology- endoscopy department. The overall TI was 0.69 that ranged from 3.00 in renal-transplant department to 0.18 in Urology- endoscopy department.

The overall percentage compliance was 27.7% with the highest percentage compliance in renal-transplant department (66.7%) followed by Plastic surgery department (56.6%). On the other hand, Urology- endoscopy was the department of the lowest percentage compliance (11.7%), followed by vascular surgery department (16.0%). There was statistically significant difference between the different surgical departments at the selected hospital regarding the percentage compliance with guidelines ($p=0.003$), as shown in Table 4.

4. Discussion

Blood and blood components are critical in elective surgery patient care, but with limited supply, unnecessary ordering, unnecessary utilization, and significant cost, careful assessment of ordering and benefits of transfusion is essential for a good management of resources [10]. Data from developing countries have shown gross over ordering of blood in 40% to 70% of patients transfused [14]. Therefore, it is essential that the usage of blood and blood products be rationalized and saved for crisis situations [10]. The current study reveals that, 74.8% of the cross- matched blood was unutilized which mean it was unnecessary. This finding is nearly similar to that was reported in an Indian study where 76.9% of blood cross-matched was unutilized.

Other studies as those conducted in Ilorin Teaching Hospital, [1] and University of Benin Teaching Hospital, in Nigeria reported similar values of unutilized blood (69.7% and 70.0%, respectively) [15]. This might indicate that this malpractice is common in developing countries.

The use of cross-match to transfusion ratio (C/T ratio) was first suggested by Boral Henry in 1975 [12]. Subsequently, a number of authors used C/T ratio for evaluating blood transfusion practices. Ideally, this ratio should be 1.0, but a ratio of 2.5 and below was suggested to be indicative of efficient blood usage. (1) According to these recommendations, the overall C/T ratio of 3.9 that reported in current study was considered to be indicative of inefficient blood usage except for Renal-transplant (1.7), Plastic surgery (2.0), and Tumor excisions departments (2.1). This ratio is higher than that reported by a study conducted in Nigeria (2.2) [15], and lower than that reported by a study conducted in in Malaysia (5.0) [16].

The results of the present study demonstrated that, C/T ratio varied widely across the surgical departments under the study from 10.7 at urology-endoscopy department to 1.7 at renal-transplant department. This was somewhat similar to that reported in a Nigerian study but to a lesser extent where the C/T ratio values ranged from 1.6 in obstetrics and gynecology department to 3.3 in

Orthopedics and accident and emergency departments [15]. Variations in rates of transfusion in the current study are due to the fact that, there is a great tendency in most departments of surgery to request more units of blood for elective procedures than what is actually required. This over ordering of blood is more often guided by habits and hospital routines rather than clinical needs. This attitude is defended by the simple excuse that, it provides a safety measure in the event of excessive unexpected blood loss during surgery.

The probability of transfusion for a given department is denoted by %T and was suggested by Mead et al. (1980) [13]. A value of 30% and above has been suggested to be appropriate and signifies the appropriateness of numbers of units cross-matched [12]. According to what is recommended in the literature, the probability of transfusion values reported in the current study for the different surgical departments under the study are considered appropriate except for Urology (28.3%), Urology-endoscopy (15.7%) and Vascular-surgery department (20.3%). The results of the present study revealed an overall %T of 36.9%. This finding was higher than that has been found in study conducted in Indian tertiary care hospital where %T ranged from 11.1% to 25% [17].

Regarding TI, a value of 0.5 or more is indicative of efficient blood usage and signifies the appropriateness of numbers of units transfused [12]. The TI reported in the current study as an overall value (0.69) and the values of the different surgical departments under the study are considered appropriate except for the department of Urology (0.47), Vascular-surgery (0.33), Urology-endoscopy (0.18) and Cardio-thoracic (0.10). This finding was higher than that has been found in a study conducted in Indian tertiary care hospital where TI ranged from .36 in September 2002 to .15 in November [17].

Practice guidelines are systematically developed recommendations that assist the practitioner in making decisions about health care. These recommendations may be adopted, modified, or rejected according to clinical needs and constraints. The purposes of these guidelines are to improve the perioperative management of blood transfusion and adjuvant therapies and to reduce the risk of adverse outcomes associated with transfusions [18].

The ratio of the number of units of crossmatched red cells for a given operation to the number of units actually transfused – the C:T ratio – should not exceed 2:1 [6, 19]. According to these guidelines the results of the present study revealed that, the overall percentage compliance with blood transfusion guidelines was 27.7%. In the current study the percentage compliance with guidelines varied widely among the individual surgical departments under the study with

a range from 66.7% in renal-transplant department to 11.7% in urology-endoscopy department. In Egypt, surgeons order cross-matched blood on the basis of habit. The criteria for ordering blood are often vague and the established policies, if there any existed, may be outdated.

In addition, the percentage compliance with guidelines in cardio- thoracic surgery department was 42.7%. Blood transfusions in cardiac surgery patients are performed inappropriately and transfusion rates would improve if more restrictive strategies for performing them were employed. However, in one large observational study, investigators reported that, despite the availability of practice guidelines for blood transfusion, rates of transfusion among cardiac surgery patients vary dramatically among hospitals in the United States [20].

We acknowledge that there are limitations to the present study. The pre-operative data including hemoglobin level and co-morbidities and intra-operative data including duration of surgery and amount of blood loss are very important for correlating the results, but, some logistics preventing us from obtaining these data. Also, the magnitude of cost implication of unnecessary cross-match can be calculated. Therefore, further work is needed to examine these issues.

Trust, confidence and cooperation of clinicians are critical for success of blood conservation policies. Continuous monitoring by members of the transfusion staff is necessary for the success of these Policies. The clinicians need to be confident that the transfusion medicine unit is capable of supplying blood on time when there is an urgent need before being willing to accept the Group Screen and Hold schedule practice. Moreover, it is necessary to continually educate incoming house surgeons and new attending surgeons concerning the value of the Group Screen and Hold schedule procedure and the cross-matching guidelines.

Acknowledgement

I would like to thank the members of blood bank. Their support was of paramount importance to the completion of this study. The study was fully funded by the researchers themselves. No financial disclosures were reported by the authors of this paper. The authors report no conflicts of interest. The authors alone are responsible for the content and writing of the paper.

Abstract: Nowadays, Existential thought is considered to be a practical approach among psychologists and counsellors. Nevertheless, what seems to be ignored is paying thoughtful attention to all dimensions of Existential thought which is an essential matter among counsellors and psychologists. Moreover, some issues in Existential thought such as time are disregarded among marital counsellors as well as individual counsellors. The goal of this article is to allocate exhausting existential time to benefit marital counsellors. Findings show that existential time has full potential to be applied for marital counselling. Furthermore, review of the related literature demonstrates that there is not enough experimental and descriptive research to evaluate the effect of existential time on matrimony.

[Seyed Mohammad Kalantarkousheh, Siti Aishah Hassan, Rusnani Abdul. Kadir, Mansor Abu Talib. **Sparkle of Existential Time as a Sanctuary in Marital Counselling**. Journal of American Science 2011;7(6):690-694]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Existential thought; existential time; marital counselling

1. Introduction

Over the years, existential thinkers and existential counsellors have strived to play an indispensable role in matrimony as well as individual life. The existence of potentials and possibilities in this line of thought has benefited, even unconsciously, social workers, psychologists, and counsellors. In fact, what is encouraging for some psychologists and counsellors is to use these existential issues in the form of different kinds of treatments and interventions in Existential thought that can be classified as some human concerns such as responsibility, freedom, meaning of life, living in the world, and trying to become aware of them (Cooper, 2003; Deurzen, 2006; Kalantarkousheh & Hassan, 2010b; Kalantarkousheh, Hassan, Kadir, & Talib, 2011a; Spinelli, 2007; Steger, 2009; Weixel-Dixon & Strasser, 2005). Existential time seems to have a considerable impact on existential counselling. This article aims to outline and give an account of the function of existential time as a fundamental element in couple counselling as well as individual counselling.

2. Existentialism

2.1. What is Existential Thought?

Existential thought considered as a philosophy became popular and more well-known in both Europe and the United States after World War II (Kalantarkousheh & Hassan, 2009c; Lantz, 1994c; May, 1967). Even though philosophers are by and large involved in abstract concepts; existential philosophers' concerns are concrete issues. Indeed, real abilities consist of concrete concepts such as human flexibility, human intentionality, human

freedom, human adaptability, and the ability to respond in a large variety of ways to the essences of life establishing a real attitude toward world and life. These abilities and adaptabilities are known as Existential thought (Cooper, 2003; Kalantarkousheh, et al., 2011a; Lantz, 1994a; Tillich, 1960). These concepts of Existential thought, emphasizing human abilities and possibilities, separate this attitude from others that depend on a deterministic thought.

2.1. Existential Time

Believing in human abilities, existential philosophers put great emphasis on existential time. Existential time like physical time has a present, past and future which is not distinct from human dimensions. Indeed, a human being, in the course of his life, will achieve or fail; in this sense, time is a reciprocal element from an Existential thought (Strasser & Strasser, 1997; Straus, 1967; Weixel-Dixon & Strasser, 2005). It means that human being, as a temporal individual is constituted by future possibilities and past facilities leading to some limitations and abilities for him or her. Furthermore, from Existential thought, in one time, an individual lives in three times; "by memory has brought his past with him into the present and by anticipation and imagination he has already laid hold on his future and projects himself into it" (Macquarrie, 1973, p. 156). From Existential thought, paying close attention to three times in one time is an exceptional human ability. However, a human being, at the extreme end of the scale, may come to now-centered which is the main characteristic of the thing or animal. Existential counsellors following existential philosophers try best to guide others to self-awareness of human

conditions, meaning that, past and future are real concepts and we, as human beings, allow them to live in the present.

2.3. Existential World

Existential time does not have any meaning without existential world. Based on Existential thought, human limitations and human possibilities are under existential world and existential time. Lantz and Gregoire (2003a) following Frankl (1959) believe that existence is manifested or disrupted at the being “of” the world, “in” the world and “for” the world dimensions of existence.

“Being of the world” refers to the fact that the human being has a body and “must” obey the rules of the biological and physical world (Frankl, 1959; Lantz & Gregoire, 2003b). In this dimension, nobody can prevent some matters. By way of exemplification, all family members must die if they are deprived of food, water, or shelter for an extended period of time. There is not any will or choice in such a situation. The past time is also one of the instances of being of the world. Indeed, the past is actualized and formed forever. Nobody can change or deny the reality of what has happened in the past.

The phrase “being in the world” refers to the fact that the human being has some freedoms in his or her existence and “can” make many different choices, and reactions to difficulties and opportunities in life (Lantz & Gregoire, 2003b). Frankl (1984) describes this dimension of existence as the “can”, where individuals have the rewards of “intentionality” and “freedom” in that “can” is used to respond to their limitations and opportunities of life. In reality, the “can” dimension of a human being is related to present time meaning that individuals can increase their quality of life and actualize their potentials of life if they want.

“Being for the world” is a dimension in which human beings answer the call of life. Frankl (1984) refers to this dimension as the “ought” dimension. It means that individuals should listen to the “call of life” to be able to discover what they “ought” to do and find a sense of meaning and purpose in life. Lantz and Gregoire(2003b) believe that when such a sense of meaning and purpose in life is frustrated, disrupted, or ignored, individuals develop a psychological “existential vacuum” that either becomes filled with a developing sense of meaning and purpose or with symptoms such as depression and anxiety.

What is worthwhile to mention is that “being in the world” and “being for the world” are arenas of decision making, freedom and then responsibility.

Moreover,” being in” and “for” the world belong to present and future because only present and future are under decision-making. There is no must or force in present and future so that we as human beings can follow the call of life or reject it. We have choice to refuse or accept present or future matters except for those issues that are related to the past, even though the past is formed by ourselves.

3. Existential Counselling

Existential counselling is an approach originating from the ideas, concepts, and insights found in Existential thought (Frankl, 1988; Kalantarkousheh & Hassan, 2010b; Lantz, 1997; Lantz & Raiz, 2004; May, 1983; Yalom, 1980). Existential counsellors attempt to help individuals to open up their world in a way that they can find their place in the world. Through this goal, individuals can manage their different and difficult situations encountered during their lifetime. Indeed, awareness of their abilities and limitations guides them to find their position in the world and to utilize creativity, their freedom, and responsibility (Frankl, 1988; Kalantarkousheh & Hassan, 2009a; May, 1994; Van Deurzen, 2006; Yalom, 1995). In Existential thought, unlike the others that assume changes in patterns of behaviors and interaction lead to internal experiences, these changes come from internal experience and the discovery of authentic existence (Haldane & McCluskey, 1982; May, 1983).

Something worth mentioning is that the existence of a range of potentials in Existential thought leads to the formation and the establishment of several existential counselling theories during a few past decades. Daseinsanalysis, Logotherapy, American Existential Humanistic theory, and British School of Existential Analysis are all theories based on Existential thought (Cooper, 2003). In a study conducted by Kalantarkousheh and his colleagues (2011a), gathered existential issues extracted from the four existential counselling theories and stated that the existential issues can be useful to apply for marital counselling as well as individual counselling.

Descriptive field studies, additionally, accentuate that existential counselling can be considered a useful approach for clients dealing with problems such as chronic illness, migrating issues, assault, rape, and cancer (Frankl, 1988; Kalantarkousheh & Hassan, 2010c; Kang, et al., 2009; Lantz, 1996b; Lantz & Raiz, 2004; Yalom, 1980).

4. The Role of Existential Time in Existential Counselling

‘Time’ has been discussed in different approaches of counselling and psychology. From an essence-oriented approach, the ‘time’ cannot be past which leads to depression and cannot be future that comes

into anxiety but present is considered to have an essential role. Existential philosophers and existential counsellors point out different approach so that the 'time' is known as an important and innermost aspect of existential counselling (Frankl, 1988; Heidegger, 1962; Lantz, 2004b; Sapienza & Bugental, 2000; Strasser & Strasser, 1997). They suppose that, regarding each part of time, individuals have different responsibilities. Indeed, mental problems come from lack of attention to the relationship among responsibility, each part of time, and different dimensions of the world. It is the role of the existential counsellor to help individuals become aware of the relationship between each part of time and related responsibility. The relationship among existential time; dimensions of the existential world and human being's responsibility towards each part of existential time beside dimensions of existential world is shown in Table 1.

Table 1: the relationship among Existential Time, Dimensions of Existential World and Responsibility

Existential Time	Three dimensions of human world	Responsibility
Future	Ought dimension	Noticing
Present	Can dimension	Actualizing
Past	Must dimension	Honoring

In *present* time, individuals have a responsibility to actualize the potentials of meaning in their life. Frankl (1988) believes that the present is the period in which human beings can utilize courage, wisdom, good faith, and responsibility to actualize and make use of the potentials and opportunities presented by life. Frankl (1986, 1988) also points out that the present is the period of time in which individuals can use "bad faith" and "irresponsibility" by avoiding the actualization of the potentials that are presented in life.

Future is the minute of time in which individuals have responsibility to notice meaning potentials in their future life. Frankl (1984, 1986, 1988) states that *future* is the side of time that holds the potentials of meaning and opportunities of human life. Individuals, in this part, ought to pay attention to the call for meaning. However, they have the choice to select the call.

The *past* is a point of time as a 'storehouse' in which all actualized potentials of meaning are placed and are forever real. This is a must dimension of human beings so that nobody can change his/ her past. It is the responsibility of individuals, by

recollection, to encounter, accept the reality and then honor their past in order to settle and form their shining present and brilliant future (Frankl, 1959; Kalantarkousheh & Hassan, 2009a; Lantz & Ahern, 1998; May, Angel, & Ellenberger, 1958; Strasser & Strasser, 1997; Weixel-Dixon & Strasser, 2005).

5. Function of Existential Time in Existential Marital Counselling

From existential marital counselling, many marital problems happen when spouses do not discover, experience, and make use of the meanings and the potentials of meaning in marriage (Lantz, 1974; Lantz, 1994b). In other words, the awareness of meaning within the marriage has a positive effect on healthy interaction, whereas lack of awareness about meanings within the matrimony can stimulate dysfunctional interaction (Kalantarkousheh & Hassan, 2010c; Lantz, 1986; Yalom, 1980). Lantz (1999), as a testimony, in a study with post parental couples, found out that existential treatment with the couples is an effective approach and it was useful with the population group. This achievement happened when the couples discovered and experienced a sense of meaning and purpose in intimate life (Frankl, 1988; Lantz, 1993). Therefore, it is the existential counsellors' duty to help spouses extract the covered potentials from an unconscious level into conscious awareness to be used in marriage (Lantz & Raiz, 2004). For this purpose, existential time has a brilliant role in existential marital counselling. In other words, finding and making meaning in marriage depends on existential time and each part of time namely present, past and future has an important role in actualizing the meaning in matrimony. Hence, the existential marital counsellor has the responsibility to give awareness about all parts of time.

Regarding the present, an existential counsellor has the duty to facilitate conditions for spouses to actualize the potentials for meaning in life. The counsellor has the responsibility to remind the spouses, in the present time, of the potential to look towards the past of their marital life based on new interpretation. In addition, spouses should be made aware that their future will be made based on how they see their future.

Furthermore, existential marital counsellors have the duty to help spouses pay close attention to their past as an honoring responsibility. They need to remember even though they have some limitations in their past matrimony they achieved in many cases during that time. By doing so, spouses can find and give meaning to their marriage. Indeed, considering the 'can' dimension, spouses 'can' choose their attitudes towards life to be able to show their abilities

in giving response to life situations (Lantz & Gregoire, 2003b). It is believed that common marriage problems originating from this dimension include both structural and communicative problems. Re-collection which is related to the past occurs every evening when each of the spouses share their achievements, problems and joys with the other in a regular and consistent way (Lantz, 1993; Lantz, 1996a). Indeed, re-collection is a responsibility for spouses looking for a successful marriage. This responsibility helps spouses to recover and recollect forgotten meanings that have been deposited in the past (Frankl, 1955; Lantz, 1995, 1996a; Lantz & Alford, 1995). This recollection leads and provides considerable energy to the marriage. From an existential counselling "forget the past" will create a marital meaning vacuum in which symptoms grow and flourish (Lantz, 1993; Lantz & Ahern, 1998). In other words, symptoms and problems grow and develop among couples when they cannot discover and experience a sense of meaning and purpose in life (Lantz, 1999). Helping spouses to remember the meanings that have been actualized and deposited in the past is a mainly useful way to "shrink" the marital meaning vacuum and those symptoms that grow and flourish in this existential meaning vacuum (Lantz & Ahern, 1998). Additionally, changing the past to a good interpretation motivates spouses to notice and actualize the present and future of their marriage creatively, logically and out of responsibility. Therefore, focusing on the past provides an enhanced understanding of the future and the present (Lantz, 1995; Lantz & Ahern, 1998).

From an existential point of view, it is believed that change among couples occurs only when spouses are able to find a reason or purpose for change, namely through the dimension of life which is related to the future. Hence, another responsibility of existential counsellors is to help the couples become aware of potentials of the meaning that are useful for the future of their marriage (Frankl, 1988; Lantz, 2004b).

6. Conclusion

This article represents an attempt to present the application of existential time in existential marital counselling. Inevitably, the consequence necessitates investigating and considering existential time as a fundamental factor in counselling. As already indicated, there is a close relationship between parts of existential time and meaning of life, which is a need in marriage. More specifically, it is the existential counsellors' responsibility to use existential time for helping couples to enrich their life on three dimensions of existence, three parts of time and three responsibilities. However, it seems that, up

to now, there is a lack of adequate descriptive and experimental research in existential time. Therefore, further research needs to be done to provide more empirical evidence for existential time as a sanctuary in marital counselling.

Discovering A Transformational Science of Marketing in Corporate, Social And Knowledge Perspectives: Is Not It About Time That A Marketing Scholar Becomes A Nobel Laureate?

*Wael Kortam and Abeer Mahrous

Department of Business Administration, Faculty of Commerce, Cairo University, Egypt

*wakortam@gmail.com

Abstract: This paper is for marketers who strive to bring about a change in marketing to change this world. This paper aimed at fulfilling this far reaching end by configuring and devising a transformational philosophical logic. This logic is composed of transformational postulates reaching out to transformational edges of marketing as a science. Such process would be reflected within transformational domains to be magnified and streamlined by transformational edges of marketing theory and practice. Firstly, transformational postulates are illuminated by the backbone argument of pragmatic versus dogmatic marketing creeds. This gives rise to four subsequent core controversial arguments, contrasting the critical issues of empiricism, valorization, context specificity and multidisciplinary against their rival extremes of theorization, generalized universality, global transcendence, and original authenticity. Second, these heated intellectual polarizations take marketing ideologies on a journey of revisits and blurring, to reconsider transformational marketing edges consolidated in the boundaries of customer orientation, convergence marketing, value-based marketing, knowledge-based marketing, interdisciplinary marketing, and contextual marketing. Third, such revisits are expected to fulfill their full transformational potential when viewed through the lenses of transformational marketing domains including corporate, social and knowledge perspectives, which telescope (focus?) the transformational influences of marketing thought and practice. Fourth, and conclusively, the paper is a proactive endeavor to unleash the transformational leverages of marketing actions in order to perpetuate the transformational thrust of marketing research and practice through the deliberate adoption of, and capitalization on, transformational agendas, methodologies and deliverable outputs. Thus the authors propose a cohesive progressive philosophy of marketing science that optimizes its change-catalyst extremes in order to broaden the horizons of academic marketing breakthroughs and decision/policy initiatives. The aim is to justify a well-earned legitimacy for marketing scholars to be Nobel Laureates, for their contributions to transforming their economic, moral and scientific universes.

[Wael Kortam and Abeer Mahrous. Discovering A Transformational Science of Marketing in Corporate, Social And Knowledge Perspectives: Is Not It About Time That A Marketing Scholar Becomes A Nobel Laureate? Journal of American Science 2011;7(6):695-703]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Transformational Science of Marketing in Corporate; Social; Knowledge; Perspective; Nobel

Introduction and Synthesis

This concept paper argues for a main controversy with four subsequent sequel controversies within the scope of three perspectives that should augment the credentials of marketing as a transformational scientific area of inquiry with wide range and far reaching basic and applied contributions to human knowledge and welfare of mankind. Subsequently this solid standing should boost marketing scholars on equal foot with their counterpart social scientists in their eligibility for Nobel prizes and other highly recognized and self actualizing scientific awards reflecting their dedication to and excellence in creating rigorous and fruitful transformational human knowledge. The main controversy that is argued to be pursued for anchoring this legacy for marketing science and scientists is that of pragmatic versus dogmatic discipline of marketing and four related subsequent controversies. These controversies in turn, are argued

to bring about their full conceptual and intellectual impact on making the marketing discipline an influentially transformational area of scientific inquiry, when viewed through three perspectives reflecting somehow diverse priorities for empirical and abstract marketing intelligentsia. These perspectives are corporate perspective reflecting business targets of entrepreneurs and their organizational settings, a social perspective raising public welfare and moral concerns toward marketing institutions and organizations and a knowledge perspective addressing the uses and implications of marketing knowledge processes and platforms to marketing trends and ideologies. The transformational influence of revisiting the above controversies through bearing the views of business entities, social inertias, and knowledge breakthroughs ought to serve as catalysts for real transformational marketing edges.

These controversies are arguably expected to serve as an effective vehicle for revisiting the boundaries of marketing science as envisioned through the three perspectives to make it more transformational in terms of its agenda, methodologies and quality of produced outputs. The paper concludes with a suggested research agenda as an impetus for embarking down the road map to make marketing thought transformational to earn its due place among contemporary and future world disciplines. This road map as expressed in the research agenda and its logically sequenced progression emphasizes a holistic transition of marketing thought and practice according to a crafted outlook looking to trigger an integrated stream of transformational marketing ideology and eventually a supportive best practice. The proposed paper's synthesis is depicted by Figure (1).

Literature Review

Transformational marketing addresses the role of marketing in driving organizational, social, community and environmental change. In particular, transformational marketing encourages, facilitates and inspires investigations that are framed by a fundamental problem or opportunity to: move marketing from the back room to the boardroom (Kumar and Shah, 2004); respect, uphold, and improve life in relation to the myriad conditions, demands, potentialities, and effects of consumption (Mick, 2006); focus on research which carries significant implications for both theory development and social action (DeBerry-Spence, 2008 and Lai, 2010).

To that end, transformational marketing is the process by making marketing the catalyst for corporate and social change, and for advancing human knowledge to increase the welfare of human beings. Applying marketing thought and activities to the threats and opportunities of consumption (e.g. community networks, family coherence, ecological stability) could direct radical, new solutions and synergies to organizational and consumer behaviors (Broderick, 2010). In addition, placing interactive thinking at the core of marketing strategy and offering interactive channels as the foundation of marketing delivery should facilitate these solutions and create the potential to transform organizations, markets, societies and knowledge (Romani and Kumar, 2008).

Although transformative marketing research has an immediate practical perspectives and orientations, it does not forsake rigorous methodology or perceptible theory. In fact, it is mostly—if not only—through meticulous description and compelling explanation that the findings can lead

to constructive and actionable implications (Mick, 2006). This will be outlined and discussed in the next sections.

The Need for Further Research

The question of why no marketing scholar has ever become a Nobel laureate is not a lust for fame and fortune but a serious scientific query that hammers the essence of scientific marketing knowledge. Any scientific discipline earns its due place as a breeding ground for Nobel laureates through its rigorous endeavors and broad scope paradigms that promises and strives to advance human knowledge, scientifically pursue human causes and welfare and ultimately seek the scientific truth that transform this world into a more virtuous and sustainable place for mankind to live and prosper (Gronroos, 2008 and Benton and Craib, 2001). There is a clear need for research into venues, platforms, perspectives, controversies and drives that possess the conceptual and empirical sense of direction into a clear transformational role and contributions.

Aim of Research

This concept paper aims to devise each of the above controversy to revisit one or more of the above boundaries of marketing as a science within the three perspectives to enable it to produce scientific marketing theories and best practices that are characterized by significant transformational traits. These transformational traits include truthfulness, valid essence, relevance, universality, multidisciplinary, authenticity, localization and globalization. The paper will also seek to demonstrate that the arguably robust drive and action mechanism for making marketing transformational would be through: 1) adopting a more transformational marketing agenda, 2) developing more transformational research methodologies and 3) producing drastically transformational scientific marketing outputs.

Conceptual Framework

The logic of the proposed conceptual framework is hung up on three pillars, namely: 1) The main core controversy and its subsequent four transformational revisits of marketing controversies and their implications to marketing boundaries, 2) the three transformational perspectives as a breeding ground for these revisits, and 3) the synergistic functioning resulting from doing the revisits within the spectrum of the three perspectives and its expected transformational outcomes to marketing theory and practice. The configuration of the proposed conceptual framework for discovering a

transformational science of marketing is depicted in Figure (1).

Pillar One: Core Controversies, Revisits and Boundaries for Transformational Marketing

The main controversy that is argued to be pursued for anchoring this legacy for marketing science and scientists is that of pragmatic versus dogmatic discipline of marketing and four related subsequent controversies. The four subsequent controversies resulting from raising the main controversy of the pragmatic/dogmatic research creed and identity of marketing science are: 1) pragmatic empirical substantiation versus dogmatic conceptual framing for theorizing marketing phenomena, 2) pragmatic valorization versus dogmatic generalization of marketing knowledge, 3) pragmatic

interdisciplinary synergy versus dogmatic genuine authenticity of marketing discipline's contributions and 4) pragmatic cross-context specificity versus global human transcendence of scientific marketing findings and revelations. These controversies are arguably expected to serve as an effective vehicle for revisiting the boundaries of marketing science to make it more transformational in terms of its agenda, methodologies and quality of produced knowledge. The main boundaries of marketing discipline that are proposed by this paper as most influenced by raising the above controversies are namely; customer-orientation (which can be looked at as the mainland boundary for scientific premises of marketing) , exchange management, knowledge-based marketing, value-based marketing, convergence marketing and multi-disciplinary marketing paradigms.

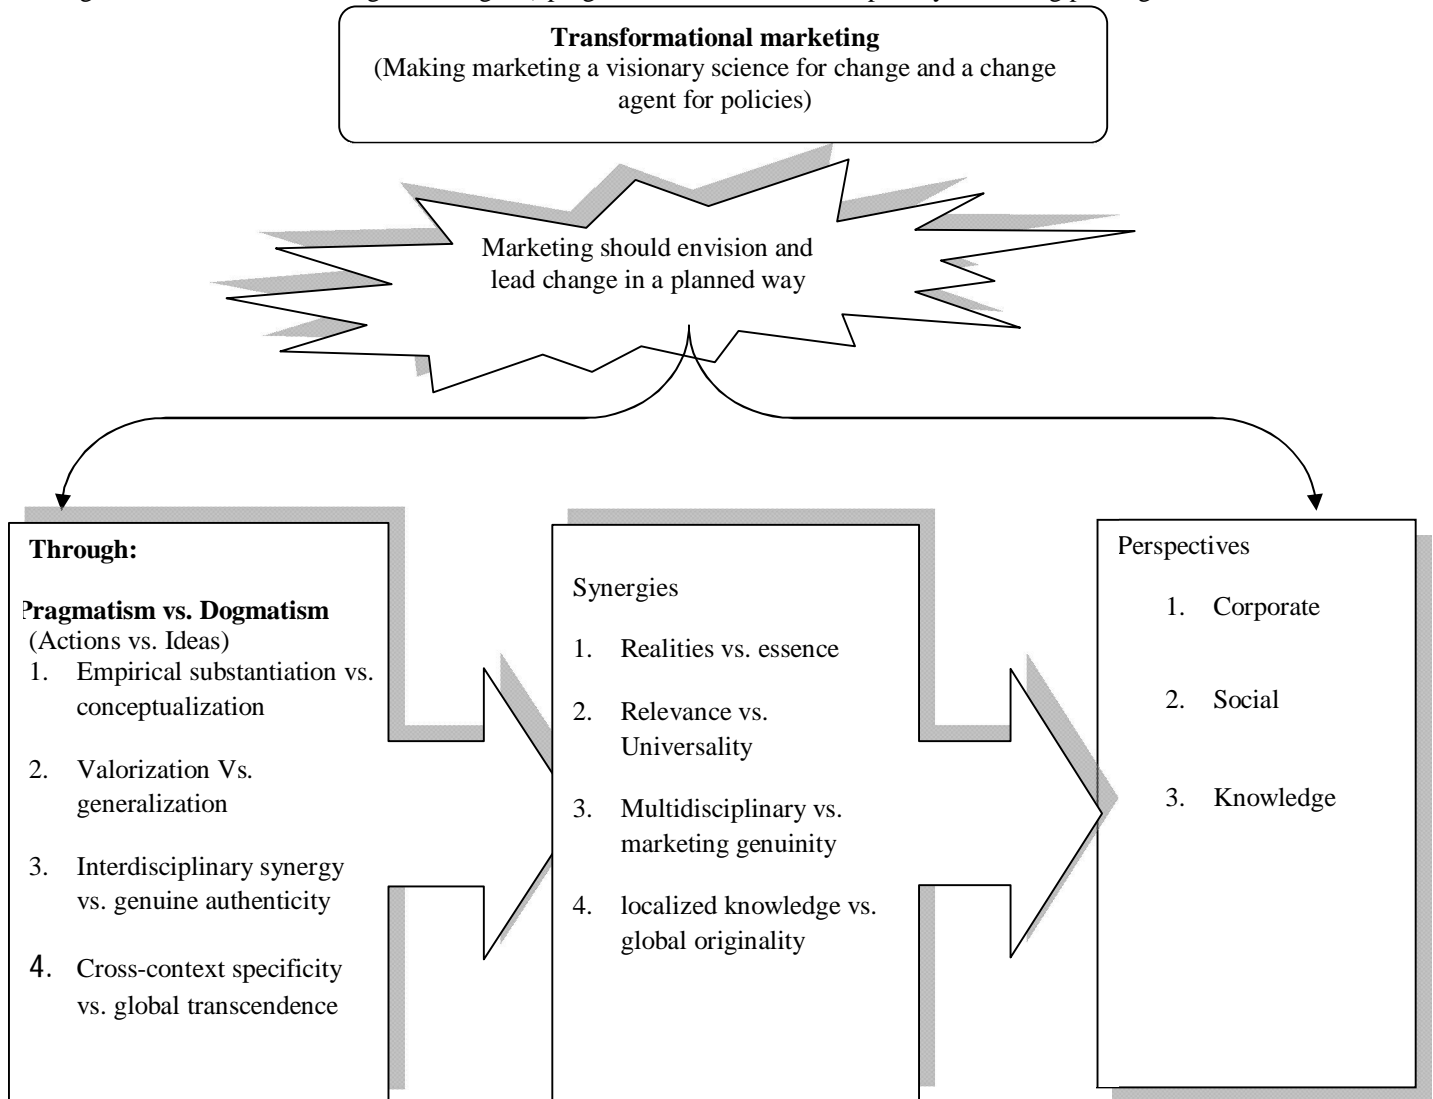

Figure 1: The Conceptual Framework for Discovering and Triggering Transformational Marketing

Core Revisit: Pragmatic versus dogmatic marketing – what orientation should marketing hold toward which customers?

The genesis, mainstream, and frontiers of marketing science and all its paradigms can be comfortably classified as pragmatism-oriented. Nevertheless such pragmatic dominance of science in marketing is not something marketing scholars have to feel apologetic about. Pragmatic marketing has and still is bringing about significant contributions and even virtues to the long-standing and status of marketing as a science (Kortam, 2004). The pragmatic creed of research in marketing made scientific marketing thought and most of its implications a highly responsive discipline to problem-solving needs of rapidly changing marketing (internal/ micro and macro) and stakeholders (especially marketing decision makers) which mainly helped to reform academic understandings and managerial practices of marketing phenomena live up to the challenges imposed by evident constant environmental changes and sometimes turbulences.

It seems that it was commonly thought that if marketing scholars aimed to adapt their research to an established social/physical sciences theory or a human dogma, this is expected to invade the outputs of marketing knowledge an ideological and flavour. Such idealistic tone is then claimed to be somehow counterproductive and luxurious to the ever pressing pragmatic agenda and action-oriented demands of the marketing discipline's prime beneficiaries, i.e., marketing executives at the front lines and edges of marketing realities (Gronroos, 2008 and Kelemen and Rumens, 2008). On the contrary to this argument, this paper suggests that such strong pragmatic orientation of research in marketing could deprive it as a science from a more proactive and broad-scoped transformational role.

Dogmatic marketing is argued to have a strong orientation to future outlooks and a broader base of stakeholders. Highly regarded and recognized scientific theories and human/social dogmas concern themselves with sensing the future of universe and all various segments of mankind.

Consequently, if marketing scholars aimed to address more prevalent and widely accepted theories and dogmas, this should lead to a kind of customer orientation for the discipline of marketing that: 1) does not only address the nagging needs of present and potential customers and 2) adopt a broader definition of customers to include other influential and important stakeholders including external and internal customers, suppliers, distributors, governments and general publics. Admittedly, research in marketing can be easily found guilty of over-emphasis on reacting to short-term and acute

issues for the sake of one main group of stakeholders which is marketing decision makers. Other groups are only considered in the best interest of main group of stakeholders in many instances.

Dogmatic marketing is not mutually exclusive to pragmatic marketing since grounding marketing theories on practical evidence and scientific ideologies on equal foot are complimentary rather than competing methodologies (Benton and Craib, 2001). In the main, this can be attributed to that the proposed dual-identity and well-blended research creed is expected to add a transformational virtue to the already existing highly valued reformvirtue of the science of marketing. This transformational contribution should result from making research in marketing more proactive to anticipated, foreseen or prophesied deliberate environmental changes that affect a much broader base of stakeholders and their agenda's like the well-being rather than the satisfaction of external and internal customers (Gronroos, 2007), win/win situations for distributors and suppliers, public welfare for government social values for general public and peace of mind, joy and happiness for the world. It is pragmatic/dogmatic disciplines where "reality influences thought" and "thought creates reality" that devise scholarly work that combines present needs with future aspirations of mankind in an equitable methodology to cater to legitimate felt deprivations and reasonable ambitions of all various stakeholders' groups.

In order to enact and augment this research creed of transformational science of marketing, four main measures expressed as further revisits of boundaries of marketing science. These proposed revisits are supposed to serve as trade-off mechanisms that create the needed balance between strongly present pragmatism and vigorously promised dogmatism for scientific marketing paradigm. The expected ultimate destination of this paradigm shift in scientific marketing inquiries is giving transformational marketing a greater room in subtle and revolutionary research endeavors in marketing.

The implications of each revisit to one or more marketing boundaries are briefly explained below.

Subsequent Revisit 1: Pragmatic empirical substantiation versus dogmatic conceptual framing for theorizing marketing phenomena – expanding the scope of knowledge-based marketing to embrace higher levels of abstraction.

Pragmatic empiricism marketing has produced heavy reliance on positivistic methodologies producing highly supported and applicable yet myopic marketing knowledge. Thus, marketing discipline is rendered as a much more realistic reformer and a much less visionary transformer

(Chaston, 2004). Dogmatic conceptual marketing is supposed to produce more normative generalisable marketing knowledge across different settings over an extended period of time which leads to higher levels of abstraction in marketing theories. These new horizons of abstraction play a profound role in triggering a true futurology of marketing as a transformational science that manages promise/dream/change agencies thus improving its ranking among universally welcomed and rewarded privileged disciplines.

Subsequent Revisit 2: Pragmatic valorization versus dogmatic generalization of marketing knowledge – Searching for new sources and constructs of marketing-attributed values.

It can be obviously acknowledged that pragmatic marketing has made significant contributions to the measurement, creation and sustenance of marketing-attributed values from owners' and customers' perspectives. These values are often smartly and rigorously expressed in financial terms in shorter rather longer time horizons (Doyle, 2004 and Dubois *et al.*, 2007). Dogmatic marketing would be expected to explore and move research in marketing attributed-values toward other social, scientific, universal and broadly human values reflected in more stochastic and possibly qualitative measures with longer-term outlook.

Subsequent Revisit 3: pragmatic interdisciplinary synergy versus dogmatic genuine authenticity of marketing discipline's contributions – devising multi-disciplinary means to achieve exclusive ends of marketing discipline.

It can be argued that pragmatic marketing has made significant contributions through offering marketing perspectives on other disciplines' phenomena and variables without equally drawing on other disciplines to shed novice light on marketing phenomena and variables (Gronroos, 2008 and Kelemen and Rumens, 2008). On the other hand, dogmatic marketing can capitalize on other disciplines' theories and constructs to produce really new and genuine insights and extensions of theoretical marketing propositions and conceptual frameworks.

Subsequent Revisit 4: pragmatic cross-context specificity versus global human transcendence of scientific marketing findings and revelations – creating marketing convergences and exchanges beyond contexts of companies, industries, technologies, cultures and countries – reaching out to planet, galaxy and eternity horizons.

Pragmatic marketing deserves substantial credit for producing highly adapted marketing knowledge to specific contexts which properly triggered and guided context-friendly specific exchange and convergence processes within each context (Gronroos, 2007). Dogmatic marketing ought to find ways to rise above context-specific levels of analysis to produce universally applicable marketing knowledge across all contexts. Consequently, improving the essence of exchange and convergence processes across all contexts. These research efforts holds an unprecedented promise of promoting a reciprocal and uniform science of marketing that goes beyond geographical, demographical, time, psychographic and other narrow divisions to broadest possible contexts hand to hand with other globally esteemed physical and social disciplines.

Pillar Two: Perspectives on Transformational Marketing

On the other hand, this conceptual framework proposes that the above revisits can only deliver their potential transformational influences when realized three main perspectives in which marketing phenomena and variables function and take place. These perspectives were deliberately selected from the various environmental perspectives through which marketing issues can be tackled.

There are three layers of environments, the internal environment to which the corporate perspective belongs, the micro environment to which the knowledge perspective belongs and the macro environment to which the social perspective belongs. This paper focuses on these three specific environments because they are expected to reflect transcending, sustainable leveraged transformational impacts as below illustrated and explained for each perspective.

This is mainly because corporate perspective represents important marketing organizational settings such as marketers, suppliers, distributors, business customers, government, media, etc. As a marketing guru once said, marketing has changed from a “field of dreams” to a “field of deals” (Kumar and Shah, 2004). To restore and/or create the genuine role of marketing as a science and an organizational function, marketing should be a transformational agent for corporations, for societies and for human knowledge in general. Specifically, marketing should shift from focusing on the tactical four Ps to create and/or facilitate the transformational initiatives and waves of corporate, society and scientific knowledge.

On the corporate frontier, marketing must aspire to participate in shaping the firm's destiny. Instead of doing things better, marketing must transform to do better things (Kumar *et al.*, 2009;

Donthu et al., 2005). In this line of reasoning, marketing should shift from implementation focus to strategic focus (Rust (a)*et al.*, 2004; Venkatesan and Kumar, 2004). Marketing, therefore, should help the organizations to seek strategic leadership by exploiting new business opportunities, redefine industry boundaries and reinvent the value network (Kumar *et al.*, 2009).

Accordingly, there are many transformational frontiers that marketing can lead this strategic agenda by focusing on: being market-driving rather than being market-driven, providing solutions rather than selling products (Kumar and Shah, 2004); building strategic segments rather than developing market segments (Crittenden, 2005; Reinartz and Kumar, 2000); creating value network rather than managing the supply chain (Rust (b)*et al.*, 2004; Romani and Kumar, 2008); seeking global distribution partners rather than creating branded bulldozers (Nwokah, 2008).

In this line of reasoning, marketing should be more strategic, more cross-functional, and more bottom-line oriented to be able to play this transformational role in organizations (Allee, 2008, Crittenden, 2005, Trim, 2004).

The Social perspective is selected due to its unique importance and sensitivity to marketing as a science advocating social exchange processes with highly controversial social implications like socially acceptable/friendly products, IMC, green marketing, macdonaldization, privacy, gender infringement, children fallacies, characters and celebrities social falsifications, patriotism/citizenship campaigns, political marketing, etc. It has long been argued that the role of the marketing function is to create utilities and values to customers and to society in large (Kotler and Lee, 2009). The marketing functions not only positively to firm performance and shareholders wealth, but also they have unique and significant implications to customer, society, community and environment. In fact, the marketing activities result in greater employment opportunities, income generating potential, and arguably more product alternatives, more choices within product categories, and better customer value (Kotler and Lee, 2009). Nowadays, there is an increased buzz that marketing can and must do more to augment individual customer value and societal welfare (Andreasen, 2002). To this end, some marketing scholars have introduced the concept of stakeholder marketing and proposed that marketing can be an agent of change to enhance societal welfare (Czinkota and Ronkainen, 2007). Others have undertaken transformative consumer research that focuses on improving consumers' welfare and quality of life (Mick *et al.*, 2011).

Marketing can play a special role in creating the potentials to transform markets, societies and environments through addressing the threats and opportunities of consumption (e.g. community networks, family coherence, ecological stability) (Broderick, 2010), engaging in interactive communication with customers, facilitated through changes in technology (Romani and Kumar, 2008), and offering interactive channels as the foundation of marketing delivery (Broderick, 2010). In this vein, the challenge for marketing scholars and practitioners alike is to consider marketing efforts from the lens of creating customer value, while simultaneously enhancing societal welfare. Therefore, there are many arenas that should be tackled by scholars to assist practitioners in achieving the aforementioned goal, such as how can firms be socially responsible and yet remain viable (Burke and Logsdon, 1996); how can firms serve underprivileged segments, and still make required returns rates (Mick *et al.*, 2011); how can marketers embrace new information technologies for commercial purposes, and yet respect the privacy of consumers (Malhotra *et al.*, 2004); how can firms develop more green products and processes, and how can marketers create user friendly products and/or advertising campaigns. These are but a few of the numerous arenas that are worthy of attention.

The third platform focuses on the knowledge perspective which embraces various technologies, philosophies, sources and disseminations of marketing knowledge such as students evaluations, eye tracking, CRM, data mining and warehousing, database marketing, internet marketing, SMS advertising, TV shopping, digital marketing research and intelligence.

In any competitive environment, knowledge is the principal source of competitive advantage. In marketing, attracting customers is the mission a business to accomplish, and the competitors are the forces it is encountering to fulfill its mandate. Without sufficient marketing knowledge of both customers and competitors, a business is severely hindered in developing marketing strategies to gain customers and grow market share.

A marketing knowledge advantage is necessary to develop a successful oblique strategy. Partial knowledge may seem an advantage, but often results in reactive strategies. A business with excellent customer knowledge but limited competitor knowledge will likely overreact to customer demands. Similarly, having excellent competitor knowledge without adequate customer knowledge will likely result in overreaction to competitors' moves.

Businesses that lack both customer and competitor knowledge are working with an inside-

the-box strategy as they make competitive moves from an in-house perspective with no real market knowledge. These businesses can make only blind attempts at success, usually in the end losing more ground than they hoped to gain. Other businesses with partial intelligence on customers or competitors are likely to employ reactive strategies, which is the normal response to customer and/or competitor pressures when a business sees only one dimension of the marketplace. An oblique marketing strategy requires superior customer profiling and superior competitor intelligence (Chaston, 2004).

With a marketing knowledge advantage, a transformational market-based strategy can be devised to achieve desirable gains without sustaining excessive losses. Such transformational market-based strategies that leverage a marketing knowledge advantage with respect to both customers and competitors can be implemented with a non-confrontational approach that keeps losses to a minimum. This is labeled as an oblique marketing strategy because it seeks to gain a competitive advantage without direct confrontation. A competitive marketing strategy with limited or partial marketing knowledge could be more easily drawn into a frontal attack strategy - a direct attack on a competitor's position leading to unjustified and unnecessary losses (Best, 2009).

The above analysis supports the preventive and initiative role of the knowledge perspective to transformational marketing.

Pillar Three: Synergy among Revisits and Perspectives for Framing and Functioning Transformational Marketing Logic and Inertia

It is expected that making the four revisits within the three perspectives would lead to enacting the following theoretical and practical functioning for creating a sustainable thrust of transformations in marketing philosophic foundations and actions postulates, as follows:

- 1- The revisit of empirical substantiation versus conceptualization processes of marketing thought tackling the boundaries of customer-orientation and knowledge-based marketing will reflect solidly grounded marketing realities and deeper understandings of marketing essences thus resulting in transformational bases and postulates across all three perspectives.
- 2- The revisit of valorization versus generalization of marketing findings tackling the boundary of marketing values would demonstrate relevance of advanced marketing applications and universality of marketing theories thus allowing transformational frameworks across all three perspectives.

- 3- The revisit of interdisciplinary synergy versus genuine authenticity of scientific marketing truths tackling the boundary of multidisciplinary marketing capitalizes on multidimensional insights and genuine marketing contributions to result in transformational templates across all three perspectives.
- 4- The revisit of cross-context specificity versus global transcendence of marketing insights tackling the boundaries of convergence marketing and exchange management produces localized marketing solutions and global originality of marketing blueprints resulting in transformational drives across all three perspectives.
- 5- The road map and action mechanism of this framework focuses on devising the agendas, methodologies and outputs framework as vehicles for making and sustaining a transformational stream of scientific marketing thinking and theorizations across these three perspectives.

Conclusive Embarks And Research Agenda

This research aimed to trigger a sparkle among marketing scholars, scientific communities and bodies to go down the long and promising road toward giving the science of marketing a new age of universally recognized and esteemed renaissance through transforming its research agenda, methodologies and output knowledge. With a view toward doing this, three possibly useful venues are proposed. First, starting a collective initiative for recognizing and defining of the universal crisis that the marketing discipline is going through. Second, deciding on the key controversies that need to be raised and critically and innovatively tackled to hit the roots of the crisis and pave the way for a road map for transformational marketing. Third, deciding on the action mechanisms for research in marketing to reflect the proposed solutions in individual and institutional research initiatives and projects constituting the new main stream and breakthroughs of the discipline of marketing. While concept paper advocates for the triggering and leveraging drives of agendas, methodologies and outputs, the horizons for transformational marketing is widely open for further views and reviews.

Consequently, The following proposed research agenda is viewed by the authors as a first step in this long yet rewarding journey in earning the discipline of marketing and its resulting practice its long due status as a science that makes a difference in human intelligentsia and destiny.

Research Stream One: Setting the Stage for Transformational Marketing Contributions through looking for more revisits, perspectives and embarks.

Research Stream Two: Examining a Corporate Perspective for Transformational Marketing

Research Stream Three: Examining a Social Perspective for Transformational Marketing:

Research Stream Four: Examining a Knowledge Perspective for Transformational Marketing:

Research Stream Five: Encompassing a Road Map For Transformational Marketing - The Transformational Roles of Agendas, Methodologies and Outputs for shifting marketers From Highly Profiled Backstage Slogans To Highly Valued Board Room Contributions.

Abstract: Canola is one of the rapeseed varieties and is in temperate and cold climate areas. Contains 94% unsaturated fatty acid and 6% saturated fatty acid, thus, has best fatty acid composition among other oils. Canola oil causes alteration in pancreatic enzymes such as leucine aminopeptidase activity. The aim of this study was assessment of mucosal leucine aminopeptidase activity enzymes subsequently using of canola oil on turkey chicks diet. According to this survey results revealed that using of canola oil in turkey chick's diet causes increasing of leucine aminopeptidase activity (in 5% treatment than control and 2.5% treatments). It seems that use of different amounts of canola oil in turkey chick's diet causes increasing of leucine aminopeptidase activity, because this enzyme play a important role in protein hydrolyzing and this enzyme activity be more subsequently reducing of digesta transient ratio. [Jamshid Ghiasi Ghalehkandi, Ramin Salamat Doust Nobar, Abolfazl ghorbai, Ali Asghar Gharachorlu, Rahim Behesti, Alireza Fani. Effect of canola oil on mucosal leucine aminopeptidase activity enzymes in small intestine of turkey chicks. Journal of American Science 2011;7(6):704-707]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: canola oil, leucine aminopeptidase, intestine, turkey chicks.

1. Introduction

Canola is one of the rapeseed varieties and is in temperate and cold climate areas. Canola is rich of sulfurous amino acids and vitamins. Canola meal has about 40% protein. Its erucic acid is less than 2% of total fatty acids (Pajohan Mehr et al., 2008). Consist of less than 30 micromole glucosinolate per oil free dry matter. Contains 94% unsaturated fatty acid and 6% saturated fatty acid, thus, has best fatty acid composition among other oils. Because of having 61% of oleic acid, considered as full resources of unsaturated fatty acids and from this aspect, occupied in second class after olive oil. Its tocopherol is higher than olive and soya oils, that from this aspect can be attribute high antioxidant effect to it. Canola oil combination is inserted in table 1 (Pajohan mehr et al., 2008, Mohammadi et al., 2007).

Leucine aminopeptidase (LAPs) are enzymes that preferentially catalyze the hydrolysis of leucine residues at the N-terminus of peptides and proteins. Other N-terminal residues can also be cleaved, however, LAPs have been found across super kingdoms (Strater et al., 1999).

Identified LAPs include bovine lens LAP, porcine LAP, E. coli LAP (also known as PepA or XerB), and the solanaceous-specific acidic LAP

(LAP-A) in tomato (Gu et al., 2002). Historically, the mechanisms of carboxypeptidase and endoprotease have been much more well-studied and understood by researchers. Work within the past two decades has provided vital knowledge regarding the mechanisms of aminopeptidase. In this mechanism, the bicarbonate ion acts as a general base. For LAP-A, R1 could be the R group of leucine, methionine, or arginine (Kraft et al., 2006). Leucine aminopeptidase is brush border and cytosolic enzyme which hydrolyses small peptides from terminal of long peptide chains. Peptidase enzymes activity elicit to protein digestion in diet (Doçgan et al., 1999; Talebali and Farzinpour, 2006).

2. Materials and methods

2.1. Animals and diet

This research was performed one 108 Iranian native turkey chicks (from 4th to 20th week of age). In this study, the turkey chicks by chance divided into 3 treatments and each treatment divided into 3 replicates and each replicate was contained 12 turkey chicks and were fed in separate cage with 0, 2.5 and 5 percent of canola oil. The experimental diets formulated isonitrogenous and isoenergetic and balanced according to 1994 national research council

(NRC, 1994). The birds were given access to water and diets ad-libitum. The composition and calculated nutrient composition of the mixture of treatment is shown in Table 2.

2.2. Sample collection

In the Rearing period, all conditions such as temperature, humidity, light, ventilation and management were appropriate and similar for all broilers and 20th week of age of end the rearing period, after 5 hours of starvation, 2 broilers from every group (totally 18 chickens of sampling) which weighed nearly equal to the average weight of each replicate have been chosen and slaughtered. The abdominal cavity was opened, and the entire gastrointestinal tract was removed. The small intestine was isolated, and the length of intestine was determined by a graduate ruler. The positions at 1, 10, 30, 50, 70 and 90 % of the length of small intestine for analyzing the Enzymes activity were separated with specific scissors (an 8-cm sample was taken). The samples for enzymes determination were cut open lengthwise, rinsed carefully with phosphate buffer saline (pH=7), blotted dry, then samples

envelop in vacuum packed and stored at -80°C until enzymes analysis (Teshfam, 1984).

1 Vitamin content of diets provided per kilogram of diet: vitamin A,D, E and K.

2 Composition of mineral premix provided as follows per kilogram of premix: Mn, 120,000mg; Zn, 80,000 mg; Fe, 90,000 mg; Cu, 15,000 mg; I, 1,600 mg; Se, 500 mg; Co, 600 mg

2.3 Enzyme assay

After thawing, all of vacuum packed were opened and then using a sensitive scale, 0.05 gram of the mucosal small intestine was weighed and along with 10 ml liter phosphate buffer saline (pH=7) was formed into a homogenized solution using sonic Vibracell Sonics (VCX 130 TE USA) device (Teshfam, 1984). Enzymes activity of leucine aminopeptidase was measured according to the procedure Nigel et al., (1964) method was used. For detection of enzymes activity it was needed to measure total protein which Pirogallol (calorimetric) method was used (Watanaba, et al., 1986). The level of activity of enzymes of each sample is divided into the amount of its total protein so the activity level of the enzyme is calculated according to the IU in liter/gram protein (Teshfam, 1984).

2.4 Statistical analyses

The results of the research have been statistically analyzed using the linear model of SAS software (SAS, 2001).

Analysis of variance according to the model,

$$x_{ij} = \mu + T_j + e_{ij}$$

Where,

x_{ij} = All dependent variable

μ = Overall mean

T_i = The fixed effect of RRO levels ($i = 1, 2, 3$)

e_{ij} = The effect of experimental error

Values of different parameters were expressed as the mean \pm standard deviation ($X \pm SD$). When significant difference among means was found, means were separated using Duncan's multiple range tests.

Table 3: comparison of average leucine aminopeptidase activity between treatments in different periods and segments of small intestine in broiler chicks (IU/g protein)

Intestine length Groups)	1%	10%	30%
0 % canola oil	1314.2 \pm 121.1	1053.8 ^b \pm 92.9	1567.6 ^b \pm 18.4
2.5 % canola oil	1547.2 \pm 261.5	1469.6 ^{ab} \pm 377.9	1537.3 ^b \pm 350
5 % canola oil	1504.6 \pm 181.1	1811.1 ^a \pm 360.9	1559.3 ^a \pm 414.7

a, b,.. Means in the same column with different superscripts differ significantly $X \pm SD$ ($P < 0.05$).

3. Results

According to table 3 and 4, adding different levels of canola oil to turkey chick's diet have different effects on leucine aminopeptidase activity on several regions of small intestine. in part of 1% of

small intestine there is a significant increase in 2.5 and 5% treatments than control group.

Leucine aminopeptidase activity in parts of 10 and 30% of small intestine in 5% treatment has significant increase than control and 2.5% treatments whereas; in part of 50% of small intestine in 2.5 and 5% treatments have significant increasing than control group. Also in parts of 70 and 90% of small intestine there is a significant increase in 5% treatment than 2.5% and in 2.5% than to control group ($p < 0.05$).

Table 4: comparison of average leucine aminopeptidase activity between treatments in different periods and segments of small intestine in broiler chicks (IU/g protein)

Intestine Length Groups	50%	70%	90%
0 % canola oil	1848 ^b \pm 401.6	2106.9 \pm 547.1	2643.2 ^c \pm 295
2.5% canola oil	2821.7 ^a \pm 517.2	2763.7 \pm 1011.6	3006.3 ^b \pm 420
5 % canola oil	3060.2 ^a \pm 634.8	2933 \pm 692.1	3902.5 ^a \pm 398

a, b,..Means in the same column with different superscripts differ significantly $X \pm SD$ ($P < 0.05$).

4. Discussions

In current study obtained that adding different levels of canola oil to turkey chick's diet have different effects on leucine aminopeptidase activity on several regions of small intestine, there are many studies that confirm this result.

In one research were done by Turek et al. (1991), demonstrated that Resident linseed oil had a 15% increase in LAP fluorescence compared to corn oil. In one other study were done by Chambersa et al.(1978), revealed that Saudi Arabian crude oil caused decreases in the specific activities of alkaline phosphatase, -glutamyl transpeptidase and leucine aminopeptidase, and increases in the activities of glutamic pyruvic transaminase, glutamic-oxaloacetic transaminase, lactic dehydrogenase and -hydroxybutyric dehydrogenase. In other study were done by Manuel et al. (1983), observed that rapeseed oil supplementation causes increasing in -N-Acetylglucosaminidase, n-d-glucosidase, -d-glucuronidase, -l-fucosidase and leucine aminopeptidase activities when compared with control group, that is compatible with our research results. In one other study were done by Gonzalez et al. (2001), revealed that Supplementation of casein with olive oil tended to decrease the intestinal and hepatic enzyme activity. It seems that increasing diet fat reduced transient ratio. Thus digesta more exposures to acid, pepsin and proteolytic enzymes. Therefore, Leucine aminopeptidase activity enhanced

and proteins convert to components such as amino acids. Hence, use of different amounts of canola oil in turkey chick's diet causes increasing of leucine amino peptidase activity.

Blood Utilization for Elective Surgeries at Main University Hospital in Alexandria, Egypt

Samaa Z.Ibrahim¹, Heba M. Mamdouh², Amal M. Ramadan.

¹ Department of Health Administration and Behavioral Sciences, High Institute of Public Health, University of Alexandria, Egypt; ² Department of Family Health, High Institute of Public Health, University of Alexandria, Egypt. Corresponding author: Samaa Ibrahim, e-mail: samaa752002@yahoo.com.

Abstract: This study aimed to determine the efficiency of blood ordering and transfusion practices for patients undergoing elective surgical procedures and to assess the compliance with the international blood transfusion clinical practice guidelines. Auditing of blood bank registers for patients who underwent elective surgical procedures was done at the Main University hospital in Alexandria governorate. The total number of adult patients who had elective surgery for which requests for cross matching were made was 4844; of them only 1788 patients were transfused. A total of 13389 units of blood were cross-matched, but only 3373 units were transfused. Only 25.2% of total blood cross matched was utilized, leaving 74.8% unutilized. The overall Cross-match to Transfusion ratio (C/T ratio) was 3.9, the overall Transfusion Probability (%T) was 36.9% and the overall Transfusion Index (TI) was 0.69. The overall percentage compliance with Scottish Intercollegiate Guidelines was 27.7%. Institution-specific blood ordering schedules and protocols should be formulated to reduce exposure to transfusion and to screen for high-risk patient. In conclusion, ongoing audit and monitoring of blood ordering and transfusion practices in the hospital are essential for improving the ordering, distribution, handling and administration of blood components. [Samaa Z. Ibrahim, Heba M. Mamdouh, Amal M. Ramadan . Blood Utilization for Elective Surgeries at Main University Hospital in Alexandria, Egypt. Journal of American Science 2011;7(6):683-689]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: blood ordering practices, transfusion practices, utilization indices

1. Introduction:

Increasing demand for blood and blood products together with rising cost and transfusion associated morbidity led to a number of studies in the late 1970s reviewing blood ordering and transfusion practice (Olawumi & Bolaji, 2006). Moreover, in recent years there has been an increased emphasis on the potential hazards of transfusion as well as evidence supporting the use of lower transfusion thresholds (Boralessa, 2009).

Since the introduction of blood transfusion into clinical practice, its appropriate use has been the subject for debate. It has been reported that only 30% of cross-matched blood is used in elective surgery. Therefore, awareness of the hazards of blood transfusion is becoming more obvious due to the expansion of various aspects of blood transfusion services and the increased understanding of transfusion science in recent years (Abdelhadi & Bashawari, 2001).

Blood transfusion plays a major role in the resuscitation and management of surgical patients, but surgeons most of the times over estimate the anticipated blood loss thereby, over-ordering blood. Moreover, a number of studies in many countries of

the world have shown over ordering of blood by surgeons with utilization ranging from 5-40 % (Olawumi & Bolaji, 2006).

Many units of blood routinely ordered by surgeons are not utilized but are held in reserve and thus are unavailable for other needy patients. This can impose inventory problems for blood bank, loss of shelf life and wastage of blood (Vibhute, et al., 2000). In South Africa for example, 7-10% of blood is wasted annually because of over-ordering of blood (Olawumi & Bolaji, 2006). Also reports from different parts of the world revealed an unintentional misuse of the blood bank services causing a great burden on its resources, namely wastage of blood, reagents and manpower (Abdelhadi & Bashawari, 2001).

Wide variations in transfusion practice are existed between countries and institutions and even between the individual clinicians within the same institution (Western Australia Department of Health, 2010). Blood use audits in Scotland showed that, large variations are existed among individual practitioners or operating teams within a hospital (Scottish Intercollegiate Guidelines Network (SIGN), 2001). Variations in rates of transfusion may be due to many factors, including differing opinions on the threshold

level of hemoglobin below which a patient needs blood transfusion, differences in surgical and anesthetic techniques, differences in case mix, pre-operative anemia, and lack of availability of transfusion protocols. This may reflect uncertainty about the relative benefits and risks of transfusion and the different perceptions of the value of minimizing blood loss and subsequent transfusion (SIGN, 2001).

Moreover, many surgeons prescribing blood are unaware of recommended published guidelines for transfusion practice and still adhere to historical practice and not evidence (National Blood Users Group, 2001).

A study was conducted in Kuwait reported that only 28.3% of cross matched blood for elective surgery was actually transfused. In addition, it documented monthly mean wastage (\pm SD) of 45 (\pm 13) blood units due to the absence of a blood ordering policy also it was estimated that a technician can cross-match three units per hour. This results in wastage of 54.5% of technician working time, leading to an average blood bank annual loss of US \$25,000.00 for one 120-bed department of surgery (Juma et al., 1990). This can be decreased by simple means of changing the blood cross- matching and ordering schedule depending upon the type of surgery performed (Vibhute, et al., 2000). Moreover, implementation of the recommended maximum surgical blood-order schedule and introduction of type and screen for eligible surgical procedures is considered as a safe, effective and economic solution to preoperative over-ordering of blood (Bhutia et al., 1997).

A careful assessment of the risks and benefits of blood transfusion is essential for a good patient outcome. In addition, it is essential that the utilization of blood and blood products be rationalized and they are saved for critical situations. Appropriate placement of blood requests according to a planned schedule most often averts the consequences of indiscriminate ordering of blood. This requires streamlining blood ordering schedule keeping in view the blood bank resources, time, as well as money (Subramanian et al., 2010). Based on available evidence, institution-specific protocols should screen for high-risk patients including advanced age, low preoperative red blood cell volume, preoperative antiplatelet or antithrombotic drugs, complex procedures where blood conservation interventions are likely to be most productive for this high-risk subset (The Society of Thoracic Surgeons, 2007).

Studies assessing blood ordering and transfusion practices couldn't be traced in developing countries especially Egypt. Therefore, the aim of this study is to determine the efficiency of blood ordering and transfusion practices for patients undergoing elective surgical procedures and to assess the compliance with the international blood transfusion clinical practice guidelines.

2. Material and Methods

A. Study Setting:

The study was conducted at the surgical departments pertaining to Main University hospital in Alexandria governorate. It is multi-specialty 1700 bed hospital; of which, 700 surgical beds pertained to thirteen surgical departments performing about 10500 major elective adult surgical procedures per year.

B. Study Population:

Overall, a total of 4844 adult patients (2624 were males and 2220 were females) who underwent elective surgical procedures over a period of 1 year from July 2009 to June 2010 were included in the study.

C. Sampling Design:

Retrospective audit of blood bank registers was performed which covered all adult patients who underwent elective surgical procedures in all surgical departments pertaining to the study hospital and for which cross matching was requested during the study period.

D. Data Collection Methods:

Data were collected using review of registers technique. Blood ordering and transfusion practices for elective surgical procedures in the surgical departments pertaining to the study hospital were assessed according to certain indices including; Cross match to Transfusion ratio, Transfusion Probability, and Transfusion Index (Friedman et al., 1976; Mead, 1980). These indicators were computed using the following equations;

$$1- \text{Cross match to Transfusion ratio (C/T ratio)} = \frac{\text{No. of units cross matched}}{\text{No. of units transfused}}$$

$$2- \text{Transfusion Probability (\%T)} = \frac{\text{No. of patients transfused}}{\text{No. of patients cross matched}}$$

$$3- \text{Transfusion Index (T I)} = \frac{\text{No. of units transfused}}{\text{No. of patients cross-matched}}$$

Scottish Intercollegiate Guidelines Network recommended cross match to transfusion ratio (C/T ratio) for evaluating blood transfusion practices [6]. According to this guideline, C/T ratio shouldn't

exceed 2:1. In the present study, compliance with these guidelines was assessed to evaluate blood utilization practices at the selected hospital. The percent of blood cross-matched that was utilized was calculated as = $\frac{\text{No of units transfused}}{\text{No of units cross matched}} \times 100$

E. Statistical Analysis:

Data were statistically analyzed using Statistical Package for Social Science (SPSS) version 11.5 (SPSS Inc., Chicago IL, USA). Frequencies were calculated for all variables and Pearson's Chi-Square test was used to assess the statistical significance of difference in blood utilization between surgical departments pertained to the study

3. Results

The number of adult patients who had elective surgery and for which crosshatching was requested totaled 4844 patients. Male patients constituted the higher percentage (54.2%). The mean age of patients was 42 years with the highest percentage of patients was within age group "from 40 to less than 50" (31.8%), while the lowest percentage was within age group "60 years and more" (7.1%). Neurosurgery was the department of the highest admission rate (29.0%). On the other hand, renal-transplant and otolaryngology were the departments of the lowest admission rates (0.1% and 2.7%, respectively).

Table1 shows that, among a total 4844 patients, only 1788 patients were actually transfused. Neurosurgery was the department of the highest number of both patients cross matched (28.9%) and patients transfused (26.0%). On the other hand, renal-transplant was the department of the lowest number of both patients cross matched (0.06%) and patients transfused (0.16%). Blood utilization was 100% only in renal-transplant department, where the number of patients cross matched and the number of patients transfused were equal (3 patients).

As shown in Table 2, a total of 13389 units of blood were cross-matched, however, only 3373 units

were transfused. Neurosurgery was the department of the highest number of both blood units cross matched (30.1%) and blood units transfused (28.2%), while renal-transplant was the department of the lowest number of both blood units cross matched (0.1%) and blood units transfused (0.2%).

Only 25.2% of total blood cross-matched was utilized. The highest percentage of blood cross matched was utilized in Renal-transplant department (56.2%), while Urology-endoscopy was the department of the lowest percentage of blood cross matched that was utilized (9.4%).

The highest percentage of blood cross matched was utilized in Renal-transplant department (56.2%), while Urology-endoscopy was the department of the lowest percentage of blood cross matched that was utilized (9.4%), as shown in Figure 1.

Data from table 3 revealed the blood utilization indices in different surgical departments of the selected hospital. In relation to C/T ratio, urology-endoscopy was the surgical department of highest the C/T ratio and renal-transplant was the department of the lowest C/T ratio (1.7) with overall C/T ratio of 3.9. The overall %T was 36.9%, ranged from 100.0% in renal-transplant department to 15.7% in Urology- endoscopy department. The overall TI was 0.69 that ranged from 3.00 in renal-transplant department to 0.18 in Urology- endoscopy department.

The overall percentage compliance was 27.7% with the highest percentage compliance in renal-transplant department (66.7%) followed by Plastic surgery department (56.6%). On the other hand, Urology- endoscopy was the department of the lowest percentage compliance (11.7%), followed by vascular surgery department (16.0%). There was statistically significant difference between the different surgical departments at the selected hospital regarding the percentage compliance with guidelines ($p=0.003$), as shown in Table 4.

4. Discussion

Blood and blood components are critical in elective surgery patient care, but with limited supply, unnecessary ordering, unnecessary utilization, and significant cost, careful assessment of ordering and benefits of transfusion is essential for a good

management of resources (Subramanian et al., 2010). Data from developing countries have shown gross over ordering of blood in 40% to 70% of patients transfused (Chawla et al., 2001). Therefore, it is essential that the usage of blood and blood products be rationalized and saved for crisis situations (Subramanian et al., 2010). The current study

revealed that, 74.8% of the cross- matched blood was unutilized which mean it was unnecessary. This finding is nearly similar to that was reported in an Indian study where 76.9% of blood cross-matched was unutilized.

Other studies as those conducted in Ilorin Teaching Hospital (Olawumi & Bolaji, 2006) and University of Benin Teaching Hospital, in Nigeria reported nearly similar values of unutilized blood (69.7% and 70.0%, respectively) (Ebose et al., 2009). This might indicate that this malpractice is common in developing countries.

The use of cross-match to transfusion ratio (C/T ratio) was first suggested by Boral Henry in 1976 (Friedman et al., 1976). Subsequently, a number of authors used C/T ratio for evaluating blood transfusion practices. Ideally, this ratio should be 1.0, but a ratio of 2.5 and below was suggested to be indicative of efficient blood usage (Olawumi & Bolaji, 2006). According to these recommendations, the overall C/T ratio of 3.9 that reported in current study was considered to be indicative of inefficient blood usage except for Renal-transplant (1.7), Plastic surgery (2.0), and Tumor excisions departments (2.1). This inefficient blood usage was reported by other studies conducted in Nigeria (2.2), and Malaysia (5.0) (Ebose et al., 2009; Jarnee et al., 2002).

The results of the present study demonstrated that, C/T ratio varied widely across the surgical departments under the study from 10.7 at urology-endoscopy department to 1.7 at renal-transplant department. This was somewhat similar to that reported in a Nigerian study but to a lesser extent where the C/T ratio values ranged from 1.6 in obstetrics and gynecology department to 3.3 in Orthopedics and accident and emergency departments (Ebose et al., 2009). Variations in rates of transfusion in the current study may be due to the fact that, there is a great tendency in most departments of surgery to request more units of blood for elective procedures than what is actually required. This over ordering of blood is more often guided by habits and hospital routines rather than clinical needs. This attitude is defended by the simple excuse that, it provides a safety measure in the event of excessive unexpected blood loss during surgery.

The probability of transfusion for a given department is denoted by %T and was suggested by Mead (1980). A value of 30% and above has long been suggested by Friedman et al., to be appropriate and signifies the appropriateness of numbers of units cross-matched. The probability of transfusion values

reported in the current study for the different surgical departments under the study are considered appropriate except for Urology (28.3%), Urology-endoscopy (15.7%) and Vascular-surgery department (20.3%). The results of the present study revealed an overall %T of 36.9%. This finding was higher than that has been found in study conducted in Indian tertiary care hospital where %T ranged from 11.1% to 25% (Niraj et al., 2003).

Regarding TI, a value of 0.5 or more is indicative of efficient blood usage and signifies the appropriateness of numbers of units transfused (Mead, 1980). The TI reported in the current study as an overall value (0.69) and the values of the different surgical departments under the study are considered appropriate except for Urology, Vascular-surgery, Urology-endoscopy and Cardio-thoracic departments. This finding was different from that has been found in a study conducted in Indian tertiary care hospital where TI ranged from 0.36 to 0.15 (Niraj et al., 2003). This difference might explained by differences between localities.

Practice guidelines are systematically developed recommendations that assist the practitioner in making decisions about health care. The recommendations might by may be adopted, modified, or rejected according to clinical needs and constraints. The purposes of the American Society of Anesthesiologists guidelines (2006) were to improve the perioperative management of blood transfusion and adjuvant therapies and to reduce the risk of adverse outcomes associated with transfusions. These guidelines recommended that the ratio of the number of units of cross-matched red cells for a given operation to the number of units actually transfused – the C:T ratio – should not exceed 2:1.

The results of the present study revealed that, the overall percentage compliance with blood transfusion guidelines was 27.7%. In the current study the percentage compliance with guidelines varied widely among the individual surgical departments under the study with a range from 66.7% in renal-transplant department to 11.7% in urology-endoscopy department. In Egypt, surgeons order cross-matched blood on the basis of habit. The criteria for ordering blood are often vague and the established policies, if there any existed, may be outdated.

In addition, the percentage compliance with guidelines in cardio- thoracic surgery department was 42.7%. Blood transfusions in cardiac surgery patients are performed inappropriately and transfusion rates would improve if more restrictive strategies for

performing them were employed. However, in one large observational study, investigators reported that, despite the availability of practice guidelines for blood transfusion, rates of transfusion among cardiac surgery patients vary dramatically among hospitals in the United States (Worcester, 2010).

We acknowledge that there are limitations to the present study. The pre-operative data including hemoglobin level and co-morbidities and intra-operative data including duration of surgery and amount of blood loss are very important for correlating the results, but, some logistics preventing us from obtaining these data. Also, the magnitude of cost implication of unnecessary cross-match can be calculated. Therefore, further work is needed to examine these issues.

Trust, confidence and cooperation of clinicians are critical for success of blood conservation policies. Continuous monitoring by members of the transfusion staff is necessary for the success of these Policies. The clinicians need to be confident that the transfusion medicine unit is capable of supplying blood on time when there is an urgent need before being willing to accept the Group Screen and Hold schedule practice. Moreover, it is necessary to continually educate incoming house surgeons and new attending surgeons concerning the value of the Group Screen and Hold schedule procedure and the cross-matching guidelines

Information and communication technologies (ICT) and its effect on rural development¹Mojtaba Sadighi and ²Mehran Bozorgmanesh^{1,2}Damavand Branch, Islamic Azad University, Damavand, Iran*Corresponding author: sharif11070@yahoo.com

Abstract: Direct or indirect application of ICT, in rural development sector has also been referred to as “Rural Informatics”. Rural economies can be benefited from ICT by focusing on social production, social consumption and social services in the rural areas. The inculcation of a Citizen-to-Government (C2G) and Citizen-to-Citizen (C2C) interface would provide this link that would also lead to community participation in design and implementation of ICT interventions. This in return could promise better economic opportunities as well as social inclusion of rural people in the processes of governance. Such attributes in the social set up are essential prerequisites for good governance and rural development. Globalization and technological changes, the processes in the past fifteen years have been quickly lead to a new global economy have been driven with the reinforced technology and fuel (energy) that by providing information and knowledge. The global economy requires the kind of necessity and purpose of educational institutions. Since the current trend towards reducing incomplete information and access to accurate information is growing, other schools can not control time to transfer a set of prescribed information from teacher to student during a fixed time point are, but schools must to promote Culture of "Teaching for Learning For example, acquisition of knowledge and continuous learning skills which make possible during the individual's life.

[Mojtaba Sadighi and Mehran Bozorgmanesh. **Information and communication technologies (ICT) and its effect on rural development.** Journal of American Science. 2011;7(6):713-716]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: information and communication technologies (ICT), rural development

Introduction:

The concept of development of the rural, today, is not just project initiatives and governance; it is much more beyond that. This paper uncovers a whole plethora of ICT emergence as a technology of the new millennium. Against the backdrop of the ongoing ICT boom, this paper makes an attempt towards studying its applications and usage planning process and policy making for the rural communities focusing on how it helps in aligning the key factors and reduce the problems of alienation, fragmentation and dislocation of knowledge. Review of literature shows that intervention of information and communication technologies (ICT) in rural development initiatives are capable of development, but are not successful. Lack of community participation, absence of an integrated approach and non-inclusion of traditional knowledge systems (TKS) in the project designs are the major impediments. We therefore suggest a systems-based approach in the design of e-Governance projects, and brief some future directions. Sustained development using rural informatics is possible, only if ICT interventions are able to respond to the local needs and re-adjust as per the prevailing knowledge (Traditional Knowledge Systems- TKS) of the rural areas.

Concerns about educational quality and educational opportunities with the necessity of developing those most vulnerable are the accumulation of globalization is symbiotic. Generally, "the changes of globalization in developing countries, on low-income groups,

especially women and girls and" low skill workers, as well as all groups applying for and obtaining new skills to press. (Bellamy and Taylor, 1998).

In the rural context, development involves use of physical, financial and human resources for economic growth and social development of the rural economies (Burkey, 2000). The term rural development also represents improvement in quality of life of rural people in villages. As per Chambers (1983) “Rural Development is a strategy to enable a specific group of people, poor rural women and men, to gain for themselves and their children more of what they want and need.” Singh (1999) defines Rural Development as “A process leading to sustainable improvement in the quality of life of rural people, especially the poor”. The fact of the matter is that three quarters of the world’s poor, about 900 million people are in rural areas, and the Millennium poverty target set by Millennium Development Goals (MDG), cannot be met unless the world addresses rural poverty. “Sustainable Rural Development can make a powerful contribution to four critical goals of: Poverty Reduction, Wider shared growth, Household, national, and global food security and Sustainable natural resource management” (World Bank, 1997). Hence worldwide there is a growing emphasis on development of rural economy of the countries. Any improvement, in the social or economic status of rural areas would not just directly benefit rural poor but would also bring down the migration-pressures on cities and contribute by positive ripple effect in global stride towards development.

The process of development in a country is to be aided by its governance. The goal of governance “should be to develop capacities that are needed to realize development that gives priority to the poor, and creates needed opportunities for employment and other livelihoods” (The World Bank, 1992, UNDP, 1994). Increased number of poor, hungry or marginalized people in a country represents decrease in its quality of governance. To promote development, various studies have proposed governance in the contextual realities of each country, including veritable participation of citizens in the governmental decision-making process (Grindle, 2004; Evans and David, 2006). Several Institutions and experts accept Governance as a reflexive process, wherein policies, institutions, outcomes and analysis interact, to maximize the process of participatory development (UNDP, 1997; Ludden, 2005; Mehta, 2006).

Information and communication technologies (ICT), including radio and television and the newer digital technologies like computers and the Internet as potentially are introduced powerful tools and activators of educational reform and changes. different ICT, when properly applied can be developed to help access to education and the relationship between training and workshops to strengthen the increasingly digital, the quality of education also helped to create teaching and learning in an active process connected to real life high take. However, the experience of being raised by ICT in the classroom and other educational sites around the world during the last few decades proves that is not automatic fully realize the potential benefits of ICT training. (Guptaand et al, 2004)

Effective integration of ICT in the educational system is a complex process that involves not only technology but also involves educational and technical training, institutional readiness, teacher competencies and long-term investment. In fact the subject of such vital importance is that the technology to get the easiest part of it. Introduced ICT information and communication technologies are for this purpose, as a different set of tools and technology resources, used to information communicate, create, release, storage and management have been defined. These technologies are including computers, internet, broadcasting technologies (radio and television) and telephone. In recent years started a wave of intense public interest about how computers and the Internet can become a better control to the efficiency and effect of education at all levels and in both formal and informal development. (Rogers and Shukla, 2001).

But nowadays, ICT is more than a technology. Although the old technologies such as telephone,

radio and television, will be less attention in the past but were used as educational tools. For example, "radio and television are used for over forty years to open and distance education. In this regard, although print remains the most expensive method and therefore available, but in developed and developing countries is provided the most prominent mechanism. ICT for developing countries, are associated a potential for increased availability and quality of training and development. ICT basis and attract a lot of knowledge and its acquisition, providing unprecedented opportunities for developing countries, adding and expanding educational systems, improve policy formulation and implementation of opportunities to expand scope of work and gives poor facilitation. One of the biggest hardships that the poor are bearing the other people, who live in the poorest countries, is the sense of isolation. Communication technologies such sensory loss, are guaranteed and also has been unthinkable facilitate access to knowledge through the ways that already. However, the reality of the digital divide (the gap between those who control access technology and those who do not have access) means that the introduction and integration of ICT are challenging at different levels and in various types of training, most commitments. Failure in this struggle to become more significant gap of knowledge and the deepening economic and social inequalities (UNDP, 1997; Ludden, 2005; Mehta, 2006).

How ICT can help developing access to education?

ICT is a potentially powerful tool for developing educational opportunities, whether formal or informal is for areas already "stated (rural and dispersed populations) ethnic minorities, women, girls, disabled and old people traditionally excluded from education groups because of cultural or social reasons are also all those financial reasons or time constraints can not register in educational centers. Any time, anywhere (defining feature ICT) capability in ICT is a passing of time and place. ICT, education or training with asynchronous features provide a time delay between education and its acceptance by students makes it possible.

ICT applications in education:

Organizations and educational policy planners should first of all about the desired educational outcomes (mentioned above) is straightforward. The broad objectives must choose different technologies used to go and how to apply the guidance to go. Potential of each technology varies according to how to use. Haddad and Draxler have been identified IT application in education at least five levels of:

1. present,
2. experimental proof,

3. practice and practice,
4. interaction,
5. collaboration

Each of the different ICT tools (print, audio cassette and video, broadcast radio and television, computer or Internet) may provide the most basic means and surfaces used to go to prove. Except for visual technology, practice and practice the maximum use of both technologies may be offered. Each of the different ICT (print, audio cassette and video, broadcast radio and television, computer or Internet) used to may provide the most basic means and surfaces. Except for visual technology, may be offered practice and practice the maximum use of both technologies. The other network computers and Internet, ICT interactive learning that are provided and they if only used for providing proof or go, was not realized can better their full potential (Jauhari, 2004)

Conclusion:

Regardless of the wide differences in ICT access between rich and poor countries and between different groups in the country, there are concerns that challenge the application of ICT in education with the existing differences among the lines of economic, social, cultural, geographic and gender will be broader. Everyone equal opportunities in terms of suitability for participation are necessary, but access to various factors, either as users or as producers through their sources is difficult and heavy. Therefore, the primary differences enhance and even grow. Consequently, programmers' international education is faced with a difficult challenge and how to help solve the problem and its development.

Promoting ICT in education, when done without careful study, can lead to the marginalization of those with more favorable conditions are unknown. For example, "women compared with men, because of illiteracy, lack of higher education, lack of time and mobility and poverty, controlling access to ICT and fewer opportunities for training are relevant. Also, more boys than girls' access to computers at home and school are not strange to say that if more boys than girls are willing to work with computers. The report of the University Association of American Women is that "Although some girls have an important gender gap have been limited, but today's technology, technology club, and boys in public schools while its own problems and programs are settled girls use computers for word processing the brand". In an assessment in four African countries, the activities organized by World links remote international cooperation on projects between

teachers and students in developing countries will promote, despite creating programs without regard to sex contacts, sexual inequalities remain Uganda and Ghana. In addition, while more girls than boys in relation to academic performance and advanced communication skills program will enjoy more than boys, but they were unable to perform their technological skills were. A set of economic factors, organizational and cultural differences involved in the social.

"The high ratio of students to computers and politics, whoever came first, the first is used in accordance with the girls wanted it." Girls travel restrictions in the early hours of daily work and home responsibilities are that this will limit their access. Also because local patriarchal beliefs dominate the boys are in the computer lab environment. Including proposed measures to address this discrimination, strategies to encourage schools to create "fair use" in the computer labs and the holding of meetings and sexual sensibilities conductivity decreased defense duties after school girls. ICT provides access to only a small part of the action is created equal. Equal attention should also be applied to ensure the technology really "is used by learners and ways of how well their needs will cure.

An educational program that reinforced this approach shows the overall program is bilingual. The program seeks to establish technology learning centers for bilingual teachers, students, teachers, parents and community members. Technical teams from each center three students, two teachers and the director of the Center with at least one female student and a teacher are female.

Another example of a general approach to the application of ICT in education, radio education project Gobi Women of Mongolia, which seeks to provide professional and educational structure of women's favorite courses around the nomads and their opportunities for income generation.

It contains topics such as livestock rearing, family support (family planning, health, nutrition and health) to create income in the application of local raw materials and basic skills for the job is a new market.

Abstract: Distance education dictates changes in behavior for both the teacher and the learner. The successful student develops persistence and skills in self-directing work. The successful distance education teacher becomes conversant with new technology and develops new instructional styles, moving from creating instruction to managing resources and students and disseminating views. Administrative and faculty support for distance education are critical to the success of this instructional method. Administrators should take note that the implementation of a distance education program may allow access to a greater number of students. However, the time and work associated with teaching at a distance exceeds the normal requirements of campus-based instruction. Students in distance education settings perform as well or better on assignments, class activities, and exams when compared to campus-based students. Nevertheless, students must maintain persistence and a clear focus to succeed in a distance learning situation. Self-direction, a passion for learning, and strong individual responsibility are important influences on achievement. There are indications that distance education works best for more mature, motivated, well-organized, and already accomplished learners. Distance education courses vary greatly in scope, level, and length. Some have a few assignments and require only a few months to complete, while others have a hundred or more lesson assignments requiring three or four years of conscientious study. Distance education is a method of education in which the learner is physically separated from the teacher and the institution sponsoring the instruction. It may be used on its own, or in conjunction with other forms of education, including face-to-face instruction. In any distance education process there must be a teacher, one or more students, and a course or curriculum that the teacher is capable of teaching and the student is trying to learn.

[Mehran Bozorgmanesh and Mojtaba Sadighi. **The role of utilization Distance Education in adult education.** Journal of American Science 2011;7(6):717-721]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Distance Education, adult education

Introduction:

Distance education is education designed for learners who live at a distance from the teaching institution or education provider. It is the enrollment and study with an educational institution that provides organized, formal learning opportunities for students. Presented in a sequential and logical order, the instruction is offered wholly or primarily by distance study, through virtually any media. Historically, its predominant medium of instruction has been printed materials, although non-print media is becoming more and more popular. It may also incorporate or make use of videotapes, CD or DVD ROM's, audio recordings, facsimiles, telephone communications, and the Internet through e-mail and Web-based delivery systems. When each lesson or segment is completed, the student makes available to the school the assigned work for correction, grading, comment, and subject matter guidance by qualified instructors. Corrected assignments are returned to the student. This exchange fosters a personalized student-instructor relationship, which is the hallmark of distance education instruction. Trainers using these new technologies were successful educational programs to millions seek learning opportunities and thereby reach out to the educational spaces, training centers to expand. With the development of long-

distance telephone system in the early twentieth century method of capacity and distance learning methods for students to access educational opportunities in the world increased Translation. But until the invention of mobile tele conference ever in the 80 and 90 and the main role in the concept of distance education did not play. Telemetry system, allowing for teachers conference provided that without the slightest delay at a time when your students can listen to them talk and sometimes they see.

Expansion of computer networks in the decade 1990 and connect millions of people through lines to the telephone networks made it possible to simply distance learning via computers and computer conferences around the world is possible (a) and Today with the development of control technology are in science and technology around the world.

Historically, most distance education courses were vocational in nature, but today courses are offered for academic, professional, and avocational purposes for students of all ages. There are numerous specialized programs, such as those for blind persons and for parents of small children with hearing impairments. Distance education is available in practically any field, from accounting to zoology. Courses are offered in gemology, high school diploma,

journalism, locksmithing, child day care management, yacht design, and many fascinating subjects. Distance education courses also vary greatly in scope, level, and length. Some have a few assignments and require only a few months to complete, while others have a hundred or more lesson assignments requiring three or four years of conscientious study. Since 1890, more than 130 million Americans have studied at DETC member institutions, including Franklin D. Roosevelt, Walter P. Chrysler, Walter Cronkite, Barry Goldwater, Charles Schulz, and many other distinguished alumni of DETC members. Unlike most distance education courses offered by traditional colleges and universities that are semester and classroom oriented, with courses offered by most of the DETC-accredited institutions you can study any time and anywhere. Distance education is especially suited for busy people who wish to increase their knowledge and skills without giving up their jobs, leaving home, or losing income. You learn while you earn. Many courses provide complete vocational training; others prepare you for upgrading in your present job, without losing wages, experience or seniority. You receive individual attention, and you work at your own pace. In recent years, technology has played a significant role in transforming the traditional distance education school into a dynamic, interactive distance learning method using toll-free telephone lines, as well as a diverse array of personal computers, video devices, CD and DVD ROMs, online courses over the Internet, interactive devices, and other modern technological innovations. The future for distance study promises to be exciting!

Distance education can be used for some aspects of most disciplines. For example, several institutions of higher education already have developed certificate programs, undergraduate programs, and graduate programs in health and physical education that are delivered using distance education methods. Eastern Oregon University, Emporia State University, Kutztown University, LaSalle University, the Medical College of Wisconsin, University of Wisconsin at Stevens Point, and Virginia Tech are among institutions integrating distance technology into their physical education programs.

Traditional programs that are heavily based in skill development and demonstration or require laboratory work can be offered in a distance education framework using interactive video interfaced with computers to facilitate a hands-on learning approach at a distance. Classes that use lecture and laboratory experiences are easily adapted to a distance education situation. Course materials, including animals for dissection, are sent to class participants with video and written instructions and assignments.

Distance education dictates changes in behavior for both the teacher and the learner. The successful student develops persistence and skills in self-directing work. The successful distance education teacher becomes conversant with new technology and develops new instructional styles, moving from creating instruction to managing resources and students and disseminating views (Strain, 1987). Administrative and faculty support for distance education are critical to the success of this instructional method. Administrators should take note that the implementation of a distance education program may allow access to a greater number of students. However, the time and work associated with teaching at a distance exceeds the normal requirements of campus-based instruction.

Students in distance education settings perform as well or better on assignments, class activities, and exams when compared to campus-based students (St. Pierre, 1998). Nevertheless, students must maintain persistence and a clear focus to succeed in a distance learning situation. Self-direction, a passion for learning, and strong individual responsibility are important influences on achievement. There are indications that distance education works best for more mature, motivated, well-organized, and already accomplished learners (Rintala, 1998).

Garrels (1997) describes five critical elements for successful teaching at a distance:

1. Instructor enthusiasm. This requires animation and comfort in front of the camera, or with the technology utilized. Faculty support and interest are critical to the success of distance learning endeavors.
2. Organization. Teaching materials must be prepared in advance; timing, variation, and smooth transitions must be planned. Instructors should allocate from 3 to 5 hours of preparation for each hour of distance instruction. Great attention to detail is required long before the actual classroom activity occurs (Summers, 1997).
3. Strong commitment to student interaction. Whatever the modality used to teach at a distance, the instructor must encourage and facilitate ongoing communication between the students and the instructor.
4. Familiarity with the technology used in the class format. Faculty development is important before beginning any distance activities, and instructors should be trained in video use, computer use, or other forms of instructional technology used.
5. Critical support personnel. Production staff, graphic designers, and technical staff members will help the instructional setting produce successful teaching at a distance.

Distance education is any type of schooling that takes place away from a physical campus. Distance education is also known as:

- distance learning
- virtual learning
- online learning
- e-learning
- online education
- web-based training

Types of Distance Education Programs:

There are two types of programs offered by distance education schools: synchronous learning programs and asynchronous learning programs. With synchronous learning, distance education students must log on to the school's website at a set time. Often, they interact with their peers and professors via group chats, web seminars, video conferencing, and phone call-ins. With asynchronous learning, distance education students complete all coursework on their own time. They often learn via assignment sheets, message boards, email, pre-recorded video lectures, mp3s, and traditional mail correspondence. Distance education began for the delivery of courses to students who live in remote areas. Over the years, though, this form of education has become the preferred method for learning outside of the classroom.

Distance Education is now undertaken by people with busy schedules, hectic lifestyles, special needs, and also those living in isolated areas. What's more, with such flexible learning options you can choose to study at any time and from any location you like.

There are a number of different **forms of distance education** and it's important to know which method you prefer:

- **Correspondence learning:** your course materials are printed and sent out to you by mail/courier. The advantages are that you have a printed set of reference materials, you can study anywhere and you are not reliant on a computer, you can learn for long periods of time.
- **eLearning:** your course materials are provided to you in multimedia format; that is, on CD/DVD. In this way you can choose to take your study materials within you and learn anywhere in the world with just a laptop.
- **Online learning:** no materials are sent to you and you do all your learning online. The limitation is that you need to be logged onto a computer (though you may be able to download and print some of your materials yourself, though this can cost you more in ink), there is a limit to how much you can absorb and do

online, and most people's attention span on-screen is limited to 20 minutes (your eyes get tired after that).

- **Broadcast learning:** where you tune into a series of television, radio or Internet broadcasts (e.g. podcast, YouTube, etc.).
- **Teleconferencing:** where your lessons are conducted in real time through an Internet connection. Limitations are that streaming can be slow, connections can cause problems (students and teachers generally need to be computer literate) and there can be delays in talk-time, depending on software, hardware and connection capabilities.

Conclusion:

Interactivity may be delayed but interaction provided by teacher telephone office hours when students can call or through time with on-site facilitators. Classes with large numbers of students have a limited amount of interactivity. Much of the activity on computer networks is on a delayed basis as well. Possibilities for audio and visual interaction are increasingly wide. Distance learning is expanding and examples of it are increasing dramatically. Fewer than 10 states were using distance learning in 1987; today, virtually all states have an interest or effort in distance education. Distance learning systems connect the teacher with the students when physical face-to-face interaction is not possible. Telecommunications systems carry instruction, moving information instead of people. The technology at distant locations are important and affect how interaction takes place, what information resources are used, and how effective the system is likely to be.

Technology transports information, not people. Distances between teachers and students are bridged with an array of familiar technology as well as new information age equipment. What sets today's distance education efforts apart from previous efforts is the possibility of an interactive capacity that provides learner and teacher with needed feedback, including the opportunity to dialogue, clarify, or assess. Advances in digital compression technology may greatly expand the number of channels that can be sent over any transmission medium, doubling or even tripling channel capacity. Technologies for learning at a distance are also enlarging our definition of how students learn, where they learn, and who teaches them. No one technology is best for all situations and applications. Different technologies have different capabilities and limitations, and effective implementation will depend on matching technological capabilities to education needs.

Distance education places students and their instructors in separate locations using some form of

technology to communicate and interact. The student may be located in the classroom, home, office or learning center. The instructor may be located in a media classroom, studio, office or home.

The student may receive information via satellite, microwave, or fiber optic cable, television (broadcast, cable or Instructional Television Fixed Services (ITFS)), video cassette or disk, telephone - audio conferencing bridge or direct phone line, audio cassette, printed materials - text, study guide, or handout, computer - modem or floppy disk, and compressed video. Recent rapid development of technology has resulted in systems that are powerful, flexible, and increasingly affordable. The base of available information technology resources is increasing with dramatic speed. Much has been learned about connecting various forms of technology into systems, so that the ability to link systems is growing. Most distance learning systems are hybrids, combining several technologies, such as satellite, ITFS, microwave, cable, fiber optic, and computer connections.

High front-end costs prevented an early widespread adoption of electronically mediated learning. Distance learning has been aggressively adopted in many areas because it can meet specific educational needs. As the concept of accountability became accepted and laws required certain courses in high school in order for students to be admitted to state colleges, telecommunications was examined as a way to provide student access to the required courses. Many rural school districts could not afford the special teachers to conduct required courses. Distance education met this need by providing courses in schools where teachers were not available or were too costly to provide for a few students. It also fulfilled a need for teacher training and staff development in locations where experts and resources were difficult to obtain. These systems link learner communities with each other and bring a wide array of experts and information to the classroom.

Challenges which faced the early users of distance education are still with us today. If distance education is to play a greater role in improving the quality of education, it will require expanded technology; more linkages between schools, higher education, and the private sector; and more teachers who use technology well. Teachers must be involved in planning the systems, trained to use the tools they provide, and given the flexibility to revise their teaching. Federal and state regulations will need revision to ensure a more flexible and effective use of technology. Connections have been established across geographic, instructional, and institutional boundaries which provide opportunities for collaboration and resource sharing among many groups. In the pooling

of students and teachers, distance learning reconfigures the classroom which no longer is bounded by the physical space of the school, district, state or nation.

The key to success in distance learning is the teacher. If the teacher is good, the technology can become almost transparent. No technology can overcome poor teaching which is actually exacerbated in distance education applications. When skilled teachers are involved, enthusiasm, expertise, and creative use of the media can enrich students beyond the four walls of their classroom.

Teachers need training in the system's technical aspects and in the educational applications of the technology. Areas for assistance include the amount of time needed to prepare and teach courses, how to establish and maintain effective communication with students, strategies for adding visual components to audio courses, ways to increase interaction between students and faculty, planning and management of organizational details, and strategies for group cohesion and student motivation.

Income Bipolarization and Poverty: Evidence from Rural Nigeria

Oluwole I. Ogunyemi¹ & Omobowale A. Oni²¹Agricultural Economics Department, University of Ibadan, Ibadan, Oyo State, Nigeria. woleoguns@yahoo.com²Agricultural Economics Department, University of Ibadan, Ibadan, Oyo State, Nigeria waleoniayo@yahoo.com

Abstract: The disappearance of the middle class- income bipolarization could result into tension and social conflict. If such conflict starts in the rural area, the possible resulting revolts would clog the wheel of economic production and policy implementation and there is possibility of spreading to the urban area. The study therefore estimated income bipolarization in the rural area of Nigeria from 1980 to 2004 using Foster-Wolfson –FW- (1994) and Lasso de le Vega and Urrutia – LU- (2006) indices. Bipolarization linked poverty was estimated for the periods through the later and Foster-Wolfson bipolarization estimates were linked with the poverty status and other socio-economic features of the rural households by tobit regression analysis. Bipolarization was found to be on reduction from 1992 to 2004 moving in the direction of poverty level. FW Bipolarization was 0.6125, 0.4067, 0.4775, 0.4108 and 0.3529 in 1980, 1985, 1992, 1996 and 2004 while LU Bipolarization was 0.1676, 0.1430, 0.1610, 0.1460 and 0.1383 for the same years respectively. Poverty has highest significant positive effect on bipolarization with a marginal effect of 0.02520. The marginal effects of age was 0.00014, female head households was 0.00119. Household size, father's education, mother education, married status, farming and wage employment have significant negative marginal effects of 0.00037, 0.00027, 0.00013, 0.00636, 0.000697 and 0.00105 respectively. Income bipolarization is higher among households located in the South than their base category, the north. Poverty and its covariates have higher sum total interactive positive effect on bipolarization than their base categories, the non-poor covariates. There is need to reduce poverty for bipolarization to decline. The southern part needs more attention in bipolarization reduction strategies. All variables that reduce poverty like education would have to be harnessed further to reduce bipolarization to guide against the occurrence of its consequences.

[Oluwole I. Ogunyemi & Omobowale A. Oni. Income Bipolarization and Poverty: Evidence from rural Nigeria. Journal of American Science 2011;7(6):722-731]. (ISSN: 1545-1003). <http://www.americanscience.org>

Key words: Middle Class, Disappearance, Bipolarization, Poverty, Rural

1. Introduction

Income distribution analysis is a phenomenon that has attracted the attention of researchers in recent times and the importance of income becomes more apparent as poverty is characterized by low income. Income refers to consumption opportunity gained by an entity (household) within a specified time frame, which is generally expressed in monetary terms (Wikipedia, 2008). Radwan (2008) reported that about 90 percent and 70 percent of Nigerians live on less than US\$2 and US\$1 per day respectively implying 10 percent living on US\$2 and above. This somehow indicates that income in Africa and Nigeria in particular, is not evenly distributed; some are in the lower part, some in the middle class and the remaining in the upper class. NBS (2007) mentioned that it is clear that high rate of poverty and income inequality have threatened the Nigerian middleclass with extinction; creating doubt about the relevance and impact of most macroeconomic reforms of the past. If the distribution is at either side of the divide, lower or upper class with the middle class shrinking or becoming extinct, such income distribution is said to exhibit polarization. (Vander puye-Orgele, 2002; Chakravarty and Majumder, 2001; Rodriguez, 2006).

According to Chakravarty and Majumder (2001), income polarization is the decline of the middle class and is of two types: The first type is if a distribution is more spread out from the middle position to the tails, thus increasing the distance between two groups below and above the median income level (polarization). And the second type is increased bipolarity (bipolarization) where incomes below or above the middle position become closer to each other as shown in figure 1, which we have decided to measure in this study as a matter of choice and for us to bring in the concept of poverty which still remain a problem in Nigeria. Therefore polarization engenders clustering of the elements in the income distribution at polar modes. This markedly shows that income polarization is quite different from income inequality another feature in income distribution analysis which means how the element spread out from the mean or median which is overall dispersion of the distribution.

Considering an income distribution continuum of $x = (x_1, \dots, x_n)$ where x_i is the positive income level of the i^{th} person and $m(x)$ is the median income of x as shown in figure 1. The figure shows polarization increasing movement which is increased bipolarization and it occurs when income levels below

Figure 1. Increased Bipolarization (Inferred from Wang and Tsui, 2000)

or above $m(x)$ move closer to each other; bipolarization will increase if y_i and x_i below and y_j and x_j above $m(x)$ move closer to each other. y_i and x_i below and y_j and x_j above $m(x)$ become identify with reducing inequality, that is, increasing identity but increase alienation between those below and above $m(x)$. The distribution therefore features poor and rich groups (Esteban and Ray, 1994). An individual eventually falls into either of the groups; the distribution exhibiting a population that is either rich or poor with very small or no middle class bridging the gap between the two.

Presently, Nigeria economy is driven by agriculture and is rural based employing large proportion of her labour force with about 70% of the population (NBS, 2005) in the rural area and the sector was reported to have the highest contribution of 41.84% to her GDP in the year 2009 (NBS, 2010). If income distribution is therefore polarized in the rural area, the possible tension and social conflict that could arise will disrupt rural production and spill over to urban sectors with serious strikes, demonstrations, processions and revolt which Duclos, Esteban and Ray (2004) identified as consequences of polarization with implications for sustainability of policy implementation (Aigbokhan, 2000).

In spite of the relevance of income bipolarization, literature on it is very lean and much is still needed to be done and reported (Wang and Tsui, 2000) and the situation is not different in Africa. This study adds to the available literature on income polarization in Nigeria and Africa which include that of Aigbokhan (2000), Vanderpuye-Orgle (2002) and Awoyemi et al (2006). The study therefore adopted Foster Wolfson (1994) (FW) and Lasso de la Vega and Urrutia (LU) as demonstrated by Duclos Esteban and Ray (2008), and Rodriguez (2006) respectively to measure income bipolarization over some years due to available software and relative ease in their computation. With LU, bipolarization was linked with poverty.

The linkage of bipolarization and poverty is desirable due to the fact that poverty level is high in Nigeria with poverty incidence of 54.5% in 2004 while it was 43.2% and 63.3% in urban and rural areas respectively (NBS, 2004). It is therefore worth measuring income bipolarization between the poor people and the rest of society and to make policy makers aware of the possible social conflict which could be measured by the bipolarization index due to

poverty (Rodriguez, 2006). Hence the use of LU bipolarization linked poverty to establish if the rural income distribution poses a danger of social conflict in Nigeria. Consequently, the paper is aimed at addressing the pattern of bipolarization in the rural sector of Nigeria over the period 1980 to 2004, the linkage between bipolarization and rural poverty, and households' socio-economic characteristics which include their poverty status through regression. Many studies including Nnadi and Nnadi (2009) applying regression analysis often capture socio-economic features and we hypothesize that there is no significant relationship between the characteristics and bipolarization.

2. Methodology

The geographical area of this research is the rural area in Nigeria. The sample frame is all the rural households enumerated by NBS in 1980, 1985, 1992, 1996, and 2004. The same research design was used by NBS to get the five sets of data. Therefore, secondary data of the four national consumer surveys done in 1980/81, 1985/86, 1992/93 and 1996/97 by the Federal Office of Statistics (rechristened National Bureau of Statistics, NBS) were used and that of year 2004 Nigeria Living Standard Survey. The complete household level survey data set were used and were extracted from diskettes obtained from NBS. It should be noted that the surveys were done with the assistance of the World Bank and British Council (NBS, 2004). These data sets were use by NBS (2004, 2005) to analyze the published poverty profile in Nigeria. Normalized real per capita consumption expenditure of the households was used as proxy for income and analyzed as follows:

The pattern of bipolarization among the rural households:

a) Foster-Wolfson (1994) index and Lasso de la Vega and Urrutia bipolarization index were used.

i) The Foster-Wolfson index (FW) (1994) is based on the Lorenz curve and it is derived from the Gini-Coefficient and it was demonstrated by Duclos, *et al* (2008) as

$$FW(k) = 2[2[0.5 - L(k, 0.5)] - I_2(k)] \frac{\mu(k)}{Q(k, 0.5)} \dots\dots\dots (1)$$

$$= \frac{\xi(k; \rho=2) - 2GL(k, p=0.5)}{Q(k, p=0.5)} \dots\dots\dots (2)$$

Where:

- () = The Gini social welfare Index
 - GL(p) = The Generalized Lorenz Curve
 - Q(p) = The Quantile function
 - I₂(k) = The Gini index of inequality
- We use equation (1) because Gini social welfare index was not reckoned with.

ii) Lasso de la Vega and Urrutia bipolarization index as demonstrated by Rodriguez (2006) is given as

$$P^{LU}(X; \alpha, \beta) = \left[\frac{\prod_1^\alpha (1 - G_1)^\beta + \prod_2^\alpha (1 - G_2)^\beta}{\prod_1^\alpha (1 - G_1)^\beta + \prod_2^\alpha (1 - G_2)^\beta} \right] G_h^B(x) \dots\dots\dots (3)$$

where,
 h= income that separate the income distribution into two different income groups
 if h= m, the median income Equation (3) becomes

$$P^{LU}(X; \alpha, \beta) = \left(\frac{1}{2} \right)^\alpha \left[\frac{(1 - G_1)^\beta + (1 - G_2)^\beta}{(1 - G_1)^\beta + (1 - G_2)^\beta} \right] G_m^B(x) \dots\dots\dots (4)$$

- where,
- x = x₁, ..., x_n = income levels
- x_i = the income of the ith household
- m = median income
- ∏_i = percentage of the population of group i
- ∏_i^α = the identification term
- = 1 or 1.6 = importance of group identification
- β ≥ 0 = the degree of sensitivity towards group cohesion
- ∏_i^α (1 - G_i)^β = Identification term of group i
- i = 1, 2
- G^B = Between groups Gini-coefficient

Moreso, bipolarization was linked with poverty using Rodriguez (2006) approach. Accordingly, if poverty line, z, is the income level that divides the income distribution in two groups, the bipolarization between poor people and others is explicitly based on a poverty index and LU bipolarization index is a function of the normalized poverty deficit index of Foster-Greer-Thorbecke (FGT) as stated here-under.

$$P^{LU}(X; \alpha, \beta) = \left[\frac{\prod_1^\alpha (1 - G_1)^\beta + \prod_2^\alpha (1 - G_2)^\beta}{\prod_1^\alpha (1 - G_1)^\beta + \prod_2^\alpha (1 - G_2)^\beta} \right] \left[\frac{T_Z^{FGT}(x; 1) + \frac{\prod_1 \mu_i (\mu - Z)}{\mu}}{\mu} \right]$$

$$T_Z^{FGT}(x; \gamma) = \text{product of headcount and income gap ratio} \dots\dots\dots (5)$$

$$T_M^{FGT} = T_Z^{FGT}(x; \gamma) = \frac{1}{N} \sum_{i=1}^n \Gamma(x_i)^\gamma \dots\dots\dots (6)$$

$$\Gamma(x_i) = \max \left[\frac{Z - x_i}{Z}; 0 \right] \dots\dots\dots (7)$$

where, FGT = Foster-Greer-Thorbecke family of poverty measure

- γ = FGT parameter = 1
- x_i = income of the ith household
- x = the household distribution, x₁, x₂, ..., x_n
- n = number of households below the poverty line, Z
- N = the total sample population
- Z = poverty line (2-3rd of mean income)
- μ = mean income of the total population distribution.
- μ₁ = mean income of the poor in x-distribution below Z

This family of poverty measures is the normalized poverty deficit index or the product of the headcount and income gap ratios, D_Z(x)/Z = I_Z(x), when γ = 1, I₁ = q/n and I_Z(x) is the income gap ratio. The model, equation 5, is sensitive to incidence of poverty and its intensity because γ = 1. Rodriguez (2006) mentioned that it might be more suitable to use the poverty line to measure income bipolarization instead of using the median or mean incomes to divide the income distribution into two groups. By this, bipolarization and poverty measures are closely related, capturing normalized poverty deficit index as bipolarization is between the poor and the non-poor in the income distribution.

Finally, using 2004 data point, households' poverty status and bipolarization were considered using tobit regression with covariance analysis approach because most of the regressors are dummy variables. We generated FW bipolarization estimates for all the Thirty Six States of the Country. The estimate per state was then adopted for all households in that State as their bipolarization indices. This is because bipolarization estimate cannot be directly measured for each household and the household bipolarization estimate of the entire rural households was used as dependent variable against their poverty status as poor and non-poor households based on the two-third

poverty line and other socio-economic variables as shown below. The lowest and highest bipolarization estimates were used as the lower and upper limits for the tobit application using Stata 10.1. The tobit equation is as follows:

$$Y_i^* = \beta X_i + \varepsilon_i \quad \dots\dots\dots (8)$$

For , $Y_i = Y^*$ if $Y^* > T$
 Y^* if $Y^* \leq T$

Assuming $T = 0$

Thus $Y_i = Y^*$ if $Y^* > 0$ or
 0 if $Y^* \leq 0$

If $Y_i^* = Y$, then

$$Y = f(X_i, d_i) \quad \dots\dots\dots (9)$$

Where, $i = 1, 2, \dots, n$

Y = Bipolarization, Continuous variable

X = Socioeconomic Variable

d = Dummy socioeconomic variable (some will be additive while some will be multiplicative).

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 d_1 + \beta_6 d_2 + \beta_7 d_3 + \beta_8 d_4 + \beta_9 d_5 + \beta_{10} d_6 + \beta_{11} d_7 + \beta_{12} d_8 + \beta_{13} d_9 + \beta_{14} d_{10} + \beta_{15} d_1 d_2 + \beta_{16} d_1 d_3 + \beta_{17} d_1 d_4 + \beta_{18} d_1 d_5 + \beta_{19} d_1 d_6 + \beta_{20} d_1 d_7 + \beta_{21} d_1 d_8 + \beta_{22} d_1 d_9 + \beta_{23} d_1 d_{10} + \beta_{24} d_1 X_1 + \beta_{25} d_1 X_2 + \beta_{26} d_1 X_3 + \mu \quad \dots\dots\dots (10)$$

Where,

Y_1 = Income Bipolarization of household $i = 1$

X_1 = Age (in years)

X_2 = Household Size (number of individual in each household)

X_3 = Fathers' Education (Years)

X_4 = Mothers' Education (Years)

d_1 = Household poverty Status (Poverty Dummy: 1 = poor, 0 = Non Poor)

d_2 = Gender (Female Dummy: 1 = female, 0 = male)

d_3 = Marital Status (Married Dummy: 1 = Married, 0 = otherwise)

d_4 = Religion Status (1 = Christian/Muslim, 0 = otherwise)

d_5 = Occupational Group (Farming Dummy: 1 = Farming, 0 = Non Farming)

d_6 = Membership of Socio Group (Membership Dummy: 1 = Membership, 0 = Non Membership)

d_7 = Retired Age (1 = Minimum of 60 years-Retired, 0 = below 60 years- Active age)

d_8 = Wage employment (Wage Dummy: 1 = Wage employment, 0 = Non Wage employment)

d_9 = Geographical location (South Dummy: 1 = South, 0 = North)

d_{10} = Credit status (Credit Access Dummy: 1 = Access to Credit, 0 = No Access to credit)

Interactive Dummies = $d_1 d_2, d_1 d_3, d_1 d_4, d_1 d_5, d_1 d_6, d_1 d_7, d_1 d_8, d_1 d_9, d_1 d_{10}, d_1 X_1, d_1 X_2, d_1 X_3,$

All coefficients of d_1, d_2, \dots, d_{10} (that is $\beta_5, \dots, \beta_{14}$) are differential intercepts coefficients because they tell us by how much the mean value of bipolarization indices of the dummy category that receives the value

of 1 differs from the intercept coefficients of the benchmark category, the category that receives the value of 0.

$\beta_5, \dots, \beta_{10}$ = Differential effects of the respective dummy variable (or Differential Intercepts Coefficients)

$\beta_{11}, \dots, \beta_{19}$ = Differential effects of the interaction dummies in multiplicative form (or Differential Slope Coefficients)

$\beta_{20}, \dots, \beta_{22}$ = Differential Slope Coefficients or Slope Drifter.

β_1, \dots, β_4 = Slope Coefficients of X_i
 ε_i = Error term

3. Results and Discussion

Pattern of income bipolarization by FW and LU: Foster-Wolfson (FW) and Lasso de la Vega and Urrutia (LU) bipolarization indices show similar pattern. Bipolarization decreased between 1980 and 1985, increased up to 1992 and reduces through 1996 to 2004 as shown in Table 1. Bipolarization estimates through FW index were 0.6125, 0.4067, 0.4775, 0.4108 and 0.3529 in the years 1980, 1985, 1992, 1996 and 2004 respectively. This means that the size of the middle class in the rural area increased in 1985, reduced in 1992, then increased in 1996 and further in 2004. This calls for the sustenance of existing macro-economic policies and rural economy development programmes in encouraging the trend to continue. Compare with Awoyemi (2009) bipolarization estimates of 0.49 and 0.37 in 1996 and 2004 respectively, the estimates are close with similar trend. Aigbokhan (2000) also obtained Wolfson bipolarization of 0.72, 0.65 and 0.51 for the rural Nigeria in 1985, 1992 and 1996; these estimates are comparable with our figures. Similar pattern is provided by LU Index. The LU index with $\beta = 1.6$ and $\alpha = 1.0$ gave the lowest estimates of 0.1676, 0.1430, 0.1610, 0.1460 and 0.1586 in 1980, 1985, 1992, 1996 and 2004 respectively as shown in table 1. So the discussion forthwith will be based on the estimates obtained with degree of alienation parameter $\beta = 1.6$ and degree of identification parameter $\alpha = 1.0$; the extreme case of bipolarization parameters and the choice of these parameters is at the discretion of the researcher. As shown in Table 1 the estimates of FW are higher than the LU estimates but the two shows similar pattern within the years under consideration. It should be noted that in the period of Structural Adjustment Programme, 1985 through 1992, bipolarization were enhanced while in post SAP era 1996 to 2004 bipolarization reduced. The probing instinct is that why did bipolarization decreased between 1980 and 1985 and then increased from 1985 through 1986 to 1992.

Table 1. Extent and Pattern of Income Bi-polarization

		Bi-Polarization Indices			
		Lasso de la Vega and Urrutia			
Year	Foster-Wolfson	= 1.6; = 1.0	= 1.6; = 0.5	= 1.0; = 1.0	= 1.0; = 0.5
1980	0.6125	0.1676	0.2024	0.2540	0.3068
1985	0.4067	0.1430	0.1667	0.2168	0.2526
1992	0.4775	0.1610	0.1951	0.2440	0.1899
1996	0.4108	0.1460	0.1703	0.2213	0.2582
2004	0.3529	0.1383	0.1586	0.2096	0.2404

One would recollect that the Federal Government of Nigeria said that economy policy of SAP was a failure in Nigeria instead of improving the income of the rural households, it made it worst. But in subsequent years, the economic frameworks and programme like National Economic Empowerment and Development Strategy, National Poverty Eradication Programme and Fadama Programme appear to be helping in increasing the middle class size in the rural areas. This perhaps is in tandem with the findings of NBS (2007) which showed that there was an upward movement from the core poor to the upper middle class and specifically there was a movement from 12 per cent income of the lowest class to an increase of more than 7 per cent of the upper middle class in 2004. Thus the pattern of bipolarization reflects the policy environment and political economy of the country.

As shown in Table 2, when poverty gap increases, bipolarization increases and when it decreases, bipolarization decreases. In 1980, poverty gap was 0.4481 and bipolarization was 0.2502. In 1985, 1992, 1996 and 2004, the former was 0.2955, 0.3603, 0.2665 and 0.1927 while the later was 0.1939, 0.2110, 0.1816 and 0.1419 respectively. Poverty incidence was 80.44, 66.95, 71.16, 62.76 and 50.39 per cents for the respective years. Thus, as poverty increases/decreases, bipolarization increases/decreases as well. In rural Nigeria therefore, there are those that are poorer among the rural poor population as it has been reported that about 70 per cent of Nigeria population is poor and majority lives in the rural areas (NBS, 2004). Income is bipolarized in rural Nigeria according to the findings and there are poorer people among the rural population indicating income heterogeneity. As households become poorer they move away from the middle income level where majority should be for equality, to the tail end of the income continuum while fewer and fewer households are left in the middle and of course the upper end of the income continuum is usually of very few households as well.

Relationship between bipolarization, household poverty status and socio-economic features:

As shown below table 3, the diagnostic features of the FW bipolarization tobit regression indicate that left and right censoring were zero as all the 42,525 observations in the data set were used in the analysis. The Pseudo R-square was -0.0379; it was pseudo R-square because there are no direct equivalents of R-square (from OLS regression) in non-linear model. The log likelihood ratio chi-square of 5818.92 (df=26) with a p-value of 0.0000 indicates that the model as a whole fits significantly better than a model with no predictors. In the table 3, one would see the coefficients, their standard errors, the t-statistic, associated p-values and the 95% confidence interval of the coefficients as well as the marginal effect of 100% change in the regressor's value on the regressand. Since bipolarization has been observed to move in the same direction with poverty, the expected signs of the coefficients of the regressors, as shown in table 5, follow those of poverty analyzed by Hahm (2010), Mok *et al* (2007), Omonona (2001), Imai *et al* (2009) and Gaiha *et al* (2007).

Age, Poverty Status, Female Gender and Christian/Muslim Religion Status, South Location and Credit access have positive effects on income bipolarization. Household size, Father's and Mother's years of education, Married Status, Farming Occupational Group, Membership of social group, Retired age and Wage employment have negative effects on income polarization. All except household size and credit access follow the apriori expectation. Religion, membership of socio-group, retired age and credit access are not significant even at 10 per cent level of significance; Retired age is significant at 14 per cent while others are significant at higher levels.

Using the marginal effect estimates being superior to the Beta coefficients, If age of household head increases by 1 year, bipolarization will increase by 0.00014 and if household size increases by 1 unit, bipolarization will decrease by 0.00037. If father's or mother's years of education increase by one,

bipolarization will reduce by 0.00027 or 0.00013 respectively. Increasing poverty, female and Christian/Muslim status household head by 100 percent, bipolarization will rise by 0.02520, 0.00119 and 0.00008 respectively. If one increase the Married household heads, farming households, membership of socio-group, retired age households heads and wage employment households by 100 percent bipolarization

will decline by 0.00636, 0.00697, 0.00051, 0.00163 and 0.00105 respectively. If households located in South and Credit access are increased by 100 per cent, bipolarization will rise by 0.01150 and 0.00032 respectively.

Table 2. Poverty and Income Bipolarization

Year	Poverty Index	Poverty Index	LU
	(= 0)	(= 1)	Bipolarization (= 1.6; = 1.0)
1980	0.8044	0.4481	0.2502
1985	0.6695	0.2955	0.1939
1992	0.7116	0.3603	0.2110
1996	0.6276	0.2665	0.1816
2004	0.5039	0.1927	0.1419

Poverty line: 2-3rd of mean per capita consumption expenditure as proxy for income

The implication of this is that age, poverty and female gender tend to feature or induce higher income bipolarization. Christian/Muslim religion status tends to induce higher bipolarization but is not significant. Education, married status, farming, membership of socio-group, retired age and wage employment reduces income bipolarization while South location and Credit access enhances income bipolarization among households, though religion status, socio-group membership, retired age and credit access are not significant. The coefficient of education shows that the higher the education years of household heads, the less is income bipolarization. The more educated households are, the more opportunities the households have of earning more income. This interpretation means that irrespective of the gender and poverty status of household head, bipolarization is positively related to, for instance, age which may not hold and this informed the use of intercept coefficients.

For the differential intercept coefficients relating to the dummy variables in their additive forms the average income FW bipolarization indices of poor households are higher by 0.0252, those of female headed households are higher by 0.00119, those that are Christian/Muslim, South located and credit access are higher by 0.00008, 0.0115 and 0.00032 respectively. Households that are married, farming, member of socio-group, retired age, and wage employment have average income polarization lower by 0.00636, 0.00697, 0.00051, 0.00163 and 0.00105 respectively (refer to table 3) compared with their base categories. Interactively, however, some of the signs and level of significance change for some of the covariates, as shown in same table 3.

According to Table 3, the average income bipolarization index for poor-female headed households is higher by 0.00492 and that of poor-married household is lowered by 0.01652. Similarly, for poor- conventional religion, it is higher by 0.00465 whereas, poor-farming, poor- membership of socio group, poor and 60 years of age minimum, poor- wage employment, poor-south located and poor- access to credit are lower by 0.01048, 0.00105, 0.00252, 0.00060, 0.00569 and 0.00128 respectively when compare with their base categories. Poor households with respect to age have mean income bipolarization that is higher by 0.00041, but with respect to household size and father's education their average income bipolarization is lower by 0.00102 and 0.00058 respectively compared with their base category non-poor.

Table 4 reveals that the sum bipolarization interactive effect of poor-female of 0.03131 is higher relative to poor male or non poor-female and this value is higher than 0.0252 of poverty difference alone and 0.00119 gender difference alone. This probably signals that gender issue will remain one important source of input in income distribution policy as this study shows that income distribution is more polarized among females than male.

Poor - married sum interactive effect of 0.00232 is higher than their base category but the value is lower than the 0.0252 poverty difference alone and higher than marital difference alone (-0.00636). This should not be a surprise finding because most of the household heads are married and their lower mean bipolarization effect only has downward pressure on the sum interactive effect

Table 3: Tobit Regression of Foster-Wolfson Bipolarization

Foster-Wolfson Polarization	Coef	Std. Err	t	P>/t/	Marginal Effect

Poor – religion: The sum interactive effect shows that the household heads that are poor with religion affiliation have average income polarization of 0.02993 more than those that are non-poor with religious affiliation. This value is more than the poverty level difference (0.0252) and religion difference (0.00008) if considered separately. Though not significant, religion affiliation tends to contribute more to income bipolarization. This is contrary to the idea that being a member of a religious group could afford a household

of additional income through interpersonal gifts in terms of money and material items. Religious organization can also give such items to their members thus belonging to a religious organization should have income equalizing effect. It is also common in Nigeria context that religious groups identifies their members' areas of professions and affords them with income rewarding jobs in the religious system.

Table 4. Interactive Effect of the Coefficients:

Interactive or Multiplicative Dummy	Sum of Differential Intercepts and Slope coefficients & Multiplicative Coefficients	Total Interactive Effect
Poor-Female Household	$0.02520 + 0.00119 + 0.00492$	0.03131
Poor- Married Household	$0.02520 - 0.00636 - 0.01652$	0.00232
Poor- Christian/Muslim Household	$0.02520 + 0.00008 + 0.00465$	0.02993
Poor- Farming Household	$0.02520 - 0.00697 - 0.01048$	0.00775
Poor- Member of Socio-Group	$0.02520 - 0.00051 - 0.00105$	0.02364
Poor- 60 years old Minimum	$0.02520 - 0.00163 - 0.00252$	0.02105
Poor- Wage employment	$0.02520 - 0.00105 - 0.00060$	0.02355
Poor- South Located	$0.02520 + 0.01150 - 0.00569$	0.02066
Poor- Access to credit	$0.02520 + 0.00032 - 0.00128$	0.02424
Poor- Age of Household Head	$0.02520 + 0.00014 + 0.00041$	0.02575
Poor- Household Size	$0.02520 - 0.00037 - 0.00102$	0.02381
Poor- Father's Education	$0.02520 - 0.00027 - 0.00058$	0.02435

Poor and farming household have sum interactive effect of 0.00775 higher when compared with their base category. The value is lower than poverty intercept but higher than farming intercept and their slope coefficients of 0.0252, -0.00697 and -0.01048 respectively. This means that poor and non-farming households have less average income bipolarization indices.

Poor and membership of socio-group with total interactive coefficient of 0.02364, the households that fall into this category have income bipolarization that is higher by 0.02364 than their base category, non poor – membership of socio group or poor non-membership of socio-group. This value is lower than poverty difference alone (0.0252) and higher than membership of socio-group difference (-0.00051) when taken into consideration alone. The household heads that are poor and minimum of 60 years old have sum mean bipolarization indices of 0.02105 lower than the poor households intercept difference or higher than the households that are 60 years old minimum (-0.00163) compared with the poor below 60 years of age or non poor-60 years old minimum and it is between 0.0252 (poverty status alone) and -0.00163 (active age difference alone). This shows that among the rural households there probably exists lower income bipolarization among those that are 60 years old and above than those below. As age increases, productivity increases, ceteris paribus, get to peak and start declining to the point of negative. It is only aged people that have probably remittances, savings and socio-economic insurance, for instance, standing perennial cash crops that may not become poorer, that is, that may not fall into victim of being at the tail end of income distribution continuum.

Bipolarization is therefore lower among the aged.

Poor and wage employment household heads have sum interactive income polarization indices of 0.02355 less than poverty difference, 0.0252 but more than those on wage employment difference, -0.00105 compare with their base category, poor-non wage employment or non-poor wage employment. This perhaps implies that with wage employment, polarization of income tends to decline. In the rural area, there exists little or no wage employment opportunities except probably on-farm hired labour which may be one of the reasons for high income bipolarization.

Poor-South located households have sum interactive income bipolarization indices of 0.02066 lower than poverty difference alone (0.0252) but higher than south-located alone (0.0115) compared with their base category, poor -North located or non-poor south located. This implies that income bipolarization indices are higher in the South than in the Northern Nigeria on the average.

Poor- access to credit: The Household heads that fall into this category have sum interactive average income polarization index of 0.02424 higher than their base category, non-poor credit access household heads. This index is lower than 0.0252 (poverty difference alone) and higher than 0.00032 (access to credit difference alone). All these covariates of poverty indicate that poverty has large significant positive effect on bipolarization.

From table 3, the differential slope coefficient of income polarization of the poor households with respect to age, 0.00041 is significantly higher than the non-poor just like its intercept coefficient of 0.0252 is significant both with p values of less than 1

percent. The slope coefficient of the polarization function with respect to age significantly differs for poor households and non poor households just like their intercept coefficient significantly differs as well. One may reject the hypothesis that polarization indices for the poor and non poor households with respect to their age are the same.

The differential slope coefficient of the bipolarization of the poor households with respect to household size is 0.00102 less than those of the non poor and it is significant just like the intercept coefficient of the poor households is higher by 0.0252 than that of the non poor households and is also significant. Therefore there is significant difference between the polarization of the poor households and non poor households with respect to the number of individuals per house.

The differential slope coefficient of the bipolarization function of the poor households with respect to father's education is 0.00058 less than that of the non-poor households just like the intercept coefficient is higher by 0.0252 than that of the non poor households. The two coefficients are significant at 1 per cent level and indicate that the income polarization function in respect to fathers' education differs between the poor and non poor households. Polarization has significant relationship with the socio-economic characteristics of households.

4. Conclusion

In this paper, we have applied Foster-Wolfson (1994) and Lasso de la Vega bipolarization (2006) indices to estimate bipolarization in the Nigeria rural sector from 1980 to 2004. Bipolarization reduced from 1992 to 2004 indicating that income distribution is improving in the sector. We linked bipolarization with poverty and it was established that they both moved in the same direction. If the income distribution have more poor households, the more it becomes bipolarized; a feature that should be expected in Africa where poverty level is high. The consequence social conflict and tension from bipolarization should be avoided through income redistribution policy that will balloon the middle class in the rural area where income distribution is heterogeneous with majority of Nigeria population. We equally showed that it is possible to apply regression analysis in bipolarization analysis by relating bipolarization with households' socio-economic variables. Income bipolarization was higher among households that are poor, female-headed, lower among married, farming based and members of social group household heads compared with their base categories. Bipolarization was higher among South located households than those in the North. Poverty has the highest positive significant

effect on bipolarization. Focus would therefore have to be more in the South on income equalizing and redistribution policy to reduce bipolarization. We suggest that in the rural area, membership of social group should be promoted, education made accessible, wage employment encourage and efforts at reducing poverty should be stepped up to reduce bipolarization and prevent the revolt that could result from it. However, we are not unmindful of the short-coming of our data sets that were of very little documentation with the exception of 2004 data point. This we played down by verbal discussion and explanation with the staff of the Statistical Department of Nigeria.

Abstract: Nowadays, using computers has changed man's life at all aspects. Done researches in relation to development programs of all countries, represent central role of information technology and communication at these programs. information technology and communication can be used as a powerful tool for improving quality and efficiency of education so that change traditional practices of education and no more physical presence at classrooms. If so far, education benefited just from teachers and trainers, books were considered as major informational sources for education, nowadays education has faced with new communicational tools and environments. Recent progress at computer industry and local information networks, regional and international information (especially Internet), multimedia, communicational technologies, have placed new tools and practices against planners, programmers, managers and executors of educational programs. Influence of new informational technologies on educational centers (schools to universities) and even houses, have changed simple relationship between students and teachers completely.

Keywords: Distance Education, Agriculture

Introduction

In this order, traditional learning samples have changed and users is faced with large extent of information and knowledge. Now, most countries which are leading at the field of telecommunications are establishing and operating virtual universities and class or developing their traditional systems. Establishing and managing these organizations would have some problems and challenges in addition to its benefits. But what is obvious is that virtual universities are suitable place for emergence of talents and innovations. At farming, we deal with learners who have unique features. Learners who are mostly adults and all responsible of their family life. Adults, who have been far from educational studies for a while, would need to review required skills ranges by studying again. They need to increase their required skills for their life and work by spending least time during learning. One suitable solution can be Distance education (Ismaili, 2010).

Definition of Distance education:

Distance education refers to those systems which relation between learner and teacher is through communicational systems. So in this system there isn't any time and place restriction for learner. At the other hand, in these way educational materials is available for learner through multimedia so that they benefit from this education without attending class, effectively. Generally, Distance education begins with corresponding method and these kind of

education also progressed in accordance with science and communication technology progress. So that after corresponding method, using Radio, TV and Video taped were common and after diffusion and development of personal computers and fast growth on multimedia equipments and especially emergence of internet (through various electronics tools (internet, intranet, satellite networks, video and audio tapes and CD-ROMs) was distributed and being operated by different methods (courses, modules, low learning activities) and its operation is without any geographical and time constraints (asynchronous and simultaneous learning) that great change emerged on Distance education (Grimes, 2003).

History:

Distance education organizations, are established base on their special educational needs in each country. In Australia, broadness of country and decentralization of population were most important factor for emerging and prevalence of Distance education. In china and India, base factor of tendency to Distance educational system are: population density and lack of dynamism and budget of educational organizations (Rasouli, 2010).

In USA, England, France, Germany and Japan, adult education issue and its continuity and also familiarizing with new sciences and skills are among most important factor for establishing Distance education organizations. In African countries,

economic problems caused that Distance education being common as a cheap system and partly replaced by traditional education system. In Iran , also due to broadness , decentralized population , great number of villages and existence of nomadic population and also young population (that even are bigger than whole population of some countries) has made it necessary to apply Distance education(Anonymous, 2010).

Tools such as slides and animation entered to classrooms as an educational assistance tools and emergence of TV industry made milestone at evolutionary process of education, at the other hand it caused that education theorists and experts release from traditional corresponding education environment and simultaneously use TV for education. At recent decades, range of activity at the field of education and learning like other scientific, cultural, economical and social activities has changed and affected by fast development of technology and emergence of phenomenon such as satellite, computer, internet ant etc (Information society - information technology, 2010).

History of electronic education in Iran refers to time of using audio and visual educational assistance tools such as slide showing and educational films at classrooms. After that, TV was considered as an educational media and Iran national TV del with public education across the country formally. After entering computer industry to Iran and growth and influence of personal computers among different social-cultural groups, activity at the field of computer-base education began. And now it is more than 10 years which this activity continues and these issues were begun by producing educational CDs.

First corresponding schools were founded about 1892 at Europe that they paid to teaching foreign language and stenography through Post. License of first collegiate educational Radio issued at 1921 that was considered as a first base for forming electronic education. At 1960 Distance education technology was changed, by evolution and development of media, and universities enroll students by combinatory application of multimedia tools and official structures for supporting education. Personal computers and internet, caused recreation of education appearance and they have provided learning for students from Distance. At 1980, TV broadcasting was changed be satellite emergence and caused revolution at electronic education industry ((Ismaili, 2010).

By emergence of internet, first course of undergraduate was provided by technology institute of New Jersey at 1984 through online system. Within this, electronic education in Iran was considered by science, research and technology ministry. At 2001,

virtual education site of Tehran University began by providing 9 lessons for students, daily. At 2003, first educational organization dependant to Shiraz university was established and at 1386 this organization changed to college according to developing educational activities and increasing number of students. Now, most of well known university of country, has established their electronic education units as a virtual education center. First unit which was pioneer for establishing and applying Distance education at Iran, is PAYAM NOOR university. Universities and organizations of country , began their activities at the field of learning electronic within 1998 to 1999 averagely . generally , after second half of year, approach to this item was more serious and operational activities at the field of internet education and using telecommunication width band was began for providing educational courses across the countries(Jeffres, 2005).

Benefits of Distance education :

1- religious and cultural differences ;

learning from Distance considers religious, cultural, racial and ethnical differences. Nowadays, these differences exists at most part of world and are among factors which causes problems at schools and educational centers. Distance education can consider these issues and teach according to learner. Also Distance education can develop time chances for education.

2- education for everyone and everywhere;

in this education , learner's access to course content isn't depend on time and place. Internet can be logical solution for organizations and provide their access to educational goals. Through computer networks, access to electronic education can be forever and there isn't any limitation for clerks , students and also other people. Just base need for using computer-base education and Online education is having one computer. At electronic education , people are able to learn their needed information in all time of day and week(Rasouli, 2009).

3. Update education;

For production education organization and companies, important subject is training forces according to progress of technology in order to make them ready to enter competitive market and for earning more revenue. In electronic education , educational managers can change their educational page and content according to needs of society and marketplace moment by moment while in traditional education, level of reviewing and changing content last even months(Chizari and linder, 2002) .

4- population increase

One of main challenge of less developed countries is social, economical and cultural imbalanced growth

of different parts. Distance education has affective role as a one of strategy for establishing balance by offering various trainings.

5. chance for deprived areas

Distance education provides more educational chances for residents of deprived area especially at different field of girl's education .

6. affection on public culture

since that Distance education provides especial options for Provinces so each province can deal with programming for its subsidiaries parts according to geographical conditions and status. And by establishing educational centers at different parts ,increase education cover level at secondary and high school especially those areas which face with limitation for access to education. Therefore this kind of education is field for reinforcing public culture at one hand and existing subculture at the other hand in this area(Labani, 2009).

7. flexibility at time and place

main advantage of electronic education is that allow participants to set their programs. Flexibility allows them to decide wherever and when to study and how long spend for learning. In this method, education flow isn't against with work plan , social and cultural condition and even with family responsibility of participant. Having no limitation for boarder and time, being provide possibility of learning everywhere and for everyone are among its unique features(Barron, 2002).

8. girls and women's access to education :

at village usually there is some limitation for girls and women's education ; because often there isn't possibility for learning higher than primary school at this villages . so they have to go to bigger villages and next cities. Now if it is possible to provide electronic education facility at houses or at least at their villages , so they would able to learning and also it is possible to teach them other life skills such as housekeeping, farming, ranching and etc .

9- developing justice and equality

Electronic education , typically creates justice and equality among different groups at different parts by establishing equal terms for all learners. Developing or less developed countries can decline their gaps with industrial and developed countries, By using this kind of educational method . also electronic education at village can decline gap between city and village and creates new hopes at rural society in order to dynamism at the field of production and efficiency and also cause economic growth(Badragheh, 2006).

10. prevent migration:

Now, major part of villagers especially youths migrate to cities due to various reasons such as education, job and etc that this issue has caused some problems both at cities and villages. While, there is possibility for job and education at villages through applying ICT , not only it prevents migration but even some of them return to their previous location.

11. immediate access to high volume data :

Ease of access to high volume data and existing knowledge at the world and immediate and timely access to information are among its benefits.

12. using limited numbers of available educators:

Distance education , uses limited available educators optimally especially while we faced with educational personnel shortage or those who learned related education with need. At this educational system, educators focused on geographical direction and student are able to communicate with their teachers at education center directly or through telephone or Post(Parrott, 2005).

13. reducing costs

Distance education has high costs at first. But over time it would decrease by equipping educational centers and producing educational content such as tutorial book, educational assistance books , work and practice, VCD, VHS, and multimedia CDs and would lead to saving costs(Bates, 2000).

14. help workers and disabled persons :

Distance education is good channel for educating workers and persons who less enjoy physical abilities.

15. emergence of learning :

Need to basic lessons can be planned as concentrate form and can be applied for removing emergences and facilitating learning through different methods(Carter, 2001).

16. without fear learning :

Students who register at one online course, have entered to risk free environment that can test them at new cases and make mistakes without impose themselves against other's judge. This ability is valuable for student experience skills such as decision making and guiding. Risk free environment , would increase student's self confidence and productivity(Rintala, 2002).

17. Update education :

For organizations and production-education companies , main issue is training forces according to the technology progress in order to make them ready for entering competitive markets and earning more revenue. In electronic

education, educational managers can change their pages and educational contents according to society and marketplace moment by moment while in traditional education reviewing levels and changing contents, lasts months.

18. simulating educational environments :

Electronic education is able to create all various educational environments according to different softwares and offers to users. At this kind of education, users are able to enter to places which really is hard to access and they are able to use educational assistance base on their needs (Romiszowski, 2000).

19. overcome on Physical gap

They overcome on physical gap By Distance learning. Learners living at faraway regions who aren't able to attend physically at schools and also learners and educators who are far from each other, can learn needed educations by using benefits of this system (Bolton, 2002).

20. costs saving

At electronic education, travel costs and costs related to professors and advisors would reduced and prevent time waste. At this education, educational courses can divided to short sessions and offers at more days and weeks instead. At electronic education, organizations will not lose their staffs and employer's efficiency would increased (Labani, 2009).

21. forever learning

Distance education prepares field for all students and those who interested by providing them various educational facilities in order to actively deal with education constantly and also with additional efforts and always increase their knowledge level or coordinate their knowledge with global knowledge and indeed reach to forever and constant learning.

22. continuing education of women and mothers

Since that usually there are some especial conditions for mothers and women which prevent them to learn (housekeeping, cultural problems of child care and ...) so this method is new way for them (2010).

Disadvantage of Distance education :

1. low level of personal computers (PC) per capita in country : unfortunately, there isn't formal and exact statistic about number of PC in country yet. However it seems that there is increasing number for PC but yet due to different reasons, PC wasn't considered as basic home appliances. For example It can be mentioned that : high relative cost for

buying PC, lack of knowledge about its potential capabilities, regrettable low level of computer literacy even among educated persons and professors which consider PC as a decorative device or toy at house or office. Or some negative and cynical attitudes toward entering PC and internet to home environment that maybe be due to low computer literacy and lack of knowledge about its useful capabilities (Pierre, 2004).

2. low rate of access to internet global network at country :

access rate to internet at Iran is very low even compared to same developing countries. However there isn't any exact statistics for that but base on most optimistic surveys, just 2,000,000 persons access to internet however it is predicated that this number reaches to 15,000,000 until third five year plan.

3. relatively high primary cost :

among abovementioned essentials, preparing hardware and communicational necessity is very costly which sometimes is hard to prepare. This issue is more significant at developing countries.

4. continuing communication and supporting costs :

cost of using Internet isn't one time forever and its cost, continue over time. Cost of telecommunication subscription and supporting computer can be problematic for persons and organizations and cause that they face with high costs.

5. need to computer literacy:

in order to enter to electronic education, first step is dominating on computer, at the other hand, in order to access to electronic education we need to computer as a main education tools and everybody learn to use it. Because at this sense, electronic education would manifested. Now, In our country, providing electronic services is developing daily but it isn't inclusive yet due to lack of people's aware of these services. at most part of world starting point of internet is new and most persons aren't familiar with this environment and facilities. so, computer aversion make affairs more difficult and makes them far than ever (Badragheh, 2006).

6. education by non-native language :

most information and articles, exist at English language on internet, which we should have language proficiency in order to understand them. Moreover, many ethnic groups living at different rural area of country, that even using some subjects and Persian educations are difficult for them, and maybe some subjects being unfamiliar for them.

7. resisting against change :

because , technology contains big changes at designing method and applying education , so it has created large resistance among persons and organizations. Reasons of resistance against change is different such as : fear of unknowns , need to effort at learning new subjects , losing power and prestige due to role changes and disagree with new beliefs.

8. affects on village life and context

certainly, presence of ICT at villages has affected rural context and maybe affects on family's form. Presence of this technology create critical condition due to capability of accepting is lower at villages. Also maybe while villager's knowledge level increase so he desists farming and deal with non-productive affairs which this problem has more possibility among youths.

9. lack of suitable infrastructure at country :

all governmental and private efforts would result usefully in relation to electronic education if primary infrastructure and facilities being available across the country. In order to access and search in world wide web, we need to hardware , software and communicational facilities undoubtedly which preparing them can be cheap or expensive base on conditions . this fact is acceptable for all that we can use electronic education well , when learners and teacher have easy and orderly access to computer and connection to web. This problem isn't exist at cities of developed countries but exist at rural and urban area. When we consider whole advantage and disadvantage of Distance education , we would find that disadvantage are more than disadvantages. But this dose not mean that forget disadvantages(Rasouli, 2010).

Necessity of using Distance education by Internet at agriculture:

This is a question that how we can decline digital gap between villagers and burghers that needs high thinking. But simple answer is that electronic education and creating infrastructure and fields , and making it applicable at villages can be prevent creating barrier between urban and rural , and would provide motivation for staying at village and help for economic of country at the national and international fields. Recently, Agriculture magazine (Corp) assessed more than 350 farmers in relation to using internet orderly(Strain, 2004).

About 75% of these farmers have more than 500 hectares. Next, 44% started using internet and also enjoy credit cards. This analysis shows that farmers more using internet for more easement of buying inputs and selling productions and even receiving various data by increasing busy of work and even

under cultivation field. Technology at production process , and value of goods efficiency can increase . so , time technology can be affective if user use it for tangible interests. If electronic education contains applicable data and global knowledge , so farmer not only can increase his/her productions but also is able to improve his/her life level from different aspects. For example, if farmer can gain proper data about seed of his region, most suitable time and planting principles , number and cycle of watering , suitable time for fertilization through electronic education and use them properly so undoubtedly he would able to improve his life condition through increasing productions and also can prepare better condition for his family. We can return dynamism to rural life by taking new technology to village and nativization these technologies and base on that , educating villager for affective using of these technologies and so decline deep technologic gap between rural and urban that everyday get deeper , then we would be able to prepare following rural development(Rasouli, 2009):

- completing knowledge and improving character of rural society members
- growth public knowledge of villagers about saying beliefs around their fates and society
- growth of useful ideas about self-help and cooperation of rural societies
- Growth of productivity on rural society members and try to discover potential resources
- Villager's maturity for identifying and solving problems about their societies and themselves
- Growth of villager's technologic data for systematic choosing and using and premier production methods

Using electronic education at agriculture of Iran

From sense of growth at IT fields ,Iran are among those 50% which retarded from rapid informational revolution caravan . Iran population at 2004 has been 66991500 which about 23 million live at rural area. About 5 million internet users exist at urban area of Iran but limited numbers connect to internet at villages. Until a few years ago , most peoples were not familiar with IT concept and some people defined it as computer and internet. Informatics officials of country were not excluded from this principle and applied many plans to show their activities at this field that maybe just few numbers was included as IT definition. But fortunately , at recent years , newspapers and news agencies by establishing IT services , officials by different plans and organization , individual and legal persons by performing

innovative plans and establishing informative web ; had participated on introducing IT to people and using it optimally in order to improve efficiency. at the global information society summit that was held at 2003 and Iran was signer member of this law and it was prescribed that signers countries connect Universities up to 2005, hospitals up to 2010 and all villages up to 2015 to internet. Villages are retarded traditionally and it isn't good from social sense that we give all facilities to cities. At 2000 , first internet village "SHAHKOOH" which is one of big village of Golestan province was entered to virtual world. This action that was due to 2years project , has deep affection on rural life at the economical , social and cultural fields. Farming improved and people found that it is possible to enter to market without dealer , then analysis its logic and buy everything and sell too. More than 500 persons at the village which accommodates 300 families have passed computer and internet course and large number could pass get license from technical-professional organization. Second internet village is GHARNABAD at Golestan. At 2004 , first inclusive IT user services was opened there. Residents are same residents from SHAHKOOH that spend their summer at SHAHKOOH and their winter at GHARNABAD. ICT ministry decided to equip 10,000 villages of country to rural ICT offices at the national plan. These offices provide Post bank , telephone, and other governmental services further connection of those village with Internet .

Necessity of communication at Distance education:

since that we have less face to face communication at Distance education , so some principles should be considered at this kind of education. Holmberg (1989) knows that this education as directed dialogue and considered it 7 assumptions:

- bilateral relation should be created between learning and teaching
- advanced materials for organized self learning being existed
- learning task should be fun
- law and language atmosphere should amplify friendship dialogues
- message which is received by learner should be as dialogue form and be understandable and maintainable at memory
- Distance education should be as dialogue form always
- Programming and leading is necessary for organized studying

We can easily see that Holmberg has humanism sense.

Results and suggestions:

Government and other related organizations should make decision principally and by planning at the field of internet emergence at rural area. Unfortunately, most planned programs at our country is short term and sectional. We should see this issue by broader vision and at least have twenty-years approach about rural ICT. If we decided to modify or develop infrastructure of communication network so village should be considered too and also connecting them to communication network of country. For first step we can start with those villages which have phone lines. Every villagers who have phone line also should have Internet base in order that farmers can use it. Developing ICT and drawing it to village need to invest. Government should exactly specify budget and capital for equipping villages of country with this technology. Fortunately, NGOs have act well at the field of ICT. Government can have affective role at developing ICT by supporting this part and encouraging investors to participate at national and regional plans at the field of ICT at village and also problems which NGOs have faced .

In order to gain experience and better result , it is necessary to test electronic education at small levels at one or more villages and results being analyzed. We should act by planning and forecasting About electronic education and entering ICT to villages.

Generally , it can be said that developing policy of education at world has developed. We should consider that there are very unknown point in this education that we must realize them and use them for education villagers.

Prevalence of Depression among Elderly and Evaluation of Interventional Counseling Session in Zagazig District -Egypt

Naglaa M. Abdo¹, Shereen Eassa¹ and Ahmad M. Abdalla²

¹Community Medicine and Public Health and ²Psychiatry Departments, Faculty of Medicine Zagazig University, Zagazig, Egypt. *shereeneassa@yahoo.com

Abstract: Depression is one of the most prevalent disabling and costly health problem among elderly. This work aimed to study the problem of depression among the elderly through determining the magnitude of depression among them, classifying the diseased according to the severity of depression, exploring some personal risk factors related to depression and evaluation an applied interventional counseling session for the diseased. This study is composed of two stages; the first one was a cross sectional design in which multistage random sample was applied to Zagazig District where 290 subjects were included in this study. The applied questionnaire included questions about sociodemographic status, some associated risk factors for developing depression and also Geriatric Depression Scale was applied to detect depressed patients and classify them according to the severity of the disease. The second stage was an interventional one applied to depressed elderly who were subjected to a counseling session educating them about the importance of counselling, follow up and recalling knowledge about treatment. Obtaining results revealed that the percentage of depression was 46.6 % and those with mild or moderate condition constitute 75.6%. Depression significantly increased with age, female (OR 2.56), not married (OR 4.47) and those having previous death event among the surrounding (OR 7.68). The severity increases among age group over 75 years and more (OR 4.52) and those of low socioeconomic condition (OR 8.8). The applied counseling session had a significant impact on recalling knowledge about the prescribed drugs (60.7%), how to manage the missed doses (71.4%), using drug correctly (75.0%) and recalling medication name (75.0 %) ($p < 0.05$). In conclusion depression is an undiagnosed public health problem. It significantly increases with age, female sex, not married subjects, and those having history of death event in their relatives. Moreover the severity of depression increases with age and low socioeconomic condition. The applied intervention counseling session had a good effect on improving drug knowledge and probably the attitudes of the depressed patients. So increasing the role of geriatric medicine in primary health care system and introduction of counseling session at outpatient clinics to increase compliance to treatment are good recommendations from that work.

[Naglaa M. Abdo, Shereen Eassa and Ahmad M. Abdalla. Prevalence of Depression among Elderly and Evaluation of Interventional Counseling Session in Zagazig District –Egypt. Journal of American Science 2011;7(6):739-748].(ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: depression, risk factors, geriatric medicine, counseling.

1. Introduction:

Depression is the most common mood disorder in later life. It may be associated with serious consequences, including; disability, functional decline, diminished quality of life, increased mortality and increased service utilization. Moreover it is undiagnosed in about 50% of cases (Charney et al ,2003) .World health organization (WHO) considered that the age of 65 is the beginning of aging, but in Egypt, the age of 60 is still considered the beginning of aging according to the retirement age for most of people (Sheriff ,2000).

World Health Organization is predicting that by the year 2020, depression will become the second leading cause of disability, so it is considered as a major public health problem (Finley et al, 2002&Ustun et al, 2004)

It is estimated that the prevalence of psychiatric disorders including depression in community-residing older adults is 25% or more

(Jeste et al, 1999). Rates of psychiatric disorders are much higher among elderly patients seen in primary care or hospitalized for medical conditions it is estimated to be 30%-50 % (Borson and Unutzer, 2000)

Specific sociodemographic characteristics are differentially associated with the prevalence and risk of depression onset in the community. Among the most striking is female gender and this can be explained by the presence of biological and psychosocial factors related to female gender (Kessler et al, 2003)

A number of measures and scales have been constructed and used to assess and diagnose depression in a wide variety of populations. The most widely used self-one is the Geriatric Depression Scale (GDS); it was developed to assess the cognitive, emotional and behavioral symptoms of depression among the elderly population (Montorio and Izal ,1996). But it has limited value in the

assessment of depression in Alzheimer's patients (Rubin et al, 2001).

Although antidepressants are effective in patients with depression, effectiveness is reduced by non-compliance (Nabeel et al, 2008). Compliance to antidepressant therapy is essential for positive patient outcomes. Some studies had shown that up to 70% of patients diagnosed with depression take their medication inappropriately (Boudreau et al, 2002). While therapy duration for treating depressive disorders should continue for periods of at least 9 months or even years (American psychiatric association, 2002). Various studies had shown that 30–68% of patients discontinue therapy only after 1 month of treatment (Wooley and Simon, 2000). In addition to medications a variety of interventions comprising of patient education, such as physician counseling, had been reported to improve compliance with antidepressants (Hoffman et al, 2002).

Depression nowadays is a major health problem particularly among elderly and engaging them in the medical process by providing them counseling sessions which has a significant positive effect on their compliance to medications, so the current study was aimed to study that problem through the following objectives: to determine the magnitude of depression among elderly and to classify the diseased among them according to the severity of depression by using the Geriatric Depression Scale, to explore some personal risk factors related to depression and to apply intervention counseling session and evaluate it.

2. Subjects And Methods

This study was carried out through two phases:

Phase I:

1-Technical Design:

- Study design and sampling technique:

A cross-sectional study that was carried out on a suitable sample of elderly people who were above 60 years of age, the sample was collected using multistage random sampling technique. Zagazig District was divided by Moes Sea (one of the derivatives of Nile River) into two sectors; west and east. The west sector was chosen randomly (1st stage) then the west was divided into urban and rural areas. Two urban regions and two villages were selected randomly (2nd stage). Each selected village and urban region were divided into four sectors and one sector was selected randomly from each one (3rd stage)

Then each house in the selected areas was given a code and recorded. The sample included all

houses within each of the two selected areas (rural and urban)

- Sample size:

The sample size was calculated by assuming that the estimated prevalence of depression in elderly is 20% (Yount and Sibi, 2009), confidence level was 95% and the total number of elderly in Zagazig District according to Central and General Package Statistics System in 2006 was 60035 central and general package statistics system 2006, the calculated sample size was 245 subjects, accounting for non-response rate 20% the study sample size will be 290 subject

Time of the first phase:

This phase was carried out during the period from January 2009 to March 2009.

-Tools used:

Data collection tools:

Data for this study were collected by a pre-constructed and pre-tested questionnaire that was designed to include the following:

- 1- Socio-demographic data: age, sex, marital status, education level, occupation, income, and with whom he/she lives.
- 2- Some Risk factors for depression: losing a close person, leaving family home, living alone.
- 3- Geriatric Depression Scale (GDS): This scale was developed as a basic screening measure for depression in older adults. It is composed of 30 questions. Each question may be answered yes or no. One point is assigned to each answer and corresponds to a scoring grid. Total Score: 0-9 = normal; 10-19 = mild depression; 20-30 = severe depression (Sheikh et al, 1991). This scale was translated into Arabic and tested for its validity.

2- Operational design

It included two stages, namely pilot study, and field work stage.

-Pilot study:

A pilot study was conducted to assess the feasibility of the translated GDS and the time needed to fill out the questionnaire. It was conducted on 30 elderly subjects. They were excluded from the main study sample. Data obtained from the pilot study were analyzed, and accordingly necessary modifications in the questionnaire were done.

- Work Field:

All study members were interviewed by the researcher in front of their houses. A verbal consent was obtained from the study subjects after explaining the purpose of the study and reassuring them about the strict confidentiality of any obtained information and that the study results would be used only for the purpose of research, then the designed questionnaire sheet was filled by the study subjects and by the researcher for illiterate subjects

Phase II:

Design, sample size, study population and time:

An intervention (non randomized controlled trial) was conducted and applied on depressed elderly who were diagnosed according to the used Geriatric Depression Scale. Sample size was calculated in this stage by assuming that the response to counseling session about is 30%, the calculated sample to this stage was 28 subjects who will take counseling session and 28 subjects as a comparative control group. The researcher contacted subjects either by phone or personally and asked them to participate in the second part of the study. Those who agreed to participate were divided randomly into 2 equal groups (control and intervention) and they all take an appointment at Zagazig University Hospital Psychiatry Outpatient Clinic after being promised to take medications free from charge from researchers. All the contacted and diagnosed patients were asked if they previously asked for medical care or not and their points of views for the need for additional information about their medications was also collected based on agree and disagree scoring. This phase of the study was carried out during the period from April 2009 to July 2009.

Work Field

1- The first visit

The intervention group subjects were given antidepressant drugs from the specialist physician and subjected to a counseling session that took between 20 and 25 minutes in length. The counseling sessions was intended to help patients to understand the nature of depressive illness and to reinforce that taking medications in the way as prescribed. Advice was also provided on the side effects of medications. Emphasis was also placed on the need to continue taking medication unless otherwise advised by doctor. Advice was taken to patient so as not to take personal decision to modify their therapy, insist to know the medicine name, reason for medication, using medication correctly, dosage and how to manage missed doses. The control group subjects were given antidepressant drugs only. Both groups were asked to come to Psychiatry Outpatient Clinic

outpatient clinic again in a second visit 6-8 week after the first visit.

2- Second visit:

Patients of both groups interview was done to investigate the effect of counseling session by asking each patient to recall specific knowledge regarding the prescribed medicine: medication name, reason for its prescription, dosage, how to manage missed doses

Data management:

Data were computed and analyzed using the statistical package for social science (SPSS) for windows version 10.

3. Results

More than one half of our sample was females (51.4 %) and the majorities were between 60-70 years. Most of them were married 69.0 % and the majority of middle or high level of education (33.1 %, 36.9%). About 90.0 % of them were not working and living with someone in their house and more than one half of our sample were of moderate socioeconomic level (52.1%). Moreover 76.2% of them had history of deaths among their surroundings. (Table 1)

According to Geriatric Depression Scale, this study showed that 46.6 % of the study sample had depression and 75.6% of them had mild to moderate degree of depression (Figure 1&2)

Depression was found to be significantly higher among those above 70 and 75 age groups (OR 2.67, 5.08 respectively), females (OR 2.56), non married (OR 4.47) and those who have deaths among the surroundings (OR 7.68) (Table 2)

Severe depression was significantly about four times more among age group above 70 and 75 years (OR 4.50, 4.52) and those of low socioeconomic level (OR 8,8) (Table 3)

Logistic regression analysis of significant risk factors indicated that depression was more predicted among those above 70 years, not married and female. (Table 4)

Most of our sample 83.0 % preferred to get explanation about the prescribed drug. More than half of them (57.0%) had previously asked for medical care but the majority of them did not get any information about the prescribed drug (48.1%). Information was obtained mostly from medication label (25.9 %) and from physicians (20.8 %). (Table 5&6).

After applying intervention in the form of counseling session, 60.7 % of intervention group recalled their specific knowledge about the prescribed

drug and also 57.1 % of them recalled the reason for prescribed drug, moreover 78.6 % of intervention group recalled doses compared to 67.8% of the control group (Table 7).

There is a great significant difference between both groups regarding getting knowledge

about the prescribed drug, managing the missed doses, also the percentage of those using medication correctly and recalled the medication name was higher among the intervention group compared to control group ($p < 0.005$).

4. Discussion

Depression is a common and serious mental health problem faced by many elderly persons worldwide .This problem is undiagnosed in about 50% of cases.

Although effective treatment is available, case finding among elderly persons and adequate treatment is generally poor so the present study was carried out to determine the prevalence of depression in elderly and the possible risk factors associated with the disease and to assess the impact of intervention counseling session on patients.

The current study revealed that the prevalence of depression among elderly in Zagazig District was 46.6%. This finding is similar to that reported among Tunisian elderly (Yount and Sibi, 2009).however it is higher than that reported by many studies among Asian (5-30%), North American (10-15%), Saudi Arabian (38.9%) and Jordan elderly (24.3%) (Yount and Sibi ,2009&Boey and Chi ,1998 &Parker et al ,2001).The difference in the reported depression rates may be attributed to many factors including; Variations in socio-cultural and economic factors, variation in the study design and sampling technique and variation in the scales that used for assessing depression.

Mild to moderate depression was observed in 75.6% of the depressed group, while 24.4% of them had severe depression , this agrees with (Shin et al., 2008) who reported that the percentage of mild to moderate depression among their study subjects was 76.3% and about 23.7% of them had severe depression.

In consistence with other studies, we found that elderly persons belonging to age group more than 70 had a significant risk more than two times of developing depression and this risk increases more

with increasing age more than 75 to reach more than five times. A significant differences regarding to the severity of the disease was observed only with later age groups. This result may be attributed to feeling of worthlessness and lower income in comparison to high cost of health care needs in this age. We also found that, those exposed to death events among their relatives showed a significant risk of about eight times of developing depression higher than those not exposed to such situation, but there was no noted significant difference regarding the severity of the disease. This finding is due to the presence of many factors that may occur as a consequence to death of one of the relatives including; bereavement and grief, loss of independence, declining health, retirement and lack of social support (Clayton ,2000)&Schoevers et al ,2000& Cole and Dendukuri ,2003&Hur and Yoo, 2002& Lee and Lee ,2002)

Previous studies on depression in elderly populations have shown that socio-demographics are often significant in this respect. Female gender, marital status, education level, financial status, and social support are the commonly identified correlates of depression (Gottfries & Karlsson ,2008) ,so in the current study we explored these risk factors

Regarding gender effect on depression, our study showed that females had significantly higher depression percentage (57.7%) than males (34.8%); moreover they had more than two times risk for developing depression in comparison with males. This finding is in agreement with (Gottfries & Karlsson, 2008 and Lai & Tong, 2009), this can be attributed to long life expectancy in females so they are exposed more to stressful life events and health problems.

Moreover elderly subjects who are not married showed about 4 times risk for developing

depression more than married. This finding is consistent with many studies which stated that non married subjects are more liable to develop depression and this is attributed to the perceived loneliness sensation and loss of social support (Lai, 2004) & Bae et al, (2005). However, there was no significant difference between marital status, gender and the severity of the condition. This is consistent with (Kessler et al, 2003, Shin et al, 2000, Cole and Dendukuri, 2003 and Hur and Yoo, 2002)

The current study showed that the risk of depression increases with increasing educational level but without significant difference. This finding is contrast to a number of studies findings (Bae et al, 2005 & Fleisher et al, 2007) that showed low educational attainment have been reported to manifest the symptoms of depression but without statistically significant.

Although, elderly subjects with low socioeconomic status showed a higher percentage (66.7%) of depression but no significant difference was found, however low socioeconomic level subjects had been associated with significant eight times risk for developing severe depression. This result is in accordance with other researches which concluded that there is a strong association between low socioeconomic status and depression occurrence and this related to bad living conditions resulting in worsening of general health status, in addition economic independence is considered as an important factor contributing to maintenance of mental health (Bae et al, 2005 & Fleisher et al, 2007).

Elderly individuals who were exposed to death events among their relatives had more than seven times risk for acquiring depression than those not exposed to the same events. This is consistent with (Lavretsky & Kumar, 2002) findings; however the risk of developing severe depression was not significantly associated with death events.

In the current study we applied a counseling session for depressed elderly who were diagnosed by the Geriatric Depression Scale and by the help of the psychiatrist. Patients looked at the counseling session in a very positive way, while literature overview showed that the effect of educational intervention offered by clinicians on clinical follow up is controversial, other studies showed that patients have good response to the received educational intervention (Van et al, 2005 & Capoccia et al, 2004)

Evidence from examining data showed that drug counseling intervention was highly effective in conveying elementary drug information to the patient. The counseling sessions were intended to help patients to understand the nature of depressive illness and to reinforce taking medications in the way that they were prescribed would be of benefit to

them. Advice was also provided on the side effects and their management. Emphasis was also placed on the need to continue taking medication unless otherwise advised by doctor. Also, advice was given to the patients so as not to take personal decision to modify their therapy, in addition the session stressed on the value of knowing the medicine name, reason for medication, doses of drugs, using medication correctly and how to manage missed doses.

In the next visit that was carried out after 6-8 weeks of intervention session (during follow up), the patient interview was done to investigate the effect of counseling session where we found a significant increase in the response among the intervention group compared to control group regarding to recall specific knowledge about prescribed drug (60.7%), know how to manage missed doses (71.4%), using medication correctly (75.0%) and recalling the medication name (75.0%).

Although, recalling reasons for medications and dosage of drugs were high among intervention group compared to control group (57.1%, 35.7%), (78.6% 67.8%) respectively but the differences were statistically insignificant.

As regard to patient preference to get information about the prescribed drug we found that the highest percentage of them (83.0%) preferred to get information while 8.9 of them were not sure from this point as they did not have previous experience in this situation. This result is in agreement with another study conducted in Kuwait where the researchers found that the percentage of those who preferred to get explanation about prescribed drug was about 90.4% (Nabeel et al, 2008)

Among 77 depressed patients who previously had asked medical advice about antidepressant drugs, 48.1% of them did not have any information about the prescribed drug, 25.9% of them had information from medication label followed by the physician advice (20.8%). This finding is in contrast with (Nabeel et al, 2008) who found that most of their patients receive information from physician 77%. This difference may be attributed to the difference in the health system between different countries.

In conclusion, depression is an undiagnosed public health problem as it was high among the studied group. It was significantly predicted with increasing age (above 70), not married subjects, and female. Moreover the severity of depression increases with age, low socioeconomic condition. In addition ;lack of getting information about prescribed drug was found among the majority who previously received medical advise and among those who having information, the main sources of it was the

medication labels which reflect the defect in the role of physician during taking medical advice..

Also, Physician can play an important role in patient treatment cycle by providing high quality and easy to understood information during counseling. It is an effective way to improve drug knowledge and probably the attitudes of depressed patients.

Recommendations

Increasing the role of geriatric medicine in primary health care system or at least extending training the physician on diagnosis of psychiatric health problem mainly depression due to its high prevalence nowadays.

Introduction of counseling session at outpatient clinic concise to diagnostic process to increase the compliance to treatment

Abstract: Information about reproductive morbidity in developing countries is scanty and mainly based on information obtained from clinics or hospitals which are not usually reflecting the true magnitude of the disease burden. A cross-sectional study were conducted to assess the self-reported reproductive morbidity and the factors affecting it and to investigate the health seeking behavior among a sample of women in Siwa (Oasis), Egypt. A total of 340 ever-married women in the reproductive age group of 15 to 49 years were interviewed using a pre-designed questionnaire. About three quarters of women reported having any obstetric (72.6%) or any gynecological morbidity (75.6%). The most commonly reported obstetric problem was symptoms of severe anemia (43.8%), while symptoms of lower RTIs (51.2%) and UTIs (35%) were the commonest gynecological problems. Overall, 58.5% of participants had sought treatment for any morbidity with the majority had sought services of the public sector facility (80%). Regression analysis showed that education, age at first pregnancy and duration of marriage were the factors associated with women reports of any reproductive morbidity. The present results reveal a high prevalence of reported reproductive morbidity in Siwa, Egypt. Factors such as education, duration of marriage and women age at first pregnancy were associated with reported morbidity among the sampled women. This high reported rate in peripheral and remote areas needs to be explored further.

1. Introduction

Reproductive morbidity (RM) is "any morbidity of the reproductive tract, or any morbidity which is a consequence of reproductive behavior including pregnancy, abortion, child birth or sexual behavior and may include those of psychological nature (WHO, 1990). RM encompasses obstetric morbidity, gynecological morbidity and contraceptive morbidity (Sadana, 2000).

Addressing reproductive health issues of women is on the global social agenda for the forthcoming century. Maternal mortality has long been the only indicator for women's health even though RM occurs far more frequently and seriously affects women's lives (Kambo *et al.*, 2003). The pattern of disability adjusted life years (DALYs) lost from reproductive ill health either due to premature mortality or morbidity associated with reproductive conditions is substantially different from that for deaths alone. This is because of the large component of years lived with disability (YLDs) resulting from many of these conditions (Abou Zahr, 1998; Murry & Lopez, 1998).

RM is high among women of developing countries resulting in devastating consequences on health and social well being of women. Usually many

reproductive disorders go unnoticed, either because of being asymptomatic, or because of producing vague and non specific symptoms. Low level of female literacy, low level of awareness, as well as socio-cultural norms, values and taboos withhold women from seeking health care for reproductive tract infections (Rathore *et al.*, 2003).

Information about RM in developing countries is scanty and mainly based on information obtained from clinics or hospitals. However, large proportion of women doesn't visit such facilities; results are not usually reflecting the true magnitude of the disease burden. This type of information is better obtained through community-based self reporting surveys (Rahman *et al.*, 2004).

The procedure of relying on symptoms reported by women has been widely used in health surveys in developing countries such as Demographic and Health Survey and the Pan Arabic Project for Child and Development (Zurayk *et al.*, 1993). Research has shown that self reporting corresponds closely to clinical diagnosis when diagnostic criterion is clear (Zurayk *et al.*, 1995). Thus, such surveys could prove to be an inexpensive way for generating continuous information on reproductive health (RH) issues (Rahman *et al.*, 2004).

Since the International Conference on Population and Development (ICPD), Egypt has given much attention to RH situation by applying policies and programmes to provide adequate services, but reorienting policies and programs have been more challenging. Closing the gap between urban and rural or remote areas' access to and use of RH care is a major challenge for North Africa and Middle East region including Egypt (Fahimi, 2003). Though the region has experienced major improvements in health over the past few decades, significant inequities in access to health care services and overall health status persist for the region's women, especially in the area of reproductive health (Fahimi, 2006).

The present study aimed to assess the self-reported reproductive morbidity and the factors affecting it among a sample of ever-married women in Siwa (an isolated oasis in a frontier governorate-Matrouh), Egypt. It also aimed to understand the treatment seeking behavior of the sampled women for these morbidities.

2. Materials and Methods

A community-based, cross sectional study was conducted. A systematic random sampling technique was adopted, voluntarily taking ever-married women in every fifth house for interviewing, in Siwa town, located in the southern part of Siwa Oasis (Siwa Oasis, information from anserws.com, 2011). Siwa Oasis is one of Egypt's isolated settlements, with 23,000 total populations. Siwi women have traditionally been kept behind closed doors that made them difficult to be examined by strangers (Women's freedom comes slowly to a sleepy Oasis, 2011). RH services are delivered only through one governmental hospital for the whole town. The number of health units that provided RH services in Matrouh governorate equals 82 (compared to 197 in Cairo and 167 in Alexandria). The majority of people living in the Oasis lacks the basic infrastructure, sanitation and proper water supply.

A total of 340 ever-married women in the reproductive age group of 15 to 49 years were interviewed. Women were asked about the symptoms of obstetric morbidity they experienced during their most recent pregnancy, delivery and post-partum period. Also, symptoms of gynecological morbidity that women experienced during the past 12 months were inquired about. The study considered self reported RM status to measure the prevalence of RM, as laboratory verified estimates are eight times more expensive than self reported status (Zurayk *et al.*, 1993). Also, health facilities at the community level in Siwa are generally poorly equipped and service

providers are not well acquainted to detect the morbidity or to provide counseling.

After reviewing the available literature, a pre-tested, structured interview questionnaire was used. The questionnaire drew on a number of existing instruments used to gather data on RM experiences (Zurayk *et al.*, 1993; Swimini *et al.*, 2004; NIPORT, 2003).

In addition to investigating the socio-demographic characteristics, the questionnaire included detailed questions about obstetric history; the complications experienced during pregnancy, delivery and the postpartum period; gynecological morbidity; and patterns of treatment sought for morbidities experienced. The study investigated RM in the form of gynecological and obstetric morbidities. Contraceptive morbidity could not be included owing to the small number of participants reported currently using any contraceptive methods (30.9%). Women were interviewed at their homes by female doctor researchers. The aim of the study was explained to all participants and only volunteered responses were recorded. This study conducted after taking the approval of the research and ethical committee of the High Institute of Public Health, Alexandria University. The study was carried out from April 2010 to October 2010. Data entry and analysis were carried out using SPSS version 16. Univariate analysis was performed with χ^2 test whenever applicable. Logistic regression analyses were used to identify variables that were significantly related to women's reporting of RM. The outcome variable was ever exposure to any RM with women's age, education, age at first pregnancy and duration of marriage taken as covariates (significant variables by univariate analysis).

3. Results

Regarding the socio-demographic characteristics of the participants, about forty percent of the women were in the age group 20 to less than 30, with a mean age of 33.5 ± 8.7 years. Nearly half the participants had ever enrolled in schools (51.8%). Almost all the women were currently married (95%), with a mean duration of marriage of 14.1 ± 10.2 years. The mean age at first pregnancy was 19.1 ± 3.3 years. Four in ten participants reported ever having any pregnancy wastage. Less than one in two women (45%) reported history of institutional deliveries. Only 47.1% of the participants reported ever use of any contraceptive methods and less than one third (30.9%) of them reported current use. Slightly more than half of the women (55.3%) reported having from 1 to 3 deliveries and 12.4% had 9 deliveries with a mean number of 4.4 ± 3.5 deliveries.

Self-reported obstetric morbidity

Findings indicate that more than half (52.9%) of the participants reported suffering from any pregnancy problem during their last pregnancy. The most commonly reported complications during pregnancy were symptoms of severe anemia, reported by about four in ten women (43.8%), excessive vomiting (15.3%) and symptoms of preeclampsia (9.7%). Less commonly reported complications included threatening abortion (6.2%), high fever (8.2%), vaginal bleeding (2.1%) and fits (1.8%).

Concerning complications experienced during delivery, one in five women reported experiencing any complication during the last delivery. As for the individual complications experienced during delivery, 9.7% of participants reported experiencing premature rupture of membranes, 7.9% suffered from prolonged labor

(>12 hours) and 4.4% reported having abnormal presentation of the fetus (other than the head).

In addition to morbidities experienced during pregnancy and delivery, the study also explored the morbidities that women experienced during the post-partum period, with one in four women reported experiencing any post partum complication. The most commonly reported complications after delivery were symptoms of sepsis and heavy bleeding (9.7% & 8.8%, respectively). Breast engorgement and postpartum depression were less frequently reported by all women (3.8 % & 1.8%, respectively).

Table 1 finally presents the percentage of women who reported experiencing any obstetric complication during the last pregnancy with about three quarters of women reported having any obstetric problem (72.6%).

Reproductive morbidities were assessed using the following clinical presentations;

Dysmenorrhea	Painful menstruation.
Menorrhagia	Prolonged duration of more than five days with excessive bleeding
Oligomenorrhea	Duration of bleeding less than three days with scanty period or spotting.
Lower reproductive tract infections (RTIs)	Vaginal discharge with associated itching or irritation, white colored discharge with or without foul odor
Dyspareunia	Painful sexual intercourse.
Lower Urinary Tract infections (UTIs)	Dysuria (pain or burning sensation while passing urine) and frequent urination.
Prolapse	A feeling of heaviness or something coming out (protruding) from vaginal opening
Chronic pelvic pain	Pain in the pelvis that lasts for at least 6 months.
Premature rupture of membranes	Clear fluid leaking from the vagina prior to the beginning of labor contractions.
Preeclampsia after 20 weeks gestation	Includes both blurred vision and severe headache or high blood pressure.
Severe anemia	Includes pale eyes, pallid face, pale palms, breathlessness following light work and breathlessness when lying on one's back.
Post-partum heavy bleeding	Bleeding during the postpartum period that required the woman to change the cloth used to contain the blood every hour or more often
Post-partum sepsis	Includes experience of high fever with foul-smelling discharge within 72 hours following delivery.

Self-reported gynecological morbidity

Surprisingly, high proportion of participants reported having at least one gynecological problem (75.6%). The most commonly reported gynecological problems were symptoms of lower RTIs, reported by nearly half of the sampled women (51.2%), symptoms of UTIs (35%), menorrhagia (32.1%) and symptoms of chronic pelvic pain (31.5%). Less commonly reported complications included severe menstrual pain (25.8%), dyspareunia (24.1%), hypomenorrhea (5.2%) and

uterine prolapse (4.1%). Nine in every ten women reported having any RM.

Treatment seeking for RM

Out of the 247 women who experienced any obstetric morbidity only 83 (33.6%) sought treatment for these health problems. Similarly, out of 257 women who reported having any gynecological morbidity, nearly half of them (47.8%) sought treatment for their morbidities. Overall, 58.5% of participants reported that they had sought treatment for any RM.

Among women who had sought treatment for any RM, the majority had sought the services of the public sector facility (80.1%), one in four women (26.8%) sought the services of private sector, and 18.1% reported receiving treatment at home.

Among women who had sought treatment for morbidities, the majority had sought the services of a doctor from a public sector facility (74.2%) or a private sector facility (26.8%). Almost one-fifth (19.8%) reported that they had sought treatment from an unqualified provider or relied on over-the-counter medications or home remedies and 11.1% reported having sought treatment from a nurse or auxiliary nurse-midwife.

Factors affecting RM

Using univariate analysis selected demographic and reproductive characteristics that associated with the women reports of any RM were elicited (data not shown). The highest prevalence of RM was reported by women in the age group of 20 to 29 years (96.4%), compared to 82.1% among women aged 40 years with significant differences between age groups of women ($p < 0.05$). Illiterate or women who can just read and write reported significantly higher proportion of RM than women with secondary education or above (96.3% & 81%, respectively, $p < 0.01$). Women who got pregnant at first time at age of 20 to 24 reported the least percentage of RM than those who had their first pregnancy at older ages (93%) or younger, with significant differences between these groups. Women with shorter duration of marriage (9 yrs.) reported significantly lower RM compared to women who married for 9 or more yrs. (85.9% vs. 98.7%, $p < 0.01$). Though women who had history of any pregnancy wastage reported more RM than those without such a history, the differences were not statistically significant. Minor insignificant differences were also encountered in the reported morbidity between ever users of contraceptive methods than never users (92% vs. 88.8%). Concerning the place of delivery, women who had their last delivery at an institution reported significantly higher percentage of RM than those who had their last birth delivered at home (95.4% vs. 88.7%, $p < 0.05$). Women who had 9 deliveries reported significantly higher proportion of RM than those with 1-3 deliveries (100% vs. 93%, $p < 0.01$).

Results of the stepwise logistic regression analysis for factors affecting RM among sampled women were shown in Table 4. Illiterate or just read and write women and those with primary and preparatory education were five-times (AOR= 5.51, 95% CI=2.1- 8.4) more likely to report any RM than women with secondary or higher education. Women who got pregnant for the first time at ages older than 25 years were more likely to report any RM than those

who had their first pregnancy at age 20-24 years (AOR=1.73, 95% CI=1.23-2.17). Long duration of marriage was positively associated with the reported RM, with women married for 20 years were more likely to report any RM than women with less than 9 years of marriage (AOR= 4.34, 95% CI=2.08-5.48). All data are available from the authors upon request of any interesting reader.

4. Discussion

In Egypt, the health status of women has improved over the past fifteen years (after the ICPD), but their needs have changed over that same period of time. Their overall health and reproductive indicators are slowly improving; however, this improvement was not eventually distributed among all Egyptian women with noticeable variations by women's education, wealth and place of residence (El Zanty & Way, 2008).

Community based studies have emphasized on elicitation of symptom complexes of RM for correct diagnosis (Bhatia & Cleland, 1995; Hawkes *et al.*, 2000). Till the time, at least peripheral laboratory tests could routinely be incorporated at peripheral health facilities, the diagnosis and treatment of conditions such as RTIs has to rely upon the symptomatology (Nanda & Tripathy, 2005).

The present study revealed a high reported reproductive morbidity rate; all, except nine percent of the sampled women reported having any RM. Findings indicate a high prevalence of most problems, especially symptoms of RTIs, UTIs, chronic pelvic pain and symptoms of anemia. This high prevalence reported by the current study could be explained as most of Siwi women lack access to many RH services (in terms of availability, affordability and even quality of services). Data from 2008 Egypt Demographic & Health Survey (EDHS) revealed that 64.7% of women in the frontier governorates reported receiving regular antenatal care compared to 85.1% of women in urban governorates (El Zanty & Way, 2008). Besides, this high frequency could be attributed to different socio-demographic characteristics of the sampled women than women in other parts of Egypt (in terms of living standard and education). The morbidity rate reported by the study is comparable to that described by the Giza study, a cornerstone study of reproductive morbidity in Egypt, as only 5 percent of women in the Giza study had no RM (Zurayk *et al.*, 1993). A high prevalence of RM has also been reported in studies from other developing countries (Al Riyami, *et al.*, 2005; Bhandari & Kannan, 2010; Rahman *et al.*, 2004).

Symptoms of severe anaemia, as expected, were the most commonly reported symptoms during the last pregnancy by the participants (43.8%), which can be attributed to the high parity of the sampled women (mean number of deliveries of 4.4). It is also interesting to mention that Zurayk *et al.*, (1993)

reported higher prevalence of anaemia in a previous decade (63%). It should be noted that in 2008 EDHS, the percentage of women who received iron during last pregnancy was much lower in the frontier governorates than those in urban governorates (42.3% & 62.9%, respectively), (El Zanty & Way 2008). About one third of women in the current study reported suffering from symptoms indicating UTIs. This high prevalence might be attributed to that the main source of drinking water in Siwa town is artesian and non artesian wells that handled directly from the source after minor treatment (carries a risk of contamination). Al Riyami *et al.* (2005) stated in their study that a urinary culture should supplement self-reports of UTI to enhance specificity, although the presence of a positive culture in the absence of symptoms is of no clinical significance in non-pregnant women or women without renal disease.

Much has been documented to demonstrate the prevalence of RTIs. It is unlikely that symptoms indicating lower RTIs have been reported by more than half of women in our study. Reporting abnormal discharge provides some insight into the extent to which women are aware of abnormal reproductive tract symptoms. It is worth to mention that Zurayk *et al.* (1993) reported in their study a high percentage of vaginal discharge (77%). Their findings revealed that women's reports of vaginal discharge agreed moderately well with the physician's observations, but are not good predictors of the occurrence of reproductive tract infections (Zurayk *et al.*, 1995). Different frequencies of RTIs have been reported in Bangladesh (64.5%), India (52%) and Nepal (30.1%) (Dangal, 2008; Sharma & Gupta, 2009; Rahman *et al.*, 2004).

Furthermore, chronic pelvic pain has been mentioned by almost one third of our sample. This was largely in agreement with Muhammad (2010) who reported a similar prevalence of chronic pelvic pain (27%) in her study in Alexandria, Egypt.

The extent of a woman's use of health services during pregnancy, at the time of delivery and at the post-partum period, is an essential factor in avoiding most of the obstetric morbidities and in treating them quickly when they occur. Women use of services for gynecological morbidities is equally important in controlling reproductive morbidity, and will depend on her perception of need, as well as on availability, accessibility and, especially, on quality of these services (Zurayk, 1995). The situation revealed by our study highlights that less than half of participants had never sought treatment for any form of RM (only 33.6% & 47.8% sought treatment for obstetric and gynecological complications, respectively). The majority of them sought treatment from a public sector facility, in spite of high parity and

high rate of morbidity. Women of these remote areas (Siwa Oasis) tend to internalize their health problems because of their status in the family. They may not be allowed to seek health care, or they may feel shy about reporting reproductive problems causing them to be stigmatized by the community. It should be noted that women's low social status plays an important part in keeping women's suffering from being recognized and addressed. Besides, many women in developing countries have been taught to accept their symptoms as part of being a woman.

Data from 2008 EDHS demonstrated that women in frontier governorates (63.9%) were more likely to be concerned about the unavailability of female providers than women in urban governorates (30%) indicating more cultural obstacles in frontier areas (El Zanty & Way, 2008). El-Mouelhy *et al.* (1994) described even that those women who experience symptoms might not make any linkage with a specific morbidity conditions due to lack of awareness about morbidity conditions, therefore, refrain from seeking medical assistance. Comparatively, Nanda & Tripathy (2005) reported that more than 80% of women included in their study had sought some kind of treatment.

The effect of selected socio-demographic characteristics on reported morbidity was addressed in the present study. Women's age, their educational status, age at marriage, duration of marriage, place of delivery and number of deliveries were the factors that associated with women reporting of any RM by univariate analysis. After using logistic regression analysis for controlling for confounders, only women's education, age at first pregnancy, marital duration were the significant correlates for women's reports of any RM. The effect of socio-demographic factors on RM has been previously reported in other studies (Iyoke *et al.*, 2010; Zurayk *et al.*, 1995).

The experience of our research process revealed that women who never attended schools were 5-times more likely to report any morbidity than women with secondary education or higher. This finding might indicate that illiterate women suffer from heavier morbidity burden or they were more to report due to lack of information generally or awareness about morbidity in particular.

Concerning the duration of marriage, our results revealed that longer duration of marriage was associated with more reporting of RM. Long marital duration is associated with high parity and in turn higher obstetric and gynecological morbidities linked to Iyoke *et al.*, 2010. This finding was in accordance with that of Garg *et al.* (2002) who emphasized a positive association between the duration of marriage and the reporting of RM.

Table 1: Self-reported obstetric & gynecological morbidities among the sampled women.

Characteristic	No.	Percentage
Any Pregnancy complication	180	52.9
Excessive vomiting	52	15.3
Threatening abortion	21	6.2
Severe Fever	28	8.2
Fits	6	1.8
Symptoms of pre-eclampsia after 20 weeks of gestation	33	9.7

In this study, women who got pregnant for the first time at ages older than 25 years or at age lesser than 20 years were more likely to report any RM than those who had their first pregnancy at age 20-24 years (this age group had the least reported morbidity in the present results). Increased morbidity associated with adolescent pregnancy has been long reported (WHO, 2004).

5. Conclusions:

The present results reveal a high prevalence of reported RM among women of reproductive age in Siwa, Egypt. Socio-demographic factors such as education, duration of marriage and women age at first pregnancy were the factors that associated with reported morbidity among the sampled women. This high reported rate in peripheral and remote areas needs to be explored further. In the absence of cost effective tests, health workers have to be trained to carefully elicit symptoms, and use standardized criteria for clinical diagnosis.

Acknowledgments:

I would like to thank all the women who participated in this study. Without their help this work would never be completed. The study was fully funded by the researchers themselves. No financial disclosures were reported by the authors of this paper. The authors report no conflicts of interest.

Abstract

Lavander has been used as a medicinal plant and to treat several diseases. Knowledge of moisture desorption isotherms is useful in food dehydration and drying. The equilibrium moisture content for *Lavandula officinalis* L. flowers were measured by using the gravimetric static method with water activity ranging from 11% to 85% and three temperatures of 30, 40 and 50°C. Five mathematical models (modified Henderson, modified Oswin, modified Halsey, modified Chung – Pfost and GAB equations) were used to fit the experimental data of desorption. The modified Halsey model was found to be the best model for describing desorption isotherms curves.

Keywords: *Lavandula officinalis*; Equilibrium moisture content; Desorption

1. Introduction

Lavander is an important medicinal plant of the Labiatae family. Linalool and linalyl acetate are the main component of lavender oils. The relationship between Equilibrium Relative Humidity (ERH) and Equilibrium Moisture Content (EMC) is normally defined by Moisture sorption isotherms (Soysal and Öztekin, 1999). Moisture desorption isotherms help us to determine the maximum moisture that the plant can be allowed to lose during drying. Since all the agricultural products are generally hygroscopic, it is important to determine their equilibrium moisture content for drying, storing, mixing and packaging operations. Having different physical and chemical structures, agricultural crops demonstrate different EMCs under similar conditions (Ahmadi Chenarbon et al., 2010). Medicinal and aromatic plants are used extensively in food, cosmetic, and pharmaceutical industries for the production of spice, essential oils and drugs (Soysal and Öztekin, 2001). Due to their high moisture content and vulnerability to microorganisms, it is very important to provide optimum drying and storage conditions in order to prevent quality spoilage. EMC is defined as the moisture content of hygroscopic material in equilibrium with a particular environment in terms of temperature and relative humidity (Soysal and Öztekin, 1999). In practice, the result of moisture exchange between the product and the surrounding air yields a relative humidity which is known as the Equilibrium Relative Humidity (ERH) (Silakul and Jindal, 2002). The common technique for measuring sorption properties is the static method. This method benefits from the ability to maintain constant conditions (Arnosti et al., 1999; Barrozo et al., 1994). Temperature and relative humidity of the environment

in which samples are placed, are adjusted. When sample mass attains a constant level, sample moisture content is measured and adopted as the Equilibrium Moisture Content (EMC) value. Several empirical and semi-empirical equations have been reported to provide a correlation for the sorption isotherm values of agricultural and food products, including aromatic and medicinal plants (Belghit et al., 2000; Park et al., 2002). However, no single equation is comprehensive enough to predict the relationship between the EMC of agricultural and food products and the relative humidity over a wide range of temperature (Lahsasni et al., 2004; Park et al., 2002). The objective of this study was to determine the desorption isotherms of *Lavandula officinalis* L. flowers at relative humidity and temperature levels ranging from 11 to 85% and from 30 to 50°C, respectively. Five popular models (modified Henderson, modified Oswin, modified Halsey, modified Chung – Pfost and GAB equations) in the literature were fitted to the experimental data in order to verify their adequacy to describe the EMC of the *Lavandula officinalis* L. flowers (Chung and Pfost, 1967; Halsey, 1985; Oswin, 1946).

2. Materials and Methods

2.1. Experimental procedure: The *Lavandula officinalis* L. fresh flowers used in desorption experiments have been grown in the Institute of Medicinal Plant of Iran in 2010. After harvesting, the flowers were cut from stems immediately. 1g (± 0.0001) samples of fresh flowers for desorption experiments were weighed and placed into the glass jars. The equilibrium moisture content of *Lavandula officinalis* L. flowers were determined by using the static gravimetric method at 30, 40 and 50°C. These temperatures are

often used for drying of medicinal plants. In this method, seven saturated salt solutions (LiCl, CH₃COOK, Mg Cl₂, K₂ CO₃, NaNO₂, NaCl and KCl) with relative humidities ranging from 11 to 85% were used

to maintain relative humidities in the jars (Greenspan, 1976). Table1 gives the equivalent relative humidities for the selected salt solutions at three temperatures.

Nomenclature			
C ₁ , C ₂ , C ₃ , C ₄	equation coefficients	RSS	Residual Sum of Square
C ₅ , C ₆ and C ₇		SEE	Standard Error Estimation
T	Temperature, ° C	MRD	Mean Relative Deviation
Ta	absolute temperature. K	df	degrees of freedom
R	universal gas constant, kJ/kmol k	EMC	Equilibrium Moisture Content
R ²	determination coefficient	d.b	dry basis
ERH	Equilibrium Relative Humidity (decimal)	m	Number of samples
i	sample number		

Table1. Saturated Salt solutions and Equilibrium Relative Humidities at different temperatures

Salt type	Equilibrium Relative Humidity (ERH)		
	T=30°C	T=40°C	T=50°C
LiCl	0.113	0.112	0.111
CH ₃ COOK	0.216	0.204	0.192
MgCl ₂	0.324	0.316	0.305
K ₂ CO ₃	0.432	0.432	0.433
NaNO ₂	0.643	0.616	0.597
NaCl	0.751	0.747	0.744
KCl	0.836	0.823	0.812

Samples were weighted every three days until constant weight was reached. Crystalline thymol was used in the jars to prevent microbial spoilage. Constant weight was reached after about 3 weeks in different levels of temperature and relative humidities. The moisture content of each sample was determined in a drying oven at 105°C for 24h (Anon1996; AOAC, 1990).

2.2. Data analysis: Five models, namely, modified Henderson, Oswin, Halsey, Chung – Pfof and GAB equations were used for correlating and defining the relationship between the equilibrium moisture content data and relative humidity at three temperatures (Table 2).

Table 2. Mathematical relationships applied for desorption modeling of *Lavandula officinalis* L.

Model name	Model expression	References
Modified Henderson	$EMC = \left(-\frac{1}{c_2(T+c_2)} \ln(1 - ERH) \right)^{1/c_3}$	(Thompson <i>et al.</i> 1968)
Modified Halsey	$EMC = \left(\frac{-\exp(C_1+C_2T)}{\ln(ERH)} \right)^{1/C_3}$	(Iglesias and Chirife 1976)
Modified Oswin	$EMC = (C_1 + C_2T) \left(\frac{ERH}{1-ERH} \right)^{1/C_3}$	(Brooker <i>et al.</i> 1974)
Modified Chung-Pfof	$EMC = \frac{1}{c_2} \ln \left(\ln(ERH) \frac{(C_2-T)}{c_3} \right)$	(Chung and Pfof 1967)
GAB equation	$EMC = \frac{C_2 C_3 (ERH)}{[1-C_2(ERH)][1-C_2(ERH)+C_2 C_3(ERH)]}$	(Van den Berg and Bruin 1981)

C₂ and C₃ in the GAB equation were determined by using the following equations (Arabhosseini *et al.*, 2005).

$$C_2 = C_4 \exp\left(\frac{C_6}{RTa}\right) \tag{1}$$

$$C_3 = C_5 \exp\left(\frac{C_7}{RTa}\right) \tag{2}$$

Nonlinear regression analysis was used to estimate the constants of models in desorption experiment (Chen, 2002; Peleg, 1993). Mean relative deviation (MRD), determination coefficient (R^2), residual sum of squares (RSS), and standard error estimation (SEE) were used to evaluate the fitting quality of models.

$$SEE = \sqrt{\frac{\sum_{i=1}^m (EMC - \overline{EMC})^2}{df}} \tag{3}$$

$$MRD = \frac{1}{m} \sum_{i=1}^m \frac{|EMC - \overline{EMC}|}{EMC} \tag{4}$$

$$RSS = \sum_{i=1}^m (EMC - \overline{EMC})^2$$

3. Results and discussion

3.1.Experimental Results: Fig.1, 2 and 3 illustrates desorption isotherms of *Lavandula officinalis* L. flowers obtained at various water activities for three temperature levels of 30, 40 and 50°C. As shown, S- shaped curves were found for all three temperatures similar to the most biological products (Ait Mohamed et al., 2005; Kouhila et al., 2002; Lahsasni et al., 2003). On the other hand the full range of water activities and temperatures had a significant effect on EMC and with decreasing temperature in a constant relative humidity, the EMC was increased (Fig.1-3). Such behavior may be explained by considering the excitation state of molecules. At high temperatures, molecules are in an increased state of excitation, leading to weaker attractive forces. This in turn, results in a decrease in the degree of water sorption at a given relative humidity with increasing temperature (Kouhila et al., 2002).

3.2.Fitting of the desorption models to equilibrium moisture data: Desorption curves of *Lavandula officinalis* L. were fitted to five isotherm models. The results of non- linear regression analysis at the three temperatures are listed in Tables 3 and 4. As inferred from the tables, parameters were found to be temperature dependent for all the models. The modified Halsey equation provided the best fit to experimental data of desorption isotherms with the maximum $R^2 = 0.99$ and the lowest MRD = 0.101and SEE=0.081, respectively.

Figure 1. Desorption isotherms data of *Lavandula officinalis* L. flowers at 30°C and fitted curve of the Halsey model

Figure 2. Desorption isotherms data of *Lavandula officinalis* L. flowers at 40°C and fitted curve of the Halsey model

Figure 3. Desorption isotherms data of *Lavandula officinalis* L. flowers at 50°C and fitted curve of the Halsey model

4. Conclusions

Moisture desorption curves of *Lavandula officinalis* L. flowers were obtained at three temperatures (30, 40, 50°C) and relative humidity levels ranging from 11 to 85%. Statistical analysis was used to determine the best equation for predicting the desorption curves of *Lavandula officinalis* L. flowers. Halsey equation was the best fit with lowest error.

Abstract

Lavender has been used as a medicinal plant and to treat several diseases. Knowledge of moisture desorption isotherms is useful in food dehydration and drying. The equilibrium moisture content for *Lavandula officinalis* L. flowers were measured by using the gravimetric static method with water activity ranging from 11% to 85% and three temperatures of 30, 40 and 50°C. Five mathematical models (modified Henderson, modified Oswin, modified Halsey, modified Chung – Pfost and GAB equations) were used to fit the experimental data of desorption. The modified Halsey model was found to be the best model for describing desorption isotherms curves.

1. Introduction

Lavender is an important medicinal plant of the Labiatae family. Linalool and linalyl acetate are the main component of lavender oils. The relationship between Equilibrium Relative Humidity (ERH) and Equilibrium Moisture Content (EMC) is normally defined by Moisture sorption isotherms (Soysal and Öztekin, 1999). Moisture desorption isotherms help us to determine the maximum moisture that the plant can be allowed to lose during drying. Since all the agricultural products are generally hygroscopic, it is important to determine their equilibrium moisture content for drying, storing, mixing and packaging operations. Having different physical and chemical structures, agricultural crops demonstrate different EMCs under similar conditions (Ahmadi Chenarbon et al., 2010). Medicinal and aromatic plants are used extensively in food, cosmetic, and pharmaceutical industries for the production of spice, essential oils and drugs (Soysal and Öztekin, 2001). Due to their high moisture content and vulnerability to microorganisms, it is very important to provide optimum drying and storage conditions in order to prevent quality spoilage. EMC is defined as the moisture content of hygroscopic material in equilibrium with a particular environment in terms of temperature and relative humidity (Soysal and Öztekin, 1999). In practice, the result of moisture exchange between the product and the surrounding air yields a relative humidity which is known as the Equilibrium Relative Humidity (ERH) (Silakul and Jindal, 2002). The common technique for measuring sorption properties is the static method. This method benefits from the ability to maintain constant conditions (Arnosti et al., 1999; Barrozo et al., 1994). Temperature and relative humidity of the environment

in which samples are placed, are adjusted. When sample mass attains a constant level, sample moisture content is measured and adopted as the Equilibrium Moisture Content (EMC) value. Several empirical and semi-empirical equations have been reported to provide a correlation for the sorption isotherm values of agricultural and food products, including aromatic and medicinal plants (Belghit et al., 2000; Park et al., 2002). However, no single equation is comprehensive enough to predict the relationship between the EMC of agricultural and food products and the relative humidity over a wide range of temperature (Lahsasni et al., 2004; Park et al., 2002). The objective of this study was to determine the desorption isotherms of *Lavandula officinalis* L. flowers at relative humidity and temperature levels ranging from 11 to 85% and from 30 to 50°C, respectively. Five popular models (modified Henderson, modified Oswin, modified Halsey, modified Chung – Pfost and GAB equations) in the literature were fitted to the experimental data in order to verify their adequacy to describe the EMC of the *Lavandula officinalis* L. flowers (Chung and Pfost, 1967; Halsey, 1985; Oswin, 1946).

2. Materials and Methods

2.1. Experimental procedure: The *Lavandula officinalis* L. fresh flowers used in desorption experiments have been grown in the Institute of Medicinal Plant of Iran in 2010. After harvesting, the flowers were cut from stems immediately. 1g (± 0.0001) samples of fresh flowers for desorption experiments were weighed and placed into the glass jars. The equilibrium moisture content of *Lavandula officinalis* L. flowers were determined by using the static gravimetric method at 30, 40 and 50°C. These temperatures are

often used for drying of medicinal plants. In this method, seven saturated salt solutions (LiCl, CH₃COOK, Mg Cl₂, K₂ CO₃, NaNO₂, NaCl and KCl) with relative humidities ranging from 11 to 85% were used

to maintain relative humidities in the jars (Greenspan, 1976). Table1 gives the equivalent relative humidities for the selected salt solutions at three temperatures.

Nomenclature			
C ₁ , C ₂ , C ₃ , C ₄	equation coefficients	RSS	Residual Sum of Square
C ₅ , C ₆ and C ₇		SEE	Standard Error Estimation
T	Temperature, ° C	MRD	Mean Relative Deviation
Ta	absolute temperature. K	df	degrees of freedom
R	universal gas constant, kJ/kmol k	EMC	Equilibrium Moisture Content
R ²	determination coefficient	d.b	dry basis
ERH	Equilibrium Relative Humidity (decimal)	m	Number of samples
i	sample number		

Table1. Saturated Salt solutions and Equilibrium Relative Humidities at different temperatures

Salt type	Equilibrium Relative Humidity (ERH)		
	T=30°C	T=40°C	T=50°C
LiCl	0.113	0.112	0.111
CH ₃ COOK	0.216	0.204	0.192
MgCl ₂	0.324	0.316	0.305
K ₂ CO ₃	0.432	0.432	0.433
NaNO ₂	0.643	0.616	0.597
NaCl	0.751	0.747	0.744
KCl	0.836	0.823	0.812

Samples were weighted every three days until constant weight was reached. Crystalline thymol was used in the jars to prevent microbial spoilage. Constant weight was reached after about 3 weeks in different levels of temperature and relative humidities. The moisture content of each sample was determined in a drying oven at 105°C for 24h (Anon1996; AOAC, 1990).

2.2. Data analysis: Five models, namely, modified Henderson, Oswin, Halsey, Chung – Pfof and GAB equations were used for correlating and defining the relationship between the equilibrium moisture content data and relative humidity at three temperatures (Table 2).

Table 2. Mathematical relationships applied for desorption modeling of *Lavandula officinalis* L.

Model name	Model expression	References
Modified Henderson	$EMC = \left(-\frac{1}{c_2(T+c_2)} \ln(1 - ERH) \right)^{1/c_3}$	(Thompson <i>et al.</i> 1968)
Modified Halsey	$EMC = \left(\frac{-\exp(C_1+C_2T)}{\ln(ERH)} \right)^{1/C_3}$	(Iglesias and Chirife 1976)
Modified Oswin	$EMC = (C_1 + C_2T) \left(\frac{ERH}{1-ERH} \right)^{1/C_3}$	(Brooker <i>et al.</i> 1974)
Modified Chung-Pfof	$EMC = \frac{1}{c_2} \ln \left(\ln(ERH) \frac{(C_2-T)}{c_3} \right)$	(Chung and Pfof 1967)
GAB equation	$EMC = \frac{C_2 C_3 (ERH)}{[1-C_2(ERH)][1-C_2(ERH)+C_2 C_3(ERH)]}$	(Van den Berg and Bruin 1981)

C₂ and C₃ in the GAB equation were determined by using the following equations (Arabhosseini *et al.*, 2005).

$$C_2 = C_4 \exp\left(\frac{C_6}{RTa}\right) \tag{1}$$

$$C_3 = C_5 \exp\left(\frac{C_7}{RTa}\right) \tag{2}$$

Nonlinear regression analysis was used to estimate the constants of models in desorption experiment (Chen, 2002; Peleg, 1993). Mean relative deviation (MRD), determination coefficient (R^2), residual sum of squares (RSS), and standard error estimation (SEE) were used to evaluate the fitting quality of models.

$$SEE = \sqrt{\frac{\sum_{i=1}^m (EMC - \overline{EMC})^2}{df}} \tag{3}$$

$$MRD = \frac{1}{m} \sum_{i=1}^m \frac{|EMC - \overline{EMC}|}{EMC} \tag{4}$$

$$RSS = \sum_{i=1}^m (EMC - \overline{EMC})^2$$

3. Results and discussion

3.1.Experimental Results: Fig.1, 2 and 3 illustrates desorption isotherms of *Lavandula officinalis* L. flowers obtained at various water activities for three temperature levels of 30, 40 and 50°C. As shown, S- shaped curves were found for all three temperatures similar to the most biological products (Ait Mohamed et al., 2005; Kouhila et al., 2002; Lahsasni et al., 2003). On the other hand the full range of water activities and temperatures had a significant effect on EMC and with decreasing temperature in a constant relative humidity, the EMC was increased (Fig.1-3). Such behavior may be explained by considering the excitation state of molecules. At high temperatures, molecules are in an increased state of excitation, leading to weaker attractive forces. This in turn, results in a decrease in the degree of water sorption at a given relative humidity with increasing temperature (Kouhila et al., 2002).

3.2.Fitting of the desorption models to equilibrium moisture data: Desorption curves of *Lavandula officinalis* L. were fitted to five isotherm models. The results of non- linear regression analysis at the three temperatures are listed in Tables 3 and 4. As inferred from the tables, parameters were found to be temperature dependent for all the models. The modified Halsey equation provided the best fit to experimental data of desorption isotherms with the maximum $R^2 = 0.99$ and the lowest MRD = 0.101and SEE=0.081, respectively.

Abstract: In this paper, we incorporate information flow in a supply chain model. Also for decreasing the risk of the supply chain system, we first predict the customers' demands and then this forecasting is used as an input to the supply chain model. In this paper a markov chain model will be used to forecast the customers' demands. A simulated annealing (SA) algorithm is developed for solving the supply chain problem. The results indicate that the SA method and proposed markov chain model are efficient for a wide variety of problem sizes.

Keywords: Supply chain model; Demand forecasting; Markov chain; Simulated annealing

1. Introduction

The performance of a supply chain depends critically on how its members coordinate their decisions. Information sharing between supply chain partners is a prerequisite for coordinated supply chain management. Over the last few years, considerable research has been devoted to understanding the role of information in achieving supply chain coordination. The research of information sharing in supply chain grew largely out of two-stage inventory models. The following papers mainly examine what kind of benefit can be gained through demand-oriented information sharing: Gavirneni et al. (1999), Lee et al. (2000). Further studies that analyze the benefit of information sharing with multiple retailers are as follows: Cachon and Fisher (2000), Gavirneni (2001), Aviv and Federguen (1998). Some other researchers investigated forecasting information sharing. Cachon and Lariviere (2001) studied forecast sharing in a single product, two-level supply chain. Aviv (2001) compared three settings under a two-level supply chain. Zhao et al. (2002) presented the impact of different forecasting models on the value of information sharing in a supply chain.

In this paper, we will establish a supply chain model that includes sources, make and deliver processes to examine the effect of supply information sharing. Also we predict the customers' demands in the supply chain system. The forecast of future demand forms the basis for all strategic and planning decisions in a supply chain. In the literature several techniques have addressed time series prediction (pourahmadi, 2001). Time series can be modeled by using Markov chains. In many occasions, one has to consider multiple Markov chains (categorical sequences) together at the same time, i.e., to study the

chains in a holistic manner rather than individually. The reason is that the chains (data sequences) can be "correlated" and therefore the information of other chains can contribute to explain the captured chain (data sequence). Thus by exploring these relationships, one can develop better models.

When we predict the customers' demand, then it is used an input to the proposed supply chain model. For solving the supply chain model, a simulated annealing algorithm is used. The reminder of this paper is organized as follows. Section 2, discusses the proposed markov chain model. In section 3, the mathematical formulation of the supply chain model is presented. Section 4, discusses the solution approach for solving the problem. Section 5, discusses some computational results. Finally, section 6 contains some conclusions and future research development.

2. The Markov Chain Model for forecasting customers' demands

In this section, we propose our new multivariate markov chain model for forecasting customers' demands. The following multivariate Markov chain model has been proposed in Fung et al. (2003). The model assumes that there are S categorical sequences and each has m possible states in

$$M = \{1, 2, \dots, m\}$$

Here we adopt the following notations. Let $X_n^{(k)}$ be the state vector of the k th sequence at time n . If the k th sequence is in State j at time n then we write

$$X_n^{(k)} = e_j = \left(0, \dots, 0, \underset{jth}{1}, \underset{entry}{0}, \dots, 0 \right)^T.$$

The following relationships among the sequences are assumed:

$$X_{n+1}^{(j)} = \lambda_{jj} p^{(jj)} X_n^{(j)} + \sum_{k=1, k \neq j}^s \lambda_{jk} p^{(jk)} X_n^{(k)}$$

for $j = 1, \dots, s$, (1)

Where

$$\lambda_{jk} \geq 0, 1 \leq j, k \leq s \quad \text{and} \quad \sum_{k=1}^s \lambda_{jk} = 1$$

for $j = 1, \dots, s$, (2)

Equation (1) simply means that the state probability distribution of the j th chain (sequence) at time $(n+1)$ depends only on the weighted average of $p^{(jj)} X_n^{(j)}$ and $p^{(jk)} X_n^{(k)}$. Here $p^{(jj)}$ is the one-step transition probability matrix of the states from the j th sequence to the states of the i th sequence. In matrix form, one may write

$$X_{n+1} \equiv \begin{pmatrix} X_{n+1}^{(1)} \\ X_{n+1}^{(2)} \\ \vdots \\ X_{n+1}^{(s)} \end{pmatrix} = \begin{pmatrix} \lambda_{11} p^{(11)} & \lambda_{12} p^{(12)} & \dots & \lambda_{1s} p^{(1s)} \\ \lambda_{21} p^{(21)} & \lambda_{22} p^{(22)} & \dots & \lambda_{2s} p^{(2s)} \\ \vdots & \vdots & \ddots & \vdots \\ \lambda_{s1} p^{(s1)} & \lambda_{s2} p^{(s2)} & \dots & \lambda_{sj} p^{(sj)} \end{pmatrix} \begin{pmatrix} X_n^{(1)} \\ X_n^{(2)} \\ \vdots \\ X_n^{(s)} \end{pmatrix} \equiv QX_n \quad (3)$$

When we forecast the customers' demands then this forecasting is used as an input to the supply chain model.

3. The Supply Chain Model

We assume that there are several capacitated suppliers, one manufacturer, and several retailers. The retailers are confronted with time-varying customer demands, which were predicted in the previous section. In the proposed supply chain model, each supplier can supply one material. The manufacturer produces several products, which consume several materials respectively.

Then the production planning in the manufacturer is a multi-product multi-resource constraints lot sizing problem. The sequence of events in every period is as follows. First, the

manufacturer decides on his production quantity for the period, and the materials he needs are transported from suppliers under the resources constraints. Next, the manufacturer consigns his products to several retailers. If the manufacturer cannot satisfy the full order of the retailer, we assume that the retailer acquires the shortage part of the order elsewhere. All happen with no lead time. Then customer demands occur. At last inventory holding or shortage penalty costs are charged.

Now we introduce some indices and parameters, which will be used in the following formulas and models.

Index sets

l : Product index, $l = 1, \dots, L$;

n : Supplier index, $n = 1, \dots, N$;

m : Retailer index, $m = 1, \dots, M$;

t : Index of planning period, $t = 1, \dots, T$;

Parameters

a_{nlt} : Capacity needed on material n for one unit product l in period t ;

R_{nt} : The supplier capacity of available material n in period t ;

b_n : Unit transportation cost for material n to the manufacturer;

c_{lt} : Unit production cost for product l in period t ;

h_{lt} : Unit inventory holding cost for product l in the manufacturer in period t ;

g_{lm} : Unit transportation cost for product l to the retailer m ;

h_{lmt} : Unit inventory holding cost for product l in the retailer m in period t ;

β : The penalty coefficient for the shortage of the manufacturer to the retailer;

D_{lmt} : The predicted customer demand for product l in retailer m in the period t ;

Decision Variables

I_{lt} : The inventory of product l in the manufacturer at the end of period t ;

I_{lmt} : The inventory of product l in the retailer m at the end of period t ;

O_{lmt} : The shortage of product l for the retailer m from the manufacturer in the period t ;

X_{lt} : The amount of product l produced in period t ;

f_{lm} : The quantities of product l distributed to the retailer m in period t .

So the problem can be formulated as follows:

$$\begin{aligned} \text{MIN} \quad & \sum_{n=1}^N \sum_{l=1}^L \sum_{t=1}^T b_n a_{nlt} X_{lt} \\ & + \sum_{l=1}^L \sum_{t=1}^T (c_{lt} X_{lt} + h_{lt} I_{lt}) \\ & + \sum_{m=1}^M \sum_{l=1}^L \sum_{t=1}^T (g_{lm} f_{lm} + h_{lm} I_{lm} + \beta O_{lm}) \end{aligned} \quad (4)$$

Subject to:

$$\sum_{l=1}^L a_{nlt} X_{lt} \leq R_{nt} \quad \text{for all } n, t \quad (5)$$

$$I_{l,t-1} + X_{lt} - I_{lt} = \sum_{m=1}^M f_{lm} \quad \text{for all } l, t \quad (6)$$

$$I_{l,t-1,m} + f_{lm} - I_{ltm} + O_{ltm} \geq D_{ltm} \quad \text{for all } l, t, m \quad (7)$$

$$X_{lt} \geq 0 \quad \text{for all } l, t \quad (8)$$

$$f_{lm} \geq 0 \quad \text{for all } l, t, m \quad (9)$$

$$I_{lt} \geq 0 \quad \text{for all } l, t \quad (10)$$

$$I_{ltm} \geq 0 \quad \text{for all } l, t, m \quad (11)$$

$$O_{ltm} \geq 0 \quad \text{for all } l, t, m \quad (12)$$

Constraint (5) is the total capacity for a material n needed to produce all the scheduled products in period t . Constraint (6) defines the quantities of product l on consignment by the manufacturer for the retailers in period t . Constraint (7) is to satisfy the customer demands. Constraints (8)-(12) enforce the non-negativity restrictions on the corresponding variables.

4. Solution approach

A simulated annealing algorithm is used for solving the problem. The SA methodology draws its analogy from the annealing process of solids. In the annealing process, a solid is heated to a high temperature and gradually cooled to a low temperature to be crystallized. As the heating process allows the atoms to move randomly, if the cooling is done too rapidly, it gives the atoms enough time to align themselves in order to reach a minimum energy state that named stability or equipment. This analogy can be used in combinatorial optimization in which the state of solid corresponds to the feasible solution, the energy at each state corresponds to the

improvement in the objective function and the minimum energy state will be the optimal solution. The SA parameters are as follows:

T_0 : Initial temperature,

C : Rate of the current temperature decreases (cooling schedule),

ST : Freezing temperature (the temperature at which the desired energy level is reached),

L : Number of accepted solution at each temperature,

S : Counter for the number of accepted solution at each temperature,

X : A feasible solution

$C(X)$: The value of objective function for X ,

In the section 4.1, 4.2, we describe the initial solution construction and generating the candidate move which we use for SA algorithm.

4.1. Representation and Initialization

The procedure for obtaining the initial solution is randomly. The decision variables in our problem are X_{lt} and f_{lm} , they are positive variables of real numbers. We encode variables X_{lt} and f_{lm} as follows:

$$(X, f) = (X_{11}, X_{12}, \dots, X_{1T}, X_{21}, X_{22}, \dots, X_{2T}, \dots, X_{LT}, f_{111}, f_{112}, \dots, f_{11M}, \dots, f_{2T1}, \dots, f_{2TM}, \dots, f_{LT1}, \dots, f_{LTM})$$

For a capacitated lot-sizing problem, the decision variables X_{lt} are dependent on the available resources capacities R_{nt} . In this situation, we can first check it whether the total capacity for a resource needed to produce all the scheduled products in this period exceeds the total available capacity for this resource at this period. If exceeds, we will generate another solution to replace.

4.2. Obtaining the candidate move

For obtaining the candidate move, we randomly select one X_{lt} in X part of the solution and regenerate its value. Then adjust the correlative value of f of the solution according to the replacement and check the feasibility of it.

Table 1. Comparison of optimal solution and SA solution

NO.	# Retailers	# Suppliers	Optimal solution		SA solution		
			Cost	CPU time	Cost	CPU time	Gap (%)
1	4	2	19125.6	12	19125.6	1	0.00
2	6	3	25892.1	28	25892.1	3	0.00
3	8	3	32978.4	54	32978.4	9	0.00
4	9	3	35026.4	132	35026.4	13	0.00
5	20	6	79226.1	487	79226.1	29	0.00
6	30	8	109213.4	695	110054.2	39	0.77
7	40	10	144786.7	847	146157.4	51	0.95
8	50	13	181912.5	1475	183792.7	67	1.03
9	60	16	211326.9	3524	213375.1	80	0.97
10	70	17	254975.9	6748	258138.6	94	1.24
11	80	18	292381.7	10511	296364.2	110	1.36
12	90	20	346759.7	3 hours limit	337882.6	127	-2.56
13	100	22	383674.1	3 hours limit	369734.2	146	-3.63
14	120	24	469526.4	3 hours limit	435186.4	181	-7.31

Gap(%)= 100*(Heuristic solution value – LINGO best solution value) / LINGO best solution value.

5. Computational results

The computational experiments described in this section were design to evaluate the performance of our overall solution procedure with respect to a series of test problems. The SA algorithm was coded in visual basic 6 and run on a Pentium 4 with 3 GB processor. For simplicity we assume that the number of periods is three and the number of products is two in all of the instances, and also we use the following parameter values.

a_{nl} Is uniformly drawn from [5, 8]

b_n Is uniformly drawn from [8, 15]

c_{lt} Is uniformly drawn from [8, 15]

h_{lt} Is uniformly drawn from [7, 12]

g_{lm} Is uniformly drawn from [7, 12]

h_{lm} Is uniformly drawn from [7, 12]

$\beta=10$

And R_{nl} with regard to the size of the problem is generated randomly.

5.1. Comparison of optimal solution and SA solution

For evaluating the SA algorithm, fourteen problems are solved by LINGO software (Table 1). For each problem, the tuning of the parameters is done by carrying out random experiments.

It can be seen that the SA solutions are optimal (or near optimal) in different problem instances (Table 1). The average CPU time are less than or equal to 181 seconds for the SA method (CPU

times are in the seconds). However, the maximal average CPU time for obtaining the optimal solutions is equal to 10511 seconds, and for problem instances 12 to 14 by a reasonable amount of time limit, LINGO can not find the optimal solution, and the SA solutions in these problem instances are better than the best solutions that are obtained by LINGO.

5.2. Validating the markov chain model

For validating the proposed markov chain model, we comprise it with the Auto Regressive Moving Average (ARMA) model. The order of the ARMA model which we use is (1, 1) (i.e., ARMA (1,1)). After running we see that the absolute error for the markov chain predictor model is less than the absolute error of the ARMA model, the absolute error for the proposed markov chain model is 0.24 and the absolute error for the ARMA model is 0.46.

6. Conclusions

In traditional supply chain inventory management, orders are the only information firms exchange, but information technology now allows firms to share demand and inventory data quickly and inexpensively. In order to have an integrated plan, a manufacturer needs to know not only demand information from its customers but also supply information from its suppliers. In this paper, we incorporated information flow in a supply chain model. Also for decreasing the risk of the supply chain system, we first predicted the customers' demands and then this forecasting was used as an input to the supply chain model. A markov chain model was proposed to forecast the customers' demands.

A simulated annealing (SA) algorithm was used for solving the distribution network problem. The results of extensive computational tests indicated that the SA method and proposed markov chain model is both effective and efficient for a wide variety of problem sizes.

Abstract: This research investigates the status inconsistency among women in Hamadan province, Iran. The study was carried out in eight cities and 32 villages. Questionnaire was applied to collect data from 767 women from urban areas and 786 women from rural area. Data analysis was done by using SPSS software and multi-variable regressions. The results show considerable status inconsistency among women in Hamadan. In addition, with decreasing social status of women here, the status inconsistency increases and the rate of status inconsistency in the rural area was higher than the urban area.

Keywords; Status inconsistency, Socio-economic Status, Self-image, Expectations, Prediction, Women

1 Introduction

Status inconsistency is a concept that is linked with modern society and its subsequent offshoots such as individualism, democracy, separation, distinction and social mobility (Chelbi, 1996; Slomczynski, 1989; Tamin, 1994). In the case of status inconsistency, people and groups suffer from stress and pressures that lead them to abnormal reactions through different attitudes and behavioral forms (Brown, Cretser, & Lasswell, 1988). Imbalance between various aspects of backgrounds, including wealth, power, prestige and knowledge, when followed by growth and development such as urbanism and education, brings along situations such as higher expectations and demands that could not be fulfilled in many societies. Furthermore, denying those claims would affect the societies and individuals in undesirable ways. This lack of conformity and agreement might be a source of negative attitudes for people and leads to social problems such as depression, anxiety and disappointment.

Studies carried out in Iran on status inconsistency determined that this social problem dramatically affects the people of Iran, especially youngsters. Moghaddas (1994) revealed that although job mobility is usually the result of education and passing of different courses and makes it possible to have social mobility, it may not be accompanied by economic achievements. It has been specified that despite educational or even job mobility, people still cannot attain a sound economic position, and the result is imbalance between their desires and their

socio-economic status (Chelbi & Azadeh, 2000; Moghaddas, 1994).

1.1 Status Inconsistency

Status inconsistency has its roots in Max Weber's theory of multi fundamentals in social inequality (Berger, Norman, Balkwell, & Smith, 1992). Lenski (1954) employed the concept of status inconsistency for the first time. Whitt (1983) defined status inconsistency, as the simultaneous occupancy by the individual of unequal ranks in two or more status hierarchies. Goffman (1957) argued that there has been a relationship between status inconsistency and intention to change in power distribution. Rush (1967) found the same relationship between status inconsistency and political views. Treiman (1966) expressed that there was no relationship between this concept and prejudgment with control of social status of respondents. On the other hand, Geschwender (1967) obtained some results that indicate a link between status inconsistency and some of the attitudes and prejudgments (Brown, et al., 1988).

In primary studies on these phenomena, the undesirable psychological results were more emphasized (Caston, 1989; Haus, 1983). Slomczynski (1989) found a decrease in social inequalities and increase in flexible and tolerating attitudes in situations of status inconsistency. Krueger (1989) defines increase in new jobs, independent staff, innovation and creativity of entrepreneurial managers with status inconsistency, and De-Graaf (1991) found status inconsistency to be present when high consumption of cultural products is

accompanied by lower consumption of physical goods to the Under-rewarded people, i.e., people with high education and low income.

In recent studies about status inconsistency, dimensions such as physical capital, job prestige and education find more importance. In addition to materialistic and prestige values, new theories have stressed cultural capital and organizational power, which are among important dimensions in establishing social positions and are being used in determining individuals' background along with other dimensions and aspects (Bourdieu, 1984; Chelbi & Azadeh, 2000; Coleman, 1988).

Some researchers such as Hornung (1980) studied status inconsistency with respect to the mediate variables such as conflicts in expectations and also confusion. His study implies that by using regression analysis models and controlling social status, the status inconsistency manifests many psychological pressures.

Kim (2000) employed status inconsistency in some studies on assigned status, typically when members of minority groups gain some advantages over members of a dominant group. Study on another type of status inconsistency revealed lower migration rates for couples in which the wife's education is higher than the husband's education than for couples in which the wife's education is equal to or lower than the husband's education (Lee, Toney, & Berry, 2009). Another research has shown that individuals with status incongruence, such as a mismatch between educational and occupational attainment, experience overall poorer health (House, 2001; Smith & Frank, 2005).

1.2 Socio-economic Status

Socio-economic status has some dimensions that show the amount of access to the valuable four resources: organizational capital, physical capital, cultural capital and social prestige (Chelbi, 1996; Chelbi & Azadeh, 2000).

From this point of view, physical capital is the name given to physical wealth, accessible financial resources and income of a certain position. Organizational capital relies on the organizational power of the person, control of power, supervision and decision making for others. Prestige shows social obligations and degree of influence on the minds of society members, and cultural capital shows the amount of access to knowledge resources, particularly education.

1.3 Self-image, Expectations and Predictions

Self-image is people's perception of their socio-economic status, which is not necessarily the same as their real socio-economic status (Chelbi,

1996; Chelbi & Azadeh, 2000). Expectation is considered as what people anticipate to gain access in life, in other words, the socio-economic status that they wanted to achieve (Chelbi, 1996; Chelbi & Azadeh, 2000). Prediction refers to the socio-economic status that people think they can achieve, or will achieve in the future. The difference between Expectation and Prediction is narrow but very important. While Expectation is the socio-economic status that people think is sufficient and merited by them, Prediction is about socio-economic status that they think they will achieve at some time in the future.

2 Research Hypotheses

For delivering a complete understanding of research results, we categorized research hypotheses into two main groups.

Hypotheses 1: aims to determine relationships between self-image, expectation, prediction and socio-economic status among women of Hamadan province.

Hypothesis 1a: There is a relationship between self-image of women of Hamadan province and their socio-economic status.

Hypothesis 1b: There is a relationship between expectation of women of Hamadan province and their socio-economic status.

Hypothesis 1c: There is a relationship between prediction of women of Hamadan Province and their socio economic status.

Hypothesis 2: aims to determine relationships between socio-economic status, self-image, expectation and prediction of women of Hamadan provenance and their status inconsistency.

Hypothesis 2a: There is a relationship between socio-economic status of women of Hamadan provenance and their status inconsistency.

Hypothesis 2b: There is a relationship between self-image of women of Hamadan provenance and their status inconsistency.

Hypothesis 2c: There is a relationship between expectation of women of Hamadan provenance and their status inconsistency.

Hypothesis 2d: There is a relationship between prediction of women of Hamadan provenance and their status inconsistency.

3 Methodology

The methodology adopted for the research is survey and data collection through questionnaires and interviews. The population subject of the research consisted of women between 20 to 55 years old from Hamadan province. Based on the last overall census

in Iran, the female population in Hamadan province is 828,734 and 317,854 women out of this number are in the 20-55 age bracket. With respect to the dispersion of this population in the cities, villages and in the different provinces, the Cochran's formula was used and the size of samples determined to be 1553.

To cover the entire province, we used the multi-stage cluster sampling, and ultimately we took eight cities in the province as the sample for urban regions. To select villages, with respect to the share of each city, we selected the sample populations from four villages by using the systematic random method. This research was conducted in 2008, and we analyzed the data by SPSS software and multi-variable regressions.

4 Results

Table 1 contains the descriptive statistics for the variables in the model. These simple descriptive statistics revealed some important findings. The table shows that 55 percent of urban women are in a very low level of socio-economic status; 33.4 percent are in low level, 5.3 percent are in high level, and 4.4 percent are in average level and only 1.8 percent of them are at top level.

In rural districts, 77.1 percent of women (highest frequency) are in very low socio-economic status, 21.2 percent of them are in low level, 1.4 percent are in average level, 0.1 percent in high level and only 0.1 percent in top socio-economic status.

In general, Table 1 shows low level of socio-economic status for women both in rural and urban districts of Hamadan province. Only 1.65 percent of urban women are in higher level in socio-economic status than rural women.

Based on results depicted in Table 1, 39.9 percent of urban women in Hamadan province assess their self-image of socio-economic status as average, 35.7 percent assess their status as low and 4.3 percent as very low. On the other hand, only 19.2 percent assess their status as high and 0.9 percent as very high. This situation was more pronounced among rural women; 48.2 percent (highest frequency) assess their socio-economic status as low. Among them, 11.3 percent assess their socio-economic status as very low level. In addition, 29.9 percent of these women assess their self-image of socio-economic status as average, 10.2 percent as high and only 0.4 percent assess their status as very high. In general, 42 percent of urban and rural women assess their socio-economic status as low, 34.8 percent as average and 14.6 percent as high level. Also 7.9 percent think they are in very low position and 0.6 percent assessed their status as very high.

Moreover, Table 1 showed 56.7 percent of urban women of Hamadan province had high expectation of their potential socio-economic status and 22.6 percent expected to be in average level. The results become significant when it becomes clear that only 1.6 percent of the women population expected to be in low level and about 0.1 percent expected to be in very low socio-economic status level. On the other hand, 19 percent of these women expected to be in very high level of socio-economic status. In the rural areas, 58 percent of women have high expectation about their socio-economic status. In addition, 15.5 percent expect to be in very high socio-economic status. Results also show that 25.4 percent expect to have average socio-economic status, 0.9 percent fell in the low category and 0.1 percent in the very low category.

Result of prediction show that 60 percent of urban women predicted their socio-economic status in future as high and 18.8 percent as very high level. Also 9.8 percent of these women predicted their socio-economic status as average, 10.4 percent as low and only 1 (one) percent as very low level. In rural areas, 51.9 percent of women predicted their socio-economic status to be high and 21.2 predicted they would have a very high economic status in the future. Results also show that 15.9 percent predicted their socio-economic status as average, 9.4 percent as low and 1.5 as very low in the future.

In this research, we used the "criteria variance" and "deviation of different capitals" to assess status inconsistency. The value zero to fifty-hundredth shows low status inconsistency, fifty one-hundredth to ninety nine-hundredth denotes average status inconsistency and one and above is considered as high status inconsistency.

With respect to the relative distribution of status inconsistency, it is clear that almost seventy percent of the sample population had high status inconsistency and only about twenty percent were in a position of low status inconsistency. In addition, the average rate of status inconsistency among the women of Hamadan Province was 2.50, showing relatively high status inconsistencies; this number was 2.64 in urban areas and 2.36 in rural areas, showing higher status inconsistency in urban women.

We tested the first group of hypotheses to determine the relationship between the factors of Self-image, Expectation, Prediction and Socio-economic status. In order to achieve this, we employed the Pearson r correlation coefficient between the variables. The Pearson correlation proved the existence of relationship between Self-image ($M=2.58$, $SD=.8555$), Expectation ($M=3.90$, $SD=.681$) and Prediction ($M=3.83$, $SD=0.9026$) with Socio-economic status ($M=1.45$, $SD=0.7642$).

As depicted in Table 3, relationships between Self-image ($r = 0.540$, $N=1553$, $p < 0.01$), Expectation ($r = 0.646$, $N=1553$, $p < 0.01$) and Prediction ($r = -0.467$, $N=1553$, $p < 0.01$) with Socio-economic status do exist. Findings showed that there was a significant relationship between three dimensions and socio-economic status and correlation analysis showed that expectation has the strongest relationship with socio-economic status.

In addition, Pearson Correlation shows that there is a significant relationship between three dimensions (Self-image, Expectation, Prediction) and Socio-economic status ($R^2 = 0.559$, $F(3, 1549) = 653.6$, $P = .000$). An R-squared value of .558 implied that the three aforementioned predictors explain around 56% of variance/variation in the socio-economic status.

The ANOVA model summary in Table 5 provides an analysis of variance for regression. The significant F value, [$F(3, 1549) = 168.79$, $P < 0.001$] indicates that a significant relationship exists between the weighted liner composite of the independent variables and the dependent variable.

For the first independent variable (Self-image), the test was statistically significant ($t = 23.32$, $Beta = 0.692$; $p = 0.001$). This suggested Self-image was the significant predictor of socio-economic status. For the second independent variable (Expectation), the test was statistically significant ($t = 7.47$, $Beta = 0.352$; $p = .000$) and Expectation is the significant predictor of socio-economic status. For the third independent variable (Prediction), the test was statistically significant ($t = -8.89$, $Beta = -0.242$; $p = .000$). This suggested Prediction was the significant predictor of socio-economic status. This Prediction variable had a negative significant relationship with the dependent variable.

As depicted in Table 6, the largest beta coefficient belonged to the Self-image dimension ($\beta = 0.692$). This means that this variable makes the strongest unique contribution to explaining the socio-economic status. The Beta value for "Expectation" is the second highest (0.352), and the lowest Beta value is for "Prediction" (-0.242). The results showed that the hypotheses 1a, 1b, 1c were supported and the estimated equation for analysis presented as:

$$Y (\text{Socio-economic status}) = -0.466 + 0.692 (\text{Self-image}) X_1 + 0.352 (\text{Expectation}) X_2 - 0.242 (\text{Prediction})$$

We tested hypotheses 2a, 2b, 2c, and 2d with Pearson r correlation coefficient for the variables. As depicted in Table 7, relationships exist between self-image ($r = 0.287$, $N=1553$, $p < 0.01$), Expectation ($r = 0.329$, $N=1553$, $p < 0.01$), Prediction ($r = 0.283$, $N=1553$, $p < 0.01$) and Socio-economic status ($r = 0.123$, $N=1553$, $p < 0.01$) with status inconsistency. Correlation analysis showed that the

Expectation has the strongest linear relationship among variables.

The regression analysis indicated a significant relationship between four dimensions (Self-image, Expectation, Prediction, Socio-economic Status) and Status Inconsistency ($R^2 = 0.129$, $F(4, 1548) = 57.507$, $P = .000$). R^2 value of .127 implies that the four aforementioned predictors explain around 13% of variance/variation in the socio-economic status.

The ANOVA table [$F(4, 1548) = 32.99$, $P < .001$] indicates that a significant relationship exists between the weighted liner composite of the independent variables and the dependent variable.

Based on data presented in Table 10, Beta of Self-image was statistically significant ($t = 3.883$, $Beta = 0.188$; $p = 0.001$) with status inconsistency. For the second independent variable (Expectation), the test also was statistically significant ($t = 6.113$, $Beta = 0.295$; $p = .000$) and this suggested Expectation was the significant predictor of status inconsistency. However, the third independent variable was not a significant predictor ($t = 0.326$, $Beta = 0.013$; $p = 0.745$) of status inconsistency. For the fourth independent variable (Socio-economic status), the test was statistically significant ($t = -5.772$, $Beta = -0.206$; $p = .000$) and Socio-economic status was the predictor (with negative effect) of status inconsistency.

By analyzing the result of the research, we proved that the hypotheses 2a, 2b, and 2d were supported but 2c was not supported and estimated equation for analysis is:

$$Y (\text{Inconsistency}) = 0.945 + 0.188 (\text{Self-image}) X_1 + 0.295 (\text{Expectation}) X_2 + 0.013 (\text{Prediction}) - 0.219 (\text{Socio-economic status})$$

Discussion and Recommendation

Regarding the two obtained equation and significant relationships, we can present the final linear regression model for status inconsistency of women in Hamadan province as follows;

As the Figure 1 makes clear, Expectation had the highest influence on status inconsistency while Self-image had the strongest relationship with Socio-economic status. Another important finding is the significant relationship between Prediction, Expectation and Self-image. An interesting point is Prediction and Self-image had a negative relationship with each other. Finally, it is important to note that Socio-economic status has the lowest relationship with status inconsistency. Absence of adaption between different dimensions of the Socio-economic status such as wealth, power, dignity and knowledge caused status inconsistency and conflict between the Self-image and Prediction and Expectation of socio-economic status of people. The results of this research support other findings of other studies about roots and dimensions of status inconsistency (Brown,

et al., 1988; Chelbi & Azadeh, 2000; Moghaddas, 1994; Tamin, 1994; Treiman, 1966).

Results of the research also showed that we should consider status inconsistency as a real threat and crisis among women in Hamadan province. The percentage of the people with high status inconsistency is more than 70 percent, which shows the severity of this social problem. We believe adopting mechanisms for balancing between psychological factors of status; most importantly Expectation, and Socio-economic status, could be a helpful way to overcome this social problem. The simplest way to achieve this is to provide a situation of fair and equal chances for everyone to pursue their desire and expectations.

Fair distribution of wealth, countering the discrimination against women, and increasing the level of the power and dignity of women are considered as the most important solutions for this social problem. This effort should be doubled when in the case of women in rural areas, because the severity of the problem in these areas is much higher than the cities.

Sweet ent-kaurene diterpene glycosides of *Stevia rebaudiana* Leaves Bertoni and Biological Evaluation**^{1*}El-Gengaihi, Souad,²Ibrahim Nabaweya,¹ Riad. Sahar,³ El-Regal, S.N. and Sherief Naglaa**¹ Medicinal and Aromatic Plants Dept., ² Pharmacognosy Dept., ³ Medicinal Chemistry Dept., National Research Centre Dokki 12311 Cairo Egypt⁴ Biochem. Dept. Fact. of Science Ain Shams Univ. Cairo Egypt*souadelgengaihi@yahoo.com , *souadgengaihi@hotmail.co.uk

Abstract: *Stevia rebaudiana*, Bertoni, a sweet, non-caloric natural source, perennial herb native to Paraguay and Brazil. A rapid better resolved HPLC separation of sweet glycosides of *Stevia rebaudiana* leaves and different biological activities were determined. Eight sweet ent-kaurene diterpene glycosides (SEDG) were quantitatively and qualitatively fractionated by HPLC from the butanol soluble fraction. Two major sweet glycosides were chromatographically isolated. Acid hydrolysis and chemical degradation of the glycosides were performed; their aglycones were also isolated and identified. Hypoglycemic effect of the glycosides on diabetic rats was estimated. Kidney function was revealed; by creatinine and serum urea. Significant decrease in the levels of serum fasting glucose, glycohemoglobin (HbA_{1c}), urea, creatinine, total cholesterol, total lipids, alanine and aspartate aminotransferases enzyme (AST&ALT). In addition, remarkable improvement in vitamins C, and E levels and antioxidant enzymes, glutathione, glutathione oxidase, glutathione reductase and lipid peroxides levels were observed in the liver tissues compared to diabetic controls. Histopathological investigations of the control diabetic rats were characterized. The kidney of diabetic rats treated with sweet glycoside showed mild protective effects as compared to the diabetic control rats.

[El-Gengaihi, Souad, Ibrahim Nabaweya, Riad. Sahar, El-Regal, S.N. and Naglaa Sherief. Sweet ent-kaurene diterpene glycosides of *Stevia rebaudiana* Bertoni Leaves and Biological Evaluation. Journal of American Science 2011;7(6):775-782]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: *Stevia rebaudiana*, glycosides, hypoglycemic, HbA_{1c}, liver, kidney function antioxidant status.

1. Introduction:

Stevia rebaudiana Bertoni, belonging to the Asteraceae, is a perennial herb native to Brazil and Paraguay, is a sweet non-caloric natural source alternative to artificially produced sugar substitutes(1). *Stevia*, sweeteners extracts from the leaves of this herb, are commercially available in Japan, Korea, China, South-East Asia and South America and have been used for some decades to sweeten a variety of foods including beverages, confectionery and pickled vegetables. *Stevia* extracts have been extensively used as the dietary supplements in USA (2). Steviosid is the predominant sweetening approximately 3-8% of the dry leaves weight. Many researchers have demonstrated that *Stevia* has several therapeutic effects, such as hypoglycemic activity (3), as hypotensive (4) and as anti-inflammatory (5). In addition, it has been used for patients suffering from obesity and heart disease

In the present study, we report a more rapid, better resolved HPLC separation of sweet glycosides and also different biological studies were carried out for the cultivated *Stevia rebaudiana* leaves.

2. Material and Methods**Plant Materials**

Stevia rebaudiana seeds were kindly secured by Prof. Dr Jose Walter Pedroza Carneiro, Maringa

University, Brazil, to whom we appreciate very much. As *Stevia* seeds were poorly germinated and also establishment of the seedlings was slow, so tissue culture technique was conducted in order to obtain the plants which consequently give up the cuttings used for cultivation of appropriate area to provide the leaves material (6). The leaves were collected, air dried and powdered.

Spectral analysis

EI/MS, Finnigan mat SSQ 7000 (Thermo Inst., system Inc., USA), and mass mode, EI: 70 Ev. ¹H-NMR spectra were recorded in (CDCl₃) or (CD₃OD) at 300 MHz on a Varian Mercury (HPLC) of (SEDG) Shimadzu system Controller Scl-10AVP with UV detector, UV-Visible detector, and Shimadzu liquid chromatography pump. Conditions: Column: zorbax NH₂ Du pont (4.6m x 25 cm). Eluting solvent: 84-70% v/v acetonitrile- water (pH: 5) changed over a period of 15 min. Flow rate: 2ml/min. UV detector: 210 nm.

Preparation of Sweet glycosides:

The sweet glycoside was isolated from butanol soluble fraction. The dried butanol extract was dissolved in hot methanol (5 ml). The total crude (sweet ent-kaurene diterpene glycosides, SEDG) was precipitated by adding ether (500 ml) and the

precipitate was collected and purified by repeated precipitation with acetone. The precipitate was collected, dried, weighed and kept in a desiccator over anhydrous calcium chloride; portions of isolated crude (SEDG) were dissolved in methanol and then subjected to fractionation on TLC, GF₂₅₄ using solvent system, chloroform: methanol: water (6:3:1, v/v/v) plates were visualized by sulfuric acid (60%) kept at 110°C for 10 min and examined in daylight. Eight compounds were revealed from which two major compounds were isolated, each isolated compound was identified by spectral analyses, MS ¹H-NMR, IR and by HPLC.

HPLC of sweet glycoside:

100 mg of sweet glycoside and 2 mg of each isolated compound was dissolved in 1 ml methanol, HPLC grade from which 25 µl were injected to HPLC using previously mentioned condition (7), (Table 1).

Acid hydrolysis:

Sweet glycoside and the isolated major compounds (0.5g each) were hydrolyzed using 20% sulfuric acid for 5 hrs. The residue was applied on silica column chromatography using chloroform as eluting solvent and TLC using solvent system CHCl₃–MeOH (9:1) then sprayed with p-anisaldehyde, isosteviol was revealed, crystallized with methanol and identified by spectral analyses.

Chemical degradation:

Sweet glycoside and the isolated major compounds (0.5g each) were stirred with sodium periodate (1g). The residue obtained after workup of the reaction mixture was chromatographed over a silica gel column for purification (particle size, 200-63 µm; Merk 63 µm) eluting with CHCl₃–MeOH (49:1) and crystallization from MeOH gave pure steviol which confirmed by spectral analyses (8). The sugar moiety in each case was identified as glucose by paper chromatography and confirmed by GLC after silylation.

Determination of biological effects of Sweet glycoside:

The biochemical effects of sweet glycoside on diabetic rats were carried out. Induction of diabetes was performed by IP administration of alloxan monohydrate (150 mg/kg b.w) to adult male albino rats weighing from 100-140g used for one week (9). Rats were divided into three groups (6 rats each). Group I: Normal control rats. Group II: Control non-treated diabetic rats. Group III: Diabetic rats treated with sweet glycoside of *Stevia rebaudiana* leaves (2.5 g/kg b. w orally) over a period of 21 successive days. The blood samples were withdrawn from the retro-

orbital venous plexus at zero, 10 and 21 days. The following biochemical parameters were determined including, HbA_{1c} (10), serum fasting glucose (11) urea (12) creatinine (13) sodium, (14) potassium (15). Cholesterol (16), Total lipids (17) and the ALT, AST (18).

Ethics

Anesthetic Procedures and handling with animals were compiled with the ethical guidelines of medical Ethical Committee of the National Research Centre in Egypt and performed for being sure at any stage of the experiment.

Tissue samples:

The animals of the different groups were sacrificed at the end of the experiment, histopathological studies for kidney and liver tissues were investigated. (19). the following antioxidant parameters including vitamin C (20) vitamin E (21). Lipid peroxides (22) glutathione (23) glutathione peroxidase (24) and glutathione reductase (25) were estimated.

3. Results and Discussion

Sweet ent-kaurene diterpene glycosides reached 5.58% of dry weight which were detected and fractionated by TLC and HPLC, eight compounds were revealed (Table 1). Two major compounds were isolated; their structures were established by chemical and spectral analyses as follows:

Rebaudioside A:

Colorless needles were obtained from the methanol extract. It showed molecular ion peak at m/z 966 in EI/MS corresponding to molecular formula C₄₄H₇₀O₂₃.¹H-NMR spectrum showed signals for the anomeric protons at δ 5.52 for β-glucosyl ester and δ 4.86, 5.20 and 5.4 for β-glucosidic linkage, these result were confirmed by Koha *et al.* (26).

Stevioside:

Colorless needles were obtained from methanol. EI/MS showed a molecular ion peak at m/z 804 corresponding to the molecular formula C₃₈H₆₀O₁₈, this result coincided with the results of Crosby *et al.* (27).

Isosteviol:

Acid hydrolysis of sweet glycoside, rebaudioside A and stevioside yielded isosteviol which was identified by TLC and spectral analyses that coincided with the reports of Starratt (28). Isosteviol has been isolated for the first time in free state from *Ceriops decandra*, (29). ¹H-NMR spectrum showed proton signals of three methyl group at δ 0.79, 0.98 and 1.25 ppm.

Mass spectrum of the substance showed a molecular ion peak at m/z 318 M^+ (80%) corresponding to the molecular formula $C_{20}H_{30}O_3$, another main ions were at m/z 300(40%), 273(42%), 259(25%), 203(22%), 165(25%), 152(22%), 109(30%) and 81(25%).

Table (1): HPLC of the SEDG in *Stevia rebaudiana* leaves.

15	14.53	0.51	Unidentified

Steviol:

Chemical degradation of sweet glycoside, rebaudioside A and stevioside yielded steviol which was identified by TLC and spectral analyses, these analysis agreed with Ogawa(30). Steviol was isolated in free state from the root bark of marine mangrove .

Many analytical methods have been applied for the separation and quantification of sweet entkaurene diterpene glycosides from the leaves of *Stevia rebaudiana*(31) Quantified only stevioside levels enzymatically (32) quantified total glycosides content by gas chromatography after acid hydrolysis(33). TLC was applied to identify four more abundant glycosides, stevioside, rebaudioside A, C and dulcoside A. Makapugay (34) quantified the diterpene glycosides by HPLC using soxhlet extraction. Mauri *et al* (35) Employed a capillary electrophoresis method to analyze *Stevia rebaudiana* glycosides where they obtained rebaudioside A and steviolbioside using a semi preparative HPLC.

Biochemical studies:

In the present study, the hypoglycemic effect of the sweet glycoside of *Stevia rebaudiana* leaves was evaluated on diabetic rats. The continuous treatment with crude stevioside (2.5g/kg b.w) for a period of 21 days caused a significant decrease in the blood glucose levels of diabetic rats (-32.98%) (Table 2) as compared with diabetic control rats. Jeppesen *et al.* (36) stated that, stevioside and steviol possess hypoglycemic effects by stimulation of insulin secretion from mouse islets, while Huber *et al.* (37) showed that stevioside has a stimulatory action on glycogen deposition in the rat liver.

The present work revealed an increase in HbA₁ percentage (19.66%) in diabetic control rats reflected as an increase in mean serum fasting glucose levels (160 mg/dl), group III treated with sweet glycoside restored normal level of HbA₁ percentages (7.05%) as compared to diabetic control rats (Table 3).

Concerning the kidney function tests, it was found that diabetic rats treated with sweet glycoside showed a slightly decrease in serum urea levels. (Table 4). Serum creatinine levels are frequently used as screening test for renal dysfunction (38). The level of serum creatinine was significantly decreased by (-26.88%) in comparison to diabetic control and reached normal values (0.68 mg/dl) after 21 days (Table 2).

The present results indicate that sweet glycoside had a significant decrease in serum sodium (139 mEq/L) and potassium levels (3.39mEq/L) after 21 days. This result may be due to increase the excretion of sodium and potassium in urine (Table 4).

Melis (39) showed that intravenous infusion of crude extract of *Stevia* leaves increase both sodium and potassium excretion however, insignificant difference was detected in mean arterial pressure in male Wister rats under antidiuresis or water diuresis. The author suggested that the extract may have a direct effect on salt and water transport in renal tubules.

Table (2) Effect of SEDG of *Stevia rebaudiana* leaves on serum creatinine levels in diabetic rats in comparison to normal and diabetic controls.

From these results it is concluded that sweet glycoside have natriuresis and kaliuresis effect, and acts as a vasodilator. The fact that water and sodium excretion increased following sweet glycoside infusion in spite of an unchanged glomerular filtration rate. This may be explained by decreased water and sodium reabsorption in the proximal tubules. The greater enhancement of renal blood flow caused more marked changes in the startling forces around the proximal convolution, resulting in a substantial decrease of the proximal tubular reabsorption and an increase in urinary flow and sodium excretion(39). Treatment of diabetic rats with sweet glycoside not only caused blood glucose homeostasis but also reversed changes in lipid metabolism

In the alloxan-induced control diabetic rats, the rise in blood glucose is accompanied by an increase in serum total cholesterol (87.5mg/dl) and total lipids (393 mg/dl) levels after 21 days as compared to the normal control. The treatment with sweet glycoside caused decrease in total cholesterol and total lipids level (45.3 mg/dl and 200.7 mg/dl, $P \leq 0.05$ respectively) as compared to diabetic control rats (Table 3). It has been suggested that the increase in the total cholesterol and triglycerides levels in diabetes mellitus was the result of resistance to insulin dependent glucose uptake, which consequently increase the serum glucose levels, leading to an increase in hepatic total cholesterol and triglycerides synthesis and secretion.

The aminotransferases constitute a group of enzymes that catalyze the interconversion of amino acids and α -oxo-acids by transfer of amino groups. In liver diseases, serum ALT and AST levels are elevated, where ALT level is characteristically higher than AST level. Elevated serum AST activity with no ALT elevation indicates muscle necrosis or myocardial infarction.

In diabetic control rats, serum ALT and AST levels (30.5 U/ml and 66 U/ml, $P \leq 0.05$, respectively) were significantly higher than normal rats (19.33 U/ml and 16.16 U/ml, respectively) but treatment with sweet glycoside caused significant decrease in both enzymes (-1.63 and -41.42% $P \leq 0.05$, respectively) as compared to diabetic control rats (Table 5).

Free radicals formation and oxidative stress may act as a common pathway to diabetes itself as well as, to its later complications (40). Hyperglycaemia is thought to be associated with increased oxidative stress via glucose autooxidation which produces superoxide radicals and free radicals generated from glycosylated proteins (41).

In the present study it was found that lipid peroxidation level was increased ($0.34 \mu\text{mole/g tissue}$) in diabetic rats compared to normal ones (0.28

$\mu\text{mole/g tissue}$). On the other hand, diabetic rats treated with sweet glycoside (Table 6) showed significantly decreased levels of lipid peroxidation (-11.7% $P \leq 0.05$).

Peroxidation reactions and oxidative stress occurring in disease states can be controlled by supplementing the diet with antioxidants such as vitamin C, E, flavonoids, caffeic acid, chlorogenic acid, anthocyanins. Vitamin C is a strong reducing agent, it is a naturally occurring suppressor of free radicals also it enhances vitamin E efficiency in reducing lipid peroxidation. Vitamin E is the major chain breaking antioxidants in plasma, red cells and tissues. It represents first line of defense against peroxidation of polyunsaturated fatty acids in cellular and subcellular membrane phospholipids (42).

In this study, it could be concluded that *Stevia* sweet glycoside were used to control diabetes and scavenging agents for control free radicals associated with diabetes. So, the effect of administered *Stevia* to diabetic rats was also undertaken as antioxidant agent.

The present results showed that diabetic rats treated with sweet glycoside led to a significant increase in vitamin C, E (80.99 and 75.68% $P \leq 0.05$, respectively) as compared to diabetic control rats (Table 6).

In this study, a significant increase in glutathione level was found in both diabetic rats treated with sweet glycoside (19.11 %), in addition to glutathione peroxidase and reductase activities which were significantly increased (28.84 and 38.49% $P \leq 0.05$, respectively) in comparison to diabetic control rats (Table 6), it could be also concluded that sweet glycoside may have potential use as antidiabetic agents, and could be used as antioxidant agents, controlling free radicals in diabetes.

Histopathological studies

The present study showed that the kidney tissues of diabetic control rats were characterized by vacuolar degeneration, fatty changes in tubular epithelial cells and glomerular degeneration. The kidney of diabetic rats treated with sweet glycoside showed mild protective effects as compared to the diabetic control rats. These changes appeared in the form of marked diminution of fats. In the present work, the pathological changes observed in liver and kidney of diabetic rats may be attributed to lipid peroxidation and free radical causing damage to cells, these side effects may be neutralized by treatment of diabetic rats with sweet glycoside Figs (1 and 2).

It is realized that the treatment of diabetic rats with sweet glycoside alleviated the deleterious effect of alloxan on liver and kidney tissues.

Stevia rebaudiana leaves might be recommended as natural alternative to chemical sugar substitutes; in

addition, the sweet glycosides have many biological effects.

Abstract: Because of their analgesic and anti-inflammatory properties especially for patients with rheumatoid arthritis, nonsteroidal anti-inflammatory drugs (NSAIDs) are one of the most often ingested drugs during pregnancy. The aim of the present work was to evaluate and compare some of the maternal and neonatal toxicity induced by three presently marketing antirheumatic drugs namely meloxicam, celecoxib and leflunomide. The study revealed an ascendent retardation in the body weight gain of experimental dams during gestation compared to control in a drug dependent manner for meloxicam, celecoxib and leflunomide, respectively. Moreover, maternal atrophy of femur cartilage thickness associated with lacking of the integrity was observed in the treated dams. Significant retardation in weight, size and length of the maternally treated newborns was also detected compared to control. A number of congenital malformations associated with a significant decrease in ossified lengths of certain axial and appendicular bones and evident missing of ossification centers were observed in the maternal treated litters. The mentioned maternal and neonatal toxicity showed direct dependency on the applied drug. The results indicate that the tested drugs should be avoided during pregnancy and if necessary, this should be done with caution.

1. Introduction

The use of nonsteroidal anti-inflammatory drugs NSAIDs is increasing because they remain first-line during therapy for a wide range of rheumatic conditions and they are the drugs of choice for the treatment of inflammatory arthritis. It is well known that NSAIDs provide analgesia and suppress inflammation by inhibiting the enzyme cyclooxygenase, resulting in decreased prostaglandin synthesis (Urban, 2000). Many rheumatic diseases affect women of childbearing age, and the medications used to treat these diseases may affect both maternal and fetal organs (Janssen and Genta, 2000). The deleterious side effects that accompany the chronic use of NSAIDs on human health are of concern, particularly their impact on reproduction (Fort, 1999). NSAIDs readily cross the placenta and contribute alongside maternal and placental toxicity in blocking prostaglandin synthesis in a variety of foetal tissues (Burdan *et al.*, 2009 b). The risk of NSAIDs during pregnancy is best searched for aspirin including a number of complications such as diaphragmatic hernia, midline (gastro-sichisis/umbilical hernia) and cardiac septal defects (Kauffman, 1989, Cook *et al.*, 2003 and Kozer *et al.*, 2002 & 2003, Burdan *et al.*, 2006 a & b, Ofori *et al.*, 2006). Examples of other NSAIDS that have been searched for are indomethacin, sulindac, naproxen, ibuprofen, ketoprofen, and diclofenac (Ostensen, 2001) mostly because of their ability to suppress

premature labour.

Animal studies may provide some guidance in the usage of drugs during pregnancy though they cannot be easily extrapolated to the human situation. A few reports have demonstrated that NSAIDs exerted embryotoxicity and teratogenicity among experimental animals including isopropylantipyrine (Burdan, 2000), Diclofenac (Chan *et al.*, 2001), acetylsalicylic acid (Espiridiao *et al.*, 2002), ibuprofen and tolmetin (Burdan, 2004) and piroxicam (Burdan, 2005a). The latter study showed that piroxicam caused maternal toxicity, intrauterine growth retardation, and increase of external and skeletal variations in rats, while the decrease of fetal length was the only signs of developmental toxicity observed in pups. More recently, a number of histopathological side effects have been reported for both celecoxib and leflunomide on liver and kidney of both neonatal and pregnant albino rats (El-Sayyad *et al.*, 2010).

As immunosuppressant drug, leflunomide has been found to be teratogenic in a wide range of experimental animals. In rabbits, fused and incomplete ossification of the sternebra are seen when treatment began during fetal organogenesis (Sanofi-Aventis, 2003). In mice, leflunomide causes multiple malformations over the entire body of the fetus when administered to pregnant mice during gestation day 6-15 (Fukushima *et al.*, 2007). The latter study showed that the characteristic

malformations induced by leflunomide are exencephaly, cleft palate, tail deformity anomalies of the axial skeleton, and cardiovascular malformations. A more recent studies (Fukuschima *et al.*, 2009 & 2010) demonstrated that leflunomide induced limb malformations in mice fetuses via inhibition of dihydroorotate dehydrogenase, a key enzyme in the *de novo* synthesis of pyrimidine found in lymphocytes and other cells with subsequent inhibition of RNA and DNA synthesis. The same study demonstrated that the coadministration of uridine inhibited most of the teratogenicity caused by leflunomide.

In human, it has been reported that NSAIDs can cross the placenta and therefore have been detected in foetal tissues (Siu *et al.*, 2000). A few reports confirmed the animal findings and indicated that the use of prescribed NSAIDs was found to be highly associated with miscarriage beside certain teratological effects and an increased risk for defects of oral facial clefts (Ericson and Kallen, 2001). Santis *et al.* (2005) reported higher incidence of congenital malformations in neonatal outcome among women subjected to leflunomide-treatment during pregnancy. Leflunomide was also found to cause dose-related teratogenicity and fetotoxicity including malformations of the skeleton and central nervous system and prenatal exposure resulted in decreased birth weight and increased mortality in the offspring (Brent 2001 and Casanova *et al.*, 2005). It is well known that cyclooxygenase inhibitors caused intrauterine growth retardation and increased the number of skeletal developmental variations (Gross *et al.*, 1998, Reese *et al.*, 2000 and Burdan *et al.*, 2003). Such observations were partially confirmed in manufacturer studies with celecoxib (PDR, 2003). However, those results were never fully published in available journals.

The present experimental study was therefore aimed to evaluate and compare some of the possible morphological and skeletal maternal and neonatal teratogenic effects of certain marketing NSAID, namely, meloxicam and selective COX-2 inhibitor i.e. celecoxib as well as leflunomide as immunosuppressant drugs.

2. Material and Methods

2.1. Animals and Housing

Forty eight sexually mature healthy Wister albino rats (*Rattus norvegicus*), 12-15 weeks of age and weighing 125 ± 5 g were purchased from the breeding center of experimental animals at Helwan University, Helwan, Egypt and used for experimentation. The rats were acclimated for at least 2 weeks, housed and maintained in an animal care facility. The experiments were approved by the

Animal Research Ethics Committee at Menoufiya University and were conducted in accordance with the guidelines for animal experiments at Menoufiya University. Free access of standard diet composed of 50 % grinding barley, 20% grinding yellow Maize, 20% milk and 10% vegetables was supplied and tap water was allowed *ad-libitum*. Rats were housed in individual cages and maintained in a room at 23 °C. They were kept under good ventilation with a 12 hour light/dark photocycle. Feed and water consumption were monitored daily after the acclimatization period. Females were made pregnant by keeping them with healthy fertile male rats overnight (at a ratio of 1 male: 3 females). On the next morning, vaginal plugs were examined. Vaginal smears were carried out to give a precise determination of the onset of gestation i.e. the designation of gestation day 0. The pregnant rats were arranged into four groups nine female each including one control group and three experimental groups.

2.2. Applied drug-treatment

Three anti-rheumatic drugs were used in this study, namely, celecoxib and meloxicam as non-steroidal cyclooxygenase inhibitor drugs and leflunomide (*Avara*) as a disease-modifying antirheumatic drug. The three drugs were bought from a local pharmacy and manufactured by Amoun pharmaceutical Company, El-Obour city, Cairo, Egypt. The drug tablets were ground separately with Tween-80 (Sigma Chemical Co., St. Louis, Mo, USA). Using distilled water, the suspension was freshly prepared and orally administered by the use of gastric tube to experimental pregnant rats every other day beginning on gestational day 6 and ending on the day 20 few hours before spontaneous delivery which occurred on day 21, while the control group had no treatment. The drug administration period was therefore prolonged to the end of pregnancy, according to the FDA guidelines (Christian, 2001). Care was taken just before the anticipated day of parturition to prevent dams from eating any malformed offspring. The applied therapeutic dose for celecoxib (Pulbutr and Sookvanichsilp, 2002) and leflunomide (Menor and Dunham, 1999) was 0.2 mg/kg body weight whereas it was 0.4 mg / kg body weight for meloxicam (Salhab *et al.*, 2001).

2.3. Maternal investigation

Dam body weight was monitored every other day before drug administration from day 6 until the end of pregnancy. All animals were observed at least once daily before treatment and two times a day during treatment. The total numbers of delivered newborns were recorded for both control and experimental groups. At parturition, the pregnant rats of both control and experimental groups were sacrificed and ten femur bones were incised and

fixed by immersion in 10% neutral formalin for 24 hours and decalcified in 5% nitric acid for 24 hours, after then washed carefully in water and returned to 10% neutral formalin. Consequently, the femur bones were dehydrated in ascending grades of ethyl alcohol, cleared in xylol and mounted in molten paraplast 58-62°C. 5 μ m histological sections were cut, stained with Harris hematoxylin, counter stained with eosin and investigated under bright field Leitz microscope. The obtained sections were subjected to morphometric analysis. Some sections were photographed with "Leitz-Laborlux-S" binocular photomicroscope.

2.4. Delivered newborns investigation

When fetuses were spontaneously delivered on gestational day 21, they were routinely examined. External variations and different morphological abnormalities were examined. The size (cm³), weight (g.) and crown-rump length (cm) of delivered newborns of both control and experimental groups were therefore determined and recorded. The size of the newborns was determined using measuring cylinder containing 10 cm³ fixative solution (10 % neutral formalin). The final size after putting the newborn was subtracted from the constant volume of the fixative i.e. 10 cm³ to find out the exact size of the specimen which represents the displacement volume.

After analyzing the morphological teratogenic effects, both experimental and control delivered newborns were further investigated for the possible adverse effects on bone elements. This has been done by eviscerating and fixing the whole specimens in 10% neutral buffered formalin followed by treatment with 2% potassium hydroxide for 5 days till ossified areas were clearly visible through the soft tissue. The whole specimens were stained following transparency technique for demonstration of bones by Alizarin red "S" method (Mahony, 1973).

The axial and appendicular bones were examined for the occurrence or absence of ossification centers. Lack of alizarin staining was interpreted as bone missing. The incidence of missing bones and length reduction of axial and appendicular bones were determined. Length measurements of mandibular bone (axial region) as well as of ischium, ilium and fore- (humerus, radius and ulna) and hind (femur, tibia and fibula) limbs were carried out in 10 specimens per each group using an ocular micrometer to assess the degree of length reduction displayed by experimental groups comparing with the control.

2.5. Statistical Analysis

The data are presented as the means \pm standard error of the mean (SEM) of different groups. Statistical analysis was carried out using normal

deviates (z-scores) and Student's t test to compare the experimental groups with the control using Minitab 12 computer program (Minitab Inc. State College, PA). A difference was regarded as statistically significant at a value $P < 0.05$.

The following four integrated teratogenic parameters were therefore investigated for both control and experimental groups:

- 1- *Body weight gain of dams during gestation as well as the total number of delivered newborns.*
- 2- *Histological alterations of maternal femur.*
- 3- *Body weight (g.), size (cm³) and crown-rump length (cm) of delivered newborns.*
- 4- *Morphological and skeletal abnormalities of the delivered newborns including morphometric assessments of both axial and appendicular skeletal bones.*

3. Results

3.1. Maternal toxicity examination

Within treated groups, food consumption exhibited retardation compared with control in an ascending order for celecoxib, meloxicam and leflunomide respectively.

3.1.1. Body weight gain of dams during pregnancy

Fig.1 demonstrates the significant decrease in the accumulated body weight gain of experimental groups during gestation compared to control. Statistical analysis showed that the reduction magnitude in weight gain was 19.67, 28.96 and 31.97% of that of the control for celecoxib, meloxicam and leflunomide, respectively.

3.1.2. Histological examination of femur

The femur of the control dams exhibited normal epiphyseal cartilage with regular arrangement of cartilage column. The epiphyseal cartilage differentiates into resting layer, cartilage column, hypertrophied zone and calcified zone and bone trabeculae (Fig. 2 A). However, femur of dams treated with celecoxib (Fig. 2 A1) and meloxicam (Fig.2 A2) showed a marked disruption of cartilage cells including reduction of cartilage column, lacking their integrity, deranged epiphyseal line and lacked most of their building cartilage cells. The cartilage stromata became widened with widely separated cartilage cells. The bone trabeculae attained a considerable reduction. Leflunomide treated dams exhibited disruption of cartilage column cells including reduction of the epiphyseal cartilage associated with irregularity of cartilage column cells and reduction of trabeculae bone (Fig. 2 A3).

3.1.3. Morphometric assessments of femur

Fig. 3 illustrates the depths of epiphyseal cartilage (μ m) of femur bone of control and experimental dams. The antirheumatic drug-treatment induced a significant atrophy of epiphyseal cartilage in an ascending manner i.e. celecoxib, meloxicam,

and leflunomide groups.

3.2. Developmental toxicity

3.2.1. Morphological abnormalities of delivered newborns

Table 1 shows three of the investigated parameters of developmental toxicity. Fetal weight was significantly reduced and followed the same trend of the experimental dams. It therefore has an ascending order for celecoxib, meloxicam then leflunomide respectively. The table also shows the evident reduction of body size (cm³) and crown-rump length (cm) of delivered newborn rats maternally treated with the tested anti-rheumatic drugs.

Examining the gross morphology of maternally treated newborns shows the presence of some pattern of congenital malformations including kyphotic body, uni- & bilateral malformation of both fore -& hind limb, kinky tail and presence of superficial spotty regions of skin hemorrhage in head, neck and trunk regions (superficial haematomas). These abnormalities are observed at higher rates in delivered newborns maternally treated with either celecoxib or leflunomide. Table 2 summarizes all the external malformations and Figs. 4 A1 & A2 demonstrates two malformed examples compared to control (Fig. 4 A).

3.2.2. Effects of the tested drugs on ossification of delivered newborn skeleton

Contrarily to the control group (Fig. 4 B) delivered newborns maternally-treated with the tested antirheumatic drugs show a significant decrease in the length of the primary ossification centers in both axial and appendicular bones. Fig. 4 B1 & B2 demonstrate examples of skeletal preparations. As can be noted from the figures, the decrease in the length of the primary ossification centers were restricted mainly in nasal , parietal, interparietal ,zygomatic arch of squamosal , hyoid

arch , squamosal, tympanicum , exoccipital , supraoccipital , sternum , ischium , pubis and distal phalanges. As shown in table 3, delivered newborn rats of the three experimental groups exhibit significant reduction in the ossified length of mandibular, scapula, ilium, humerus, radius, ulna, femur, tibia and fibula. It is also evident from the table that the highest reduction of ossified length is detected post- leflunomide and celecoxib-treatment.

Assaying the incidence of missing ossified bones in newborns of different experimental groups revealed that the most affected bones are distal phalanges of both fore- & hind limbs, tympanic region, hyoid arch, exoccipital, and pubis. Developmental skeletal variations are seen in the treated litters (Table 4).

4. Discussion

The majority of rheumatologic disorders have been increased frequently in women (Temprano *et al.*, 2005). Rheumatic diseases in women of childbearing years may necessitate drug treatment during pregnancy to control maternal disease activity and to ensure a successful pregnancy outcome. The illness may be severe enough that it requires therapy even during pregnancy and lactation. Health care providers need to be aware of the potential adverse effects of these antirheumatic drugs during conception and pregnancy and should carefully weigh the risks and the benefits of these medications for both mother and child. It is worth mentioning that observations concerned prenatal toxicity are out of the scope of this study since the present data are limited only to the maternal and neonatal toxicity. The latter is attracting special interest particularly in view of the present FDA initiative to encourage clinical trials in children (FDA, 1998).

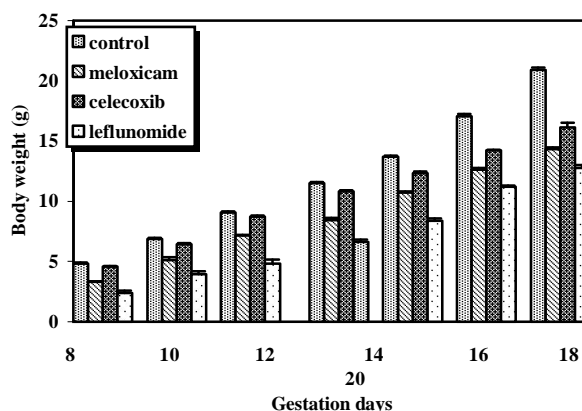

Fig. (1): Maternal increase in body weight gain of control and experimental dams.

Fig. (2): A: Photomicrograph of histological longitudinal section of femoral head epiphyseal cartilage of control dam showing normal arrangement of epiphyseal cartilage column. (H&E. X100). A1 & A2: Photomicrographs of histological longitudinal sections of femoral head epiphyseal cartilage (EC) of celecoxib and meloxicam-treated dams showing marked atrophy of cartilage thickness, irregular epiphyseal line (IEL) and degenerated cartilage cells (DCC). The arrangement of cartilage column is disturbed and the trabeculae bone (TB) is reduced. (H&E. X200).

A3: Photomicrograph of histological longitudinal section of femoral head epiphyseal cartilage of leflunomide-treated dam showing reduction of epiphyseal cartilage thickness associated with irregularity of cartilage column cells and reduction of trabeculae bone. (H&E. X100).

Ischium	0	4	2	0
Pubis	0	4	4	4
Tibia & Fibula	0	2	2	0
Distal phalanx	0	10	12	12

The present study showed that the investigated drugs caused morphological as well as skeletal changes in both dams and their newborn albino rats. Thus, a reduction in the weight gain of pregnant dams compared with control was largely noticed with leflunomide, meloxicam and celecoxib respectively and therefore, the decrease in the rate of body weight gain varied with the drug type. It is well known that maternal toxicity reflects adversely on the offspring (Chahoud *et al.*, 1999 and Burdan *et al.*, 2009 b) and consequently, similar findings were also noticed among the newborn rats, where the body parameters and bone ossification were adversely affected. These adverse effects would be exemplified by the magnitude of weight gain reduction, which is a symbol of the overall drastic change of these drugs. Thus, it could be stated that the drastic effect on health as reduction in weight gain of the studied animals exhibited significant dependency upon the applied drug. Hewiston *et al.*, (2000) showed that among its adverse side effects, leflunomide caused weight loss. Other animal data indicated that exposure to leflunomide at normal therapeutic levels during pregnancy has teratogenic and foetotoxic effects including reduced foetal weight (Hazes *et al.*, 2004). The observed developmental effects as expressed by delayed ossification are related to the fetal growth retardation (Burdan, 2005a).

The morphological abnormalities were evident in delivered newborn rats maternally treated with the tested drugs. According to the present data, the incidences of abnormalities are found to appear markedly higher in newborn maternally treated with either leflunomide or celecoxib more than meloxicam. The observed morphological abnormalities were kyphotic body, malformed fore- & hind limb, reduced neck region, superficial haematomas and kinky tail. These abnormalities were associated with reduction in body weight, size and crown-rump length. According to Manson and Kang (1994) the body weight, the crown length of the fetuses were considered sensitive indicators of animal's response to xenobiotics. However, superficial haematomas can be interpreted as a side effect of inhibition of cyclooxygenase enzyme (Burdan, 2000). In accordance with the present data, decreased foetal length was reported post piroxicam treatment by Burdan *et al.* (2005a) and similar pattern of congenital abnormalities were observed post diclofenac-treatment (Chan *et al.*, 2001).

Number of animal and human studies showed that cyclooxygenase inhibitors may disturb bone physiology and decrease synthesis of cartilage matrix (Seidenberg and An, 2004 and Burdan 2005b). Studies stem from variety of animal models indicating that NSAIDs have adverse effects on the

skeletal system. According to Allen *et al.*, 1980; Tornkvist and Lindholm, 1980; Keller *et al.*, 1987 Ho *et al.*, 1995, the NSAIDs induced cytotoxicity of cartilage cells, the element components of epiphyseal cartilage of the femur. The defects of epiphyseal cartilage may be attributed to the inhibition of glycosaminoglycan and collagen synthesis (McKenzie *et al.*, 1976; Palmoski and Brandt, 1979; Herman *et al.*, 1984). Meanwhile, the disruption of cartilage column and degeneration of cartilage cells manifesting the apoptic cell death as a result of drug toxicity. These may be attributed to the slow physiological death leading to apoptosis (Kuhn *et al.*, 2004).

The direct effects of NSAIDs on cartilage have frequently been reported to be adverse (Smith *et al.*, 1995) but generally ignored owing to the fact that they are not visible during clinical evaluation and are shadowed by the effects on inflammation. Despite that, there is a significant amount of evidence that cartilage is sensitive to certain NSAIDs which inhibit the synthesis of cartilage proteoglycans (Dingle, 1999). Decrease in alizarin staining, as a qualitative sign of mineralization reduction, was observed in bones whose development occurred slowly and / or late in fetal life e.g. cranial, phalanges, metacarpal and metatarsal (Zoetis *et al.*, 2003). Lack of the alizarin staining in well formed cartilage structures, indicating a delay of ossification as a result of intrauterine growth retardation. Poorly ossified metacarpal, metatarsal and caudal vertebrae were also observed in the present work after drug treatment with highest average in leflunomide-treatment. The results obtained from this study indicated that ossification centers of different parts of axial and appendicular regions were retarded especially in tympanic region, sternbrae, clavicle, ischium, distal phalanges of fore- & hind limbs as well as caudal vertebrae which represented by higher incidence of missing ossified bones or delayed formation. Length measurements of ossified bones in mandibular, humerus, radius, ulna, femur, tibia, fibula, scapula and ilium appeared markedly reduced in maternally treated newborns. These findings are in agreement with the report of Brent (2001) in that leflunomide given to pregnant rats and rabbits in doses equivalent to human doses induced skeletal malformations in the offspring. Other studies have shown similar pattern of retarded ossifications including coccygeal, sarcococcygeal vertebrae missing, reduced ossification of skull bones, wavy ribs and decreased ossification of appendicular bones in newborn maternally treated with the highest dose of cox-2 inhibitors NSAIDs including tolmetin, ibuprofen and piroxicam (Burdan *et al.*, 2005 & 2009a). Similar results have been reported by Fukuschima *et al.*

(2009 & 2010) on mice fetuses. *In vitro* experiments revealed that NSAIDs including celecoxib suppress proliferation, delay the endochondral ossification and induce cell death of cultured osteoblasts of fetal rats (Chang, *et al.*, 2006). However, according to available data (Fritz, 1975, Khera, 1981, Beck, 1990 and Solecki *et al.*, 2003) growth restriction and most of the skeletal variations, including treatment-related decrease of bone ossification, could be normalized during postnatal life and thereafter. However, more recent studies indicated that delayed fetal mineralization may be the cause of complications in adulthood (Burr, 2002).

Taken together, the spectrum and frequency of bone malformation presented here are similar to those observed in fetuses exposed prenatally to paracetamol and caffeine (Burdan and Wyskiel, 1999; Burdan, 2001). The maternal toxicity is manifested by decreased body weight gain and both hepato- and nephrotoxicity lead to fetotoxicity (El-Sayyad *et al.*, 2010). Most of the observed developmental defects, e.g., morphological and skeletal malformations are possibly related to the foetal growth retardation (Burdan, 2003).

Based on the present data, it could be concluded that celecoxib, meloxicam and leflunomide induced maternal and neonatal toxicity and consequently, it is highly recommended to delay the treatment with these drugs until the termination of pregnancy.

Curcumin Improves Insulin Sensitivity and Ameliorates Serum Pro-inflammatory Cytokines Levels in Diabetes Rat model Irrespective of type of Diabetes

Mohamed Khaled Mohamed Mahfouz

Department of Biochemistry, Faculty of Vet Medicine, Benha University

drm_mahfouz@yahoo.com

Abstract: Objectives: To evaluate the impact of type of diabetes on serum levels of pro-inflammatory cytokines and the effect of chronic administration of curcumin on their levels in experimentally-induced diabetes in albino rats. The study included 60 (20 as control group) male albino rats; diabetes mellitus (DM) was induced using intraperitoneal injection of a single dose of 50 mg/kg of streptozotocin (STZ) after animals were maintained on high-fat diet for 2-weeks (20 rats) for induction of non-insulin dependent DM (NIDDM) or without dieting regimen for induction of IDDM (20 rats). One-week later, rats received oral curcumin (200 mg/kg). Homeostasis Model Assessment of Insulin Resistance (HOMA-IR) and rapid insulin sensitivity test (RIST) were used for clinical assessment. Two fasting venous blood samples were obtained after induction of diabetes and prior to initiation of therapy and at 6-wks after treatment for calorimetric estimation of fasting blood glucose (FBG) and ELISA estimation of fasting plasma insulin (FPI), serum interleukin (IL)-1 and -6 and tumor necrosis factor- (TNF-). Results: Curcumin induced significant reduction of FBG levels, irrespective of type of diabetes and in NIDDM animals, post-treatment FPI levels were significantly lower compared to their pre-treatment levels. Diabetes, irrespective of its type, induced significantly higher pre-treatment serum levels of pro-inflammatory cytokines in both study groups compared to control group. However, curcumin significantly lowered serum levels of estimated cytokines at 6-weeks after treatment compared to pre-treatment levels. In group II, post-treatment RIST index was non-significantly higher compared to control index. In group III, pre-treatment HOMA-IR index was significantly higher compared to control index, while post-treatment HOMA-IR index was significantly lower compared to pre-treatment levels, despite still being significantly higher compared to control group. It is concluded that chronic administration of curcumin improves insulin sensitivity and thus imposing an anti-diabetic effect manifested as decreased FBG levels with concomitant decreased FPI and ameliorated the increased serum levels of pro-inflammatory cytokines and such effects are manifested in both types of diabetes.

[Mohamed Khaled Mohamed Mahfouz. **Curcumin Improves Insulin Sensitivity and Ameliorates Serum Pro-inflammatory Cytokines Levels in Diabetes Rat model Irrespective of type of Diabetes.** Journal of American Science 2011;7(6):794-799]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Diabetes mellitus, Curcumin, pro-inflammatory cytokines.

1. Introduction

Diabetes and inflammation form a vicious circle, where diabetes is usually associated with inflammation and inflammation contributes to the development of diabetes. Glucose is proinflammatory and even a 75-g glucose load given orally to normal subject results in profound oxidative stress and inflammatory changes at the cellular and molecular level. This occurs even without an increase in plasma glucose concentrations into the pathological range and in spite of endogenous insulin secretion. Therefore, if high plasma glucose concentrations are maintained, they can be expected to be profoundly pro-inflammatory; this is indeed the case, especially if endogenous insulin secretion is inhibited^(1, 2, 3).

Insulin resistance is typically defined as decreased sensitivity or responsiveness to metabolic actions of insulin, such as insulin-mediated glucose disposal in skeletal muscle and adipose tissue and inhibition of hepatic glucose production⁽⁴⁾. Cross-talk between inflammatory signaling pathways and

insulin signaling pathways causes metabolic insulin resistance and endothelial dysfunction⁽⁵⁾.

Insulin resistance plays a major pathophysiological role in type 2 diabetes and is tightly associated with major public health problems, including obesity, hypertension, coronary artery disease, dyslipidemias, and a cluster of metabolic and cardiovascular abnormalities that define the metabolic syndrome⁽⁶⁾. The metabolic syndrome is considered to be a pro-inflammatory state because it is associated with elevated levels of high-sensitivity C-reactive protein, IL-6, fibrinogen, and plasminogen activator inhibitor-1, all of which promote the development of atherosclerotic cardiovascular disease⁽⁷⁾.

Improvement of insulin sensitivity has been suggested in many reports to be feasible by certain herbs and drugs. For instance, it was reported that curcumin improve blood glucose and insulin sensitivity in rat models of diabetes. Curcumin, a polyphenolic compound, is the major yellow-colored

pigment found in the spice, turmeric. It has been used in traditional Indian medicine for centuries, and has numerous pharmacological activities, including potent anti-inflammatory, antioxidant, chemopreventive and chemotherapeutic actions^(8, 9, 10).

The present study aimed to evaluate the impact of type of diabetes on serum levels of pro-inflammatory cytokines and the effect of chronic administration of curcumin on their levels in experimentally-induced diabetes in albino rats.

2. Materials and Methods

Animals

The present study comprised 60 male albino rats with weight range of 250-300 grams. Rats were grouped and kept in separate animal cages, under the prevailing atmospheric conditions and maintained on a balanced diet (bread, barely, carrots, lettuce, milk) and fresh-water supply.

Induction of diabetes

- A) Type 1 diabetes mellitus (IDDM group) was induced by injecting rats intraperitoneally with a single dose of streptozotocin (STZ) (Sigma) in a dose of 50 mg/kg body weight dissolved in 0.2 ml of citrate buffer (pH 4.5)⁽¹¹⁾ without dieting regimen.
- B) Type 2 diabetes mellitus (NIDDM group) was induced by feeding rats with high-fat diet (HFD) consisting of 22% fat, 48% carbohydrate and 20% protein. After two weeks, rats were injected intraperitoneally with a single dose of streptozotocin (STZ) (Sigma) in a dose of 50 mg/kg body weight dissolved in 0.2 ml of citrate buffer (pH 4.5)⁽¹¹⁾.

Diagnosis of diabetes

On the third day of injection, the animals were checked for the presence of glucose in the urine using enzymatic test strips as STZ induces diabetes within 3 days by destroying the beta cells, (*Karunanayake et al., 1975*). Confirmation was done by measuring fasting blood glucose levels by taking a drop of blood from the rat-tail using a glucose-measuring device (Glucocheck). Rats had blood glucose levels of 200 mg/dl were considered diabetic⁽¹¹⁾.

Grouping & Dosing:

- Group I (Control group): 20 animals were considered as a control group for estimated parameters and were divided into 2 subgroups:
 - a) Group I-A: included 10 rats received no medications and kept under the same conditions as prior to start of the study.

- b) Group I-B: included 10 rats were injected intraperitoneally with one injection of citrate buffer and received 1ml/rat of 1% gum acacia orally for 6 weeks.

- Group II: included 20 rats had induced IDDM and were administered 200 mg/kg body weight of curcumin in 1% gum acacia, orally/day for a period of 6 weeks
- Group III: included 20 rats had induced NIDDM and were administered 200 mg/kg body weight of curcumin in 1% gum acacia, orally/day for a period of 6 weeks.

Biochemical Evaluation

Two fasting venous blood samples, withdrawn from the tail vein, were obtained, the 1st after induction of diabetes and prior to initiation of therapy and the 2nd at the end of the 6-wks treatment period. Blood samples were divided into 2 parts:

- A) The first was put in a tube containing sodium fluoride (2 mg sodium fluoride/ ml blood) to prevent glycolysis. Plasma was separated by centrifugation and used for calorimetric estimation of glucose by glucose oxidase method⁽¹²⁾.
- B) The second part was allowed to clot then serum was separated by centrifugation at 3000 rpm for 10 min. Serum was removed, divided into 2 parts:
 1. The first part was used for RIA determination of serum level of insulin⁽¹³⁾.
 2. The second part was placed in pyrogen-free Eppendorf tubes and stored at -80°C until ELISA assayed (within one month) for estimation of serum levels of IL-1⁽¹⁴⁾, IL-6⁽¹⁵⁾ and TNF-⁽¹⁶⁾ using Quantikine ELISA kits from R & D Systems, Inc., (Minneapolis, MN).

Insulin sensitivity Evaluation

Insulin sensitivity of control animals was evaluated by both tests, for comparison with IDDM using RIST and NIDDM using HOMA-IR test

- a. Homeostasis Model Assessment of Insulin Resistance (HOMA-IR)⁽¹⁷⁾ on the basis of fasting insulin and glucose levels and according to the formula $HOMA-IR = I \times G / 22.5$, where I is fasting plasma insulin level (μ U/ml) and G is fasting blood glucose in mg/dl divided by 18, considering an abnormal HOMA-index >3.8 ⁽¹⁸⁾.
- b. Rapid insulin sensitivity test (RIST): The RIST starts with the administration of an insulin bolus (50mU/kg i.v.), over 5 min. At 1 min after initiating the insulin infusion, arterial blood glucose was measured and glucose infusion (D-Glucose/saline, 100 mg/ml, i.v.) was started at a

rate of 5mg/kg/min. According to arterial glucose concentrations measured at 2 min intervals, the infusion rate of the glucose was readjusted to maintain euglycemia. When no further glucose infusion was required, usually within 35 min, the test was concluded. The amount of glucose necessary to maintain euglycemia along the test quantifies insulin sensitivity and is referred to as the RIST index (mg glucose/kg)⁽¹⁹⁾.

Statistical analysis

Data are presented as mean±SD and compared using Wilcoxon ranked test for unrelated data (Z test) using SPSS program (Version 10, 2002). P value at <0.05 was considered significant.

3. Results:

Estimated variables showed a non-significant ($p>0.05$) difference between both subgroups of control rats, (Table 1), so all statistical analyses of study groups were compared versus the total number of control rats and arbitrary named control group.

Fasting blood glucose (FBG) levels estimated either prior to or at end of therapy, were significantly ($p<0.05$) higher in all studied animals compared to control group. Administration of curcumin induced significant ($p<0.05$) reduction of FBG despite still being significantly ($p<0.05$) higher compared to control group. Curcumin induced reduction of FBG, irrespective of type of diabetes, as judged by the non-significant ($p>0.05$) difference of

post-treatment FBG levels in both groups. The impact of type of diabetes was evident on fasting plasma insulin (FPI) levels which were significantly ($p<0.05$) lower in Group II compared to both control group and group III at pre- and post-treatment estimates. On contrary to FBG, curcumin has no impact on FPI in group II, while significantly reduced FPI levels in group III at 6-weeks after initiation of administration compared to prior to administration, despite being still significantly ($p<0.05$) higher compared to control levels, (Table 2).

Induced diabetes, irrespective of its type, significantly induced release of pro-inflammatory cytokines as evidenced by significantly ($p<0.05$) higher pre-treatment serum levels of pro-inflammatory cytokines in both study groups compared to control group. However, the ameliorative effect of curcumin was also evident as manifested by the significantly ($p<0.05$) lower serum levels of estimated cytokines at 6-weeks after treatment compared to pre-treatment levels, despite still being significantly ($p<0.05$) higher compared to control levels

In group II, post-treatment RIST index (34.5 ± 3.9) was non-significantly higher ($p>0.05$) compared to control index (30.6 ± 7.8). In group III, HOMA-IR index calculated prior to initiation of therapy (2.3 ± 0.08) was significantly ($p<0.05$) higher compared to control index (0.17 ± 0.03), while post-treatment HOMA-IR index (0.81 ± 0.19) was significantly ($p<0.05$) decreased compared to pre-treatment levels, despite still being significantly ($p<0.05$) higher compared to control group.

Table (1): Mean values of estimated parameters in both control subgroups

Variable	Group I-A	Group I-B
Fasting blood glucose (mg/dl)	77.4±9.1	81±9.3
Fasting insulin (µIU/ml)	0.9±0.2	0.82±0.21
HOMA-IR index	0.17±0.03	0.16±0.05
IL-1 (pg/ml)	1.28±0.23	1.19±0.31
IL-6 (pg/ml)	12.2±3.3	11.9±4.2
TNF- (pg/ml)	1.82±0.6	1.86±0.52

Data are presented as mean±SD

Table (2): Mean (±SD) of FBG and FPI levels estimated in studied animals pre- and post-treatment compared to control levels

	Fasting blood glucose (mg/dl)		Fasting plasma insulin (µIU/ml)	
	Pre-ttt	Post-ttt	Pre-ttt	Post-ttt
Control	77.4±9.1		0.9±0.2	
Group II (IDDM)	173.4±28*	127.7±6.5*†	0.28±0.1*	0.29±0.1*

4. Discussion

Curcumin induced significant reduction of FBG levels in both diabetic groups, irrespective of type of diabetes. Moreover, in NIDDM animals, FPI levels estimated at end of therapy despite being still significantly higher compared to control levels, but were significantly lower compared to their pre-treatment levels. These findings indicated that the effect of curcumin was mediated through increasing the sensitivity of insulin receptor to the available secreted amount of insulin and consequently increased glucose metabolism with lowering FBG without any impact on insulin secretion.

The obtained results coincided with and supported that previously reported by Pari & Murugan(2005) ⁽²⁰⁾ who investigated the effect of tetrahydrocurcumin (THC), one of the active metabolites in curcumin, on the key hepatic metabolic enzymes involved in carbohydrate metabolism in STZ-induced diabetic rats and found that in untreated diabetic control rats, the activities of the gluconeogenic enzymes were significantly increased, whereas hexokinase and G6PD activity and glycogen levels were significantly decreased, while both THC and curcumin were able to restore the altered enzyme activities to near normal levels and normalize blood glucose in diabetic rats. Thereafter, Murugan & Pari ⁽²¹⁾ investigated the effect of THC on lipid profile and lipid peroxidation in type-2 diabetic rats and reported a significant reduction in blood glucose, which proved its antidiabetic effect and caused a significant reduction in lipid peroxidation and lipids in serum and tissues, suggesting its role in protection against lipid peroxidation and its antihyperlipidemic effect.

Murugan & Pari ⁽²²⁾ and Suryanarayana et al. ⁽²³⁾ examined the effect of THC and curcumin on erythrocyte membrane bound enzymes and antioxidants activity in type-2 diabetic model and reported that administration of THC and curcumin induced increased levels erythrocyte antioxidants and the activities of membrane bound enzymes and concluded that these biochemical observations

indicate that the THC and curcumin possess a significant beneficial effect on erythrocyte membrane bound enzymes and antioxidants defense in addition to its antidiabetic effect. In support of the reported data, post-treatment HOMA-IR and RIST indices were significantly improved in the studied animals compared to pre-treatment levels.

Furthermore, post-treatment serum levels of studied cytokines were significantly lower compared to pre-treatment levels, such ameliorative effect of curcumin on pro-inflammatory cytokines could be a possible mechanism for the reported effects on insulin sensitivity that proved to be improved irrespective of type of diabetes.

The reported beneficial effects of curcumin especially on IDDM could be attributed to its anti-oxidant and anti-inflammatory effects and go in hand with Tikoo et al. ⁽²⁴⁾ who reported that treatment of type-1 diabetic rats with curcumin significantly decreased blood urea nitrogen and creatinine and increased albumin; variables associated with the development of diabetic nephropathy and prevented the increased levels of HSP-27 and MAP kinase (p38) in diabetic kidney and at nuclear level curcumin prevented the decrease in dephosphorylation and increases acetylation of histone H3. Moreover, Kanitkar et al. ⁽²⁵⁾ demonstrated that curcumin in vitro protects pancreatic islets against cytokine-induced death and dysfunction by scavenging reactive oxygen species (ROS) and normalized cytokine-induced NF-kappaB translocation by inhibiting phosphorylation of inhibitor of kappa B alpha and in vivo curcumin prevents STZ-induced diabetes.

Kang & Chen ⁽²⁶⁾ found curcumin dose-dependently eliminates insulin-induced hepatic stellate cells (HSC) activation by suppressing expression of type I collagen gene, interrupts insulin signaling in HSC by reducing the phosphorylation level of insulin receptor and suppressing its gene expression. Furthermore, curcumin attenuates insulin-induced oxidative stress in HSC by inducing gene expression of glutamate-cysteine ligase leading

to de novo synthesis of glutathione. Also, Lin et al.⁽²⁷⁾ found curcumin suppresses gene expression of lectin-like oxidized LDL receptor-1, leading to the blockade of the transport of extracellular oxidized LDL into cells through interruption of Wnt signaling and the activation of peroxisome proliferator-activated receptor-gamma

Recently, El-Moselhy et al.⁽²⁸⁾ found curcumin showed an anti-hyperglycemic effect and improved insulin sensitivity, and this action may be attributed at least in part to its anti-inflammatory properties as evident by attenuating TNF- levels in high fat diet (HFD) fed rats, and its anti-lipolytic effect as evident by attenuating plasma free fatty acids and concluded that curcumin could be a beneficial adjuvant therapy in patients with T2DM. El-Azab et al.⁽²⁹⁾, (2011), reported that treatment with curcumin significantly reversed STZ-induced hyperglycemia/glucose intolerance, hypoinsulinemia, and damage of pancreatic islets. Moreover, El-Azab et al.,⁽²⁹⁾ found curcumin blunted the pancreatic lipid-peroxidation, up-regulated activities of the antioxidant enzymes, and suppressed serum levels of TNF- and IL-1. Lin & Chen⁽³⁰⁾, (2011), observed that high levels of glucose induced cell proliferation, type I collagen production and expression of genes relevant to HSC activation, and elevated intracellular glucose levels in cultured HSC, but curcumin eliminated such stimulatory impacts, abrogated the membrane translocation of GLUT2 by interrupting the p38 MAPK signaling pathway, suppressed Glut2 expression by stimulating the activity of peroxisome proliferator-activated receptor-gamma and de novo synthesis of glutathione.

The obtained results and data extracted from literature allow concluding that chronic administration of curcumin improves insulin sensitivity and thus imposing an anti-diabetic effect manifested as decreased FBG levels with concomitant decreased FPI and ameliorated the increased serum levels of pro-inflammatory cytokines and such effects are manifested in both types of diabetes.

Abstract: Objectives: To explore myringosclerotic tissue levels of two bone modeling markers: osteopontin (OPN) and osteoprotegerin (OPG) in experimentally-induced, histologically-confirmed myringosclerosis (MS). **Materials & Methods:** The right middle ear of 24 normal healthy growing male Wister rats was inoculated, via transtympanic access, by *Streptococcus pneumoniae* type 3, after a period of 8 weeks the tympanic membrane (TM) was examined Otomicroscopically for transparency and graded as normal TM, mild or marked opacification. Then, tympanic bullae were removed and a part of myringosclerotic plaque was excised for ELISA estimation of tissue extract levels of OPN and OPG and the remainder of the TM was stained with hematoxylin-eosin for light microscopic grading of TM inflammation according to extent of calcification into 5 grades. **Results:** 20 ears developed otoscopically defined myringosclerotic changes, 14 ears showed mild and 6 had marked opacification that was localized in 4 ears and diffuse in 2 ears. Histological examination reported inflammation of grade III in 7, grade IV in 13 and grade V in 4 specimens. Mean estimated tissue extract level of OPN and OPG in studied animals were significantly higher compared to control animals with a positive significant correlation between histological grading and tissue-extract levels of both OPG and OPN and a positive significant correlation between otoscopic grading and tissue-extract levels of OPG, but the correlation was non-significant with OPN **Conclusion:** Increased myringosclerotic tissue extract levels of both bone modeling markers indicated their possible role in initiation and/or progression of sclerotic changes in TM after chronic suppurative otitis media.

[Ahmed Al-Shal, Nahla E. El-Azab, Mohamed Khaled Mohamed Mahfouz. **Biochemical Determination of Tissue Ossification Markers in Experimentally-induced Myringosclerosis.** Journal of American Science 2011;7(6):800-807]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: suppurative otitis media, myringosclerosis, Osteoprotegerin, Osteopontin.

1. Introduction

Tympanosclerosis involves the hyalinization and calcification of the collagen layer in certain areas of the tympanic membrane. The process is most often seen in the TM but may also involve other sites in the middle ear. The incidence of tympanosclerosis was found to be 35.6% of patients with chronic suppurative otitis media, but 77.8% of these patients had dry ear and the majority of them had hearing loss of the conductive type, ⁽¹⁾.

The pathogenesis of TS is still unclear and various studies tried to explore the etiopathogenesis of MS especially that occurred in conjunction with or secondary to middle ear aeration using ventilation tube. The relationship between oxygen-derived free radicals and occurrence of MS has been proven in experimental models, and it was also shown that the formation of MS after experimental myringotomy could be reduced by application of various free radical scavengers, ⁽²⁾. Kazikdas et al., ⁽³⁾ reported that the formation of MS after experimental myringotomy can be diminished by intramuscular alpha-tocopherol injections and Uneri et al., ⁽⁴⁾ reported similar results after topical application of vitamin E in human subjects.

Osteopontin (OPN) is a phosphorylated glycoprotein that is initially identified in osteoblasts as a mineralization-modulatory matrix protein and is constitutively expressed in mineralized tissues and in epithelial surfaces, ⁽⁵⁾. In calcified tissues OPN plays an important regulatory role in bone mineralization and tissue remodeling, through the control of bone cell adhesion, osteoclast activation and matrix mineralization, ⁽⁶⁾. OPN has been studied as a multifunctional protein that is upregulated in a variety of acute and chronic inflammatory conditions, such as wound healing, fibrosis, autoimmune disease, and atherosclerosis, ⁽⁷⁾.

Osteopontin plays an important role in the inflammatory response, in which it stimulates macrophage and T-lymphocyte migration and activation, ⁽⁸⁾. In the latter cells, OPN polarizes the early Th1 cytokine response and inhibits Th2 cytokine expression, ⁽⁹⁾. During inflammation, OPN is also expressed by cells of both innate and adaptive immunity, such as activated T lymphocytes, macrophages and resident fibroblasts, ⁽¹⁰⁾. Moreover, OPN has been found to play an important role in neoplastic disorders and in the control of blood vessel neof ormation (angiogenesis) via the stimulation of endothelial cells proliferation and progression, ⁽¹¹⁾.

Osteoprotegerin (OPG) is an extracellular regulator of osteoclast differentiation and activation,⁽¹²⁾ OPG is synthesized as a propeptide (401 amino acids for the human, mouse, and rat forms), of which the signal peptide (21 amino acids) is cleaved, thus generating the 380 amino acids mature peptide,⁽¹³⁾ In contrast to all other TNFR superfamily members, OPG lacks transmembrane and cytoplasmic domains and is secreted as a soluble protein. Moreover, OPG mRNA has wide tissue distribution not restricted to bone or immune tissues and high levels of OPG mRNA have been detected in lung, heart, kidney, liver, stomach, intestine, skin, brain, spinal cord, thyroid gland, and bone,⁽¹⁴⁾ In addition, high OPG mRNA levels have also been detected in endothelial cells, aortic smooth muscle cells, fibroblastic cells, ovarian and breast cancer cell lines, and monocytic dendritic and B lymphocytic cell lines,⁽¹⁵⁾

As the calcification process and the sclerotic plaques of the drum mimics features of bone tissue, this study was designed to explore myringosclerotic tissue levels of two bone modeling markers: osteopontin (OPN) and osteoprotegerin (OPG) in experimentally-induced, histologically- confirmed myringosclerosis.

2. Materials and Methods

After approval of the study protocol from the Local Ethical Committee with regards to rules for dealing with experimental animals; the study comprised 30 normal healthy growing male Wister rats, weighing 200-400 gm. Rats were kept under standard conditions, temperature 20°C, humidity 60% and 12-hs day/night cycle, and maintained on standard diet and free water supply till the start of study regimens. The animals were divided into 2 groups, each in a separate cage: Control group included 6 rats and Study group included 24 rats.

The rats were anesthetized with chloral hydrate at 10% by intra-peritoneal injections after which they were placed over the surgical bench, left lateral position, so that the examiner could explore the right ear. Under otomicroscopy, using surgical microscope brand D.F. Vasconcelos, model MC-M31, the middle ear of each animal was inoculated, via transtympanic access, by 0.1ml of solution containing 10^7 colony-forming units (CFU) of *Streptococcus pneumoniae* type 3, after which the animals were sent back to their respective cages. All animals were injected in right ear only. After elapse of a period of 8 weeks control and study rats were sacrificed with a lethal dose of chloral hydrate and the TM was examined Otomicroscopically for transparency and graded as normal TM (TM appeared thin and transparent), mild opacification (diffuse or isolated mild loss of transparency) and

marked opacification (diffuse or isolated marked TM thickness with total loss of transparency),⁽¹⁶⁾ Then, tympanic bullae were removed and after decalcification of specimens in nitric acid at 7.5%, a part of myringosclerotic plaque was excised for biochemical assay and the remainder of the TM together with the external auditory canal was fixed in formaldehyde at 10%. In the post-fixation process, bullae were placed in a hot oven for 40 minutes in alcohol and 20 minutes in alcohol-xylol and later they were placed in xylol outside the hot oven, and then they were dehydrated, mounted in paraffin bloc (50 minutes). The material was sectioned at axial sections of 4mm thickness, with intervals of 50mm, encompassing the whole TM, and stained with hematoxylin-eosin and then examined under light microscopy,⁽¹⁷⁾

Microscopically, TM inflammation was graded into 5 grades: Grade 1: exudation, characterized by marked polymorphonuclear infiltrate; Grade 2: granulation, characterized by marked neovascularization and presence of elements of the macrophage mononuclear system (fibroblasts, lymphocytes, macrophages); Grade 3: fibrosis, characterized by major proliferation of fibroblasts and formation of collagen fibers, reduction of vascularization; Grade 4: hyalinization, characterized by reduction in number of fibroblasts, which are replaced by collagen fibers, which fuse forming plaques and Grade 5: calcification, characterized by calcium and phosphorus deposits, giving the collagen matrix an aspect similar to that of cartilage or bone tissue,⁽¹⁸⁾

Immediately after removal of the sclerotic plaque; specimens were homogenized in 10 mg/ml ice-cold phosphate-buffered saline to get a concentration of 10% (W/V). Homogenization was performed for 1 minute with the aid of a motor driven homogenizer at 5000 rpm on an ice background,⁽¹⁹⁾ The homogenate was then centrifuged to get the supernatant for Enzyme-Linked Immunosorbent Assay (ELISA) estimation of tissue extract levels of Osteoprotegerin using the RayBio® Human Osteoprotegerin ELISA,⁽¹³⁾ and Osteopontin using the R&D Systems, Inc.,⁽²⁰⁾

Statistical analysis

Obtained data were presented as mean±SD and ranges. Results were analyzed using Wilcoxon Z-test. Possible relationships were investigated using Pearson linear regression. Statistical analysis was conducted using the SPSS (Version 10, 2002) for Windows statistical package. P value <0.05 was considered statistically significant.

3. Results:

At the end of the study period, 20 of the study animals developed otoscopically defined myringosclerotic changes. The TM of 4 ears (16.7%) appeared normal, while 14 ears (58.3%) showed mild opacification. The remaining 6 ears (25%) developed marked opacification that was localized in 4 ears (Fig. 1) and diffuse in 2 ears, (Fig. 2).

Seven (29.1%) specimens showed grade-3 changes with hyalinization, reduced number of fibroblasts and appearance of collagen fibers, (Fig. 3). Thirteen (54.2%) specimens showed grade 4 changes with fibrosis, proliferation of fibroblasts and formation of collagen fibers associated with reduction of vascularization, (Fig. 4). Four specimens (16.7%) showed grade-5 changes with calcification giving the collagen matrix an aspect similar to that of cartilage or bone tissue, (Fig. 5). All studied samples showed microscopic evidence of sclerosis varied between fibroblastic proliferation and evident calcification. On contrary, clinical evaluation failed

to detect sclerotic changes in 4 ears with sensitivity of 83.3%.

Mean estimated tissue extract level of OPG in studied animals (127 ± 12.5 ; range: 103.9-165.4 ng/ml) was significantly ($p < 0.05$) higher compared to that estimated in control animals, (71.9 ± 7.6 ; range: 62.3-81.4 ng/ml). Also, mean estimated tissue extract level of OPN in studied animals (204.3 ± 45.5 ; range: 135-265 ng/ml) was significantly ($p < 0.05$) higher compared to levels estimated in control animals, (342.5 ± 110.9 ; range: 194-654 ng/ml), (Fig. 6).

Moreover, there was a positive significant correlation between tissue-extract levels of OPG and otomicroscopic grading, ($r = 0.430$, $p = 0.036$) and histological findings, ($r = 0.581$, $p = 0.003$), (Fig. 8). Also, there was a positive significant correlation between tissue-extract levels of OPN and histological grading, ($r = 0.445$, $p = 0.029$), while the correlation was non-significant with otomicroscopic grading, ($r = 0.314$, $p > 0.05$), (Fig. 9).

Figure 1: Otomicroscopic examination of one affected ear showing marked opacification of the posterior portion (P) of TM with normal transparency of the anterior portion (A) of TM

Figure 2: Otomicroscopic examination of one affected ear showing marked diffuse opacification of the TM (O)

Figure 3: TM showed scattered fibroblasts (F) with areas of hyalinized collagen (HC), (Hx &E, x100).

Figure 4: TM showed collagen (C) deposition with fibrosis (F) and areas of hyalinized degeneration (D), (Hx &E, x10).

Figure 5: TM showed calcification (Cal), (Hx &E, x10).

Figure 7: Correlation between otoscopic and histological grading and tissue extract levels of OPG

Figure 8: Correlation between otoscopic and histological grading and tissue extract levels of OPN

4. Discussion

Myringosclerosis was induced inoculation of the middle ear of studied animals, via transtympanic access, by 0.1ml of solution containing 10^7 CFU of *Streptococcus pneumoniae* type 3 and animals were sacrificed 8 weeks after inoculation. Such induction protocol goes in line with de Carvalho et al.,⁽²¹⁾ who induced myringosclerosis in rats and obtained plaques after 7 weeks of inoculation with *Streptococcus pneumoniae* and the choice of type of bacterial species was dependent on the previous data of Raustyte et al.,⁽²²⁾ who found *Streptococcus pneumoniae* type 3 provokes a severe clinical course of acute otitis media that healed with scarring and myringosclerosis formation in the tympanic membrane and clinically visible myringosclerosis develops after middle ear infection caused by *Streptococcus pneumoniae* type 3, but not in cases caused by non-typeable *Haemophilus influenzae*.

Otosopic examination missed 4 ears appeared to have normal TM but histological examination of excised drum specimens determined the presence of sclerotic changes of grade 3 in these four drums with sensitivity of 83.3%; a figure consistent with Santos et al.,⁽²³⁾ who reported that from the comparison of the otomicroscopic data in relation to the histological findings, otomicroscopy showed sensitivity of 80% and specificity of 75% for diagnosis of myringosclerosis especially in mild cases

The reported histological findings coincided with that previously reported in studies concerned with tissue changes in myringosclerosis; Kazikdas et al.,⁽³⁾ reported that under light microscopy, extensive sclerotic lesions were found in the tympanic membranes; these sclerotic deposits were located in the lamina propria and myringosclerosis occurred predominantly adjacent to the handle of the malleus, but also near the annular region. Also, Stenfeldt et al.,⁽²⁴⁾ found that during infection, the collagen layer was thickened and stained strongly for type II collagen and collagen types I and III were found in the edematous connective tissue around the main collagen layer and around dilated blood vessels and 3-months after perforation or infection, all 3 collagens were present in the lamina propria of the tympanic membrane with extensive amounts were present in the scar tissue.

Mean estimated tissue extract levels of OPG and OPN in studied animals were significantly higher compared to that estimated in control animals with a positive significant correlation with both otoscopic and histological findings. These findings agreed with Makiishi-Shimobayashi et al., who immunohistochemically evaluated tissue expression of OPN in experimental tympanosclerosis,⁽²⁵⁾ and at

the calcification sites of cholesteatoma in humans,⁽²⁶⁾ and reported that in hyalinized tissues with macroscopic calcification and fibrous tissues with microscopic calcification, OPN was found in the calcification sites and in inflammatory tissues with microscopic calcification, OPN was also found in the calcifying foci, and many OPN mRNA-expressing cells, determined by in situ hybridization, located around their foci and concluded that these results suggest that OPN secreted by exudate macrophages might be an important regulator in the calcification of tympanosclerosis and the pathological calcification that occurs in association with cholesteatoma. Also, Grases et al.⁽²⁷⁾ found all rats subjected to calcosinosis induction showed OPN 8 days post-induction, and was clearly associated with calcified areas.

Raustyte et al.,⁽²⁸⁾ using a rat model of acute otitis media (AOM) determined the expression of OPN and OPG by immunohistochemistry and detected calcium depositions accumulated in the cytoplasm of macrophages and dispersed in the connective tissue layers of the pars flaccida and tensa, but late accumulation occurred in the lamina propria of pars tensa, OPN and OPG expression was found early in inflammatory cells including especially macrophages and late in pars tensa fibrocytes, but OPG expression was also located late to the inner basal membrane of pars flaccida.

These findings spotlight on the role played by inflammatory cells in pathogenesis of TM either through precipitation in tissues and subsequent release of fibrosis-inducing cytokines or through the release of bone-remodeling cytokines and supported that previously reported by Lui et al.⁽²⁹⁾ who found all the examined sclerotic plaques were surrounded with macrophages and bone morphogenetic protein 2 positive cells and were synchronously expressing CD68 positive and BMP2 positive.

It could be concluded that increased myringosclerotic tissue extract levels of both bone modeling markers indicated their possible role in initiation and progression of histologically documented sclerotic changes in tympanic membrane after chronic suppurative otitis media.

Abstract: *Purpose:* The aim of this work is to study angiogenesis of the liver of patients with chronic hepatitis, liver cirrhosis and hepatocellular carcinoma by assessment of microvessel density MVD-CD34 and VEGF in liver tissue. *Method:* Sixty patients with chronic liver disease and 30 patients with hepatocellular carcinoma (HCC) were subjected to clinical examination, laboratory investigations for hepatitis C, liver function tests and ultrasonography. Liver biopsy was performed for histopathological examination. They were 3 groups: chronic hepatitis [CH] (35), liver cirrhosis [LC] (25) and HCC (30) and ten healthy volunteers as controls with negative serological markers for hepatitis (C&B), HCC were 7 with grade I, 14 with grade II and 9 with grade III. Immunohistochemical staining for tissue vascular endothelial growth factor (VEGF) was done and MVD-CD34 was assessed by Image Analysis System. *Results:* In normal liver tissue specimen, both CD34 & VEGF were negative. MVD-CD34 was increased significantly from CH to LC to HCC and increased significantly in grade I to II to III HCC. VEGF showed a significant increase in LC compared to CH & insignificant in mean HCC compared to LC. With differentiation of HCC, MVD-CD34 increased for grade I, to II to GIII ($p < 0.01$). VEGF showed a higher expression in grade I and decreased in grade II& III. *Conclusion:* MVD-CD34 is more responsible of angiogenesis than VEGF with progression of chronic liver disease to HCC. Further research for other factors mediating and cells contributing to angiogenesis is needed, which may have therapeutic implications in the control of chronic liver disease and HCC. 1. Introduction:

Chronic viral Hepatitis infections including the hepatitis B virus (HBV) and hepatitis C Virus (HCV) are major risk factors contributing to HCC development [1].

Whatever the etiologic cause of chronic liver disease, liver injury usually results in a form of excess scarring termed liver cirrhosis where the liver synthetic and metabolic function one compromised and there is also an increased risk of developing liver cancer [2]. With progression of the scarring process, the endothelial lining of the sinusoids undergoes conversion to a non fenestrated cell leading to an appearance which has been termed "capillarization" of sinusoids [3]. In liver, resting endothelial cells rarely proliferate under physiologic conditions. When they undergo a process called "sinusoidal capillarization", these endothelial cells form tight junctions along with deposition of extracellular matrix followed by a new vessel formation [4].

According to Tosh and Strain [5], there are two reasonably well defined types of stem cells in the bone marrow. The hematopoietic stem cells (HSC) and the mesenchymal stem cells. The HSC is the precursor for the lymphoid and the myeloid cells of

the blood and they are quite well characterized and have been isolated from humans as cells with a CD34 +ve phenotype. According to Fausto [6] oval cells can be induced to proliferate under different pathological conditions. Herrera et al. [7] isolated and characterized a population of human liver stem cells (HLSCs) which in culture supplements with VEGF, expressed the endothelial marker CD34 and Lee et al. [8] stated oval cells express some of the antigens of hematopoietic cells such as CD34.

Poon et al. [9] used CD34 as an endothelial cell marker and Amarapurkar et al. [10] used it in normal liver, cirrhosis and HCC. CD34 has been widely used for the assessment of sinusoidal like neo-angiogenesis in HCC. Amongst, viral infection, HCV has been demonstrated to show more angiogenesis and has been suggested to represent a risk factor for HCC in patients with chronic HCV [11]. Furthermore high expression of CD34 positive sinusoidal endothelial cells is a risk factor for HCC in patients with HCV associated chronic liver disease [12].

VEGF is a known marker of angiogenesis [13]. It is thought to be a selective mitogen for endothelial cells. It acts as a link between angiogenesis, immune system and tissue re-modeling

[14]. It was found that VEGF secreted by replicating hepatocytes induces sinusoidal endothelial cell proliferation during regeneration after partial hepatectomy in rats [15]. Greene et al. [16] in their studies on hepatic regenerative process suggested that the regulation of angiogenesis controls the regenerative process. According to Amarapurkar et al. [17] understanding the process of angiogenesis is of great help in developing new therapeutic approach for the chronic liver disease patients; and interfering with angiogenesis may be a potential target to avoid progression of liver disease.

This paper aims to study angiogenesis of the liver assessed by MVD-CD34 and VEGF expression in liver biopsy in patients with chronic hepatitis, liver cirrhosis and hepatocellular carcinoma.

Materials and Methods

Patients

Ninety patients (66 males and 24 females); were the subject of this study. Patients were admitted to the Department of Gastroenterology and Hepatology, Theodor Bilharz Research Institute (TBRI), Cairo, Egypt. They included 35 cases of chronic hepatitis C virus infection (CH), 25 cases with cirrhosis and 30 cases of HCC, all with HCV infection. Of the HCC patients seven patients were grade I, 14 were grade II and nine were grade III. The presence of HCV-RNA in patient's sera was detected by real-time polymerase chain reaction. All patients were subjected to thorough clinical examination, urine and stool analysis, liver function tests, ultrasonography and liver biopsy for histopathologic and immuno-histochemical studies. The study protocol was approved by the Ethics Committee of TBRI according to the Institutional Committee for the Protection of Human Subjects and adopted by the 18th World Medical Assembly, Helsinki, Finland.

Ten control liver biopsies were taken from individuals subjected to laparoscopic cholecystectomy after their consent. They were 4 males and 6 females with a mean age of 48.3 ± 2.3 years. Their liver function tests were normal and had no serologic evidence of hepatitis B or C viruses.

Liver biopsies were fixed in 10% buffered formalin for 24 hours, and then processed in ascending grades of ethyl alcohol; xylene, wax and paraffin blocks were prepared. Sections (4 μ m) were cut on albuminized glass slides and stained with Hematoxylin & Eosin and Masson trichrome stains. All sections were subjected to light microscopic examination for evaluating the histopathological and basic classification of cases. Five histological features have been observed to be relatively characteristic of (although not pathognomonic for)

chronic hepatitis: (1) lymphoid aggregates in portal tracts, (2) degenerative injury type changes of bile ducts, (3) large droplet steatosis, (4) Mallory body-like material within injured hepatocytes, and (5) Lymphocytic aggregates within the lobules [18-19]. They were evaluated on a five point scale, using 20 random fields at x100 and x400 magnification per slide. Architectural changes, fibrosis and cirrhosis were evaluated on a seven point scale according to Knodell score system [19]. HCC cases were classified into 3 grades (I, II, III) well, moderately, and poorly differentiated tumors [20]. Other liver sections (4 μ m) were cut on slides, which were treated with TESPA (3-aminopropyl-triethoxysilane, Sigma) for immunohistochemistry (IHC).

Immunohistochemistry for Detection of tissue CD34 and VEGF antigens

Immuno-histochemical reaction was performed using an avidin biotin complex (ABC) immunoperoxidase technique according to Hsu and Raine [21] using anti human CD34, and VEGF antibodies on paraffin sections, which were dewaxed in xylene and hydrated in descending grades of ethanol. Endogenous peroxidase activity was quenched by incubation in 3% hydrogen peroxide in 100% methanol for 20 min. Antigen retrieval was performed by microwaving the sections in citrate buffer (PH 6.0) for 15 min at 700 W. Sections were incubated overnight at 4°C with the anti-human primary antibodies against CD34, (purchased from R&D, USA), and VEGF (purchased from Santa Cruz Biotechnology Inc.; Santa Cruz, USA) monoclonal antibody, diluted at 1:50,150 respectively in BPS. Next day, after thorough washing in PBS, the sections were incubated with alkaline phosphatase for both VEGF and tissue CD34. Staining is completed by 5-10 minutes incubation with alkaline phosphatase + substrate - chromogen which results in a pink-red colored precipitate at the antigen site for VEGF and tissue CD34 (cytoplasmic stain). Slides were washed in PBS for 5 minutes. Slides were placed in 70%, 95% and then 100% alcohol each for 5 minutes. The cell nuclei were counterstained with Mayer's hematoxylin. The cover slips were mounted using Dpx.

Positive and negative control slides for each marker were included within each session. As a negative control, liver tissue section was processed in the above mentioned sequences but the omission of the primary antibody and PBS was replaced.

Determination of microvascular density (MVD)

MVD in tissue sections was evaluated according to Gasparini's criteria [22] by independent observer who was blinded to the patients'

clinicopathologic data. At low power field (x 40), the tissue sections were screened and five areas with the most intense neovascularization (hot spots) were selected.

Microvessel counts of these areas were performed at high power field (x 200). To reduce observer-related variation, counting of the microvessels was performed with a Computer Image Analyzer (Kontrone Image Analysis System, Germany). This essentially consists of a computer controlled microscope (Zeiss axioskope), video camera, two monitors, video printer, computer unit (P.C., IBM compatible ,486Dx100) and a desk jet colored printer 560C. Image analysis was performed using the soft ware program; KS 400. The image analyzer is an integrated system of Windows-based software specially designed for immunohistochemical analysis. Any brown stained endothelial cell or endothelial cell cluster that was clearly separated from adjacent microvessels, tumor cells, and connective tissue elements was counted as one microvessel, irrespective of the presence of a vessel lumen. The image analyzer allowed the operator to select stained microvessels and make a subtraction of the background; an automated microvessel count per field was computed in each hot spot. The mean microvessel count of the five most vascular areas was taken as the MVD, which was expressed as the

absolute number of microvessels per 0.74 mm² (x 200 field). Zero% was given to unstained sections.

Immunohistochemical scoring of VEGF

VEGF was expressed as cytoplasmic pink red color of hepatocytes and endothelial cells lining blood vessels and counting the number of positive cells in 5 microscopic fields, with power of magnification (x 400) according to Shimizu et al. and Takahashi [15, 23].

Statistical analysis

The Statistical Package for Social Sciences (SPSS) for Windows (version 10) computer program was used for statistical analysis. For comparison of more than 3 group's means, one-way ANOVA test, Post Hoc test was used. Comparison between percent positive cases was calculated by Chi-square test. A P value < 0.05 was considered statistically significant.

Results

Patients were 66 males (73.3 %) and 24 females (26.7 %), their age ranged (23-72 years) with a mean of 46.6±4.5 years, as well as 10 patients without liver disease as control group. They were (4) males and (6) females, their age ranged (30-45 years) with a mean of 39.4±3.7years. Clinical and biochemical data of the studied groups are shown in Table 1.

Table 1 Clinical and biochemical data of studied groups

Variables	CH (n=35) No. of positive cases %	LC (n=25) No. of positive cases %	HCC(n=30) No. of positive cases%	Control (n=10) No. of positive cases %

CH: Chronic hepatitis

LC: Liver cirrhosis

HCC: Hepatocellular carcinoma

^a: p value <0.05 relative to the control group

^a: p value <0.001 relative to the control group

^b: p value <0.05 relative to the HCC group

^b: p value <0.01 relative to the HCC group

^c: p value <0.01 relative to the CH group

In cases of CH & LC CD 34 staining were confined to large vessels in the portal tracts. In cases of HCC on top of cirrhosis the density of microvessels was higher in the peripheral tumor tissue close to the margin than in the central areas.

By estimating MVD-CD34 by image analysis system (Table 2) positivity was not found in normal control specimens. Twenty percent of CH, 40% of LC and 100% of HCC were positive, with grades I,II,III. In CH, the mean MVD-CD34 was $(15.66 \pm 3.44 / 0.74 \text{ mm}^2)$, LC $(33.63 \pm 7.60 / 0.74 \text{ mm}^2)$. Specific staining of capillary-like vessels by anti-CD34 antibody was observed in all tumor specimens and between cancer cells $(166.77 / 0.74 \text{ mm}^2)$. MVD-CD34 in HCC cases was higher than CH and LC groups ($P < 0.01$). There was significant difference in MVD-CD34 between LC and CH liver ($P < 0.05$) (Table 2, Fig. 1A- B).

There is statistically significant difference between MVD-CD34 expression levels in HCC grades III (mean MVD-CD34, $114.7 \pm 46.83 / 0.74 \text{ mm}^2$) and HCC grade I (mean MVD-CD34, $64.62 \pm 24.86 / 0.74 \text{ mm}^2$) and II (mean MVD-CD34,

$91.71 \pm 18.29 / 0.74 \text{ mm}^2$) (at a $p < 0.01$) and no significant difference in HCC grade III relative to HCC grade II at $p = 0.129$, There was a positive correlation between mean MVD-CD34 and grades of HCC ($r=0.325$, ($p < 0.01$)) (Table 2, Fig. 2A- B).

The results of VEGF expression are shown in table 2, all control were negative, 42.8% of CH cases were positive, 80% of LC cases were positive, 100% of HCC were positive. VEGF was mainly seen in the cytoplasm of hepatocytes as intracytoplasmic granules in all tumor cells or periportal hepatocytes, VEGF showed a significant increase ($p < 0.05$) in CH group relative to control, a significant increase ($p < 0.01$) in LC & HCC groups related to control and ($p < 0.01$) compared to CH (Table 3, Fig. 3 A-B).

There is statistically significant difference in VEGF expression levels in HCC grade I (65 ± 14.4) compared to grade II (25.2 ± 10.5) and grade III (35 ± 3.9) at a $p < 0.01$, being lower in grade II & III than grade I HCC. (Table 3, Fig. 4A- B).

There was an inverse correlation between mean VEGF and grades of HCC ($r=0.295$, ($p < 0.01$)).

Table 2 MVD-CD34 expression levels in studied groups and in different grades of HCC.

Variable	CD34

Fig. 1 A) A case of chronic HCV, showing few blood vessels stained with CD34 antibody. B) A case of HCV with cirrhosis (cirrhotic nodule) showing moderate number of blood vessels stained with CD34 (IHC for CD34, alkaline phosphatase, X200, X100 respectively).

Fig. 2 A) A case of well differentiated HCC showing moderate number of blood vessels expressing CD34 antibody. B) A case of poorly differentiated HCC showing increased (intense) expression for CD34 antibody (IHC for CD34, alkaline phosphatase X 200).

Fig. 3 A) A case of chronic HCV, showing mild VEGF expression, cytoplasmic, stain sparing the nuclei B) A case of chronic HCV with active cirrhotic changes, showing moderate VEGF expression (IHC for VEGF, alkaline phosphatase X 200).

Fig. 4 A) A case of well differentiated HCC showing intense expression of VEGF. B) A case of poorly differentiated HCC showing weak, scattered hepatocytes stained for VEGF (IHC for VEGF, alkaline phosphatase, X 200)

4. Discussion

In our study MVD-CD34 staining was not detected in normal liver biopsies. It was significantly increased ($p < 0.05$) in liver cirrhosis (LC) relative to control. In HCC, a highly significant increase ($p < 0.01$) was found relative to control and to LC cases. VEGF, showed negative staining in control cases, a significant increase in CH ($p < 0.05$) relative to control, a significant increase ($p < 0.01$) in LC and HCC groups relative to control.

Park et al. [24] found that there was a gradual increase in CD34 expression from cirrhotic nodules to dysplastic nodules to HCC. Kim & Hu [14] by immunohistochemistry staining using anti CD34 and anti VEGF antibodies; found that CD34 was reactive throughout the neoplastic tissue, albeit it was confined to a few periportal sinusoids and vessels in fibrous septa of adjacent cirrhotic liver. Expression of VEGF which was localized to the cytoplasm was not correlated with all clinicopathological parameters. CD34 was closely associated with neo-vascular process in cirrhosis and hepatocellular carcinoma. Di Carlo et al. [25], studied by immunohistochemistry, the expression and distribution of CD34 in chronic liver diseases and in HCC. They found that the sinusoids of the liver showed no or focal immunoreactivity for CD34, an increased immunoreactivity was observed in the periportal sinusoids of cirrhotic nodules, whereas diffuse and strong staining was in overall HCC. They concluded that immunoreactivity for CD34 represents an effective method to evaluate angiogenesis. Ma Jee et al. [26] concluded that CD34 is a useful marker for distinguishing HCC from non cancerous liver tissue; as CD34 was not present along the sinusoidal wall in normal human liver, was weakly present in the

perinodules in few cases of cirrhosis, and HCC showed a diffuse capillarization with over expression. Cui et al. [27] found enhanced CD34 expression of sinusoidal like vascular endothelial cells in HCC.

In our study, VEGF showed higher expression in CH and LC but no significant difference in HCC group from LC groups. Yang et al. [13], by Immunohistochemical staining, found that CD34 was expressed in the vascular endothelial cells of normal liver, paracarcinomatous tissue and HCC tissue in the following proportions of specimen; 86.7%, 93.8% and 100% respectively. However, they found expression of CD34 in both normal and tumor tissue indicating that it was not a reliable marker for HCC.

According to Saaristo et al. [28] VEGF is a cell specific mitogen and is a major inducer of angiogenesis in human cancers. It was found by Shimizu et al. [15] that VEGF served by replicating hepatocytes induces sinusoidal endothelial cell proliferation and that a peak of hepatocytes production of VEGF, an endothelial mitogen, correspond to an increase of VEGF receptor expression on endothelial cells after partial hepatectomy in rats. Yoshiji et al. [29] have also shown that VEGF expression increases significantly during fibrogenesis and carcinogenesis and that the combined effect of VEGF & its receptor reflect the combined effect of both on hepatic stellate cells and endothelial cells. Also in the study by Amarapukar et al. [17] none of cases with normal histology was CD34 or VEGF positive. Angiogenesis was positive in 45.5% of cases of chronic liver diseases and was proportional to the stage of fibrosis. VEGF expression was commonly found in early stages of fibrosis and increased significantly during

fibrogenesis and carcinogenesis. They also found a significant high expression of CD34 in HCC as compared to chronic liver diseases.

In the study by Amarapukar et al. [10] by Immunohistochemical staining; CD34 positive staining was taking as any cell that stained brown with a dotted, linear, semi-circular or circular pattern and was clearly separate from an adjacent one. They found over expression of endothelial marker CD34 with gradual progression from normal liver to cirrhosis to HCC & metastasis.

Brdosky et al. [30] found that fibrotic stroma surrounding cirrhotic nodules has an increased number of vessels not only compared to the cirrhotic nodule but to the normal liver parenchyma as well. They also found that vascular density in the areas of HCC and internodular fibrotic tissue in cirrhotic liver was significantly higher than in non cirrhotic parenchyma. Additionally cirrhotic nodules were characterized by significantly lower vascularization compared with normal liver which may lead to diminished cell function.

The study by Namashima et al. [31] using CD34 staining for MVD-CD34, concluded that MVD representing tumor angiogenesis offers a new candidate prognostic factor in HCC to predict tumor recurrence and patient survival, in addition to traditional biological factors.

Cui et al. [27] have shown moderate to diffuse positivity for CD34 in the majority of well differentiated HCC. Park et al. [24] studied CD34 in HCC and found that 14 out of 21 cases of moderate to poorly differentiated HCC showed strong positivity, while it was seen in three out of 11 cases of well differentiated HCC. The importance of neovascularization in the progress of HCC has been high lightened suggesting that microvessels increase gradually from cirrhotic nodules through low grade and high grade dysplastic nodules with the greatest number recorded in HCC.

According to Yang et al. [13] much attention has been paid to the association between angiogenesis and post-operative recurrence or metastasis. Ma Jee et al. [26] found that diffuse capillarization with overexpression of CD34, collagen IV and laminin are features of HCC. Frequent breaks in and loss and decrease of the basement membrane in poorly differentiated tumors and tumors with portal vein infiltration suggest a potential metastasis of tumor cells and may play a role in metastasis of HCC. They found a significant difference ($p < 0.05$) in the expression of CD34 between the well differentiated and moderately differentiated HCC. Amarapukar et al. [10] suggested that angiogenesis as assessed by CD34 expression play an important role in carcinogenesis.

Kim & Hu [14] found that microvascular density in HCC is not directly correlated with VEGF expression, suggested that other angiogenic factors may be involved in neovascularization of HCC.

Piao et al. [32] found that MVD in HCC with metastasis, lower differentiation or without intact capsule was significantly higher than that in HCC with intact capsule, higher differentiation or without metastasis.

Brdosky et al. [30] found that in the early stages of fibrosis, the production of VEGF and the neovascularization increase, whereas in the late stages; cirrhotic nodules in hepatitis C patients are characterized by decreased density of microvasculature and that VEGF was higher in HCC and diminished in cirrhotic nodule, thus strongly correlating with the degree of vascularization.

Ivarone et al. [33] concluded that VEGF appears to be involved in the development of HCC and could be a predictor of HCC development in patients with cirrhosis. They found that angiogenic factors were equally expressed in any well differentiated & poorly differentiated tumors.

In conclusion, in the present study, MVD-CD34 increased in LC and in HCC ($p < 0.01$) and in HCC from grade I to II to III ($p < 0.05$). VEGF positivity increased in CH ($p < 0.05$) and, in LC & HCC ($p < 0.01$). In HCC higher expression was in grade I and lower in grade II & III. Therefore MVD-CD34 is more indicative of progression of CLD & HCC than VEGF is associated with angiogenesis. Further search for other cells contributing to and factors mediating angiogenesis is needed; which may have implication in providing therapeutic targets to control progress of chronic liver disease and malignancy.

^{*}waelsafwat@yahoo.com

Abstract: Background: Hepatitis C virus (HCV) recurrence in HCV+ liver transplant recipients is almost inevitable and may be promoted by immunosuppression. Basiliximab, a high-affinity chimeric monoclonal antibody functions as an immunosuppressive agent, is effective in reducing acute rejection episodes in liver allograft recipients, but the influence on HCV recurrence might be a problem. **Objectives:** To study the effect of induction therapy with Basiliximab on HCV recurrence in adult living donor liver transplantation. **Methods:** This was a retrospective study to determine the effect of induction therapy with Basiliximab on the recurrence of HCV in the grafted liver. In this study 47 HCV patients were included who passed more than 6 month post-transplantation. All HCV recurrences were all proved histologically. All our patients received corticosteroids in addition to either tacrolimus (FK) or ciclosporine (Neoral), mycophenolate mofetil was given to all except 4 patients. **Results:** From the 47 transplanted patients 14 (29.8%) had HCV recurrence. In the group which used Basiliximab (Group I); the rate of HCV recurrence was 56.3%, while the group in which no Basiliximab was used (Group II); the rate of HCV recurrence was 16.1% (P<0.001) highly significant. In patients who had HCV recurrence 64.3% of patients received induction therapy with Basiliximab, meanwhile in the non-recurrent group only 15.2% of patients received Basiliximab (P<0.001) highly significant. To out rule the role of either FK or Neoral in recurrence of HCV, we found that the rate of HCV recurrence was as follows: in a group of patients who received Basiliximab and FK; HCV recurrence occurred in 54.50%, in patients who did not receive Basiliximab but received FK; HCV recurrence occurred in 21.7% (P<0.001) highly significant. In patients who received Basiliximab and Neoral; HCV recurrence occurred in 60% and there was no HCV recurrence in patients who did not receive Basiliximab and received Neoral (P<0.001) highly significant. We also compared two groups of patients; those who received FK and Basiliximab (54.5%) had HCV recurrence, and in those who received Neoral and Basiliximab (60 %) had HCV recurrence (P > 0.05) non significant. **Conclusion:** The rate of HCV recurrence in LDLT is more when Basiliximab was used as induction therapy in patients undergoing LDLT for chronic HCV related end stage liver disease.

Keywords: Therapy; Basiliximab; Recurrence; Hepatitis C Virus; Living Donor; Liver Transplantation

1. Introduction:

Cirrhosis secondary to chronic hepatitis C virus (HCV) infection accounts for most liver transplants performed in transplant centers worldwide (1). Given the high prevalence of HCV infection, the number of patients in need of transplantation will increase. A number of factors may predispose to HCV recurrence (2). Acute graft rejection remains a major problem among additional sequelae in liver transplant recipients. Basiliximab, a chimeric monoclonal antibody with high affinity for the CD25 chain of the interleukin-2 receptor, has significantly reduced the incidence of acute rejection episodes in liver transplant recipients (3) (4). HCV recurrence in post living donor liver transplantation (LDLT) is of utmost importance to prolong both graft and patient survival. Earlier reports stated that LDLT might lead to an increased rates of HCV recurrence due to

regeneration of the graft, however with more experience and the increasing number of studies concerning this issue it turned to be the same or even better due to the fact of having a better chance of choosing a better graft with less fat and younger donor age. Multiple factors have been studied as predisposing factors for HCV recurrence; surgical factors as ischemia time and medical factors such as; overweight and steatosis, alcohol intake and immunosuppressive regimens are all incriminated factors. Considering the immunosuppression factor, no specific calcineurin inhibitor has been proven up till now superiority over the other in terms of decreased rates of HCV recurrence. The use of corticosteroids and the duration whether long term or rapid tapering or even steroid free protocols gave conflicting results. The use of induction therapy has

not been clearly studied concerning its effect on HCV recurrence in the graft (5).

Objectives:

To study the effect of induction therapy with basiliximab on HCV recurrence in adult living donor liver transplantation.

2. Materials and Methods:

This was a retrospective study. The clinical courses of 47 recipients who were transplanted for HCV end stage liver disease and successfully survived a least 6 months post LDLT were studied. The Immunosuppression regimens for all our patients included corticosteroids which were all tapered within the first 3 months. Calcineurin inhibitors used were either tacrolimus (FK) or ciclosporine (Neoral). Mycophenolate mofetil was given to all except four patients who had monotherapy with tacrolimus as they had hepatocellular carcinoma before transplantation. The diagnosis of Hepatitis C virus recurrence was suspected in cases of elevated liver enzymes with a high level of viraemia with HCV RNA PCR and then all subjected to a liver biopsy and proved histologically by our transplant pathologist. The studied group was divided into two groups; group I had basiliximab as induction therapy included 16 patients and group II had no induction therapy with basiliximab included 31 patients, and the incidence of recurrence was compared between the two groups. **Statistical analysis:** Statistical analyses were performed using SPSS for Windows release 11.0 (SPSS Inc, Chicago, IL, USA). Comparisons were performed between groups of patients (level of $p < 0.05$ were considered significant). Categorical data were analyzed using Pearson's chi-square test, and t-test.

3. Results:

From the 47 patients originally underwent LDLT for HCV ESLD and successfully passed the operation and passed at least 6 months post transplant, Age ranged from 38-62 years, 5 females and 42 males. HCV recurrence occurred in 14 (29.8%) patients. In group I (induction therapy with basiliximab) the incidence of HCV recurrence was 9 (56.3%) patients. In group II (no induction therapy with basiliximab) the rate of HCV recurrence was 5 (16.1%) patients ($P < 0.001$) which is a highly significant difference between the 2 groups. In the HCV recurrent group 9 (64.3%) patients had induction therapy with basiliximab meanwhile in the non recurrent group only 5 (15.2%) patients had induction therapy ($P < 0.001$) highly significant. In order to rule out the effect of the used immunosuppressive drug; either Tacrolimus or neoral

on HCV recurrence, the following analysis was done: Rate of HCV recurrence in the group of patients who received basiliximab and FK (11 patients); HCV recurrence occurred in 6 (54.50%) patients, in patients who did not receive basiliximab but received FK (23 patients); HCV recurrence occurred in 5 (21.7%) patients ($P < 0.001$) highly significant. In patients who received basiliximab and Neoral (5 patients); HCV recurrence occurred in 3 (60%) patients and there was no HCV recurrence in patients who did not receive basiliximab and received Neoral ($P < 0.001$) highly significant. We also compared two groups of patients; those who received FK and basiliximab 11 patients, 6 (54.5%) patients had HCV recurrence, and in those who received Neoral and basiliximab 5 patients, 3 (60 %) patients had HCV recurrence ($P > 0.05$) non significant. All other factors analyzed such as age, sex, biliary strictures had no statistical influence on HCV recurrence in our studied group.

4. Discussion:

Although liver transplantation is the second most common form of solid organ transplantation after renal transplantation, with an increasing rate of LDLT due to organ shortage and HCV being the most common indication for liver transplantation, surprisingly few data are available on the use of immunosuppressive antibody therapy in these patients. The rate of HCV recurrence and the rate of acute rejection episodes post LDLT when compared to cadaveric liver transplantation, is an important question that might influence management strategies. In our study recipients after LDLT, has been evaluated for the effect of induction immunotherapy using basiliximab on the recurrence of HCV. The previous hypothesis that HCV recurrence would be higher in LDLT is debated recently in many studies. However, In a retrospective study of hepatitis C virus (HCV)-infected transplant recipients in a 9 multi-center Adult to Adult Living Donor Liver Transplantation Cohort Study, graft and patient survival and the development of advanced fibrosis were compared among 181 living donor liver transplant (LDLT) recipients and 94 deceased donor liver transplant (DDLT) recipients. Overall 3-year graft and patient survival were 68% and 74% in LDLT, and 80% and 82% in DDLT, respectively and it was concluded that the 3-year graft and patient survival in HCV-infected recipients of DDLT and LDLT were not significantly different (6). The incidence of HCV recurrence in our studied group was 29.8% for patients who passed time ranging from at least 6 months to 4 years this average percentage of recurrence is not to be considered more than that reported in the literature for cadaveric liver

transplantation if not even less. In another retrospective analysis of 289 HCV-LT (20 LD splits) patients receiving transplants. Patient and organ survival, intensity of HCV recurrence, and fibrosis progression were analyzed with respect to deceased donor (DDLT) or (LDLT). In this patient sample, intensity of HCV recurrence was not increased in LDLT graft recipients compared to full-size recipients. Patient and organ survival were similar. LDLT can therefore be advocated for HCV patients (7). The rate of acute cellular rejection (ACR) and high-degree ACR are decreased in living-related liver transplant recipients than for cadaveric (8). It is also estimated that the number of rejection episodes is actually much less for HCV infected individuals (9). Factors contributing to the recurrence of HCV after LDLT are multiple and include; overweight, alcohol intake and level of immunosuppression. Concerning immunosuppression; keeping appropriate levels is considered as a key factor as low level of immunosuppression would lead to rejection episodes necessitating corticosteroid boluses or other antibodies leading to increased incidence of HCV recurrence, on the other hand high levels of immunosuppression would lead to increased side effects of the immunosuppressive drugs as well as severely depressed immune status also enhancing HCV replication leading to HCV recurrence in the new graft. This is consistent with a universal finding that has emerged over the past decade, that immunosuppression increases the serum level of HCV RNA, and this is particularly true for patients treated with monoclonal antibody preparations and corticosteroids (10-15). In our study we studied the effect of using different calcineurin inhibitors on HCV recurrence in our study and has been ruled out by a subgroup analysis of patients receiving FK & Basiliximab and another group receiving Neoral & Basiliximab, the incidence of HCV recurrence was 54.5% Vs 60% respectively ($p > 0.05$ nonsignificant). Although the use of induction therapy with basiliximab seems to be safe and efficient, its effect on the recurrence of HCV in our study is hazardous. Induction therapy with basiliximab increased HCV recurrence as presented in our study; a 56.3% in the induction group Vs 16.1% in the non-induction group which is statistically a highly significant difference ($P < 0.001$). We find that these findings are indirectly proven in more than one study as the effect on the incidence of recurrent hepatitis C is of major concern with any additional immunosuppressive agent used. In two trials, any favorable effect on rejection with basiliximab was smaller in HCV positive patients. The investigators stated that the rate of recurrent hepatitis C at 6 months post-transplantation was 48.4% (16). In summary, our study shows the

deleterious effects of using induction therapy with Basiliximab on the recurrence of HCV post LDLT. We demonstrated that the use of the different calcineurin inhibitors had no effect on HCV recurrence in our studied group. Therefore we recommend limiting the use of basiliximab as induction therapy in cases of HCV patients undergoing LDLT, only for cases whom starting immunosuppression need to be delayed post transplant specially those patients with renal impairment. Specially that the need for induction therapy for fear of rejection, which is generally less in cases of LDLT than that in cases of cadaveric liver transplant.

Abstract: The present study aimed to investigate the impact of educational program among open heart surgery patients on minimizing the incidence of post operative infections. Data were collected from cardiothoracic surgery department, intensive care unit, and outpatient clinic at Assiut University Hospital. The study was conducted on 60 adult patients with open heart surgery (30 - study group and 30 - control group) who have been selected randomly. Data were collected through: four tools; (cardiac surgery patient needs assessment sheet, cardiac teaching program based on individualized patient needs assessment, cardiac post operative observation checklist sheet, and cardiac post operative wound site infection evaluation sheet). Results of this study concluded that, more than half of the patients in study group 53.3 % were females, 70 % were married, and 40 % their ages ranged from 18 - 29 years. While the majority of the patients in the control group 63.3 % were male, 46.7 % were married, and 33.3 % from 30-39 years. Conclusion; Significant differences for improvements throughout educational program phases among study group regarding total score of knowledge and practice about open heart surgery. The study recommended that, pamphlets and simple illustration booklet should be available for patients illiterate to with simple explain how to safely live after open heart surgery. The patients must understand the importance of oral hygiene and visiting a dentist regularly because dental infections can affect the valve prosthetic.

Key Words: Open heart surgery, Infection, Post operative care

1. Introduction:

Cardiac surgery is surgery on the heart and/or great vessels performed by a cardiac surgeon. Frequently, it is done to treat ischemic heart disease (for example, coronary artery bypass grafting), correct congenital heart disease, or treat valvular heart disease created by different causes including endocarditis. It also includes heart transplantation (Morton & Fontaine, (2009).

Postoperative surgical site infections (SSIs) are a major source of morbidity in the United States. Wound infections rates are; clean surgery infection rate typically 1-2 %, clean-contaminated infection rate usually < 10 %, contaminated infection rate 15-20 %, and dirty infection rate 40% (Williams & Wilkins (2006).

Nurses play a vital role in the prevention of SSIs in patients with open heart surgery. By managing disease processes, through education and assessment (Harrington *et al.*, 2005). The unique challenge for the critical care nurse is to integrate theoretical knowledge, assessment skills, and problem solving ability to provide optimal nursing care and maintain high quality outcomes (Morton & Fontaine, 2009).

Pre operative preparation for cardiac surgery includes physiological and psychological components. Physiological preparation includes history, physical examination, chest radiography, and an ECG. Effective pre operative teaching, which reduces anxiety and physiological responses to stress and after surgery, is an important aspect of psychological preparation. The surgical procedure, the Intraoperative, and postoperative experiences are explained to the patient (Morton & Fontaine, 2009).

Post operative phase patients are transported directly to the intensive care unit (ICU), where they recover from anesthesia and usually remain for 24 hours after surgery. Patients arrive in the ICU with numerous lines and tubes (e.g., endotracheal tube and hemodynamic monitoring lines). Immediate postoperative care involves cardiac monitoring and maintenance of oxygenation and hemodynamic stability (Rosborough, 2006).

Discharge instructions for heart surgery patients includes observe appetite of the patient, signs and symptoms of swelling, sleeping condition, gastro intestinal problems as constipation, diet, care of incision, instruction about medication used, activity, shower daily if he/she is strong enough to stand and

wash the incision with a mild antimicrobial soap. Using a clean towel, the patient should pat dry the incision. No lotions, creams, oils, or powders are to be used. The patient also should avoid sun exposure, sexual, driving, lifting heavy objects, work, stress management and follow exercise program given to the patient by physical therapist in the hospital (Society of Thoracic Surgeons, 2006).

Significance of the study:

Wound site infections are a major source of post operative complications, accounting for approximately a quarter of all nosocomial infections. Many international studies have defined the patients at highest risk for infection in general and in specific operative procedures (Abd El Aziz *et al.*, 2007). However, there is a scarcity of local studies dealing with this problem. It is hoped that, data generated from this study could help in educating the patient and managing care for patients with open heart surgery as well as training adequately the patients to decrease incidence of infection and complications. Complications increase morbidity, inpatient stay, hospital cost, and increase mortality of patients. So, this study will be carried out to investigate the impact of educational program among open heart surgery patients on minimizing the incidence of post operative infections.

Aim of the study:

To investigate the impact of educational program among open heart surgery patients on minimizing the incidence of post operative infections.

Research hypothesis:

Open heart surgery patient attending educational program will exhibit a positive effect on minimizing surgical site infections post operatively.

Material and Methods:

Research design:

Quasi-experimental research design was utilized to fulfill the aim of this study.

Materials:

Setting:

Cardiothoracic surgery department, intensive care unit, and outpatient clinic for follow up at Assiut University Hospital.

Subjects:

Patients admitted in cardiothoracic surgery department (60 patients) were included in the study, (31) male and (29) female their ages ranged between 18 and 60 years. The patients classified inrolled randomly (convenience sample) into two groups (study and control group). The study group (30

patients) who were received nursing instruction (educational teaching nursing program), while the control group (30 patients) who were received routine hospital care.

Tools of the study:

Four tools were used to investigate the impact of educational program among open heart surgery patients on minimizing the incidence of post operative infections. These tools were deduced by the researcher based on reviewing of related literatures (Horan & Gaynes, 2004; Williams & Wilkins, 2006; Smeltzer *et al.*, 2008; Berman *et al.*, 2009; Morton & Fontaine, 2009; Proehi, 2009).

Tool I:

Cardiac surgery patient needs assessment sheet (Annex 1):

This tool was developed to assess open heart surgery patients needs. It contains 23 items and will be developed by the researcher and it includes 5 parts:

Part I: Assessment of the sociodemographic patients' profile: To assess the patients profile as patient's name, age, sex, marital status, diagnosis, family size, housing condition...etc).

Part II: Patients nursing needs pre cardio surgery: This part includes structured items to identify patient's pre cardiac surgery nursing needs.

1. Present, Past, and family history

Scoring system:

Weight(kg)

For body mass index (BMI) =-----

Height (in meters) 2

Within standard level	20 to < 26
Over weight	26 to < 30
Obese	30 to < 40
Morbid obesity	> 40

This equation and classification of BMI were adopted from (Syed & Davis, 2000).

2. Physical examination.

3. **Psychological needs:** assess psychological state of patient such as fear, irritable, insomnia, and apprehensive.

Part III: Laboratory investigation.

Part V: Diagnostic procedure.

Part IV: This part carry out pre/ post test questionnaire and observation checklist sheet was used prior to implementation of the teaching program to measure the exact knowledge level and assessment practice for patient about open heart surgery. The same part used after implementation of the teaching program and after 2 weeks later to evaluate the gain in knowledge after the intervention. It consists of 2

main parts: Patient assessment knowledge and practice about open heart surgery.

Scoring system:

As regard patient assessment knowledge about open heart surgery which includes 18 items, each item was assessed, categorized, and scored into either yes = 1 or no = 0 on all items. Patient assessment practice about open heart surgery. Which includes 14 items, each item was observed, categorized, and scored into either yes = 1 or no = 0 on all items.

Tool II:

Cardiac teaching program based on individualized patient needs assessment (Annex2)

The educational program was designed to minimizing the incidence of post operative infections with open heart surgery patients through individualized session of educational program. It developed by the researcher based on the review of relevant literature, available resources, and the patient needs assessment. Number of session; a total 9 educational sessions will be conducted for each patient in addition to the pre assessment session. Preparing of educational training place, teaching aid and media (pictures, Arabic handout; the content of program modified in Arabic language and give it to the patient, and models) to help and facilitate the implementation of the educational program for the patient. Prepare the contents of training program, based on the assessment and the available equipment in the unit for its application

The first session; included information about the heart and its function, meaning of heart disease. The second session; provided information about open heart surgery and importance of surgery. The third session; included information about teaching skills related to preparation before surgery. The fourth session; included information about daily activity and exercises. The fifth session and sixth session; included information about wound care schedules. The seventh session; included information about specific nutrition for post cardiothoracic surgery. The eighth sessions; included information about wound infection: local and systemic signs and symptoms, and medication used. The ninth session; included information about discharge instructions for heart surgery patients. The duration of each session about 15 – 20 minutes according to patient tolerance. The end of each session makes discussion and feedback, except for the session for discharge instruction, which take 60 minutes

Tool III:

Cardiac post operative observation check list sheet (Annex 3):

An observation checklist was designed based on reviewed related literature Serna & Cathy (2006); Bonnie & Barnard (2007). The observation was performed to evaluation of effectiveness of the educational nursing program related to postoperative wound management on minimizing infection before discharge and follow up post discharge.

Scoring system:

As regard cardiac post operative observation check list sheet, each item was observed, categorized, and scored into either present or not present on all items of local wound manifestation of infection and systemic manifestation schedule of observations.

Tool V: Cardiac post operative wound site infection evaluation sheet:

Used evaluation tool sheet for wound site infection (Southampton Wound Assessment Scale) The wounds were graded before discharge and after 10 – 14 days postoperatively into one of four categories; normal healing, minor complication, wound infection , and major haematoma (Pudner, 2005).

Southampton scoring system:

Grade	Appearance
0	Normal healing
1. Normal healing with mild bruising or erythema: A B C	Some bruising Considerable bruising Mild erythemia
2. Erythema plus others signs of inflammation: A B C D	At one point Around suture Along wound Around wound
3. Clear or haemoserous discharge: A B C D	At one point only (< 2 cm) Along wound (> 2 cm) Large Volume Prolonged (> 3 days)
4. Major complication (Pus): 0 A B	Normal At one point (< 2 cm) Along wound (>2cm)
5. Deep or severe wound infection with or without tissue breakdown; haematoma requiring aspiration	

Scoring system:

As regard cardiac post operative wound site infection evaluation sheet, each item was observed, categorized, and scored into either present or not present on all items of Southampton scoring system for study and control groups.

Methods:-

Techniques for data collection:

- Official approval and administration permission were obtained from the head of internal

cardiothoracic surgery department and post operative ICU to collect the necessary data.

- The consent from the patients who will be participating in the study will be taken.
1. The tools 1, 2, 3 and 4 used in this study was developed by the researcher based on reviewing the relevant literature (Bonnie & Barnard, 2007).
 2. Jury of programs tested by 5 expertise's from the field of staff thoracic surgery and nursing educators for content validity of program.
- A pilot study was conducted during September 2009. It included 5 patients, in order to test the clarity and applicability of the tools.
 - The data collection covered a period of one year starting from October 2009 till the end of October 2010.
3. Confidentiality and anonymity were assured.

Description of the nursing intervention program:

This program included three major parts;

- 1- The first was concerning the cognitive skills, i.e. knowledge about; The heart and its function, meaning of heart disease, definition and indications of open heart surgery, wound care schedules, knowledge about preoperative preparation, and postoperative instructions as regards open heart surgery, information about specific nutrition for post cardiac surgery, wound infection; local and systemic signs and symptoms, and medication used and discharge instructions for post cardiac surgery patients, and the importance of follow-up instruction of care.
- 2- The second was concerning the practical skills, i.e. deep breathing and coughing exercise, leg exercise, activities of daily living.
- 3- The third was related to carry out (implementation) the educational program practice among open heart surgery patients on minimizing the incidence of post operative infections.

Procedure:

The study was carried out in three phases: 1st, 2nd and 3rd phases:

- 1- Preparatory phase (Assessment and planning phase), involved the following: Review of relevant literature (Berman *et al.*, 2009), (nursing textbooks, journals, internet resources, etc), about nursing care for cardiac patient, jury for program by 9 expertise nurses and doctors, arrange for the training program schedule, based on the contents of the program, each patient was interviewed and counseled individually, time availability and the resources available.
- 2-The second phase (implementation phase): This phase comprised the preoperative, postoperative,

and during this phase the exercise training program was implemented.

Pre-operatively:

- Patients were equally enrolled in the study as control and study groups sequentially. The 1st patient's interview was used to explain purpose and nature of the study as well as patient agreement for voluntary participation was obtained.
- The 1st 3 sessions from educational nursing program were carry out in 2nd interview with study group and take break 10 minutes between every session.
- The 4th, 5th, and 6th sessions from educational nursing program were carry out in 3rd interview with study group and take break 10 minutes between every session.
- The last 3 sessions from educational nursing program only were carry out in 4th interview with study group and take break 5 minutes between every session.

Postoperatively:

- The 5th interview with study group was at 1st day post-operatively, and then once time daily during hospitalization for base line data was obtained from study and control groups patients to fill tool 3.
 - Before discharge the investigator emphasized the importance of follow up visit for all subjects (study and control) and arranged with study group the time and place for follow up which were 2 weeks postoperatively in out patient cardio thoracic surgery clinic at Assiut University Hospitals.
- 3-The last phase of proposed teaching program is the evaluation phase. After implementation as well as after 2 weeks the patient knowledge and practices has been evaluated by the researcher through filling the tool (1). Also local wound and systemic manifestation of infection was assessed utilizing tool 3 during hospitalization before discharge and after 2 weeks post discharge (follow up). A line of contact was established between the investigator and subjects of both groups for feed back, monitoring, and provision of needed consultation and help.

Analysis of data

Data collected by computer program SPSS" version. 17" Chicago. USA. Data expressed as "mean \pm standard deviation" "number, percentage". Using T.test to determine significant for numeric variable. Using Chi.square test to determine significant for non-parametric variable. Using person's correlation for numeric variable in the same group.

n.s $P > 0.05$ no significant. $P < 0.05$ significant.

** $P < 0.01$ moderate significant.

*** $P < 0.001$ highly significant.

Limitations of study:

- 1- Time available for follow up not enough as many patients were coming from far town and need to leave hospital early.
- 2- The patient's anxiety and feelings of vulnerability may interfere with the ability to learn information provided.
- 3- Participants suffered from transportation and financial problems.

3. Results:

Distribution of the biosociodemographic variables in study and control group subjects: the data reveals the more than half of the patients' in study group 53.3 % was female, 70 % were married, were 40 % from (18 to 29 years), 33.3 % were illiterate, 50 % were non working, family size 70 % from 4 to 8 persons and 56.7 % were moderate housing condition.. While the patients' in control group 63.3 % were male, 46.7 % were married, were 33.4 % from (30 to 39 years), 26.7 % were read & write, 43.3 % were non working, family size 66.7 % from 4 to 8 persons and 46.7 % were low housing condition. With no statistical significant difference between study and control groups as regards biosociodemographic variables.

Distribution of the sample according to vital signs means scores preoperative assessment for both study and control groups: There are highest mean scores as regard to temperature and pulse rate in control group than in study group (37.04 ± 0.37 , 36.92 ± 0.457 and 85.53 ± 15.38 , 83.43 ± 11.55 , respectively). Table show that highly statistical difference between control and study group related to respiratory rate ($P = 0.005$).

Distribution of the sample according to preoperative risk factors for study and control group: the high percentage in both study and control groups (80 % and 73.3 %, respectively) have non smoking. As regards body mass index the highest percentage (63.3 % and 40%, respectively) in study and control groups have standard level of weight. As regard percentage of chronic obstructive pulmonary disease and use of antibiotics they were equally in both groups, while highest percentage in study group have used of anticoagulant (80%) and one third of patients in control group have hypertension (33.3 %).

Distribution of the sample according to hereditary diseases & medical history for both study and control group: more than half percentage (60 %) in study group have diabetes and 40 % have hypertension and in control group were 80 % of

patients have diabetes and 76.7 % hypertension. As regard the medical history streptococcal infections it was found that 86.7 % and 96.7 % in study and control groups, respectively. There was significant difference related to hypertension between both groups.

Table (1): This table shows that the cardiovascular preoperative and health habits clinical assessment for both study and control groups. The findings indicated that 96.7 % and 100 % of the patients in the study and control groups had palpitation preoperatively, while half of the sample in both study group and control had equal percent of leg edema. Concerning of extremity pain of both study and control groups preoperative assessment; the findings indicated that there were significant differences between the study and control groups in preoperative period ($p < 0.05$).

The data reveals that cigarette smoking the majority of the patients' in study group had smoked cigarette more than control ones (83.3 %, 62.5 % respectively). The result also revealed that, there were highest mean scores of smoking index was found in study group than control ones (310 ± 65.21 , 120.23 ± 20.25 , respectively). The data reveals that the patients' in control group as performing exercise more than study ones (33.3 %, 26.7 % respectively). Difference was statistically significant ($p < 0.01$) for smoking index, and common symptom.

Table (2): This table demonstrates that significant difference was found between study and control groups as regard magnesium studies finding ($P = 0.042$).

Table (3): This table demonstrates that, significant difference was found between study and control groups as regard coagulation factories and blood glucose studies.

Table (4): The highest percentage (33.33 and 26.67 %) in study group and in control groups were has knowledge about rest and sleep. As regards percentage of knowledge about define of surgical site infection, sources and predisposing factors for surgical site infection, health teaching activities after discharge, notify the physician if patient have any abnormal, and daily activities to infection control they are equally in both groups and they have not any knowledge about this items.

Table (5): As regards pre operative nursing care practice the highest percentage (73.33 % and 66.67 %) in study and in control groups were have about foot and leg exercises, while they have not any knowledge about how to use incentive spirometry and elastic stocking. Also the table shows that assessment of level of practice about post operative nursing care among patients in study and control group, approximately an equal percentage in study and control groups (73.33 % and 70

%) were have knowledge about nursing care of urinary catheter, activities and exercises in intensive care unit. As regards discharge instructions for open heart surgery patients the highest percentage (60 % and 43.33 %) for study and control groups have had knowledge about how perform walking exercises.

Table (6): The above table shows that, there were significant differences improvements throughout the educational program phases among study group regarding total score of knowledge and practice with $P = 0.000$, 0.000 about open heart surgery.

Table (7): The above table shows that, there were statistical significant differences improvements of throughout the educational program phases among study group while non statistical significant differences were noticed throughout the educational program phases among control group regarding level of knowledge and practice.

Table (8): This table shows that, Non significant difference were existed between infection scoring system at three phases for both group in all items except normal healing in pre discharge ($P = 0.06$).

Also table enumerate that significant difference in post discharge for all items except major complication ($P = 0.015$), deep or severe wound infection ($P = 0.03^*$), and clear wound discharge ($P = 0.009$).

Table (9): This table demonstrates that, non significant difference between study and control groups as regard to hospital stay and ICU stay.

Figure (1): The table mentioned that, statistical significant differences of study groups was exited between housing condition & incidence of namely fever ($p=0.005$), delayed wound healing ($p=0.027$) and pneumonia ($p=0.027$).

Figure (2): The table shows that, statistical significant differences was exited for study group between ICU stay & incidence of fever, delayed wound healing, endocarditis, myocarditis, pericarditis and pneumonia.

Figure (3): The table mentioned that, a statistical significant difference was exited for study group between hospital stay & incidence of endocarditis, myocarditis, and pericarditis ($p < 0.01$).

Table (1): Distribution of the sample according to preoperative cardiovascular clinical assessment and health habits for study and control group.

4. Discussion:

Patient education is an essential component of nursing practice, there has been a continuous development and emphasize on the leadership role of nurses in the arena over the last century. Kern, (2005) stated that the nurse is responsible for providing preoperative nursing care for patients which includes assessing physical and psychological needs preparing patients for operation includes the following instruction such as listing medication routinely, limitation of eating or drinking before surgery with specific time, bathing, checking vital signs, laboratory investigation and administrating preoperative medication.

Based on the results of the present study biosocio-demographic characteristics, two groups study & control were included in this study with no statistically significant differences shown between them regarding: sex, age, marital status, educational level, occupation, family size, and housing condition at the beginning of the study.

Concerning sex, the present study showed that approximately half of study and control groups were female, this result agree with Hopkins, (2005) study finding who mentioned that the majority of participated patients with open heart surgery were females. Whiles this disagrees with that of Stahle *et al.*, (1997) and Borger (1998) who reported that fewer female patients than males (female: male ratio = 1: 4.4).

The result revealed that, more than one third of the total studied patients were in the age group from 18 - 29 years old in study group and control group. On same line, this finding disagrees with Chih-Hung (2005) who reported that the number of open heart surgery is increasing in patient who are 50 years old or more.

The present study findings have shown that; one third of the study groups were illiterate and less than one third of the control group were able to read and write. As patient's education can increase the patients' awareness toward the surgery and the importance of follow up program.

The present study showed that, the mean scores vital signs in study group in preoperative phase were less than those of the control ones especially for temperature and pulse (85.53 ± 15.38 , 83.43 ± 11.55 and 37.04 ± 0.37 , 36.92 ± 0.457 respectively) with highly statistical difference between control and study group related to respiratory rate (0.005). Punder (2005) and Koplow and Hardin (2007) mentioned that pulse and blood pressure serve as useful tools to assess cardiac output in heart disease..

Based in the results in the present study preoperative cardiovascular clinical assessment, more than two third of study group and all patients who participate in control group have palpitation and nocturnal dyspnea, these findings is at one with those of Gamer *et al.* (1996), Mangram *et al.* (1999), and Spelman *et al.* (2000) who reported that, all patients with cardiac disease have complained with palpitation and nocturnal dyspnea.

The present study showed that, consumption of tea and coffee it was more prevalent among control group subjects than those in the study ones. More than two third of study and control group were non smoker. This agrees with those of Kleinbaum *et al.* (1998), Delgado *et al.* (2001), and Kern (2005) who reported that, the majority of sample in study and control group were smokers and smoking is considered one of the risk factors for sternal surgical site infection.

According to Debacker *et al.* (2003) who recommended that physical activity for cardiac patient should be positively encouraged because this may reduce blood pressure, cholesterol level, and body weight. Patients should be encouraged to exercise at least four times a week, but preferably daily for a period of 30 minutes. Exercise does not need to be complex or competitive; a daily walk is sufficient to gain health benefits. These contradicts with study more than two third of the patients were not performing exercises (walking) in both groups. The American College Sports Medicine (ACSM, 1993) guidelines and Ellis (1995) who stressed that the individual will benefit from daily bouts of aerobic exercise totaling 30 minutes.

According to Syed and Davis (2000) who mentioned that within the standard level of weight 20 to < 26, over weight 26 to < 30, obese > 40 Kg. It was found in the present study, two third of the study and more than one third in the control group were

having standard level of weight. According to Grady and Jalowiec (1995), Debacker *et al.* (2003) and Jarrick (2006) who recommended that nutritional information should be given to optimize wound healing, maintain ideal body weight and reduce cholesterol levels if elevated.

With regard associated disease, the study revealed that less than one third of subjects in study and control group were complaining from diabetes this may be due to that most of the sample were young (18 -29 years). Slaughter *et al.* (1993), Minohara *et al.* (1993), Spelman *et al.* (2000), Swanton (2003), American Heart Association (2004) consistent diabetes and obesity were independent predictors of sternal surgical site infection following coronary artery bypass grafting.

Also in the present study, it was found that half of subjects in study and control group were complaining from chronic obstructive pulmonary disease. However, Paletta *et al.* (2000), Keogh (2003), American Heart Association (2004), Adam (2005), Drain & Forren (2009) and Morton & Fontaine (2009), emphasized that patients complaining from chronic obstructive pulmonary disease lead to impaired sternal wound healing.

In this context finding that all patients who participate in study and control group were using antibiotics, this is in agreement with those of Paletta *et al.* (2000); Trick *et al.* (2000) and Abd El Aziz *et al.* (2007) who mentioned that, the use of antimicrobial prophylaxis surgical procedures is one of the measures used to prevent the development of a surgical site infections.

The present study mentioned that more than two thirds of the patients in study and more than one third in control group were using anticoagulant. This agrees with those of, Kern (2003), and Punder (2005) who recommended that patients with mechanical prosthetic valves will require warfarin anticoagulation for life to prevent thrombosis and embolism.

Based on present finding mentioned that more than half of the patients in study and two thirds in control group have normal laboratory values of prothrombin time in preoperative period, while more than two thirds in study and more than half in control group have abnormal values as regard prothrombin time in postoperative period, this may be related to anticoagulation therapy.

The present study revealed that, more than two thirds in study and control group have normal laboratory values as regard serum sodium, serum potassium, calcium, and magnesium. This is in with accordance Noronha and Matuschak (2002), Diercks (2004), Palmer (2006) and Urden *et al.* (2006), who mentioned that normal serum potassium levels are 3.5

to 4.5 mEq/L. Hyperkalemia and Hypokalemia elicits significant changes in the electrocardiogram (ECG) and impairs myocardial conduction.

Regarding glucose level two thirds of the patients in study and more than two thirds in control group have normal values as regard glucose level in preoperative period. In addition Garber *et al.* (2004) and Wynne *et al.* (2007) consistent the detection of increased blood glucose (more than 110 mg/dl) during a fasting state may indicate diabetes mellitus.

The present study showed that, the highest percentage (33.33 % and 26.67 %) in study and control groups respectively were having knowledge about rest and sleep. It also showed that most of patients had a general lack of knowledge in both groups about other items. Level of knowledge was insufficient this may be due to inavailability of training programs and lacking of continuous educations. This result was in agreement with Bedier (2005) who found that their was lack of patient's knowledge about pre and post operative care which predict poor recovery outcome

After implementing of the educational program study group patients had a highly significant improvement than those of control ones in relation to all items of knowledge. In this respect, Jennifer (2003) and Charlson *et al.* (2006) found that, applying nursing intervention postoperatively plays a major role in patients' improvement of knowledge and recovery.

As regard level of preoperative nursing care practice for open heart surgery patient, more than half of the patients in both groups had knowledge about performing foot and leg exercise. It also revealed that more than one third in study and control groups has no knowledge about how to perform coughing and breathing exercises, arm and shoulder exercise. According to American College Sports Medicine (ACSM, 1993) guidelines and Urden *et al.* (2006) recommended that exercise is important in the maintenance of the healthy heart.

Based on present finding assessment of practice level about post operative nursing care among patients in study and control groups, approximately an equally more than two thirds of patients in both groups have knowledge about nursing care of urinary catheter, activities and exercises in intensive care unit. It also showed that lacking of patient's knowledge about patient observation in intensive care unit, nursing care of nasogastric tube, and nursing care of chest tube in both study and control groups.

Regarding post operative activities, Charlson and Islam (2003) stressed that, following the cardiac surgery; the patient must be encouraged slowly to resume an active life, while minimizing the risk associated with overexertion. On the other hand Gerald and Fletcher (2007). Abdel Monem (2008)

illustrated that, active but not restrictive range of motion of extremities is also well tolerated early after cardiac surgery as long as activities do not stress or impair healing of sternal incision while patient become stable and early ambulated from bed.

As regards discharge instructions for open heart surgery patients, more than one third for study and control groups has had knowledge about how to perform walking exercise. Bedier (2005) and Punder (2005) recommended that a daily walk is sufficient to gain health benefits for patients after open heart surgery.

Before program implementation (pre-test) there was unsatisfactory level of knowledge. The implementation of educational program showed an improvement in patient' level of knowledge regarding all information related to open heart surgery. This has improved immediately after the program implementation and remained in the follow up.

The present study revealed that, before program implementation the patient did not have any background or information about level of practice in preoperative, postoperative nursing care and discharge instructions for open heart surgery. Post program implementation there were significant improvement in patient' level of nursing care practice about open heart surgery preoperative, postoperative and discharge instructions on immediate post-test and follow up test.

According to Morton *et al.* (2005); Morton and Fontaine (2009) effective preoperative teaching program for patient before open heart surgery is important to help the patient in rapid recovery and prevent postoperative complications. The surgical procedure, the intraoperative and postoperative experiences are explained.

In the present study there were statistical significant differences in improvements throughout the educational program phases among study group regarding total score of knowledge and practice about open heart surgery.

The study in the line with those of Morton *et al.* (2005); Morton and Fontaine (2009); Okkonen and Vanhanen (2006) who emphasized that after cardiac surgery the patient may experience pain resulting from the chest or leg incision. In addition Wynne *et al.* (2007) and Osborn (2010) illustrated that the goals of nursing management is a thorough assessment of the patient's pain using a pain scale, provide a calm environment, adequate period of rest and sleep, administration of analgesics based on the report of pain intensity.

In present study the scoring system used is of Southampton Wound Assessment Scale to assess surgical wound infection in patients, the wounds graded before discharge and after 2 weeks postoperatively. In the present study, more than half

of the patients in study and control group were having normal healing with mild erythema pre-discharge, while in follow up phases all patients in study group and more than two third in control group were having normal healing with mild erythema. In addition Bailey *et al.* (1992), Morris (2003) and Punder (2005) devised the Southampton Wound Assessment Scale to assess surgical wound infection in patients following surgery; the wounds were graded before discharge and 10-14 days postoperatively into one of four categories; normal healing, minor complication, wound infection, and major haematoma.

Based on the study results; it was clear that there were a significance difference as regard the relation between hospital stay and ICU stay and incidence of infection. Eagle *et al.* (2004), Morton and Fontaine (2009) supported that length of stay in ICU and hospital environment after cardiac surgery increased risk for sternal surgical site infection.

It was found that in the present study there was significance difference as regard to relation between housing condition and incidence of fever, delayed wound healing and pneumonia. This in line with Minohara *et al.* (1993) and Campbell (2000) and DVLA (2003) who found that poor housing condition increases incidence of surgical site infection.

It is the fact that study documented the statement of role of the nurse play a vital role in the prevention of SSIs in patients with open heart surgery, identification of early signs of infection are vital to the prevention and optimum treatment of SSIs. The critical care nurse must be integrating theoretical knowledge, assessment skills, and problem solving ability to provide optimal nursing care and maintain high quality outcomes for open heart patients.

Conclusion:

Based on the result of the present study, it can be concluded that; Significant differences in improvements throughout educational program phases among study group regarding total score of knowledge and practice about open heart surgery. A significant relation was existed between age, nutritional status, diabetes, hospital stay, ICU stay and incidence of delayed wound healing among study group.

Based on results of the present study, the following can be recommended:

I. For patients:

1. Patients who have had valve replacement require additional verbal and written information about protecting their prosthetic valve from infective.

2. The patients must understand the importance of oral hygiene and visiting a dentist regularly because dental infections can affect the valve prosthetic.
3. Tell the patients about importance of regular follow up in regular time.
4. Advice the patient regarding effective education and information are required to enhance understanding of drug therapy (anticoagulant drug).

II. For nurses:

1. An in-service education center should be established within Assiut University Hospital to improve nursing staff level of knowledge and performance.
2. To reduce the rate of infection, implementation of universal precaution and comprehensive education are required.

III. In services:

1. Follow-up care for patients with open heart surgery phone calls, home health visits and clinic visits would help to pinpoint problems and solve it.
2. Establishment of specialized cardiac clinics in all health centers to help guiding and caring for patient with open heart surgery.

IV. For research (future study):

1. Importance of doing separate studies of open heart surgery helpfully lead to more effective and preventive – based strategies for future.
2. Studies should be done for those patients who high risk for infection

IMAGE PROCESSING AND NUMERICAL ANALYSIS APPROACHES OF POROSOME IN MAMMALIAN PANCREATIC ACINAR CELL**Waslat W. Elshennawy**Department of Biology and Geology, Faculty of Education, Ain Shams University, Roxy, Cairo, Egypt
dr-waslat@hotmail.com

Abstract: Pancreatic acinar cells have a particular role in the synthesis, storage and regulated secretion of the different digestive enzymes present in pancreatic juice. Recently a detailed understanding of the molecular machinery and mechanism of cell secretion has come to light. So, it is now an accepted belief, that the mechanism of cell secretion is quite different, and a highly regulated process. The secretory vesicles (zymogen granules) dock and transiently fuse at the base of specialized plasma membrane structures called porosomes or fusion pores. In the present study, TEM images and a computer-assisted morphometry approaches have been used to analyze quantitatively the shape and fine structure of porosome in pancreatic acinar cell of post-feeding rat. The electron micrographs illustrated the porosome as a distinct permanent, lipoprotein, cup-shaped structure at the cell plasma membrane of the pancreatic acinar cell, facing the lumen and varies in shape and structure according to the stage of secretion. The computer-assisted morphometry summarized the structural and morphological importance of the porosome and revealed its different shapes during the cell secretion. The coloured images have clearly shown the supramolecular tripartite lipoprotein structure of the plasma membrane and porosomes. Histogramic analysis showed the numerical values of the secreted materials and the three layers of both porosomes and plasma membrane which differed depending on the stage of cell secretion.

[Waslat W. Elshennawy. IMAGE PROCESSING AND NUMERICAL ANALYSIS APPROACHES OF POROSOME IN MAMMALIAN PANCREATIC ACINAR CELL. Journal of American Science 2011;7(6):835-843].(ISSN: 1545-1003).
<http://www.americanscience.org>.

Key Words: cell secretion, image processing, histogramic analysis, porosomes, secretion machinery, ultrastructure.

1. Introduction:

Since last decade, secretory process in the cells attracted great attention and concern of several investigators, and a series of elegant studies revealed a completely different molecular mechanism of secretion and membrane fusion in cell as a very important process involved in the release of hormones and digestive enzymes (Jena *et al.*, 1997, 2003; Cho *et al.*, 2002a, b, d, & e; Jeremic *et al.*, 2003; Craciun, 2004; Kelly *et al.*, 2004; Thorn *et al.*, 2004). These authors demonstrated that pancreatic acinar cells have a particular role in the synthesis, storage and regulated secretion of the digestive enzymes present in pancreatic juice. The process of pancreatic secretion involves the docking and transient fusion of membrane-bounded secretory vesicles (the zymogen granules) at a specialized plasma membrane structures called porosomes or fusion pores, to discharge vesicular contents. In 1997, Schneider *et al.* represented the first discovery of the porosome as a circular pit containing 150 nm diameter depression, presents at the apical cell plasma membrane where secretion occurs in living pancreatic acinar cells. Also, Jena who is considered as one of the most pioneer investigators in the studies of porosomes elucidated singly a lot of searches in (1997; 2002; 2003; 2004; 2005; 2007; 2008; 2009), in addition to his work with other teams. In his interesting and intense studies of the story of cell secretion, he elucidated the porosome as a permanent universal secretory machinery in a

nanometer-size lipoprotein structure at the cell plasma membrane. In addition, determination of porosome biochemical composition; its functional reconstitution into architecture lipid membrane; its structure and dynamics at nm resolution and in real time have been all explained by Jena *et al.*, 2003; Jeremic *et al.*, 2004a,b; Lee *et al.*, 2004, 2009; Cho and Jena, 2007; Cho *et al.*, 2007, 2008; Cook *et al.*, 2008; Potoff *et al.*, 2008. The monumental discovery of the porosome as a new cellular structure at the plasma membrane and its molecular mechanism of secretion were also described in the reviews of Anderson (2004; 2006) and Zhvania (2004). Similarly, Craciun (2006) and Jęftinija (2006) determined in their interesting studies the structure of the porosome in resting pancreatic acinar cells and when co-isolated with the secretory vesicles in exocrine pancreas (the zymogen granules), and demonstrated the presence of porosomes at the apical plasma membrane where secretion occurs. Ultimately solving one of the most difficult, significant, and fundamental cellular process – the cell secretion.

On the other hand, image processing is a technique for processing any image, it depends on the fact that the causes of colour in many structures are in response to the structural irregularities (Fortner and Meyer, 1997; Fraser *et al.*, 2003; Gendler, 2003; Rector *et al.*, 2004) Such use of this property can be considered as the key factor for mapping the way in

which the electron beam of TEM interact with the internal structure of organelle to produce the digital image. This digital image was further used for better characterization of the differences in fine structural field. However, the digital image consists of a square array of image elements or pixels; at each pixel, the image brightness was sensed and assigned with an integer value (from 0 to 255 in the case of gray scale image) that was named as the gray-level. For better visualization of the image, the gray-level image is transformed into colour image and converted into hue, saturation and intensity (HIS) using a discoloured technique. The simplest way of obtaining a pseudo colour image from a gray-level image is to use the RGB mode. An RGB colour consists of three individual images exposed through Red, Green and Blue filters, which are eventually combined into a single composite colour image. Note that, the individual RGB images are not in colour. They will still be gray scale images until combine them into the final colour image. This is recognized by many of the popular image processing programs like Photoshop or Paint Shop Pro (Parker, 1997; Sonka *et al.*, 1998; Myler, 1999). These programs are excellent tools when you want to crop, resize and perform final adjustments to your colour images and hence. Also, it can offer both more feasible and practical performance at simple tasks and good implementation, which would be impossible by TEM or other tools alone. However, the purpose of RGB colour model is to facilitate the specification of colours in some standard, generally accepted way, and is the most commonly used model in graphics devices (MacDonald, 1999; Lynch and Livingston, 2001). This model however, allows offering colour range for the pixels from an integer value 0 to 16777215 (number of colours: 256x256x256). This can be used as an additional parameter for identifying the fine details of the differences in the ultrastructure features.

On the light of this, the present study has been carried out to visualize on the nanosize structure and analyzes numerically and histographically the porosomes ultrastructure in mammalian pancreatic acinar cell.

2. Materials and Methods:

2.1. Experimental Animals and Ultrastructural

Preparation of Pancreatic Acinar Cells:

Ten male albino rats (*Rattus norvegicus*) ranging in weights from 150-200g were acquired from Schistosoma Biological Supply Program (SBSP) Theodor Bilharz Research Institute, Cairo, Egypt. Housed in clear plastic cages (one rat/cage) with wood chips as bedding and given pellet rodent diet, in addition of milk and water *ad-libitum*. They were kept for acclimatization and observation of their eating habit for a week, under controlled environmental conditions, including a temperature of 25°C and a 12h light/ dark cycle. At the last day, after they finished eating presented meal at morning, five rats were sacrificed by

decapitation one hour post-feeding, while the others were decapitated two hours post-feeding. The pancreas were rapidly excised and were processed for ultrastructural evaluation by electron microscopy as described previously by Dykstra *et al.* (2002) as follows: Freshly excised pancreas were cut into small blocks (1 × 1mm³) fixed in cold 4F:1G (i.e. 4% formaldehyde and 1% glutaraldehyde adjusted at pH 2.2) for 24h, and postfixed in 1% osmium tetroxide in 0.1M phosphate buffer (pH 7.3), dehydrated in an ethanolic series culminating in 100% acetone, and infiltrated with epoxide resin. After polymerization overnight at 60°C, semithin section (0.5µm) were stained with 1% toluidine blue in 1% sodium borate and examined with a light microscope. Areas of exocrine acinar cells were selected and the blocks trimmed accordingly. Ultrathin sections (80-90nm) were cut, placed on 200 mesh copper grids, and stained with uranyl acetate and lead citrate. The grids were examined and photographed using JEOL.JEM-1400-EX-ELECTRON MICROSCOPE at the Central Laboratory of Faculty of Science, Ain Shams University, Cairo, Egypt. The photographs were printed on KODABROMIDE F5s GLOSSY Black and White- Schwarzweib-Kodak.

2.2. Computer-assisted Examinations:

The TEM images of porosome at the plasma membrane of pancreatic acinar cell were visualized and examined by applying Cartographic Information System software (CIS) technique (Shulei and Yufen, 2004). Combination of image processing; numerical analysis; artificial intelligent and expert system with general vision software were used to colorize; analyze and reveal the morphological and Ultrastructural changes in porosomes by using Adobe® ImageReady® CS Middle Eastern Version "8".

3. Results and Discussion:

The electron micrograph of one hour post-feeding rat, of the apical region of the pancreatic acinar cell displays clearly the presence of porosome as a swelled flask-shaped structure at the cell plasma membrane. The mouth of the porosome opening to the outside, range in size from 130 to 150 nm in diameter. It is loaded with electron dense particles at its groove. Some of these dense particles (enzyme materials) are also seen at the acinar lumen, as shown in figure (1).

TEM micrograph of two hours post-feeding period (Fig.2) illustrates that the porosome is more or less cup-shaped with wider mouth opening (range in size from 250 – 300 nm), compared with that seen at one hour post-feeding in figure (1) and no dense particles can be detected at the groove of this porosome, i.e. the secretory material was discharged, while the acinar lumen is loaded with these dense

particles. Also, the plasma membrane appears in these electron micrographs (Figs.1&2) as a triple-layered structure consisting of two dense bands separated by a central clear zone of lipid. The structure of plasma membrane shown in these electron micrographs coincides with the well known nomenclature “the unit membrane” or the “tripartite structure” that suggested and established by Robertson (1959; 1960b) as referred in the interesting book of Heimburg (2010).

Image analysis of these electron micrographs (Figs.1&2) after being processed with CIS and histographic analysis clearly demonstrate an obvious appearance of the tripartite lipoprotein structure of the plasma membrane as; an outer and an inner protein layers which are coloured with blue colour, while the lipid bilayer that sandwiched between them is coloured in yellow, as clearly seen in figures (3A –5A) that represented one hour post- feeding period and in figures (6A- 8A) which represent two hours post- feeding period. The porosomes in these figures also appear with the same colouration of plasma membrane on their three lateral boundaries of the cup-shape which emphasize that porosome is originated from plasma membrane as a permanent supramolecular lipoprotein structure as reported by Jena (2008). In addition, it is worthy to mention that the fluid mosaic model of Singer and Nicolson (1972), is clearly seen in the coloured figures (3A-5A), as the membrane lipid is arranged predominantly in the form of a bimolecular layer which is frequently interrupted by the presence of integral embedded protein extended from the protein layers in the form of mosaic arrangement.

Also, Singer (1992) and Lundbaek *et al.* (2010) established that the lipid bilayer is essentially a fluid substance permitting lateral mobility of both the lipid and protein molecules, and hence they are capable of transitional movement within the whole bilayer. The coloured figures (6A-8A) reveal this movement by the changeable features of plasma membrane layers and porosome in comparison with the figures (3A-5A) after releasing of the enzymatic materials in to the lumen which appear loaded with these materials in the period of two hours post- feeding. That means, the plasma membrane layers and porosome are essentially involved in the process of cell secretion.

In the same coloured figures (3A-8A) the image analysis of the electron dense materials which are seen at figures 1&2 in the groove of porosome cup appear with a distinct colour of deep green, which represent the enzymatic materials, and the released enzymes from this porosome in the lumen have the same green colouration.

Regarding histographic analysis, it is well known in CIS technique as reported by Rector *et al.*, 2004; Shulei and Yufen, 2004, that the colour which is appeared, is not randomly colour, but it is related to the formation of the structure, i.e. it means that the constituents of the structure is formed of its individual elements in different colours which combine and give the specific colour of the structure.

The histographical analysis is formed of two dimensions (2D); the X and Y axes. In this study, the Y axis represented the amount or the concentration (quantitatively) of the elements or compounds, whereas X axis represented the different elements or compounds of the structure.

Histographical analysis of the coloured pictures of the lipoprotein layer of plasma membrane and porosome, in addition to the enzymatic material are represented in figures (3B-8B).

It is obviously noticed during comparison between the figures (3B-5B), which represent the features of one hour post-feeding period and the figures (6B-8B), which represent the features of two hours post-feeding period, the quite differences in arrangement and concentrations of the protein layers and lipid bilayer of the plasma membrane and porosome, as well as enzymatic material, i.e. the position of green, red, blue in the elementary map of protein and lipid layers and enzymatic material appeared totally of varying degrees of concentration and accumulation from one hour to two hours post – feeding periods. This means that the lipoprotein layer of plasma membrane and porosomes are in active and changeable condition during the process of secretion to allow the transformation of the secretory materials (the enzymes) from the inside of the pancreatic acinar cell to the outside into the lumen. This can be obviously detected by the elucidation of the histographical figures.

As seen clearly in coloured figure (3A) of one hour post- feeding period, the inner and outer protein layers which have a distinct architecture and are coloured in blue and marked in white dots have a value of 53.96 and pixelation area is 8477 pixels in the histogram (Figure 3B). The arrangement of the peaks of this histogram are green, red and blue, which may reflect that they are different types of amino acids or protein constituents of the plasma membrane. While the same layers of protein in figure (6A) which represent two hours post-feeding period, appear totally different in arrangement and it looks like that they are involved in the secretory process. Their histogram analysis in figure (6B) show a value of 101.53 and the pixelation area is 16637 pixels. The arrangement of the peaks of this histogram are also green, red and blue, but in different concentrations and a little far distance of each others.

For the lipid layer, at one hour post-feeding period, it obviously appears in figure (4A) as a distinct bimolecular layer having variant degrees of deep yellow colouration and the marked white dots have a value of 82.69 and 3718 pixels of the pixelation area as clearly seen in figure (4B) of the histogram, which displays the arrangement of the peaks as blue, green and red with observed close space between blue and green, which may represent a certain type of lipid molecules, while the red colour

which is far from the two former colours may reflect other type of molecules in the lipid bimolecular layer.

In figure (7A) which represents the period of two hours after feeding, the lipid bimolecular layer is coloured with light yellow and in this figure, the protein layers are seen to be much intermingled with lipid layer. The histogram in figure (7B) give the arrangement of the peaks as blue, green and red with a value of 165.92 and the pixelation area is 6037 pixels, and it also reflects a great changeable in the arrangement of the peaks as clearly notice in the blue colour which locates at the beginning of X axis of the histogram while the red colour locates at the end of the axis followed inwards by the green one in a close distance. These features may interpret the changeable arrangement of molecules of plasma membrane and porosome during cell secretion.

In figure(5A), the secretory materials (the enzymes) appear in the period of one hour post- feeding as a deep green colour in the base of the flask-shaped porosome, in addition, some of them are seen in the lumen of the exocrine pancreatic acinus. They are marked in white dots and have a value of 49.86 and pixelation area is 3489 pixels as obviously shown in figure (5B) of histogram. The three colours; blue, red and green in arrangement of the peaks are presented in this histogram.

After two hours post-feeding period, the secretory materials (the enzymes) are seen in light green colour at the lumen only while the porosome is empty as obviously demonstrate in figure (8A). they have value of 92.46 and 2632 pixels of the pixelation area as reveal in the histogram of figure(8B), and the arrangement of the peaks of this histogram are red, blue and green.

An interesting observation is seen in the histograms of figures (5B and 8B) of the secretory materials, that the blue colour occur as a single line in concentration. It is in arrangement before the red in the histogram of one hour post-feeding while it came after the red in the histogram of two hours post-feeding, so, it can be neglected in both cases as compared with the layers of plasma membrane and porosome.

Also, the red and green colours in these histograms are not at the same arrangement, i.e. the red peak became far away from the green peak in the histogram of released secretory materials which are observed in the lumen. These two colours might represent the types of active enzymes in the lumen.

In the present study, the changeable features that appear in the coloured electron micrograph and histogram values of two hours post-feeding period reveal obviously that the plasma membrane and porosome are in dynamics and functional reconstitution

as described in 2009, by Jena in his interesting two reviews, about the secretory portal in cells and the functional organization of the porosome complex and associated structures facilitating cellular secretion. Furthermore, Jena elucidated in these reviews that a specialized and sophisticated secretory machinery is developed even in single – cell organisms such as the secretion apparatus of *Toxoplasma gondii*, the contractile vacuoles in paramecium, or the various types of secretory structures in bacteria. Therefore, he found in not surprising that the mammalian cells such as human platelets have evolved such highly sophisticated and specialized cup-shaped supramolecular lipoprotein structures – the porosome complexes and porosome – like “canaliculi system” for the precise and regulated docking, fusion, and release of intravesicular contents from cells. So, it established that the porosome is a universal secretory machinery at the cell plasma membrane and it has various forms of specialized structures starting in nature from the single – cell organisms till the highly mammalian cells structure in the different organs of the body as clearly elucidated also by Jeremic, 2008; Cho *et al.*, 2009 and 2010; Trikha, *et al.*, 2010; Wheatley, 2010.

Beside these great and elegant efforts of these pioneer physiologist investigators in identifying porosome in different organs, the author of the present study as a cytologist utilized the computer-assisted morphometry to analyze quantitatively the shape and fine structure of plasma membrane and porosome in pancreatic acinar cell of post-feeding rat to present another method of evaluation of the dynamics, composition, and functional reconstitution of porosome and plasma membrane structures in coloured histograms and numerical values of the electron micrographs. Specially that the image processing and the numerical analysis approaches are applied in medicine and biology (Szilágyi, 2006; Sadaphal *et al.*, 2008). Beside, a plenty of image processing searches and articles have been released in a very wide scale of different science branches in 2011 from “IEEE transactions on image processing [TA]”.

Therefore, it found worthy that utilization and application of the image processing and numerical analysis techniques in the present study to evaluate and estimate the ultrastructural components of the plasma membrane and porosome of the pancreatic acinar cell, may can be also applied in cell and molecular biology branches in general.

Figure (1): Electron micrograph of the apical region of a pancreatic acinar cell at one hour post-feeding period revealing the flask – shaped porosome (PS) with mouth opening (MO) range in size from 130 – 150 nm. It is loaded with electron dense particles representing enzyme materials (ZM). Some of these particles are also seen at the acinar lumen (LU), the plasma membrane (PM) showing the “tripartite structure” consisting of two dense bands representing protein layers (PL) separated by a central clear zone of lipid (LL). (Scale Bar = 300 nm)

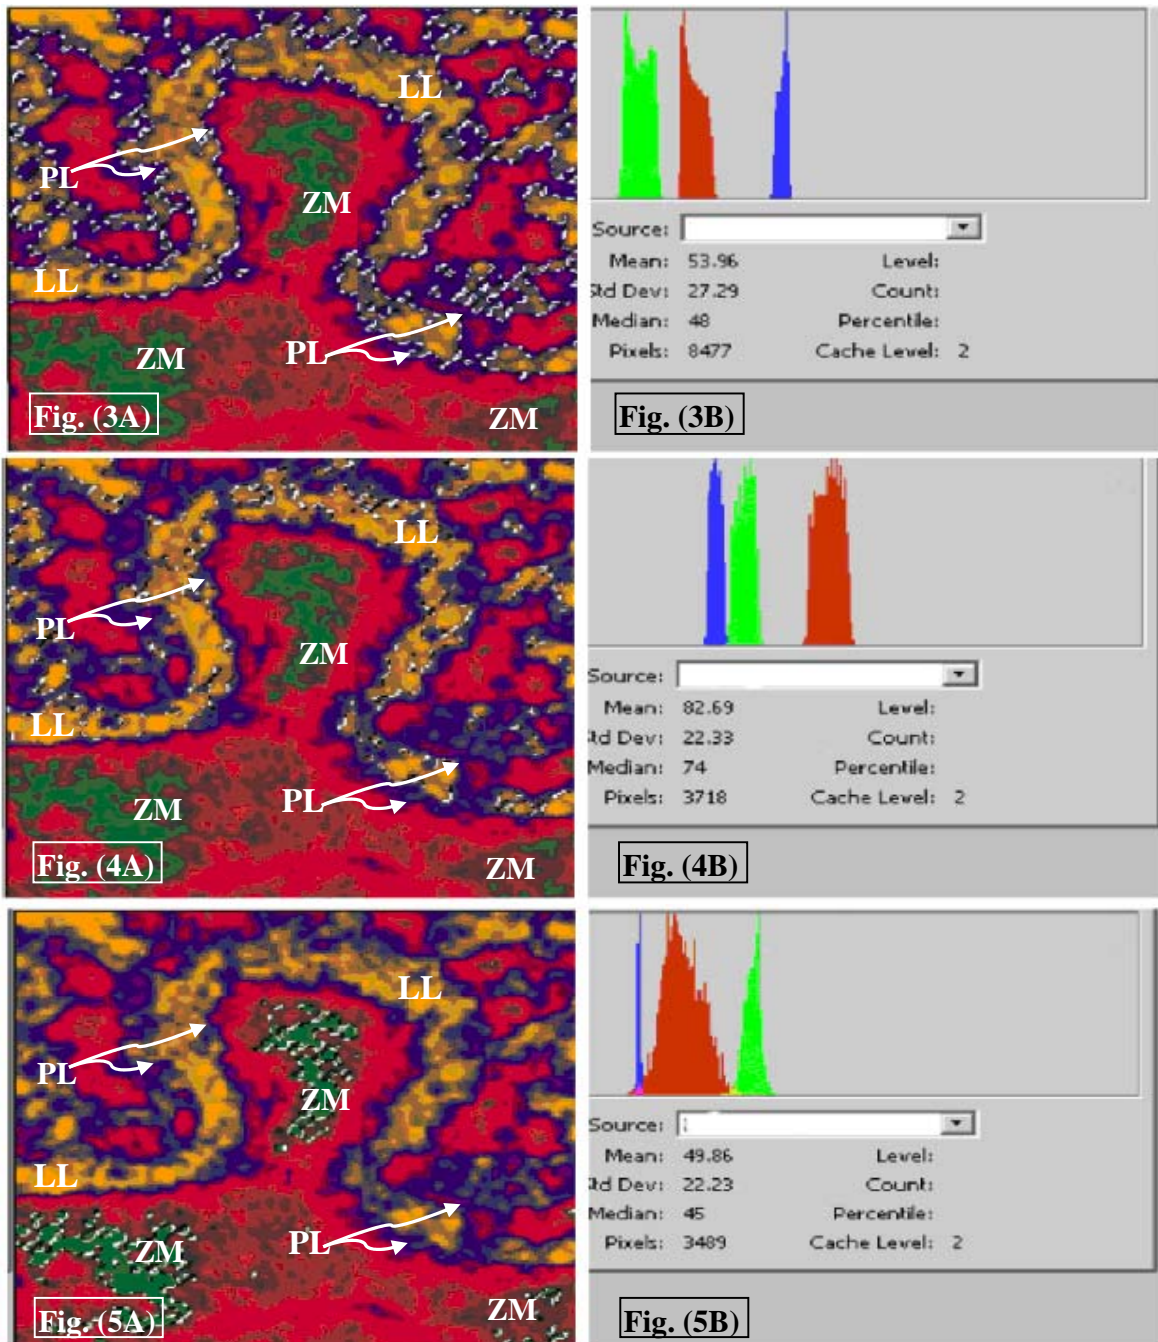

Figure (2): Electron micrograph of the apical region of a pancreatic acinar cell at two hours post-feeding period illustrating clearly cup-shaped porosome (PS) with a wide opened mouth (MO) (275– 300 nm) compared with figure (1). No dense particles can be detected at the groove of its cup, while the acinar lumen (LU) is loaded with these dense particles (enzyme materials) (ZM). (Scale Bar= 300 nm).

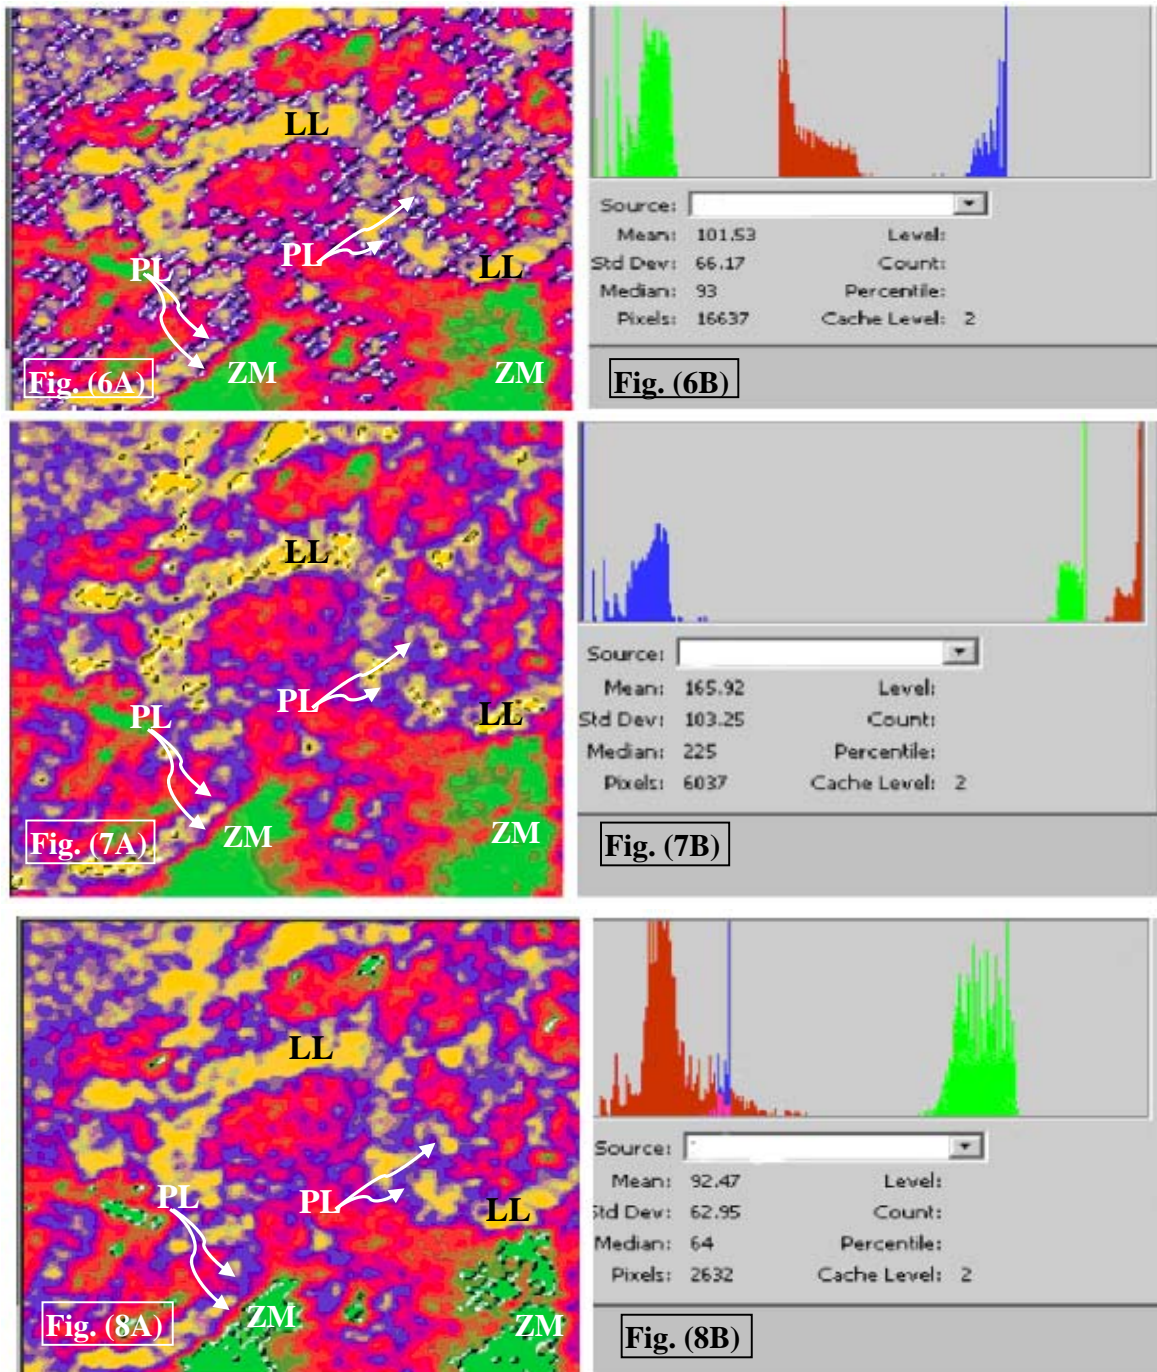

Figures (3A, 4A, 5A) : Image analysis of the micrograph of one hour post-feeding period revealing obviously the tripartite structure of the plasma membrane and the porosome; an outer and an inner protein layers (**PL**) appear with blue colour, while the lipid bilayer (**LL**) that sandwiched between them appears with a variant degree of deep yellow colour which reflecting the presence of the molecules of its bilayer. The flask-shaped porosome has the same colour of plasma membrane unit on its three lateral boundaries. The enzymatic materials (**ZM**) in porosome groove and in lumen appear with a distinct colour of deep green.

Figures (3B, 4B, 5B) : Illustrating the histograms analysis of colours and the numerical values of protein layers, lipid layer and enzymatic materials respectively at one hour post-feeding period.

Figure (3B) : The protein layers arrangement of the peaks as green, red, blue with a value of 53.96 and 8477 pixels.

Figure (4B) : The lipid layer arrangement of the peaks as blue, green, red with a value of 82.69 and 3718 pixels.

Figure (5B) : The enzymatic materials arrangement of the peaks as blue, red, green with a value 49.86. and 3489 pixels.

Figures (6A, 7A, 8A): Representing image analysis of the micrograph of two hours post-feeding period. The plasma membrane unit and the porosome appear with the same colours as in the figures of one hour post-feeding period, but they have different arrangement on their molecular structures, while the enzymatic materials which is occupying only the acinar lumen appear with light green colour.

Figures (6B, 7B, 8B): Showing the histograms and the numerical values of protein layers, lipid bilayer and enzymatic materials respectively of the two hours post-feeding period. It is obviously noticed in these figures that although the plasma membrane unit and the porosome have the same colouration arrangement of their peaks as appeared in the histograms of one hour post-feeding period, yet they have different values in number according to their position that appear on the X axis as in the following:

Figure (6B): The protein layers in value of 101.53 and 16637 pixels.

Figure (7B): The lipid bilayer in value of 165.92 and 6037 pixels.

Figure (8B): The enzymatic materials in the lumen in value of 92.47 and 2632 pixels. (The position of the blue line can be neglected)

The effect of non-linear terms on the process of computing water hammer with regard to friction coefficients for different cast iron pipe

majedi1389@gmail.com

Abstract: Water Hammer problems are complex and time-consuming even with very simple calculation method and usual boundary conditions. The governing equations of water Hammer are partial differential equation and are expressed based on continuity and momentum equations. One of the important procedures for solving the governing equations of unsteady flows is finite difference method. One procedure for simplifying the governing equations is neglecting the nonlinear terms such as $V \frac{\partial V}{\partial x}$, $V \frac{\partial H}{\partial x}$ without considering the amount of errors that are created with

this process. Therefore in this paper, the phenomenon of water Hammer in the tank, pipe and valve system has been investigated in two manners, one with full equations and other with neglecting the nonlinear terms. For doing this, an FDM code has been written in MATLAB and the amounts of head along the pipe in sequential times and the differences between two manners have been given in diagrams. The obtained results indicate that for iron pipe with different friction coefficient (smooth, perennial and worn) by decreasing Chezy coefficient, wave damping increases and the effect of nonlinear terms decreases.

[R. Daneshfaraz, S. Sadegh-Fam, M. Majedi-Asl. **The effect of non-linear terms on the process of computing water hammer with regard to friction coefficients for different cast iron pipe.** Journal of American Science 2011;7(6):844-847]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Water Hammer; Non-linear and Linear Terms; wave damping; Chezy Coefficient; Tank and Pipe System

1. Introduction

Water Hammer and its destructive potential are in many cases identified by its resultant sound. Water Hammer is caused by an abrupt change of flow velocity in a pipe. When it is created, water Hammer is propagated in the form of a wave through all parts of the system connected to it, and is a function of flow geometry and pipe characteristics. Water Hammer is assumed to be an elastic phenomenon and is expressed by continuity and momentum equations (Koutitas, 1983; Zandi, 2006). The wide-spread dimensions of water Hammer problem and numerous unknowns and problems caused by this phenomenon, as well as rapid advance in numerical computation in parallel to computer sciences provide an appropriate field for further study. Finite difference method is among techniques commonly used for solving partial differential equations and plenty of its applications exist in. The effect of nonlinear terms on process of solving partial differential equations is an issue which has not been studied much in hydraulics engineering. Therefore in the present research water Hammer phenomenon has been studied for hyperbolic differential equations with similar initial and boundary conditions and different friction coefficients, and the results obtained from finite difference method have been compared in two cases.

Governing equations and formulation

Mathematical model of this phenomenon includes the two principles of continuity and momentum, and the respective nonlinear partial differential equations are as follows:

$$\frac{\partial V}{\partial t} + V \frac{\partial H}{\partial x} + g \frac{\partial H}{\partial x} + \frac{fV|V|}{2D} = 0 \quad (1)$$

$$\frac{\partial H}{\partial t} + V \frac{\partial H}{\partial x} + \frac{C^2}{g} \frac{\partial V}{\partial x} = 0 \quad (2)$$

where H and V are values of pressure head and velocity as unknown parameters, respectively; g is earth's gravity constant; C is wave velocity; and f is friction coefficient which depends on pipe diameter and pipe smoothness (Daneshfaraz et al, 2009).

An appropriate approach for simplifying the above mentioned nonlinear equations is to neglect the nonlinear terms $\left(V \frac{\partial V}{\partial x}, V \frac{\partial H}{\partial x} \right)$. If water Hammer

phenomenon occurs in a short time period, frictional damping will be small and the equations (1) and (2) are summarized as follows considering small amount of flow velocity compared to wave propagation velocity:

$$\frac{\partial V}{\partial t} + g \frac{\partial H}{\partial x} + \frac{fV|V|}{2D} = 0 \quad (3)$$

$$\frac{\partial H}{\partial t} + \frac{C^2}{g} \frac{\partial V}{\partial x} = 0 \quad (4)$$

Equations (1) and (2) are nonlinear differential equations, while equations (3) and (4) are linear differential equations which become complete by defining initial and boundary conditions. The mentioned equations can be solved by numerical computation of finite differences on nodes at time and position intervals. To solve them, the pipe is assumed to be broken down into several discrete segments with defined lengths, and for each segment the values of pressure head (H) on nodes and velocity (V) in middle of the segment are calculated. Fig. 1 schematically demonstrates integration procedure in (x, t) plane (Daneshfaraz et al, 2009; Musavai-Jahromi, 2006).

Fig 1: Integration procedure in (x, t) plane using FDM method.

Making use of the algorithm shown in Fig. 1 and finite difference approximation, the equations (1) to (4) are expanded as follows:

$$\frac{V_i^{n+3/2} - V_i^{n+1/2}}{\Delta t} + V^* \frac{V_{i+1}^{n+3/2} - V_i^{n+3/2}}{\Delta x} + g \frac{H_i^n - H_{i-1}^n}{\Delta x} + \frac{fV^*|V^*|}{2D} = 0 \quad (5)$$

$$\frac{H_i^{n+1} - H_i^n}{\Delta t} + V^* \frac{H_i^n - H_{i-1}^n}{\Delta x} + \frac{C^2}{g} \frac{V_{i+1}^{n+1/2} - V_i^{n+1/2}}{\Delta x} = 0 \quad (6)$$

$$\frac{V_i^{n+3/2} - V_i^{n+1/2}}{\Delta t} + g \frac{H_i^n - H_{i-1}^n}{\Delta x} + \frac{fV^*|V^*|}{2D} = 0 \quad (7)$$

$$\frac{H_i^{n+1} - H_i^n}{\Delta t} + \frac{C^2}{g} \frac{V_{i+1}^{n+1/2} - V_i^{n+1/2}}{\Delta x} = 0 \quad (8)$$

where indices *i* and *n* denote position and time, respectively. To expand *V** in mentioned equations, Lax formulation has been used as follows:

$$V^* = \frac{V_{i+1}^n - V_{i-1}^n}{2} \quad (9)$$

Also, for solution's stability, Courant condition has been used as integration criterion as follows:

$$\lambda = \frac{C\Delta t}{\Delta x} < 1 \quad (10)$$

2. Experimental/Applied example

A pipe is assumed to possess following properties: length, 6000 m; diameter, 50 cm; thickness, 4 mm; output head, 5 m; wave velocity, 2980 m/s; output flow velocity, 9.9 m/s. General scheme of the system is illustrated in Fig. 2. Discharge is stopped in 2 seconds by a valve at the end of the pipe.

Fig 2: General scheme of tank and pipe system, and its segmentation.

Flow cross-section changes linearly by the valve. At beginning of the pipe, pressure head is equal to water depth in tank and is assumed to be constant. At the end of the pipe, boundary conditions depend on flow velocity and flow cross-section, and are calculated from the following equation. $V = \frac{A_{(t)}}{A_0} \sqrt{2gH}$ (11)

3. Analysis of results and discussion

Numerical solutions by FDM method were yielded from program written in MATLAB environment for smooth iron pipes with Chezy coefficient equal to 130, for perennial iron pipes with Chezy coefficient of 100, and for worn iron pipes with Chezy coefficient of 80 (The website of Southern Tehran Mechanic Society), and the following graphs were obtained.

Figs. 3 and 5 demonstrate changes in water head versus time at end part and middle of the pipe considering its material in two cases, i.e. with and without nonlinear terms, respectively. Furthermore, differences in water head values at the two mentioned cases for end and middle nodes are presented in Figs. 5 and 6, respectively. For instance in Figs. 3 and 5 the water head values at the two cases with and without considering nonlinear terms are provided for smooth iron pipes; the difference is not however much obvious due to high level of water head existing in the pipe. Therefore, these difference values are shown in Figs. 4 and 6 and are in the range of 10 and -6 m water depth.

Changes of water head along the pipe at times of 10 and 20 s considering the pipe material in the two mentioned cases, as well as differences between water head values along the pipe at times of 10 and 20 s are illustrated in Figs. 7 to 10, respectively.

Fig 3: Changes of water head versus time at end of the pipe considering the pipe material in the two cases, i.e. with and without considering nonlinear terms.

Fig 4: Differences between water head values obtained in the two mentioned cases versus time at end of the pipe considering the pipe material.

Fig 5: Changes of water head versus time in middle of the pipe considering the pipe material in the two cases, i.e. with and without considering nonlinear terms.

Fig 6: Differences between water head values obtained in the two mentioned cases versus time in middle of the pipe considering the pipe material

Fig 7: Changes of water head along the pipe at $t = 20$ s considering the pipe material in the two cases, i.e. with and without considering nonlinear terms.

Fig 8: Changes of water head along the pipe at $t = 10$ s considering the pipe material in the two cases, i.e. with and without considering nonlinear terms.

Fig 9: Changes in water head values obtained in the two mentioned cases along the pipe at $t = 10$ sec.

Fig 10: Changes in water head values obtained in the two mentioned cases along the pipe at $t = 20$ sec.

With numerical considering of mentioned figs, it has concluded that increasing of Chezy coefficient, it will result in increase of pure mean differences between two methods. Relations between them in pipe length and continued times respectively screened in figs 11, 12.

But the point that is mandatory is that the maximum differences resulted from removing non-linear

sentences in pipe length in continued times, were not constant and were in resonance. This pointed in Fig. 13.

Fig 11: Mean absolute value of the difference between $t = 20$ s and $t = 10$ s versus Chezy coefficient.

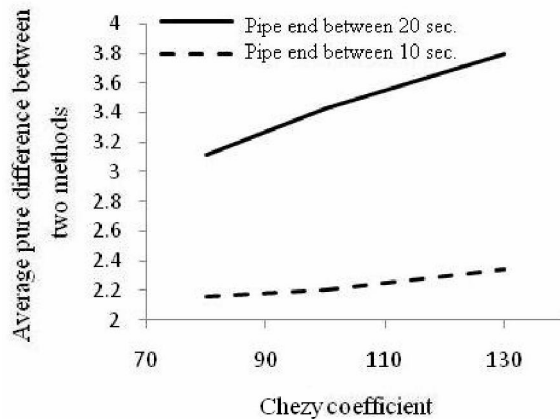

Fig 12: Mean absolute value of the difference at end part and middle of the pipe versus Chezy coefficient.

Fig 13: Position of maximum error caused by removal of nonlinear terms.

4. Conclusion

In the present paper, partial differential equations of water Hammer were solved in two cases, i.e. by considering and neglecting nonlinear terms, using FDM method for Chezy coefficients mentioned in the text, and numerous results were yielded. The most significant results are as follows:

1. Increasing Chezy coefficient has led to increase in mean absolute value of the difference between the two mentioned cases (see Figs. 11 and 12).
2. According to Figs. 3 to 6, behavior of wave is in good agreement at nonlinear and linear cases; thus by removing nonlinear terms the solution can be generalized to complete equation with an acceptable error.
3. Difference between the two mentioned cases is not constant along the pipe, and it changes according to Fig. 13.

Psychological reflection on anguish in players

Ali Feiz Khademi¹, Saadat Hajipour¹

¹ Faculty Member of Izeh Branch, Islamic Azad University, Izeh, Iran
a.khademi1389@yahoo.com

Abstract: A great deal of the literature on the relationship between anguish and performance has come from a cognitive-behavioral perspective. This paper examines the relationship between the two constructs from a psychodynamic perspective. Included are a discussion of winning and the anguish of separation from an object relations perspective, the dread of success, self psychology, Freudian instinct theory, and the secondary gain that is found in defeat. Suggestions for future directions in treatment of anguish within the athletic context are offered as well as a postscript.

[Ali Feiz Khademi, Saadat Hajipour. **Psychological reflection on anguish in players**. Journal of American Science 2011;7(6):848-851]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Psychological reflection; anguish; players; performance

1. Introduction

From a review of the literature it is clear that the most popular conceptual paradigm in sport psychology is a cognitive-behavioral one. Texts used in undergraduate and graduate courses on sport psychology are slanted heavily toward a behavioral/experimental model of intervention (Murphy, 1995; Horn, 1992). The standard sport psychology interventions include relaxation training, deep breathing, visualization, imagery, mental practice, self-talk and goal-setting. Sport psychology has its roots in academic settings which have traditionally been behavioral in orientation. However, if one works full-time in the field of sport psychology, it becomes clear that cognitive-behavioral techniques will only take you so far. These methods have a hard time with issues such as resistance in the player and more subtle effects such as shame, embarrassment and guilt when winning.

This paper will present a review in player's performance. We will not discuss the areas of resistance and narcissism, two subjects that psychoanalysis is especially suited to explore. However we will cover the various aspects of sports anguish on players. Symptoms of anguish as they relate to unconscious conflicts are psychoanalytic ideas. Both the motivation to compete in sports and conflicts about winning are largely unconscious and cognitive-behavioral interventions have little to contribute in the study of these areas. One of the very few psychoanalytic papers on the psychoanalysis of sports was written by Dan Dervin nearly fifteen years ago. He introduced psychoanalytic thinking to the world of the player, (Dervin, 1985). I will extend his introduction and focus on anguish as a psychoanalyst views it. Criteria for diagnosing Anguish during athletic performance are from the DSM IV. Under the heading of general Anguish disorder are the

symptoms of muscle soreness, trembling, restlessness, fatigue, shortness of breath, tachycardia, sweating, dizziness nausea and vomiting, being on edge, startle response, blank mind, poor sleep and irritability. The prevalence of Anguish disorders, simple phobias, obsessive compulsive disorders and post traumatic stress disorders are common in the general population and common in players as well.

These symptoms are familiar to many players. It is not at all uncommon to hear of sleeplessness, vomiting, nervousness and restlessness before games. The intensity of the anguish that is felt before and during sports is so gripping, immediate and debilitating that one feels compelled to provide fast relief for these anxious players. The need to offer a quick solution to panicking players is so pervasive that it may account for the compulsive use of behavioral techniques even when they are ill-advised or ineffective. For the psychologist that works with players full-time and over a long period of time one soon realizes that these quick fixes are often not fixes at all and at best last for very brief periods. Let us explore some psychoanalytic approaches to performance Anguish in sports.

2. Winning and the Anguish of Separation: An Object Relations Approach

A friend of mine recently qualified for the US Amateur in golf. This was a lifelong dream of his and he proceeded to finish last in a field of 160 players. These results were published in every major newspaper in the nation. Do you think he felt any embarrassment?

Shame and embarrassment are constant threats in sports because the game is usually played in front of people. Gabbard (1997) has written about performance Anguish and shame from an object-relations perspective. He suggests that shame is a

narcissistic disturbance that impacts many who perform in front of an audience. Success or winning in a player can induce a feeling of separation from the family, the opponent or the crowd and this can produce considerable Anguish and shame. This shame and Anguish can inhibit performance. Conflicts that winning brings loss and separation derive from childhood when the child is given the message to stay close to the mother and never to leave her. Separation Anguish induced by winning or the threat of winning is exceedingly common. I was working with a professional female golfer who was leading a tournament up the 71st hole. She proceeded to 4 putt #17 and triple bogey 18 to lose. When asked to free associate; to this collapse she reported that she still feels like a little kid (she is in her early 30).

Performing in front of a crowd provides enormous exhibitionistic excitement. This can bring with it a sense of shame that one is indulging in a taboo. I had a patient who was an extremely attractive female tennis player. She developed a growing sense of dread the better she became. With improvement came an increase in the number of people who watched her play. She began to experience panic attacks in front of these crowds. Analysis revealed that during childhood she was expected to exhibit herself in front of her parents and their friends by showing off her body. This experience was both exciting for her and it also instilled shame. This early and latency age experience lay dormant and repressed until she began to achieve a measure of fame on the tennis courts whereupon she began to feel the same kind of shame over being watched. The adulation was a reminder of her childhood experiences and it produced a feeling that these crowds knew of her past abuse.

3. The Dread of Success

Some players carry a dream of winning because it means that they are superior to others. Superiority, for some, means greed and selfishness. We all see this amply displayed by some professional players. The dread of success is especially felt in female players, some of whom are raised to think aggression is not nice. For many children raised religiously winning implies selfish striving which is considered sinful. Occasionally a child rose in the lower class who later becomes a star with great fame and wealth has a sense of dread that they are leaving their families behind. This explains why you so often hear professional players say their true desire is to buy their mothers a home with the money they make. Success can bring with it great guilt. The recent near disqualification of a pro golfer at a Tour event may have something to do with the dread of success. He had already won three tournaments this year. It was

reported that before the tournament he had lost two close friends to sudden death. During the event he was nearly disqualified twice, once due to almost missing a tee time and once by marking his ball on the 2nd green a failing to replace it properly. If he had signed his scorecard without the score adjustment and the two shot penalty he would have been disqualified. A fan that he later called his "guardian angel" saved him from disqualification by telling him of the infraction in time. These very unusual mishaps were neither accident as most would do not think nor divine intervention but may have had to do with the guilt over winning following the loss of his two friends. We saw similar accident proneness in Dave Jansen during his Olympic speed skating mishaps which came on the heels of his sister's death. Guilt over winning is an unconscious but powerful barrier.

4. Self Psychology and Sports

Self psychology has emerged in the last few decades as an alternative to classical psychoanalytic instinct theory. Kohut (1977) moved the focus of psychoanalytic concern away from sexual and aggressive drives and onto self concepts. A cohesive sense of self esteem which is developed in childhood is thought to enable adults to cope with pressures inherent in sports. Conversely, a disordered self will fragment under extreme pressure.

It is very common to observe players with low self image fall into rage or despair at the first sign of difficulty. I recall a player I was working with who was leading a golf tournament, missed one putt and had such Anguish and injury in him that he broke his putter over his knee, thereby guaranteeing a loss. His self-concept was so weak that the slightest sign of trouble was able to cause a collapse.

A fragmented or enfeebled self system can give way to temporary states of psychosis when under extreme pressure during competition. I recall a professional golfer leading a major a few years ago with only six holes to play. He had a fifteen foot putt on a par three and as he walked to the green he reported noticing the beauty of the trees on this course. He became obsessed with the "beauty of nature" for the last six holes as he proceeded to bogey in, thereby losing the tournament and also his reality testing for a few hours. We may have seen a similar problem in the 1999 British Open when Van de Velde appeared to lose possession of his faculties on the 72nd hole and made a triple bogey to lose the event that he could have won had he only been able to make a double bogey. I believe that the threat of self-fragmentation accounts for why so many players have one great performance and then never come close to that level again. It may be the memory of the pressure and how it threatens the integrity of the ego

is felt to be so dangerous that these players find a way to avoid it in the future by backing off leads. The experience of being "flooded" with affect as one fights for the lead in a sporting event can be explained with the concept of the self and its collapse. The collapse of ego boundaries when under pressure produces disorganization in thinking and what is referred to as choking. Many players unconsciously choose the effect of humiliation and depression over the effect of being flooded. As a result, mistakes and missed shots take on a new meaning in this light. Anything that gets them out of the pressure is a defensive maneuver used to remove the self from under pressure. Many of them say they try to "enjoy" themselves while under pressure to inhibit this overwhelming and psychosis producing emotion.

5. Freud and the Player: Instinct Theory and Sports

Sports are clearly about aggression. If you work with players you soon begin to realize just how much aggression they are capable of. The first time I met Keyshawn Johnson, wide receiver for the New York Jets, I recall that his size and power reminded me of a very large and dangerous locomotive. Boxers emanate power and grace as well thereby combining aggression and sexuality, the two basic drive states.

The inhibition of aggression occurs as a result of trauma, training in not to be aggressive or through difficulty during the oedipal phase of psychosexual development. Freud suggested that aggression is typically defended against by turning it into its opposite (passivity), turning it against oneself (self-defeat or depression) or by sublimating it through sports. Conflicts with aggression invariably lead to defeat. Tiger Woods

Horner (1981) has researched female inhibition of aggression. Women are often taught that aggression is unfeminine, not lady-like and are faced with the conflict of winning versus being seen as "unfeminine." This conflict has an impact on performance and brings us to a discussion of secondary gain over losing.

6. Secondary Gain Found In Defeat

Secondary gain is a standard psychoanalytic concept and is considered a reason that neurotic symptoms are so difficult to give up. The same unconscious dynamic holds for self-defeat in sports. Loss has the potential to produce enormous secondary gain. One need only recall Greg Norman's humiliating defeat by giving up a six stroke lead in the 1996 Masters which was witnessed by millions of television viewers. In the next few weeks he received thousands of sympathy letters as well as

supportive articles in all the major newspapers around the world. This sympathy can be quite reinforcing and gives defeat an unconscious appeal to some individuals.

7. Summary

This brief review of a psychoanalytic approach to Anguish in players should suggest that far from being an unnecessary afterthought in sports, psychoanalysis has the potential to provide a wide array of insights and interventions for the Anguish ridden player. Psychoanalysis alone provides a long-term relationship with the player which gives him or her space in which to explore the many areas of disturbance they suffer with. Post trauma due to injury or embarrassing defeat is extremely common and is remedied only in a slow and careful manner. Often the problems these players have are deeper-rooted and go untouched by standard cognitive-behavioral work. The hope for a quick fix that cognitive behavioral interventions often promise will usually lead to disappointment in all but the easiest cases. Players that suffer with narcissistic personalities, low self-image, inhibitions with aggression, guilt, shame or separation Anguish will usually require serious and delicate psychotherapy that psychoanalysis can provide. These conflicts can produce self-defeat that dynamics are largely unconscious. The therapist that plans on a full-time career in sport psychology would be advised to look into psychoanalytic training. I believe that the future of sport psychology will be found in a synthesis of cognitive-behavioral, or what I call the suppressive therapies, blending with psychoanalytic therapies which include long-term supportive treatment, modification of low self-image and ego strengthening measures, what are referred to as the expressive therapies.

8. Postscript

It also may be of interest to the reader to know that when I am asked to provide commentary to the print, radio or television media on breaking sports stories they invariably seek my psychoanalytic insights into these stories and not my cognitive-behavioral knowledge. When players "choke" or act out off the playing field the media is able to deliver common sense explanations but come seeking my knowledge of the players unconscious motives to help the public sort out these headline events. I have found that I must tap into my psychoanalytic expertise to satisfy the fans and the media questions. This provides yet another reason to include psychoanalytic thought into concerns about the sporting life.

The Effects of two different doses of Antioxidant Vitamin C supplementation on bioenergetics index in male college student

Morteza Jourkesh¹, Iraj Sadri¹, Amineh Sahranavard¹, Ali Ojagi¹, Mohammad Dehganpoori¹

¹Department of Physical Education and Sports Science, Shabestar Branch, Islamic Azad University, Shabestar, Iran
mjourkesh@iaushab.ac.ir

Abstract: In order to study the effects of consumption of 2 regimes of vitamin C (500 and 1000 mg) on bioenergetics index (aerobic and anaerobic power) in 36 physical education college male students, were selected non – randomly procedure and they were set in 3 groups .Average of age, weight, height and Fat percentage of subjects was (22.48 ± 1.84) years, (64.93 ± 7.84) kg (175.4 ± 5.66) cm and (10.94 ± 5.29) mm respectively. The period considered for consumption of vitamin C by experimental groups, was a 3 weeks period that in this period the first group consumed dose of (500 m.g) vitamin c and second group (1000 m.g) vitamin C and third group (control group) consumed placebo. The tests which have been exerted in this research consist of: assessment of anaerobic power by RAST test. 2) Assessment of aerobic power by Cooper test. Result indicated that there was not a significant ($p < 0.05$) difference between 3 group in anaerobic and anaerobic power .Therefore we concluded that daily consumption of 500 or 1000 m.g vitamin C for a period of 3 week does not have any effect on the basis of improvement of anaerobic and aerobic power in male college students.[Morteza Jourkesh,Iraj Sadri,amineh sahranavard,ali ojahi,mohammad Dehganpoori. The Effects of two different doses of Antioxidant Vitamin C supplementation on bioenergetics index in male college student. Journal of American Science 2011;7(6):852-858]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: Aerobic power, anaerobic power, Antioxidant, performance

1. Introduction

Ascorbic acid or vitamin C is involved in a number of biochemical pathways that are important to exercise metabolism and the health of exercising individuals. Vitamin, mineral and/or trace element supplements are beneficial if they supply a nutrient that is deficient in the diet. That is, when dietary intake is lower than the amount needed to provide maximum benefit as judged from all biological perspectives. It is difficult to accurately define nutrient «adequacy» in competitive athletes, for several reasons. First, requirements for vitamins and minerals vary: metabolic, environmental, and/or genetic factors can influence individual nutrient requirements. Second, physical activity and physical fitness are complex, involving multiple diverse components that are difficult to accurately and reliably measure. Third, a nutrient supplement that could improve performance by as little as 2–3% could provide a competitive edge; for example, reducing a 1500 m runner's time of 3 min 45 s by 6 s. In order to detect such small changes an intervention requires randomized, placebo-controlled, double-blind studies designed to maximize statistical power (Haskell and Kiernan, 2000.). Vitamin C has many functions within the human body. It is a water soluble vitamin vital in carnitine synthesis (needed for the transport of fatty acids into the mitochondria), Collagen formation, neurotransmitter synthesis, and most importantly, as an antioxidant. It also plays a part in the process to convert cholesterol to bile acids and aids iron absorption (Guthrie and Picciano, 1995). An important

water-soluble vitamin is vitamin C, which has diverse functions including being an antioxidant, exerting positive effects on lipid and iron metabolism, and promoting improved immune function (Victor et al.,2001;Victor et al.,2002).High doses of the antioxidant vitamin C prevent the increases in skeletal muscle mitochondrial biogenesis after exercise training(Wadley and McConnell,2010).

For years, athletes have been supplementing with vitamin C with the belief that it will aid or at least help to maintain athletic performance. As an antioxidant, ascorbic acid may react with OH (hydroxyl radical), O₂⁻ (superoxide Radical), H₂O₂ (hydrogen peroxide), and HO₂ (hydroperoxyl radical). Once ascorbate reacts with these ROS, semidehydroascorbate radical (also called ascorbyl) and water are formed. Two ascorbyls react to form ascorbate and dehydroascorbate (Frei, 1991). Dehydroascorbate can react with glutathione to form ascorbate. As a reductant, vitamin C can reduce cupric (Cu²⁺) to cuprous (Cu⁺) ions, and ferric (Fe³⁺) to ferrous (Fe²⁺) ions (which aids in their absorption in the small intestine). These two products (Cu⁺, Fe²⁺) may react with free radicals and other ROS, and may cause damage to cells via the generation of more ROS (Gruff et al., 1995). Ascorbate can react in aqueous environments within the body, including blood, extracellular fluid, and cell interiors, before any oxidative damage may occur to lipids (Frei, 1991). It is well accepted, that exercise causes an increase in the production of free radicals and other reactive oxygen species (Jourkesh et al.,2007).A proliferation of these

free radicals can cause a decrease in the function of affected cells and can result in a decreased ability of muscles to maintain work (Jourkesh et al.,2007).Several investigators believe that the ingestion of antioxidants will help to stave off this proliferation of free radicals during exercise and thus provide a beneficial effect (Keith and Merrill ,1983; Viitala et al.,2004).The established functions of antioxidant vitamins predispose them for improving physical work capacity. It is a known fact that the concentration of these vitamins increases after supplements yet further migration to tissues is hindered do to the structure and the accompanying biochemical properties, for example: water-soluble (vitamin C) and lipid-soluble (vitamin E) (Schröder et al 2001; Thompson et al .,2001).

In human subjects, supplementation with 400 mg ascorbic acid-d-1 for 3 wk increased blood ascorbic acid concentrations but did not significantly reduce plasma MDA after a bench-stepping exercise (Maxwell ,1993). However, using the same supplementation schedule and exercise protocol, Jakeman and Maxwell (1993), reported the ascorbic acid group showed reduced strength loss in the triceps surface after exercise and faster recovery, suggesting vitamin C supplementation reduced muscle damage. Delayed-onset muscle soreness may be an indicator of muscle damage induced by exercise. Staton (1952) gave men 200 mg ascorbic acid-d-1 or placebo for 30 d, and then had them perform sit-up exercises to induce soreness. When they repeated the exercise 24 h later, the supplemented group was able to perform significantly more sit-ups than the placebo group. Oxidative stress is a state where the ROS production overcomes the antioxidant system's ability to handle the ROS. Exercise-induced oxidative stress is a condition where the exercise has created a condition that produces ROS that cannot be adequately 2 handled by the antioxidant defense mechanisms of the system being measured. This exercise-induced oxidative stress can be produced through both aerobic exercise of sufficient intensity and duration, as well as high intensity exercise of short duration (Goldfarb ,1999).The type of exercise, the intensity and duration of exercise, and the form of muscle contraction involved appear to be important factors for inducing oxidative stress. Concentric contractions (muscle actively shortening) during aerobic or intense short duration exercise has been reported to increase by-products of lipid breakdown, activate antioxidant defense mechanisms and decrease the amount of reduced thiols (Armstrong, 1990). In contrast, eccentric contractions (muscle actively lengthening) that can result in greater muscle damage utilizes less oxygen for the muscle contraction. In addition, there are fewer muscle motor units recruited for the same or greater

force in an eccentric action compared to a concentric muscle action (Armstrong, 1990) As a result there is a greater likelihood for muscle damage with eccentric types of contractions.

Recently, Bryer and Goldfarb (2006) reported that this same dose of vitamin C could not only attenuate the delayed soreness to eccentric exercise but could also attenuate the increase in glutathione ratio but did not alter the leakage of proteins out of muscles as indicated by blood creatine kinase. More work is needed to determine if vitamin C can give protective effects to ROS damage of cardiac muscle. Goldfarb and Patrick (1999) reported that both 500 mg and 1 gm of vitamin C given for two weeks prior to exercise could attenuate the exercise induced oxidative stress as indicated by a reduction in protein carbonyls. Based on the current literature, it can be concluded that antioxidant supplementation may partially protect against exercise induced oxidative stress. The results are inconsistent, which could be attributed to differences in subject, exercise modes, supplementation dosage and form, and the markers of oxidative stress measured. In this research the subjects were supplemented with a highly bioavailable antioxidant (vitamin C) over a period of 3 wks. The main objective of this study was to evaluate the effect of oral supplementation with vitamin C on aerobic and anaerobic power in male university students.

2. Material and Methods

Subjects

The research included 36 male students of physical education, randomly divided into 3 groups: Group 1 (n = 12) consumed 500 mg of vitamin C daily throughout the training period, and Group 2 (n = 12) consumed 1000 mg of vitamin C, whereas group 3 (n=12). Consumed visually identical placebo. All subjects were informed verbally and in writing about the nature and demands of the study, and subsequently they completed a health history questionnaire and gave their written informed consent. The study was approved by university's ethical advisory commission P?gina: 853 which conformed to the Declaration of Helsinki. Our selection of highly trained and motivated athletes for this study was based on our experience that competitive athletes are generally willing and able to withstand considerable discomfort and to exercise until the development of physiological signs of exhaustion.

. The subjects were in good health, were not using medications known to affect immune function, and had not consumed vitamin or mineral supplements more than the recommended dietary allowance within one week of the test. All participants regularly took part in a variety of activities but were unfamiliar with the tests used in the current investigation. Subjects 'descriptive data are presented in Table 1.

Table 1. Descriptive Characteristics of Experimental Subjects

Variable	Placebo (N=12)	Vitamin C (500mg) (N=12)	Vitamin C (1000mg) (N=12)
Age (years)	22.14±1.12	22.52±1.34	22.38± 1.27
Height (cm)	176.55±1.52	177.29±2.21	177.32±1.43
Weight (kg)	73.74±1.61	72.91±1.32	71.26±2.21
% Body fat	12.2 ± 4.5	13.3 ± 2.3	11.9 ± 3.6

*Results are expressed as mean ±standard deviation.

Dietary Assessment

Three days prior to the baseline testing, athletes met a nutritionist who instructed them to maintain their normal dietary pattern throughout the course of the study and to refrain from using any other supplementation. During the supplementation regimen, all athletes consumed similar standardized diet to ensure adequate macro- and micronutrient intake (daily energy intake and protein intake were similar between the groups). Compliance was monitored by analyzing 3-d food records pre- and post-supplementation. The information therein was analyzed using the software Food Processor for Windows (version 7.30, ESHA Research, Oregon, USA).

Experimental Procedures

Before the supplementation protocol began, each subject compiled a 3-day food diary to assess the status of antioxidant vitamins. The diary length was selected based upon previous research that showed that beyond this time period, the quality of record keeping declines [Jourkesh et al., 2007; Gersovitz et al., 1978; Lee and Nieman, 1979]. Subjects' diaries were assessed for RDA levels of the selected vitamins using the software Food Processor for Windows. Subjects ingested antioxidant Vitamin C capsules consisting of 500 mg of vitamin C, or 1000 mg of vitamin C, or one placebo capsule. We carried out RAST and then the Cooper test on the subjects (pre-test). After pretest and under supervision of the researcher, the first group received cellulose-based placebo pills, the second group received 500 mg of vitamin C (in the form of ascorbic acid) and the third group received 1000 mg of vitamin C (in the form of ascorbic acid). The subjects ingested the supplement for 3 weeks before lunch, between 11:00 and 13:00 every day, under the supervision of the researcher. After 3 weeks the subjects between 15:00 and 18:00 completed the RAST and Cooper test again (post-test). Subjects completed six 35 m runs at maximum pace (10 s allowed between each sprint for turnaround). Power output in watts for each sprint was calculated according to the following equation: power = weight (kg) × distance (m) × time (s) (Zacharogiannis et al.,

2004). Each subject's aerobic power was estimated by distance covered at 12 minute (cooper, 1968).

Statistical Analysis

Means and standard deviations were calculated for all variables, and for the intragroup analysis the "One-Way ANOVA" was used with the Tukey test as post hoc. The level of significance was set for all analysis at $P < 0.05$. The data were analyzed using the statistical package SPSS, PC program (version 7.5, SPSS Inc., USA).

3. Results

The analysis of the tested subject's diet is presented in table 2. The data indicates no significant difference in the caloric value of diets of these groups. The amount of vitamin C and E, were consistent with RDA and after supplementation were much higher in the group supplemented with Zellschutz product.

There were no significant differences among the improvements in aerobic and anaerobic power between groups (Figure 1, Table 3; $P < 0.05$). There were no significant differences between groups for their supplement compliance rate ($P < 0.05$). Analyses of the dietary recalls were demonstrated no significant differences in caloric intake between the groups. Furthermore, there were no differences in macronutrient daily intake, with these groups.

4. Discussion

The present study was designed to determine whether antioxidant vitamin C supplementation influences bioenergetics index in male physical education students. Aerobic work capacity depends to a large extent on the effectiveness of the cardiovascular system and may be improved by physical training and supplementation (Haymes, 1991). Work capacity is also dependent on the synthesis of structural and enzymatic proteins. The last ones act as catalysts of chemical reactions, allowing the athlete to reach the steady state. This helps to supply the working muscles in ATP (Packer, 1997).

Table 2. Daily energy, macronutrient, vitamin C, vitamin E intake and contribution (%) of macronutrients to energy intake of subjects.

NUTRIENT	Group1 (N=12)	Group2 (N=12)	Group3 (N=12)
Total Energy Intake (Kcal)	3060 ± 626	3140 ± 604	3090±615
Carbohydrate (Kcal.Kg ⁻¹)	52.7 ± 5.2	53.5 ± 4.6	51.2 ± 6.4
Protein (Kcal.Kg ⁻¹)	1.6 ± 0.5	1.7 ± 0.4	1.8 ± 0.6
Vitamin E (mg)	3.1 ± 0.6	3.5 ± 0.4	3.2 ± 0.5
Vitamin C (mg)	28 ± 3.2	29 ± 1.1	27 ± 2.4
Carbohydrates (% of calories)	55 ± 10	51 ± 15	53 ± 10
Protein (% of calories)	16.6 ± 3.1	15.2 ± 2.4	14.4±4.3
Fat (% of calories)	30.5±3.2	29.5±4.2	29.6±2.5

*Results are expressed as mean ± standard deviation.

Table 3. Performance parameters after 3 weeks of vitamin C (500 and 1000 mg) supplementation.

Performance Parameters	Group1 <i>PRE</i>	Group1 <i>POST</i>	Group2 <i>PRE</i>	Group2 <i>POST</i>	Group3 <i>PRE</i>	Group3 <i>POST</i>
Aerobic power (ml.kg ⁻¹ .m ⁻¹)	50.4±4.5	50.7±5.2	50.6±3.7	50.7±4.3	49.9±5.6	50.2±4.2
Anaerobic power (Watt)	449	450	450	450	448	448

Data are means ± SD; Group1=500mg Vitamin C supplemented; Group2=1000mg Vitamin C supplemented; Group3=Placebo Group.

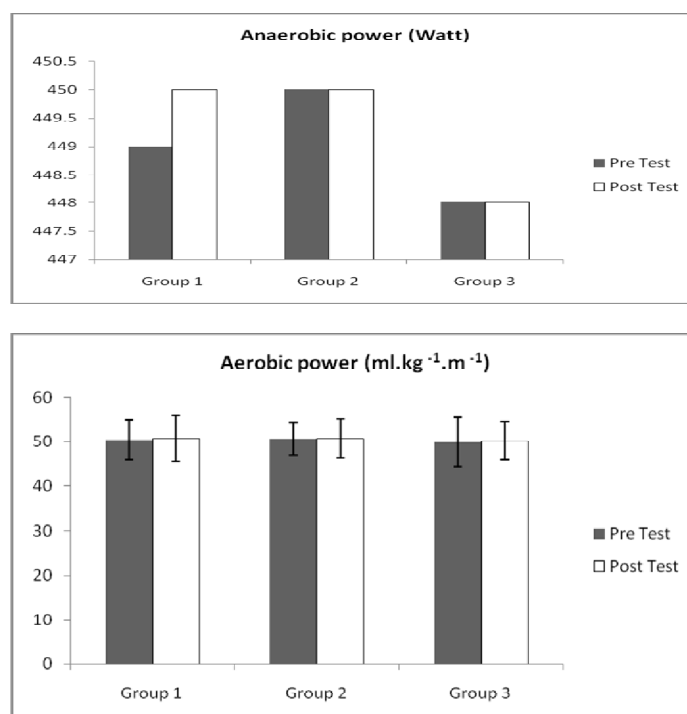

Figure 1. Work measures before and after supplementation. Data are means ± SD; Group1=500mg Vitamin C supplemented; Group2=1000mg Vitamin C supplemented; Group3=Placebo Group.

Vitamin C is an essential cofactor in number of hydroxylases such as prolyl hydroxylase and lysyl hydroxylase. Since hydroxylation adds stability to the collagen triple helix, many of the symptoms of vitamin C deficiency, such as blood vessel fragility, can be traced to lack of proper collagen strength but in addition to its role in hydroxylation, vitamin C probably functions as an antioxidant. Vitamin C acts as a free radical scavenger, neutralizing such reactive oxygen species as superoxide hydrogen peroxide and hypochlorous acid in the process being converted to dehydroascorbic acid. Dehydroascorbic acid may be recycled to ascorbic acid by various mechanisms (e.g. glutathione) (Packer, 1997). The results of this study indicate that supplementation with 500 and 1000 mg of vitamin C has not a significant effect on the aerobic capacity of male students. This study also found that using 500 and 1000 mg of vitamin C has not a significant effect on anaerobic capacity of male students during a 3-week period of ingestion. Jourkesh et al. (2007) showed that 3 weeks of vitamin C supplementation (1000 mg/day in the form of ascorbic acid) offers a significant effect on aerobic capacity of male athletes. It seems that the significant increase in aerobic capacity of male athletes can be attributed to vitamin C, which leads to an increase of aerobic capacity in male athletes (1 ml/kg/min during the second and third week as compared with pretest results).

Some authors assume that higher doses of antioxidant vitamins may cause of greater changes in aerobic capacity (Antosiewicz, 1998). A review of scientific literature indicates the lack of influence of antioxidant vitamins on work capacity (Bendich, 1991; Van, 1991). Since ascorbate in high concentrations may reduce NADPH and therefore provide the high-energy electrons necessary for aerobic metabolism (Cathcart, 1991), we were unable to show significant increase in subjects aerobic and anaerobic power. A greater amount of vitamin C in the body enhances the flow of electricity, optimizing the ability of the cells to maintain aerobic energy production and metabolic intermediaries that facilitates cell to cell communications (Michael et al., 2005). In support of this theory, it has been documented that osteoblast cells treated with ascorbic acid had four-fold increase in respiration, a threefold increase in ATP production that provided the necessary energy for cell differentiation (Komarova et al., 2000). In support results of our study, Nieman et al. (1992) found no beneficial effects of vitamin C supplementation on markers of immune function following a 2.5 h run. Various studies have also demonstrated beneficial physiological effects of vitamin C supplementation in physically-active people. Jakeman & Maxwell (1992) reported greater recovery of maximal voluntary contraction in subjects who

consumed 400 mg vitamin C/d for 21 d. Kaminski & Boals (1992) reported less calf soreness in subjects who consumed 3 g vitamin C for 3 d before and 4 d after strenuous calf exercise. Peters et al. (1993) noted fewer cases of self-reported upper respiratory tract infection in runners who consumed 600 mg vitamin C/d for 3 weeks before a 42 km road race.

In the present research antioxidant vitamin C supplementation did not show a significant effect on performance either in 500 mg or following 1000 mg supplementation. Several studies have examined vitamin C intakes in athletes from a variety of sports [Chen et al., 1989; Guillard et al., 1989; Rokitzki et al., 1994, Short, 1993]. The results from a 24-h dietary recall suggested wide variation among sports, with some indication of seasonal variation, but no consistent trends emerged (Short, 1993) Low intakes have been observed in male gymnasts and wrestlers (Short, 1993), and also in female athletes (Chen et al., 1989). In contrast to these findings, the results from another project indicated very little difference in 1- or 7-day vitamin C intakes among athletes from different sports, including wrestlers (Short, 1993). Lower intakes in some athletes may reflect dietary interventions directed at weight control in these athletes, as it has been demonstrated that vitamin C intakes are related to total energy intakes (Fogelholm et al., 1992). Therefore, the amount of vitamin C in the diets of most athletes appears to be sufficient, based on the recommended daily allowance. Another approach to measuring vitamin C status has been to examine the response of plasma or serum ascorbic acid concentrations to supplementation with varying doses of vitamin C. Claudio et al. (2006) failed to find performance benefit in soccer players after vitamins C supplementation daily during the pre-competitive season. They also demonstrated that antioxidant vitamin C and E supplementation in soccer players may reduce lipid peroxidation and muscle damage during high intensity efforts (Claudio et al., 2006).

On the other hand, no single study has detected whole body ergogenic effect of antioxidant vitamins supplementation on performance or fatigue onset process. Lawrence et al. (1979), and Rokitzki et al. (1994), did not find changes in lactate threshold in antioxidant vitamin supplemented cyclists and swimmers respectively. Similarly, Shephard et al. (1974) didn't detect alterations on muscle strength nor maximal oxygen uptake (Thompson et al., 2001). Our results agreed with the work of Thompson et al. (2001) and indicates that vitamin C supplementation can bring modest benefit for elite soccer players even under strenuous training, since it attenuated lipid peroxidation and muscle CK leakage, but did not have a direct ergogenic effect on physical performance. The reasons why antioxidant vitamin supplementation could

prevent fatigue in isolated muscle fibers, although it cannot act as an ergogenic aid in the whole body of athletes are not yet understood, and further studies are needed to clarify this issue (Claudio et al.,2006).The reason for the conflicting results is not clear, however variations in the intensity and duration of the exercise tests, the dosage and duration of antioxidant vitamin administered, and the time delay between administration and the beginning of the test are all factors that may explain these discrepancies.Epidemiological data suggest that diets rich in antioxidants protect against diseases associated with free radical damage, including cancer, cardiovascular disease and diabetes. Although some equivocation remains in the extant literature regarding the beneficial effects of antioxidant vitamin supplementation on muscle damage, there is little evidence to support such a role. Since the potential for long-term harm does exist, the casual use of high doses of antioxidants by athletes and others should perhaps be curtailed (McGinley et al., 2009).Early observations also suggested that vitamin supplements with antioxidant properties, like vitamins C and E, could also prevent or ameliorate pre-eclampsia, but most large randomized clinical trials have failed to show any benefit. Vitamin C given orally, even at high doses, does not achieve sustained serum levels that might be required for effective antioxidant activity. This may explain the failure of the numerous clinical trials involving its use in pre-eclampsia, cancers, cardiovascular diseases, etc. Vitamin C supplementation to stave off pre-eclampsia, cancer and other diseases is a 'nutraceutical' industry-driven myth which should be abandoned. We do not dispute a role for oxidative stress in the pathophysiology of pre-eclampsia, nor the possibility of amelioration of the disease by an anti-oxidant given at the right time and in the correct dosage. We simply wish to make a case that the massive and expensive clinical trials of vitamins C and E should cease until further rigorous scientific research is undertaken (Talaulikar and Manyonda ,2011).In conclusion it can be stated that supplementation with antioxidant vitamin C has not a positive effect on physical work capacity evaluated by cooper and RAST tests. For the future, researchers may want to consider a longer supplementation period or a larger sample size to be able to detect significant differences between the trained and untrained groups using the same protocol. Additionally, a study design entailing a crossover may allow for less variability since each subject would have the opportunity to fall under both treatments.

Abstract: This study intends to establish the usage of steel slag in absorption of Cu. Within this study the two types of blast furnace and converter slag were examined in laboratory conditions and the effects of parameters of time, concentration, solutions' pH on the amount of absorption were studied. Studying the experiments showed converter slag's absorption of Cu per gr was greater in a balance time of 15 minutes with high concentrations of metallic elements of 500 and 1000 ppm, but increase in pH did not alter the absorption. And the highest absorption of Cu was that of blast furnace slag with the same conditions. The only difference was that the more the pH increased the greater the absorption was, in a way that the greater amount of absorption occurred in a pH of 7. Considering the great volume of slag and its feature of absorbing Cu, usage of this absorbent can be taken into consideration as a method of quality treatment and complimentary filtration of effluent.

INTRODUCTION and LITERATURE REVIEW

In order to design equipment for the handling, conveying, separation, drying, aeration, storing and processing of bean seeds, it is necessary to determine their physical properties. Recently scientists have made great efforts in evaluating basic physical properties of agricultural materials and have pointed out their practical utility in machine and structural design and in control engineering. Dimensions are important to design the cleaning, sizing and grading machines. Coefficient of friction is important in designing equipment for solid flow and storage structures. The coefficient of friction between seed and wall is an important parameter in the prediction of seed pressure on walls (Amin et al., 2004).

Heavy metals are among the components forming the earth's crust (Das et al., 2008). Their concentration in the environment has increased nowadays as the cities, and industries such as plating, mining, painting, intinction, electronics, rubber building have grown. In addition, due to their lack of quality experience there have been many environmental problems (Asiagwu et al., 2009). Heavy metals in industrial wastewater are highly hazardous for living creatures (Obboh et al., 2009). They get concentrated in the food chain and can result in health risks to human beings (Saravanan et al., 2009). There are many physical and chemical ways to extract heavy metals from water or effluent. To name a few: chemical deposit making, membrane processes, reverse Osmosis, evaporation, solvent extraction, ion exchange, and absorption (Kefala et al., 1999; Selatnia et al., 2004). Absorption is an effective

technique in purification and extraction, which has been used in industries especially in effluent filtration. In the past, because of its high capacity activated carbon was used to absorb heavy metals, but this usage has been limited due to the cost of providing the substance especially in developing countries (Souag et al., 2009). Today there seems to be a strong tendency towards using industrial and agricultural waste such as barks, sawdust, peanut skin, mountain pistachio, rice bran, corn woods, and volatile coal ash (Saikaew et al., 2009; Shama et al., 2010). Many factors including chemical form, temperature, pH, type of metal, type of absorbent, concentration of metal, amount of absorbent, and... are effective in the process of absorption and metal removing by the absorbent (Saikaew et al., 2009). Slag is one of the substances that can perhaps be used in the process of absorption of heavy metals. Slag is one of the non-metallic byproducts of metal melting industry that is produced during the formation process of iron, made of silica, alumina silica and calcium silica (Li, 1999; Cha et al., 2006). A great amount of produced slag has been buried in the past without any proper utilization, but it has been of much use during recent decades (Durinck et al., 2008). However, due to the large amount of produced slag finding new methods for a better use is inevitable. Within this study the abilities of blast furnace slag and converter slag as absorbents and the effects of various parameters on absorption process by them were studied.

Table 1: some properties of Blast furnace slag and convertor slag

Salt's name	Chemical Formula	Molecular Weight (g)	Metal ion	Electrical load	Atomic weight (g)
Hydrated copper chloride	CuCl ₂ ·2H ₂ O	170.5	Cu	+2	63.5

MATERIAL AND METHODES

The Types of Slag under study

After preparing the two types of slag both slag samples were passed through a two-millimeter sieve and the particles smaller than two millimeters were taken under study in absorption laboratories. All tests were carried out twice and their average was considered in calculations. Some of the physical and chemical properties of slag samples are shown in table 1.

Table 2: chemical properties of salts used in laboratories of heavy metal absorption

	CEC(Meq/100g)	pH	Specific surface(m ² /g)	Bulk density(g/cm ³)
Blast furnace slag	1.9	8.0	0.51	1.1
Convertor slag	2.5	11.2	2.2	1.7

Laboratory solutions containing heavy metals

Throughout this project absorption of element copper in laboratory solutions by the two types of slag were studied. Chemical formula and properties of the salt are shown in table 2. Stoke solutions with concentration of 1000 milligrams were provided for each of the aforementioned element. Solutions containing 100 milligrams of the elements per liter were prepared by diluting the stoke solutions for the tests regarding absorption of Cu by slag. One-gram slag was added to 100 milliliter of the solution with a certain concentration of cu, and the solution was stirred using a sweep shaker at 150rpm. Then these suspensions were passed through Whatman filter papers grade 42, and the concentration of Cu in the filtered solution was measured using atomic absorption spectroscopy.

Absorption tests

Determining the balance time

In order to determine the balance time the slag types using laboratory solutions that contain pollutants, absorption tests were conducted using the suspension method, by adding one gr of slag to 100 milliliter of the solution and stirring in 5, 15, 30, 60, and 120 minutes.

The effect of pH

To study the effect of the first solution's pH on the amount of absorption of Cu: copper solutions with pH's of 3, 4, 5, 6, and 7 were prepared. With pH's

more than 7 the solubility of Cu' ions decreased and they settled in the form of hydraksyd compounds. Therefore, the absorption tests were not conducted in alkaline pH's. pH was adjusted by adding chloridric acid, or 0.1 chlorid to the the solution on a magnetic mixer having a pH-meter electrode, Jenway, model no. 3310.

The effect of concentration

Solutions with various concentrations of 0, 10, 25, 50, 100, 250, 500, and 1000 milligrams per liter of defined Cu and pH's were prepared to study the effects of primary concentration on the amount of absorption. Absorption tests were carried out using the suspension method by adding one gr of slag to 100 milliliter of solution.

RESULTS and DISCUSSION

Absorption of Cu by slag

Within this study the inexpensive material, slag, was used to absorb Cu in laboratory filtration solutions considering the four factors of time, pH, and concentration.

Determining the balance time

According to the figure 1, the absorption process for copper was completed in 15 minutes and then the amount of absorption by both elements remained constant. But for convenience, a time was picked for other elements' absorption and studying the effects of different parameters on the amount of absorption. The slag samples at hand were much different considering the amount of absorption of copper. The amount of absorption of Cu by the convertor slag reached almost 100 percent; while the amount of absorption of copper by the furnace slag was orderly 30 and 10 percent. The main reason to the higher amount of absorption of these elements by convertor slag can be associated with its being more alkaline, so much that the final pH of the solutions containing convertor slag was more than 10. In addition, the convertor slag has a bigger CEC (cation exchange capacity) and specific surface area compared to the furnace slag, which helps the absorption sites be more on its surfaces (table1).

The effects of pH on absorption of heavy metals

According to the figure 2 and table 3 and 4, there is no significant difference between the amount of absorption by the convertor slag in different levels of pH, and the amount of absorption for Cu went beyond 95%. In fact, the strong alkaline characteristic of of convertor slag in increasing the final pH of all solutions to more than 10 and settling of dissolved the solution did. This increase was not the same for all the elements under study. For copper, the percentage of absorption slightly rose from a pH of 3 to 6 and when pH=7 it

reached to its maximum of 98%. Overall, the solution's primary pH is one of the effective parameters in absorption process of heavy metals by absorbents.

Table3: the amount of absorption of Cu in different PH by Furnace slag

pH	3	4	5	6	7	8	9
Absorption(mg/g)	3.6	6.6	10	16.6	97.3	97.9	97.72

Table4: the amount of absorption of Cu in different PH by Converter slag

pH	3	4	5	6	7	8	9
Absorption(mg/g)	99.8	99.8	99.8	99.6	99.6	99.7	99.6

Effects of concentration on absorption of Cu

The effects of primary concentration of Cu in solutions when pH=5 are shown on figure 3 and table 5 and 6. The more the concentration of metal ion increased, the higher the amount of absorption (milligram/gram) of slag samples grew. However, due to the stability of the relationship between absorbent and solution (1 gr for

each various concentration) while the concentration increases, the absorption percentage, especially for furnace slag, decreases. The amount of absorption of copper was calculated orderly 77 percent.

Fig 3: the effect of concentration on the amount of absorption of copper by slag

Table 5: the amount of absorption of Cu in different concentration by Furnace slag

Concentration(ppm)	10	25	50	100	500	1000

Concentration(ppm)	10	25	50	100	500	1000
Absorption(mg/g)	9.83	24.53	47.2	93.96	325.5	770.1

CONCLUSIONS

According to the results, it seems that steel slag can be an appropriate absorbent for removing Cu from aqueous solutions. However, it should be heeded that due to its alkaline characteristic the amount of these elements is more when using the converter slag compared to furnace slag; the converter slag has played a much better role as an absorbent. As it was observed during the tests, the balance time for both types of slag was 15 minutes and it is after this time that the absorption amount remains constant. In different levels of pH for furnace slag, the more the level was, the more the amount of absorption became, while the best level of absorption happened when pH=7. But the converter slag had a large amount of absorption at all levels of pH due to its alkaline characteristic. The amount of absorption for both types of slag increased with an increase in the concentration per gr of slag. The highest amount of absorption for both types of slag belongs to absorption in concentration of 1000ppm. As it was observed, the samples were prepared in laboratory conditions. We can take a new step into the recovery of quality and complimentary filtration effluent by using steel slag, which is an inexpensive product, as an absorbent of heavy metals in effluent filtration processes. This however requires more devotion of time to tests.

Table 6: the amount of absorption of Cu in different concentration by Converter slag

Abstract: The efficacy of three *Bacillus thuringiensis* formulations, Agerin, Dipel 2X and Dipel DF were tested against 2nd larval instar of *Spodoptera littoralis*. The three formulations were tested in the laboratory, field and semi field experiments. The 48 hour LC₅₀ for Agerin, Dipel 2X and Dipel DF were 0.18, 0.07 and 0.10 % for the three formulations, respectively. The results of the field experiment indicated that the general mean of reduction were 59.0, 55.9 and 58.6 % for the three *Bt* formulations (Agerin, Dipel 2X and Dipel DF, respectively). In addition, the general mean of mortality rate in the semi-field experiments were 60.3, 60.4 and 61.3 % for Agerin, Dipel 2X and Dipel DF, respectively. Moreover, the histopathological studies using ultrastructure microscopy were carried out on the midgut of 4th larval instar after the treatment of the second instars with LC₅₀ of the three formulations. These results therefore confirm the opinion stated that the toxicities of the different three formulations, are similar to each other. Therefore the Egyptian *Bacillus thuringiensis* strain (Agerin) can be used for control of *S. littoralis* as it is cheap and readily available.

1. Introduction:

The cotton leafworm *Spodoptera littoralis* (Boisd.) (Lepidoptera: Noctuidae) is a serious polyphagous pest that damages numerous kinds of cultivated crops including corn, cotton, beet, tomato, and many others. Due to the overuse of insecticides over the past years, *S. littoralis* has developed resistance to various synthetic insecticides. Therefore alternative bioinsecticides need to be evaluated (Fahmy and Dahi 2009). *Bacillus thuringiensis* strains are high toxic to *S. littoralis* (Sneh *et al.*, 1981 and Yunovitz *et al.*, 1986). *Bacillus thuringiensis* (*Bt*) is the most widely applied biological insecticide and is used to manage insects that affect forestry and agriculture and transmit human and animal pathogens (Broderick *et al.*, 2006). It is a common gram-positive aerobic entomopathogenic endospore forming soil bacterium, which produces unique crystalline cytoplasmic inclusion bodies during the process of sporulation (Martin and Travers 1989). These crystals are predominantly comprised of one or more cry proteins, also called δ -endotoxins. These toxins are highly specific to their target insect, are harmless to humans, vertebrates and plants, and are completely biodegradable (Bravo *et al.*, 2005).

The knowledge of toxicity of different commercial formulations of *Bt* strains to the *S. littoralis* is important for their optimal use in the form of spray formulation or in the development of *Bt* transgenic cole crops. The present study, therefore,

reports toxicity of three commercial formulations of *Bt* strains, Agerin (Egyptian commercial formulation), Dipel 2X and Dipel DF, against 2nd larval instar of *S. littoralis*. Furthermore, histopathological studies using ultrastructure microscopy also will be carried out on the midgut of 4th larval instar after the treatment of the second instars with LC₅₀ of *Bt* formulations.

2. Material and Methods:-

Rearing of *Spodoptera littoralis* in laboratory:-

The colony of cotton leafworm *S. littoralis* was obtained from the division of the cotton leafworm, Plant Protection Research Institute, Doki, Egypt. Larval stages were reared on castor bean leaves at 27±2°C and 65±5% R.H. as described by El-Dafrawi *et al.*, (1964).

Bacillus thuringiensis formulations:-

Three *Bacillus thuringiensis* formulations, wettable powder, used in the present study are Agerin 6.5%, Dipel 2X 6.4%, and Dipel DF 54%, containing 32000 international units per mg. (IU/mg) of product. Agerin (*Bacillus thuringiensis aegypti*) a product of Agricultural Genetic Engineering Research Institute (AGERI). Dipel 2X and Dipel DF (*Bacillus thuringiensis*, subsp. *Kurstaki*), supplied from May trade Corporation.

Bioassays

Leaf-dip bioassay method was followed as described by Tabashnik *et al.*, (1993) using castor leaves. The leaves were first washed with distilled water and dipped in solutions of different concentrations of *Bt* formulations which prepared with distilled water. Each leaf was dipped for 5–10 Sec and allowed to air dry for a period of 1 hr. Then the leaves were placed individually into Petri dishes (15 cm dia.). Newly hatched second instar larvae were released on each dish with three replications (twenty insects /replicate) including controls. Different concentrations of Agerin, Dipel 2X and Dipel DF were prepared in distilled water. The concentrations of Dipel 2X and Agerin were 0.325%, 0.1625%, 0.08125%, 0.04063%, 0.0203% and 0.0102%. The concentrations of Dipel DF were 2.7%, 1.35%, 0.675%, 0.3375%, 0.169% and 0.0845%. Larvae were allowed to feed for 48 hrs. Larval mortality was recorded at 48 hrs. Larvae that treated with LC₅₀ of the three formulations were fed on untreated leaves after 48 hrs of treatments and followed until adult emergence to assess pupal and adult malformations.

Field experiments:

The experiments were conducted at Toukh District, Qalyobia Governorate to evaluate the field efficiency of three *Bacillus thuringiensis* formulations (Agerin 6.5 % WP, Dipel 2x 6.4%, WP and Dipel DF54 % WP) against cotton leafworm *Spodoptera littoralis*. The field area was cultivated with Giza 86 cotton variety and the normal agricultural practices were applied. The experimental area was divided into plates of 1/16 feddan (262.5 m²) one for each *Bt* formulation. The treatments were arranged in Randomized Complete Blocks Design (RCBD) with four replicates per each *Bt* formulation. Application with the three *Bt* formulations were on July 2009. A motor sprayer was used. The volume of spray solution was 100 liters / Feddan. The number of *S. littoralis* larvae were recorded before the spray and on 2, 4, 6 and 8 days after the spray on one meter lengthwise cotton plants for five times (four at corners and the last one on plot center) for each *Bt* formulation. The reduction % in the *S. littoralis* larvae population was estimated by using technique of Henderson and Tilton (1955).

Semi Field experiments:

From the same experiment area, the treated cotton leaves with the three *Bt* formulations were collected after zero time, 1, 2, 3, 4, 5, 6 and 7 days and directly transfer to the laboratory for feeding the second instar larvae of *S. littoralis* to estimate the general mean of mortality percentages for the three *Bt* formulations.

Statistical Analysis:-

The percentage of mortality was corrected according to the Abbott formula (Abbott 1925) for correction wherever required. Probit analysis was determined to calculate LC₅₀, Finney (1971), through software computer program. Statistical significant differences between individual means were determined by one way analysis of variance (ANOVA).

Histopathological studies:-

After the treatment of the 1-day old 2nd instar larvae of *S. littoralis* with LC₅₀ of three tested *Bt* formulations for 48 hrs, the histopathological and ultrastructural effects were examined in the mid-gut of the 1- day old 4th instar. For this purpose, a representative larvae of each group were fixed as soon as possible in 3% phosphate buffered glutaraldehyde (pH 7.3) for 2 hours. After two rinses in the buffer (for a period of 4 hours) the specimens are post fixed in 1% buffered osmium tetroxide for 1 hour at 4°C (Brissan *et al.*, 1996). The specimens were washed twice in a buffer for 30 minutes. The specimens are then dehydrated in the seconding grades of ethanol, 50, 70, 80, 90 and 100%. The specimens were cleared in toluene for 10 minutes and then embedded in the resin of choic Epon. Semi-thin sections are cut from these blocks (stained with toluidine blue) and examined by the light microscope (Spnrr 1969). Ultrathin sections obtained from selected blocks were mounted on copper grids stained with uranyl acetate and lead citrate and then examined with Jol 1010 transmission electron microscope (Reynolds 1963). This technique was carried out at Faculty of Science, Ain Shams University, Cairo, Egypt. 2. Materials and Methods:

This was a retrospective study. The clinical courses of 47 recipients who were transplanted for HCV end stage liver disease and successfully survived a least 6 months post LDLT. The Immunosuppression regimens for all our patients included corticosteroids which were all tapered within the first 3 month. Calcineurin inhibitors used were either tacrolimus (FK) or ciclosporine (Neoral). Mycophenolate mofetil was given to all except 4 patients who had monotherapy with tacrolimus as they had hepatocellular carcinoma before transplantation. Hepatitis C virus recurrence was suspected in cases of elevated liver enzymes with a usual high level of viraemia and then all subjected to a liver biopsy and proved histologically by our transplant pathologist. The studied group was divided into two groups; group I had basiliximab as induction therapy and group II had no basiliximab as induction therapy and the incidence of recurrence was compared between the two groups.

3. Results:

Field experiments:

The data presented in Table (1) showed that the reduction rates in *S. littoralis* larvae population in the field after the treatment with the recommended doses of the three *Bt* formulations. The reduction rates were 23.2, 51.4, 77.7 and 86.0 % after 2, 4, 6 and 8 days from treatment, respectively for the 1st

formulation (Agerin). The reduction rates for the 2nd formulations (Dipel 2X) were 24.8, 43.9, 68.0 and 86.0 % after 2, 4, 6 and 8 days from treatments, respectively. For the 3rd formulation (Dipel DF) it reaches 30.1, 49.7, 70.7 and 83.9 % after the same periods, respectively. The general mean of reduction rate were 59.0, 55.9 and 58.6 % for Agerin, Dipel 2X and Dipel DF, respectively.

Table (1): Reduction % of *S. littoralis* larval population after treated with recommended dose of three *Bt* formulations during cotton season 2009.

<i>Bt</i> commercial name	Rate of application gm / Fed.	Reduction %				General mean
		2 Days	4 days	6 days	8 days	
Agerin	250	23.2	51.4	77.7	86.0	59.6
Dipel 2x	200	24.8	43.9	68.0	86.7	55.9
Dipel DF	200	30.1	49.7	70.7	83.9	58.6

Semi Field experiments:

Data in Table (2) shows the corrected mortality percentage for *S. littoralis* 2nd instar larvae after treated the cotton plants with recommended dose of three *Bt* formulations in semi-field experiment. The corrected mortality percentage

reached to the highest rate after zero time treatment for all *Bt* formulations and it reached to the lowest one after 7 days treatment. The general mean of mortality % were 60.3, 60.4 and 61.3 % for the three *Bt* formulations (Agerin, Dipel 2X and Dipel DF, respectively).

Table (2): Corrected Mortality % of *S. littoralis* larvae in the field after the treatment with recommended dose of three *Bt* formulations during cotton season 2009.

<i>Bt</i> Commercial name	Rate of application gm / Fed.	Corrected mortality %								General mean
		Zero time	1 day	2 days	3 days	4 days	5 days	6 days	7 days	
Agerin	250	70.5	69.8	69.1	60.6	57.9	57.7	50.0	46.8	60.3
Dipel 2X	200	72.3	71.7	68.8	66.0	63.8	56.3	44.9	39.6	60.4
Dipel DF	200	72.0	68.1	67.7	64.1	62.1	58.9	52.1	45.2	61.3

Bioassays

Table (3) shows that LC₅₀ estimated values for Agerin, Dipel2X and DipelDF were 0.18, 0.07 and 0.10 % for the three formulations, respectively.

Table (3): Toxicity of commercial formulations of *Bacillus thuringiensis* to *S. littoralis* after 48 h of exposure.

<i>Bt</i> commercial formulations	LC ₅₀ %
Agerin	0.18
Dipel 2X	0.07
Dipel DF	0.10

Metamorphic and morphogenic effects:

The morphogenic abnormalities of pupae and adults which emerged from 2nd instar larvae which treated with LC₅₀ of Dipel DF, Dipel 2X and Agerin (Fig. 2,3&4, respectively) could be grouped into four categories malformed larvae, malformed

larval-pupal intermediates, malformed pupae and malformed adults as compared with normal larva, pupa and adult stages (Fig. 1). Dipel 2X induced swallowed larvae with a ring of larval cuticle around the tip of abdomen (Fig. 3-A). Malformed larval-pupal intermediates that produced by the action of Dipel DF, Dipel 2X and Agerin can be easily observed in Fig. (2-A&B), Fig. (3-B) and Fig. (4-B), respectively. Pupae with small size were observed in case of Agerin (Fig. 4-A right) with compared to control (Fig. 4-A left). Some emerged adults have various degrees of morphogenic abnormalities. Adults were unable to emerge from their pupal skins (Fig. 2-C). Adults were completely free but possessed crumpled and incomplete formation of wings (Fig. 2-D & 3-C). Collapsed appendages and evaginated elytra (4-C).

Histopathological studies:

The histopathological and ultrastructural investigations were carried out for 1- day old 4th instar larvae after feeding the 1- day old 2nd instar on castor leaves treated with LC₅₀ of Agerin, Diple2X or Diple DF for 48 hours.

Ultrathin sections of the non-infected *S. littoralis* control mid-gut showed that the apical folded plasma membrane, microvilli, (Mv) of epithelial cells are arranged in a regular array (Fig. 5-A). The coated vesicles (Cv) lie in the cytoplasm immediately adjacent to the base of the microvilli accumulates along the apical region of the cells. The endoplasmic reticulum is represented in fairly well developed rough form (RER) as long and short rod-like cisternae. Free ribosomes are found in the cytoplasm of the columnar cells (Fig. 5-A&B). The mitochondria (Mi) are distributed throughout the cytoplasm of the midgut cells. They are rounded or elongated in shapes and have various sizes (Fig. 5-B).

When the mid-gut of larvae was exposed to Diple DF, it showed increasing in the morphological changes of the epithelium Fig. (6-A). Microvilli of the epithelium were irregular and broken into the lumen in the form of blebs. Irregularities in mitochondrial structure could be observed. Disarray of cristae with more or less disintegration was also observed. In addition various sizes of round granules appear in the cytoplasm. They give rise to large vacuoles (Va) which may be liberated separately into the gut lumen through the striated border or they may first coalesce into a single large vacuole. The nuclear membrane (Nm) showed irregular shape (Fig. 6-B). The nuclear chromatins (Ch) appear distributed in large and small clumps. It was released by the rupture of nuclear envelop. The cytoplasm around the nucleus filled with *Bt* cells.

The apical part of the epithelial cell showed various degrees of damage after treatment with Agerin. Microvilli appeared activated with irregular, curled and dense shape. It filled with *Bt* cells (Fig. 7-A). Many vacuoles were observed in the apical part of the epithelial cell. Vacuoles appear to slough from microvilli into the lumen. Some of mitochondria degenerated whereas other ones maintain its morphology. Also multi vesicular bodies (MVB) appeared in the cell wall which were transported outside the cytoplasm (Fig.7-B)

Irregular microvilli filled with bacteria and broken into the lumen was observed in the midgut of larvae that treated with Diple 2X (Fig. 8-A). Vacuolated cytoplasm, irregular shape of mitochondria with loss of cristia and apical cell membrane broken in some parts was also observed in the same figure. (Fig. 8-B). The *Bt* aggregated in large vacuole in different stages. Small vacuoles

found around the rough endoplasmic reticulum was also observed.

4. Discussion:

Efficacy of the three *Bt* formulations against *S. littoralis* larvae in the field and semi-field experiments showed that the general mean of reduction rate in the field were 59.0, 55.9 and 58.6 % for Agerin, Dipel 2X and Dipel DF, respectively. While the general mean of mortality % in semi-field experiments were 60.3, 60.4 and 61.3 % for the three *Bt* formulations (Agerin, Dipel 2X and Dipel DF, respectively). It was obvious from the field and semi field experiments that no difference in the reduction rates in *S. littoralis* larvae population treated with the recommended dose of three *Bt* formulations at all sampling days. Also the bioassay data indicated that the toxicity of the three *Bt* formulations were not different from each. The LC₅₀ were close together.

Morphological deformation assay was used to evaluate the toxic effect of *Bacillus thuringiensis* Cry1 Toxins (Cerestiaens *et al.*, 2001). Zd'a'rek *et al.*, (1979) studied morphogenic effects of drugs, venoms, and other neurotoxic compounds on fleshfly pupae. These authors found that agents that paralyze neuromuscular systems at the peripheral level or suppress or modify basic motor patterns centrally cause the retention of larval morphologic characters in the pupae. Early study by Peter *et al.*, (1987) indicate that *Bt* -endotoxin induced hyperexcited activity in the insect nervous system.

Ultrastructural observations of the midgut exposed to Agerin, Dipel 2X and Dipel DF showed similar results. Microvilli were irregular and broken, mitochondria degenerated, various sizes of round granules found in the cytoplasm and distribution of nuclear chromatins in large and small clumps. The cytoplasm filled with various size of vacuoles and *Bt* cells. many other works that report the cellular changes produced in the midgut of larvae intoxicated with the Cry proteins of *Bt* such as: an increase in the volume of the epithelium cells, rupture of microvilosities, vacuolisation of the cytoplasm, changes in the organelles of the cytoplasm and rupture of cell membrane (Mathavan *et al.*, 1989; Bauer and Pankratz 1992; Bravo *et al.*, 1992; Cavados *et al.*, 2004; Knaak and Fiuza 2005 and Knaak *et al.*, 2010). Percy and Fast (1983) illustrated that the first cell damages due to the *Bt* endotoxin in midgut was related to brush border microvilli degeneration. The mode of action of Cry toxins has been characterized principally in lepidopteran insects.

Figure: 1 (control)

Figure: 2 (Diple Df)

Figure: 3 (Diple

Figure: 4 (Agerin)

Fig. (5 A&B) ultrastructural of the midgut for untreated 1- day old 4th instar *S. littoralis* larvae. Fig. (6 A&B), (7 A&B) and (8A&B) 1- day old 4th instar larvae after feeding the 1- day old 2nd instar on castor

It is widely accepted that the primary action of Cry toxins is to lyse midgut epithelial cells in the target insect by forming pores in the apical microvilli membrane of the cells (Aronson and Shai 2001; de

Maagd *et al.*, 2001 and Bravo *et al.*, 2005). The crystal inclusions ingested by susceptible larvae dissolve in the alkaline environment of the gut, and the solubilized inactive protoxins are cleaved by

midgut proteases yielding 60–70 kDa protease resistant proteins. The activated toxin then binds to specific receptors on the brush border membrane of the midgut epithelium columnar cells before inserting into the membrane. Toxin insertion leads to the formation of lytic pores in microvilli of apical membranes (Schwartz et al., 1993). These non-specific pores render the apical membrane permeable to potassium ions as well as small molecules such as sucrose, thus disrupting the ion balance and the potential difference across the apical membrane. Selective permeability of the membrane is lost. There is significant water uptake, resulting in the cell bloating up and becoming unable to regulate osmotic pressure. There is disruption of the microvillar structures and cell organelles such as nuclei, mitochondria and ribosomes. The endoplasmic reticulum is vesiculated. The epithelial cells subsequently burst open in a process termed colloid osmotic lysis, (Hill and Pinnock 1998). Subsequently cell lysis and disruption of the midgut epithelium releases the cell contents providing spores a germinating medium leading to a severe septicemia and insect death (Bravo et al., 2005). Injuries to mitochondria were important effects associated with all treatment. Dysfunctions of these organelles can be critical since they lead to an increase of reactive oxygen species that cause damage to major cellular components (Andreassen et al., 2000). Such changes in mitochondrial morphology have previously been reported for the action of *Bt* toxins on midgut epithelia of mosquitoes and lepidopteran larvae (Lüthy and Wolfersberger, 2000; Cavados et al., 2004 and Romão et al., 2006).

The use of *B. thuringiensis* endotoxins originated vacuolization of the midgut epithelial cells in the different experimental models (Rey et al., 1998, Cavados et al., 2004). The presence of small vesicles in the cytoplasm around the endoplasmic reticulum, probably derived from the endoplasmic reticulum rupture that had lost their ribosomes (de Melo et al., 2009).

These results therefore confirm that the toxicities of the different three formulations, Agerin, Dipel 2X and Dipel DF, against *S. littoralis* are similar to each other. Therefore Egyptian *Bt* strain (Agerin) can be used for control of *S. littoralis* as it is cheap and readily available.

Effect of soybean on fertility of male and female albino rats

Serag El Din, O.S.; *Batta, H., Abd El Azim; Abd El Fattah, N.

Zoology Department, Wmen's College ,Ain Shams University. *Ph_forgany@yahoo.com

Abstract: This study aimed to investigate whether consumption of soybean is useful or harmful on reproductive hormones; ovary; uterus; mammary gland; testis and subsequent fertility. In the former experiment, male and female Wister albino rats were used in the present study. Each sex was randomly divided into 4 groups, control group fed on the basal diet (AIN93 G), three treated groups given 30, 60 and 90 gm cooked soybeans/70 kg human body weight (b.w.) for three months. Female rats showed that soybean significantly decreased free estradiol hormone (E2); progesterone hormone; follicle stimulating hormone (FSH); luteinizing hormone (LH); ovary weight and number of ovarian follicles. On the other hand soybean significantly increased total E2; sex hormone binding proteins (SHBP); uterus weight and caused uterus proliferation and cystic hyperplasia. The mammary gland showed gradual hyperplasia and mammary ducts showed proliferation. In male rats soybean significantly decreased free testosterone hormone; LH and FSH, meanwhile total testosterone hormone, SHBP, testes weight and testes diameter were significantly increased accompanied with spermatogenesis arrest.

[Serag El Din, O.S.; Batta, H., Abd El Azim; Abd El Fattah, N.. Effect of soybean on fertility of male and female albino rats. Journal of American Science 2011;7(6):872-883].(ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Soybean; Fertility; Progesterone, Testosterone, Ovary; Testis.

1. Introduction:

Soybean (*Glycine max*) is considered a valuable crop among legumes as it's the world's largest oilseed and protein and is the primary source of protein for livestock (Shoemaker *et al.*, 2006 and Shao *et al.*, 2007). It's also considered the most important economic oil and cash crops in Egypt (El-Sherif and Ismail, 2009).

In addition soy is the richest dietary source of bioactive phytoestrogens (plant estrogens) called isoflavones (Setchell, 2001 and Caldwell *et al.*, 2005). Many studies have focused on the role of soy isoflavones on fertility but results remain controversial, the question of whether phytoestrogens are beneficial or harmful to fertility remains unresolved. Indeed considerable interest has been focused on the role of soy in females fertility this interest has stemmed from numerous studies which showed that consumption of soy components significantly increased menstrual cycle length; Duncan *et al.*, 1999 and Messina *et al.*, 2006); decreased sex hormone binding globulin (SHBG) level (Kumar *et al.*, 2002); lowered gonadotropin levels (Duncan *et al.*, 1999 and Hooper *et al.*, 2009); decreased progesterone hormone (Lu *et al.*, 2000) and decreased estrogen level (Watanabe *et al.*, 2001; Kumar *et al.*, 2002 and Tamaya, 2005). In contrast consumption of soy increased the level of E2 increased SHBG and progesterone hormone (Duncan *et al.*, 2000). However other studies found no difference in menstrual cycle length or hormone levels with soy supplementation (Wu *et al.*, 2000; Maskarinec *et al.*, 2002 and Nicholls *et al.*, 2002).

Studies focused on male fertility showed that soy lowered testosterone level (Lund *et al.*, 2004; Goodin *et al.*, 2004; Dillingham *et al.*, 2005; and Goodin *et al.*, 2007); lowered sperm concentration (West *et al.*, 2005 and Chavarro *et al.*, 2008) and serum E2 .

However others found that soy increased serum testosterone (Dalu *et al.*, 2002), increased LH level in male rats (Ohno *et al.*, 2003); increased serum E2 and estrone (E1) in men (Dillingham *et al.*, 2005) and influence spermatogenesis (Song *et al.*, 2006).

In contrast, others found that soy protein or isoflavones intake had no effects on serum total and free testosterone and SHBG in men (Teede *et al.*, 2001 and Hamilton-Reeves *et al.*, 2009) and in rats (Fritz *et al.*, 2002 and Assinder *et al.*, 2007); LH or FSH in men (Teede *et al.*, 2001 and Dillingham *et al.*, 2005) and E2 or E1 (Gardner-Thorp *et al.*, 2003).

2. Materials and Methods:

2. 1. Soybean Diet:

Commercial soybean seeds sample (Giza 22) obtained from the Agriculture Research Center; Giza, Egypt was used in the present study because it's the common soybean used in the manufacture of most soy foods present in local markets. Also it's used as a dietary source of proteins for poultry and livestock.

It contains 40 % protein, 20 % fat, 5 % ash and 35 % carbohydrates (soluble sugars and insoluble sugars) Food Technology Research Institute Agriculture Research Center, Giza, 2008.

Oligosaccharides are soluble sugars but are not broken down by the enzymes of the digestive tract and are fermented by the micro-organisms present in

the intestine, with the formation of the intestinal gas flatulence. That's why raw soybean was soaked for 12 hours at room temperature to get rid of these oligosaccharides. Also soybean was cooked at 120°C for 18 minutes in attempt to decrease the amount of the anti-nutrients present such as trypsin inhibitors, phytin, lectins, saponins, and hemagglutinins (Sat and Keles, 2002)

2.2 .Experimental Animals:-

Male and female Wister albino rats with average body weight 120 gm obtained from the private market Abou-Rawash, Giza, Egypt, were used in the present study. They were kept on vegetables and water *ad libitum* for one week under condition with a 12h light/ dark cycle and temperature of 25-27 °C prior to the experiment to remove any traces of previous soybean. Following this brief adjustment period, each sex was divided into four groups (n = 12 per group).

Control group: rats were kept on the basal diet (AIN 93 G) according to (Reeves, 1997) and water *ad libitum* for three months.

Three treated groups: each rat was fed individually on 30, 60 & 90 gm cooked soybean /70 kg human b.w. daily for three months. Doses used in our study are according to Messina, 1999 and Chang *et al.*, 2008.

All three treated groups were then given the basal diet (AIN 93G) and water *ad libitum* throughout the experimental period

2.2.1 . Organs Weight Analyses:

Weight of some organs as ovary; uterus and testes of control and treated rats were recorded at the end of the experimental period.

2.2.2. Analysis of hormones:

Determination of Free E2, Total E2, Progesterone, Free Testosterone Hormone, Total Testosterone Hormone, FSH and LH in serum samples were measured by enzyme-linked immunosorbent assay (ELISA) according to the method of Tietz (1995a) for Free E2, Maxey *et al.*(1992) for Total E2, Tietz (1995b) for progesterone Hormone, Chen *et al.* (1991) for Free Testosterone Hormone ; Griffen and Wilson(1992) for Total Testosterone Hormone; Rose (1998) for FSH; Rebar *et al.* (1982) for LH.

SHBP calculated according to De Ronde *et al.* (2006) equation.

2.2.3. Histopathological Analysis:-

Uterus, ovary, testis and mammary gland were dissected and carefully cleaned from adhering tissues then immediately fixed in bouin`s solution for uterus,

ovary and testis only while mammary gland was fixed in 10% neutral buffered formalin for 24 hours. Routine steps of dehydrating and embedding were applied, then transverse or longitudinal sections of 3-5µ were prepared then stained with haematoxylin and eosin (H&E).

2.3 Statistical Analysis:

Data were analyzed using the SPSS for windows (version 12.0). Analysis of variance (one-way ANOVA) was performed to test for any significant differences among groups and independent sample t-test was used to calculate statistical significant between the control group and each treated group. The level of significance was set as $P < 0.05$ for all statistical tests (Tello *et al.*, 2003)

3. Results:

3.1.Analysis Studies

Table I and Figs.(1-8) shows that serum level of free E2, LH, FSH in rats fed on 30mg soybean/70 kg human b.w. decreased significantly($p < 0.05$ & $p < 0.001$ for 60 & 90mg/kg b.w., respectively) compared with control group. Likewise serum level of progesterone significantly decreased in the three treated groups with ($p < 0.05$) However serum levels of total E2 and SHBP increased significantly in the three treated groups ($p < 0.001$) compared with control . Left ovary weight significantly decreased ($p < 0.001$) in all three treated groups . Meanwhile 60 and 90 gm soybean/ 70 kg human b.w. induced significant increase in uterus weight($p < 0.01$ and $p < 0.001$, respectively) compared to control.

Table II and Figs.(9-14) reveals that male serum level of free testosterone, LH and FSH in rats fed on the three doses significantly decreased for groups feed on 60, 90mg/70kgm($p < 0.001$) and for 30mg/kg($p < 0.05$) . Meanwhile serum levels significantly increased of total testosterone($p < 0.05$) and SHBP($p < 0.01$) in male rats fed only on 60 and 90 gm soybean/70 kg human b.w. In addition testis weight significantly increased ($p < 0.01$)for 30mg/kg and for 60 ,90 mg/kg($p < 0.001$) , respectively, compared with control groups .

3.2. Histopathological Studies

The histopathological studies (Figs. 15,16)showed that soybean decreased the number of ovarian follicles and caused endometrial proliferation (uterus proliferation) and cystic hyperplasia . Soybean also caused mammary gland gradual hyperplasia in a dose dependent manner as well as mammary ducts proliferation. Soybean increased testes diameter and caused spermatogenesis arrest at spermatid stage. Also Leydig cells showed decreased in number.

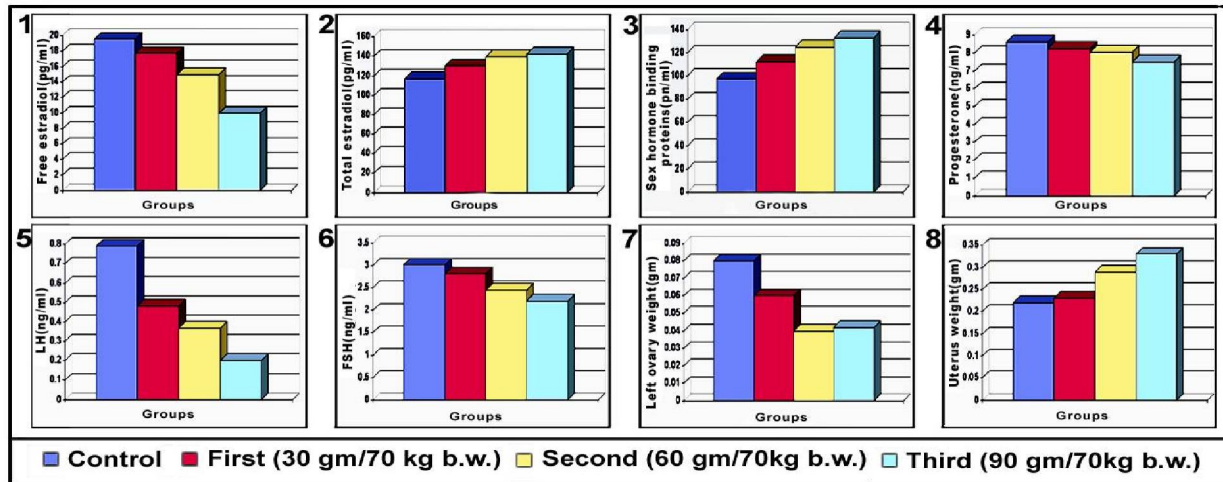

Table (I): Effect of soybean on the levels of serum reproductive hormones, ovary and uterus weight of female rats treated for three months with three different doses

4. Discussion:

This study showed that serum levels of free E_2 and LH significantly decreased in female rats fed 30, 60 and 90 g soybean/70 kg b.w. Meanwhile serum levels of progesterone and FSH significantly decreased only in rats fed with 60 and 90 g/70kg human b.w.

These results correlate with previous studies showing that administration of isoflavones resulted in significant reduction of progesterone and free E_2 concentrations in rodents (Lamartiniere *et al.*, 2002). They also agree with studies on premenopausal women which showed that soy isoflavones significantly reduced serum free E_2 (Tamaya, 2005) and progesterone hormone concentration (Lu *et al.*, 2000 and 2001).

The possible explanation for the reduction of serum free E_2 by soy may be due to the weak estrogenic and / or anti-estrogenic action of isoflavones. Indeed, Ososki and Kennelly (2003) and Dixon (2004) cited that the biological effects of isoflavonoids vary according to the female biological phase. In premenopause, when the concentration of circulating hormones are high, the estrogen receptors are active and phytoestrogen exerts anti-estrogenic effect which competes with estrogen to bind with ER and displace it from its binding sites, but once bound, have a far weaker estrogenic potency than endogenous estrogens; the result is only due to a weak estrogenic action. Also Hwang *et al.* (2006) observed that isoflavones may exert their effects as estrogen antagonists in a high estrogen environment, or they may act as estrogen agonists in a low estrogen environment.

Previous studies by Tamaya (2005) interpreted that the weak estrogenic action of soy isoflavones may be due to their ability to stimulate or up regulate SHBG which will bind with free E_2 , or down regulate enzymes involved in estrogen biosynthesis, such as aromatase (CYP 19), which converts androgens into estrogens (Rice *et al.*, 2006) or inhibit 17 α -hydroxysteroid dehydrogenase type I (17 α -HSD) that converts E_1 to the more potent E_2 (Lacey *et al.*, 2005 and Brooks and Thompson, 2005); isoflavones also may inhibit the reductive/oxidative activity of 17 α -HSD type 5 which inhibits the conversion of androsterone to testosterone and androstenediol to androstenedione. Testosterone and androstenedione are substrates for the action of aromatase which converts testosterone to E_2 and androstenedione to E_1 , so isoflavones may inhibit the conversion of these androgenic precursors to E_2 or E_1 in the estrogen dependent tissues. Also our results agree with Tamaya (2005) who found that soy suppressed the gonadotropins (FSH and LH) which stimulates E_2 production.

In addition, the decrease in progesterone level may be due to the ability of isoflavones to decrease FSH which stimulates progesterone production in granulosa cells from preovulatory follicles in rats (Whitehead and Lacey, 2000 and Nejaty *et al.*, 2001), also Tiemann *et al.* (2007) found that the isoflavones inhibit 3 β -HSD an enzyme involved in progesterone synthesis from granulosa cells.

Soybean also led to the increase of total E_2 in all three treated groups. This is because the total E_2 content is composed of endogenous estrogen plus the weak phytoestrogen from soybean. And due to the increase in level of total E_2 , likewise SHBP will increase as shown in the current results in the three treated groups to bind excess total E_2 present.

Moreover Tamaya (2005) cited that isoflavones induce human HepG2 hepatoblastoma cells to increase SHBG synthesis and secretion.

Tollefsen *et al.* (2002) showed that isoflavones potentially disrupt the endocrine function of SHBP through interacting with it and inducing changes in its internal hydrophobic binding sites and decreasing the number of its binding sites to endothelial glycocalyx and megalin cells and thus decreasing the dissociation rate of sex steroids from its binding proteins.

Hammes *et al.* (2005) explained the role of endothelial glycocalyx and megalin cells in the dissociation of SHBP from its bound hormone. They clarified that the interaction of binding proteins with the endothelial glycocalyx leads to a structural modification of the hormonal binding site and thereby change its affinity. As a result sex hormones are set free and diffuse freely into the target cells. Or sex steroids are bound together with SHBP to megalin cell which mediate endocytosis of proteins bound hormones.

A possible explanation for the reduction of FSH and LH may be due to the increase in the level of total E_2 which produces a negative feedback mechanism leading to unalleviated levels of gonadotrophic releasing hormone (GnRH) of the hypothalamus which intern will stop the secretion of FSH and LH.

The present study showed a significant decrease of ovarian weight in the three treated groups and a remarkable decrease in the number of ovarian follicles in the histological study (Fig. 3 a-p). This may be due to the decrease in serum levels of free E_2 and FSH by soybean which disturb follicles development (Dubey *et al.*, 2000 and Rosselli *et al.*, 2000).

Also the present study showed significant increase in uterine weight in rats fed only 60 and 90 g soybean/70 kg human b.w., and histological results showed endometrial proliferation and cystic

hyperplasia of uterus after soybean, as seen in Figs (3a-3d) these results are supported by Kayisli *et al.* (2002) who found that soy isoflavones induced endometrial stromal-cell proliferation, yet the proliferative effect occurred at high concentrations of isoflavones and was 8–15% lower than that induced by E2 indicating that isoflavones are weak estrogens. Also Seidlova-Wuttke *et al.* (2003) and Archer (2004) cited that the increase in uterine mass may be caused by liquid imbibitions of the tissue, and subsequently through proliferation of endo- and myometrial cells.

Moreover Moller *et al.* (2010) cited that the possible explanation of increased water impaction in rats treated with soy isoflavones may be due to that isoflavones up regulate AQP3 which in turn increases the permeability of uterus to glycerin and/or urea and water, whereas isoflavones down regulate AQP1 & AQP5 which increase the permeability to water only. This would finally lead to elevated uterus luminal fluid volumes resulting in increased uterine weight. It is likely to note that during dissection huge amount of water was observed coming out of the uterus.

As far the effect of soybean on the histology of mammary gland, the present work showed gradual hyperplasia in a dose dependent manner as well as mammary duct proliferation (Figs. 4 a-d), this agrees with Thomsen *et al.* (2006) who explained the proliferation effect of soy on mammary gland due to the weak estrogenic effect of soy isoflavones.

As far male rats treated with 30, 60 and 90 g soybean/70 kg b.w., a significant decrease in serum testosterone level occurred. Likewise serum levels of FSH and LH significantly decreased compared with control group.

These results correlate with previous studies on rodents (Ohno *et al.*, 2003; Svechnikov *et al.*, 2005; Pan *et al.*, 2007; Akingbemi *et al.*, 2007; Jiang *et al.*, 2008; Zhang *et al.*, 2009 and Hancock *et al.*, 2009) and men (Kurzer, 2002 and Spentzos *et al.*, 2003) for testosterone. Also, Pan *et al.*, 2007 and Jiang *et al.*, 2008 for LH.

Decrease in serum testosterone level may be due to the ability of soy isoflavones to inhibit the enzymes involved in steroid hormones synthesis. In fact various types of cell culture studies have demonstrated the ability of isoflavones to inhibit 3 - HSD an enzyme involved in the conversions of pregnenolone to progesterone; DHEA to androstenedione; and 5-androstenediol to testosterone (Ohno *et al.*, 2002; Whitehead *et al.*, 2002 and Ohno *et al.*, 2004) and also inhibit the enzyme 17 - HSD involved in the conversion of DHEA to 5-androstenediol and androstenedione to testosterone (Krazeisen *et al.*, 2001).

Moreover, isoflavones interfere with the first and rate-limiting step in steroidogenic pathway and may be due to their ability to decrease the activity of the side-chain cleavage enzyme P450 which catalyses the conversion of cholesterol to pregnenolone (Svechnikov *et al.*, 2005).

Also Hancock *et al.* (2009) stated the reason of decreased testosterone by isoflavones which interfere with coupling of transmembrane LH receptors (LHR) with G proteins. Uncoupling of LHR from G proteins adversely affects adenylate cyclase function and impacts LH-dependent stimulation of Leydig cells these led to decreased testicular steroidogenesis.

We also found significant increase in serum levels of total testosterone and SHBP in male rats fed only on 60 and 90 g soybean/70 kg b.w.

Tanaka *et al.* (2009) cited that isoflavones could increase the production of SHBG in the liver which binds to biologically active testosterone and consequently lowers the free testosterone levels and its bioavailability to the target cells, thus increasing total testosterone.

A possible reason for the reduction of FSH and LH may be due to the increase in the level of total testosterone which produces a negative feedback mechanism leading to unalleviated levels of GnRH of the hypothalamus which intern will lead to a decrease in FSH and LH.

We also found significant increase in rat's testis weight in the three treated groups in a dose dependent manner. Also the histological study showed significant increase in testis diameter and spermatogenesis arrest at spermatid stage as seen in Figs. (3a-p). These results confirmed previous observations on rodents reported by Roberts *et al.*, 2000 and Cederroth *et al.*, 2010 and studies on men (West *et al.*, 2005 and Chavarro *et al.*, 2008).

It is well established that the development of germ cells is dependent on testosterone and FSH. The decrease of both hormones increase germ cells apoptosis (McLachlan *et al.*, 2002). FSH regulates spermatogonial development in the adult rat (Meachem *et al.*, 1999), testosterone is essential for spermatid development, while both FSH and testosterone are required for spermatocyte development (McLachlan *et al.*, 2002). Therefore, increased apoptosis of spermatocytes; round spermatids and thereby sperms is due to the disruption of the hypogonadal–pituitary–testicular axis. Our study found significant decrease in serum testosterone and FSH as cited above. Also, decreased sperm concentration may be due to the anti-estrogenic effect of phytoestrogens, indeed ER is expressed in Leydig cells (Pelletier *et al.*, 2000); ER β in sertoli cells (Saunders *et al.*, 1998) and spermatogonia (Saunders *et al.*, 1998 and Van Pelt *et*

al., 1999); both receptor types are present in spermatocytes and round spermatids (Pelletier *et al.*, 2000). A direct role for estrogen in the prevention of human germ cell apoptosis has been described by Assinder *et al.* (2007) who demonstrated that feeding a diet of high phytoestrogen content to adult male rats, not previously exposed to elevated dietary phytoestrogens disrupt normal spermatogenesis by increasing apoptosis of developing germ cells.

Also *in vitro* studies showed that incubation of seminiferous tubules in serum and hormone-free media induce apoptosis of spermatocytes and spermatids. This apoptosis is inhibited by 17 β -E2. The same population of seminiferous tubules exhibited increased apoptosis when a diet of high phytoestrogen content is consumed. This induction of apoptosis suggests, therefore, that phytoestrogens are anti-estrogenic in this respect (Pentikainen *et al.*, 2000).

Also the present histological study showed decrease in the number of Leydig cells or interstitial cells which produces testosterone hormone in a dose dependent manner as seen in Figs. (3.a-p).

It is known that LH and FSH play a major role in leydig cell development, differentiation, maintenance and function by modulating the production of sertoli cell-derived factors (Sriraman *et al.*, 2005), so the decrease in serum levels of LH and FSH may be the reason for the decrease of leydig cells. Also previous studies showed that estrogen play an important role in leydig cell proliferation and differentiation thus the anti-estrogenic and / or weak estrogenic action of isoflavones may cause decrease in number of leydig cells (Hancock *et al.*, 2009).

Moreover, increased testes weight and diameter is due to the anti-estrogenic action of phytoestrogen. Hess *et al.* (1997) stated that ER has been found to be abundant in the efferent ductules and is responsible for the reabsorption of almost 90% of the luminal testis fluid. Thus, it was logic by Oliveira *et al.* (2001) to hypothesize that estrogen receptors play a role in the regulation of fluid reabsorption in efferent ductules. So, the disruption of estrogen action, by the removal of functional ER in mice or the administration of an anti-estrogen to adult rats causes reduced fluid absorption in the excurrent duct system, leading to the increase in water retention and it's accumulation in the lumen and the flattening of epithelial cell height.

In conclusion, the present study recommend Food and Agriculture Organization (FAO) to reconsider the benefits of soybean in our daily food since it was found to have adverse effects on male and female fertility. Also, care must be taken in the composition of rodent's diet as nearly all rodent's diet

contains soybean which may interfere with results reached in any experiment.

Abstract: Goats are seasonally polyestrous having estrous activity during late summer, fall, and winter and showing no activity during summer and spring. The objective of the present study was to improve reproductive performance of Damascus doe goats in early summer including: estrous activity (EA), ovarian follicular (OF) growth, corpus luteum (CL) development, and progesterone (P₄) profile by injection of glucose (Glu). A total of twelve apparently healthy Damascus doe goats were used in this experiment and were classified randomly into two equal groups. Animals in group A were injected by Glu via j.v.; each animal of the treated group received 94.584 g Glu daily for nine days before the expected day of ovulation. The second group (B) was injected with saline solution and used as control. All animals in both groups were synchronized by PGF₂α (cloprostenol) three times (10 days between each interval and other) with notice that Glu was injected in the second interval. Blood samples were collected from each animal; the blood was then centrifuged and the serum was analyzed for P₄ determination. All does were subjected to ultrasonographic examination on days 5, 9, and 19 after the third injection of PGF₂α and post-treatment by Glu. The results revealed that Glu injection achieved estrous activity higher than in the control (100% vs. 50 %, p>0.05). All animals showed the estrous activity through 24-72 hours after each dose of PGF₂α and post-treatment by glucose. The number of follicles (≤5mm) in the treated group was higher than in the control group (111 vs. 94 follicle, p>0.05), while the follicular diameter did not differ between the two groups. Left ovary was more active than in right ovary (107 vs. 98 follicle, p>0.05) and the ovulation rate detected from the number of corpora lutea and progesterone level was higher (p>0.05) in the treated group than in the control. Moreover, the ovulation was significantly higher in the right ovary than in the left ovary (19 vs. 9 follicles). Corpus luteum diameter in the treated group was significantly larger than in the control group (1.2±0.11 cm vs. 0.97±0.13 cm, p>0.05). The average progesterone concentration increased significantly (2.36±0.84 ng/ml) in the treated animals than in the control (0.96±0.23 ng/ml). It could be concluded that Glu treatment led to improvement of number of estruses, ovarian follicles, corpora lutea and progesterone concentration in Damascus doe goats during early summer. Therefore, treatment by energy-yielding nutrient (glucose injection) on the estrous and ovarian activity may be recommended in periods of reproductive activity impairment in goats.

[Anas A. Salem, Hassan A. H, Nasrat Abd El-Ati, and Gamal B. M.. Improving Reproductive Performance by Glucose Injection in Damascus Does Goat during Early Summer. Journal of American Science 2011;7(6):884-892].(ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: Doe goat, EA, OF, CL, Glu, PGF₂α and P₄

1. Introduction:

The estrous activity of Damascus does goat occurs in autumn and winter and not in spring and early summer (Mahmoud, 2010). This means that ovarian activity during spring and early summer in these animals is lacked. Away from the use of known hormonal treatments (gonadotropins) which evoke on the ovarian activity, high energy-yielding nutrients are used for increasing ovulation rate in sheep (Teleni *et al.*, 1989b, Downing & Scaramuzzi, 1991) and rising FSH levels during the estrous cycle (Rhind *et al.*, 1985, Rhind & McNeilly 1986). In contrast, findings obtained by Findlay & Cumming (1976), Rhind *et al.* (1989), Xu *et al.* (1989), Smith and Stewart (1990) were not compromised with the previous reports. Whereas, Vin˜oles *et al.* (2002) reported that effect of nutrition on daily follicular development led to an increase in ovulation rate and

FSH secretion and a decrease in estradiol-17β concentration during the follicular phase of the estrous cycle in ewes with a high body condition. Further, ewes fed high energy-yielding nutrients from days 8 to 14 of the estrous cycle owned increased ovulation rate by 14% (Vin˜oles, 2003). For this reason, we prefer in this experiment to use the high energy-yielding nutrients (glucose injection) to test if it is able to resume the estrous and ovarian activity of Damascus does in early summer or not, since administration of exogenous hormones is a costly treatment and may cause severe health problems (Grøndahl, 2008).

The physiological mechanism of immediate energy-yielding nutrients (glucose) on the follicular development has been investigated. Glucose may work in direct way on the ovary and metabolic hormones such as insulin-like growth factor I (IGF-I),

since the glucose transporter proteins and specific receptors for this hormone are found in the ovarian follicles (Williams *et al.*, 2001, Muñoz-Gutiérrez *et al.*, 2004). Scaramuzzi and Radford 1983, Souza *et al.*, 1997, Monget and Martin 1997, Scaramuzzi *et al.*, 1999, Williams *et al.*, 2001, reported that feeding on glucose increased Insulin and IGF-I levels which in turn supported follicular responsiveness to gonadotrophins. Additionally, metabolic hormones may also regulate the steroid synthesis (Scaramuzzi *et al.*, 1999). So, our hypothesis in this study is to test glucose injection in the synchronized doe goat on estrous activity resumption, ovulation rate, CL development and progesterone concentration during early summer under Upper Egypt (Assiut) climatic conditions.

2. Material and Methods

Animal and managements:

This experiment was carried out in goat barn, Animal Production Farm, Faculty of Agriculture, Assiut University.

A total of twelve apparently healthy does with mean body weight of 32 ± 0.8 kg were used in this experiment and classified randomly into two equal groups ($n = 6$ for each). Animals in group A were considered as treated group while B was considered as control group for A. Both groups were housed in semi-pen pens and fed maintenance ration according to NRC (1985).

Glucose injection

Each animal in the treated group was injected i.v. by 94.584 g Glu (Algomohorya Medical Company, Egypt). Glu was calculated from the dose used by Teleni *et al.*, 1989a (525 mMole/day), which was dissolved in 264 ml distal water and given to each animal daily for nine days before the expected day of ovulation. The conversion from mMole to grams is as follows:

$525 \times 10^{-3} \times 180.16$ (molecular weight of glucose, $C_6H_{12}O_6$) = 94.584 g.

Hence, 94.854 g glucose should be dissolved in 264 ml distal water.

$$\frac{264 \text{ ml}}{24 \text{ hours}} = 11 \text{ ml / hour}$$

To avoid stress on animal, 44 ml glucose/4 hours/6 times/day for 9 days was injected in each animal. While animals in group B (control) were infused by normal saline solution (Algomohorya Medical Company, Egypt).

Estrous synchronization

All does were synchronized by prostaglandin analogue (Cloprostenol, estoPLAN® injection, Parnell Laboratories, PTY.LTD, AUST)

and each doe was injected three times by 125 μ g i.m. PGF_{2 α} according to Nuti *et al.*, 1992, Kusina *et al.*, 2001 Cueto *et al.*, 2006, Khanum *et al.*, 2007 and Fernandez-Moro *et al.*, 2008). The first injection was given on day 10/7/2007, the second injection was given 10 days after the first injection, while the third injection was followed after 10 days of the last one as shown in Table (1).

Estrus detection

After each injection of PGF_{2 α} , estrus was detected by using two fertile bucks to run with the does for 30 minutes for detection the estrous does. Each buck was allowed to run with a half number of does for 15 minutes then after that, each one was replaced by the other. Estrus detection was checked daily at 8:00 a.m. for three days throughout the experiment. Estrous signs such as vaginal discharge, vulva swelling and tail twitching and mounting have been taken into consideration during determination of estrous (Mauleon and Dazquier, 1965 and Cerbito *et al.*, 1995).

Blood collection

Time table of blood samples collection, injection of glucose and synchronization by PGF_{2 α} are presented in Table (1). Blood samples were withdrawn from j.v. at 8.0 a.m. during and after each injection by PGF_{2 α} and post-treatment by Glu, then left overnight in the refrigerator (at 4 °C) to clot, and then centrifuged at 2000 g for 20 minutes to harvest the sera, after that the sera were preserved in eppendorf tube (4 ml) and stored at -20 °C until hormonal assay (Mori and Kona, 1984 and Burfening and Berardinelli, 1986).

Table 1. Shows days of blood samples collection and injections of PGF_{2 α} and Glu.

Date of treatment	Days of blood samples collection
10 / 7 / 2007 (1 st injection of PGF _{2α})	1, 2, 3 (during estrus) 4, 6 and 11 (post-estrus)
20 / 7 / 2007 (2 nd injection of PGF _{2α} with Glu injection)	1, 2, 3 (during estrus), 4, 6 and 11 (post-estrus)
30 / 7 / 2007 (3 rd injection of PGF _{2α} and post injection of Glu)	1, 2 (during estrus), 4, 8, 12, and 16 (post-estrus)
Ultrasonography (sonar)	5, 9 and 19 after Glu injection and PGF _{2α} .

Hormonal assay

Progesterone was assayed by ELISA through the kits purchased from DRG, Instruments GmbH, Germany (2005). The DRG progesterone enzyme immunoassay kit provides materials for the

quantitative determination of progesterone in serum and plasma (DRG, 2005).

Ultrasonographic (sonar) examination

All does were examined by sonar (ultrasonography) on days 5, 9 and 19 after treatment by Glu and the 3rd injection of PGF_{2α}. Trans-rectal ultrasonography was done on all animals utilizing a real-time B-mode echo camera (Pie Medical, 100 LC, Maastricht, The Netherlands) connected to a 6/8 MHz changeable transducer. The transducer was fitted in a self-manufactured connector to favor its manipulation in the rectum. The transducer was manipulated externally, with the doe in standing position. At each examination, the number, diameter and relative position of all follicles ≥ 2 mm in diameter and corpora lutea were recorded and sketched on ovarian charts to analyze the pattern of growth of follicles.

Statistical analysis

Quantitative data were analyzed by analysis of variance using the General linear model procedures (GLM) (SAS, 1996). Differences between

means were tested using Duncan's multiple range test (Duncan, 1955). Number of estruses, ovarian follicles, and corpora lutea was statistically analyzed by Chi-square analysis.

3. Results

Estrous activity:

Fig. 1. Shows that the percentage of estrus detected after the 1st injection of PGF_{2α} and before treating by Glu was significantly higher (50 %) in non-treated does than in treated does (33 %). In the 2nd dose of PGF_{2α} accompanied with Glu injection, the estrus percentage was significantly higher (100%) in treated does than in non-treated does (50%). After the 3rd dose of PGF_{2α}, and post-treatment by Glu, estrus percentage was significantly higher in treated does (100%) than in non-treated does (83 %). In addition, all does exhibited the estrus through 24-72 hrs after each dose of PGF_{2α} and even post-treatment by glucose. These data suggests that synchronized does treated by Glu achieved high estrous activity, and this should be used for rising reproductive efficiency in the animal farms.

P₄ concentration (ng/ml blood serum)

After the 1st dose of PGF_{2α} and pre-treatment by Glu, P₄ concentration was almost semi-equal in the two groups (0.23±0.04 in treated and 0.27±0.02 ng/ml, in control) as in the 2nd dose of PGF_{2α} accompanied with Glu (0.36±0.07 and 0.33±0.04

ng/ml, in treated and control does, respectively). While in the 3rd dose of PGF_{2α}, and post-treatment by Glu, P₄ level increased significantly (P<0.05) in the treated does (2.36±0.84 ng/ml) than in the control group (0.96±0.23 ng/ml) (Fig. 2).

These data also indicate that P₄ profile in the synchronized does treated by Glu remained approximately similar to levels in the normal estrous cycle, it was < 1.0 ng/ml on day of estrus, then rose gradually until reached > 1.0 ng/ml by 8 days post estrus, and the peak level occurred on day 16 of the cycle, since this level was significantly higher in the treated does than in the control group (5.86±1.73 vs. 3.62±1.21 ng/ml, respectively). These results suggest that the increased P₄ concentration in the does treated by Glue may be utilized for enhancing pregnancy.

(n=111 F) compared with that non-treated does (n=94 F). Generally, numbers of OF decreased gradually during the three examinations of sonar and reached the minimal number on day 19 in the two groups (23 OF, control and 31 OF, treatment). Follicles observed in ovaries of both groups were ≤ 0.5 cm in diameter (Fig. 3). Despite the significance was absent in the two groups, left ovaries were significantly higher in follicular production than in right ovaries (107 vs. 98 follicles) (Table 2 and Fig. 4), moreover, the left ovaries of treated does were also more active than the right ovaries in OF production (61 OF vs. 50 OF) (Table 3 and Fig. 4).

Number and diameter (Cm) of OF

In Fig. 3, does injected by Glu showed sensible increase in numbers of ovarian follicles

Figure 4. Shows numbers of OF and CL observed in the right and left ovaries (RO & LO) of treated and non-treated does during the three examinations of sonar.

Table 2. Shows mean ± SE diameters of OF and CL in the treated and non-treated does during the three examinations of sonar.

Sonar day	No. does/group	OF diameter (cm)		CL diameter (cm)

Values are least-squares means (L.S.M) ±standard error of L.S.M

^{A and b} Means in the same row with different superscripts are significantly different (P<0.05)

Number and diameter (Cm) of CL

Sonar examination showed that numbers of CL during the three examinations increased

significantly ($P < 0.05$) to 6, 5 and 8 in the treated does compared with the control (2, 2 and 5 CL) (Fig. 3). This increase was associated with increasing P_4 concentration and number of OF produced from the treated does compared with the control as shown in Table 2. The average CL diameter in the treated does was significantly ($P < 0.05$) larger than in the control group (1.2 ± 0.11 vs. 0.97 ± 0.13 cm). Furthermore, the average number of CL in the right ovary was significantly higher than that found in the left ovary (19 vs. 9, $P < 0.05$), also the right ovaries of treated does contained large numbers of CL than in the left ovaries (12 CL vs. 7 CL) (Table 3 and Fig. 4). These

Fig 6. The arrow denotes CL size on day 5 (treatment).

Fig 7. The arrow denotes CL size on day 19 (control).

data also denote that when the number of OF increases in one ovary the diameter of these follicles decreases in the same ovary or increases in the other ovary. Similarly, when numbers of CL increase in one ovary, their diameters would decrease in the same ovary or increase in the other ovary (Table 3 and Fig. 4). Otherwise, the average CL diameter increased slightly in the treated does compared with the control. However, Images (5-8) taken by sonar show the variability in CL size in the treated and non-treated does.

Fig 5. The arrow denotes CL size on day 5 (control).

Fig 8. The arrow denotes CL size on day 19 (treatment)

4. Discussion:

It is obvious from the results that all does treated by Glu came into estrus compared with non-treated does. This means that Glu improved expression of estrus in the synchronized does. These results are similar to that obtained by Funston *et al.* (1995) who indicated that expression of estrus was prevented after depletion of glucose (2-deoxyglucose) from ewes. Ott *et al.* (1980) showed that the synchronized does goat with two injections of $PGF_{2\alpha}$ (11 days apart) 70 % of them came into estrus by 54 hrs after the 1st injection and 94 % after the 2nd injection by 53 hrs. El-Amrawi *et al.* (1993) treated cycling Saanen does with the same protocol as in the study of Ott *et al.* (1980), and reported that all does came into estrus within 48 h after the 1st injection,

and 80 % became pregnant following breeding. In one study on West African dwarf goats, Akusu *et al.* (1986) reported that most goats came into estrus by 42 and 59 hrs after the 2nd injection of $PGF_{2\alpha}$ analogue, respectively. Regarding Fig. 2. P_4 concentration remained under 1.0 ng/ml after the 1st dose of PGF_2 and the 2nd dose of PGF_2 accompanied by Glu, while after the 3rd dose of PGF_2 accompanied by Glu, P_4 level rose to > 1.0 ng/ml in the treated does compared to the control group. Furthermore, P_4 level reached the peak on day 16 of the cycle, but it was significantly higher in the treated does than in no-treated group. This increase may refer to the large numbers and sizes of CL observed in the treated group. So, the immediate effect of Glu may be accompanied by an increase in P_4 concentration.

These results are similar to that obtained by Gaafar *et al.* (2005) who indicated that plasma P₄ concentrations were 0.5±0.1 ng/ml, 0.4±0.3, 2.3±0.6 and 3.5±0.5 ng/ml at days 13-14 before the estrus, day 0 (estrus), day 3 and days 5-14 of the estrous cycle of Damascus does, respectively. They indicated also that the decline in plasma P₄ concentration was noted 24-72 hrs before the estrus comes. Thorburn and Schneider (1972) indicated that during the breeding season, P₄ concentration in the blood plasma decreased during the follicular phase (< 1.0 ng/ml) of the estrus cycle and remained at this level until reached > 1.0 ng/ml at beginning of luteal phase (Chemineau, 2004 and Yu *et al.*, 2005).

The present results showed also that treatment by Gl had a vital role in recruitment follicles especially in LO than in RO, these results are similar to that reported in previous studies in sheep (Teleni *et al.* 1984, Teleni *et al.* 1985, Teleni *et al.* 1989_a, Teleni *et al.*, 1989_b and Downing *et al.*, 1995). They indicated that intravenous infusion of glucose improved ovulation rate in ewes. Teleni *et al.* (1989_b) pointed out that the increase in the ovulation rate was strongly associated with feeding on Glu and Lupin, in other study, ovulation rate was 1.64 in Merino ewes injected i.v. by Glu (Teleni *et al.*, 1984 and Teleni *et al.*, 1985). Teleni (1989_a) indicated that all ewes treated with Glu or Glu + acetate + lupin for 9 days before the expected time of ovulation led to a significant increase in the ovulation rate (approximately 25 %, P<0.001) than the control group. Downing *et al.* (1995) showed that there was a strong relationship between Glu infusion and ovulation rate in sheep. Ovulation rate increased to 2.4±0.3 vs 2.0±0.0 when ewes were administrated Glu with amount of 60-65 mM/h for five days in the end 3- 4 days of luteal phase of the estrous cycle. Mun˜oz-Gutiérrez *et al.* (2002) and Mun˜oz-Gutiérrez *et al.* (2004) reported that ewes infused by glucose and fed on lupin tended to have more follicles and high ovulation rate. San-Martin *et al.* (1968) demonstrated that left ovaries of *Lama pacos* ovulated more frequently than the right post mating or administration HCG. Letelier *et al.* (2008) reported that ovulation rate increased in ewes supplied by glucogenic mixture at first administration. They indicated also that the higher ovulation rate found in the treated ewes may be related to an increased developmental competence of their follicles. However, the cause of inequality of ovarian function is unknown, but some previous studies clarified that inequality may refer to invasion of autonomic nerves in the ovarian stroma which regulate the steroid hormones secretion and follicular growth. Thomson *et al.* (2001) indicated that the difference between

right and left ovaries may refer to anatomical and physiological differences that regulate their functions and induce ovulation. In contrast, Potashnik *et al.* (1987), Check *et al.* (1991), Jarvela *et al.* (2000) reported that right ovaries had higher ovulations than left ovaries, the reason refers to the anatomical difference in the ovarian veins which affect blood flow characteristics into ovaries (which was observed in the left ovaries more than the right ovary). The hormonal effect has also effect on ovulation rate; previous studies indicated that the increase in ovulation rate may be related to an increase in FSH and LH levels which in turn develop the ovarian follicles. Funston *et al.* (1995) reported that depletion of Glu (2-deoxyglucose) available in ewes blocked the formation of yellow body and suppressed releasing LH from the pituitary gland. Therefore, glucose could be considered as a stimulator of hypothalamic gonadotrophic releasing factors. Downing and Scaramuzzi (1991) indicated that short-term energy inputs (4–6 days) or, more specifically, infusion of glucose via i.v. increased ovulation rate. Williams *et al.* (2001) indicated that the presence of glucose transporters (GLUT1 and GLUT4) in the granulosa and theca cells may modify the follicular function within the ovary of ewe. There is also other factor may affect ovulation rate as reported by Vin˜oles *et al.* (2002), they found that ovulation rate and FSH concentration during the follicular phase were higher in ewes recognized by high body condition than in low body condition. On the other hand, Sreewart (1990) indicated that role of immediate nutrition in increasing ovulation rate was not constant. In summary, the present results indicate that glucose supports the estrous activity of Damascus does during early summer in Upper Egypt (Assiut governorate) and modifies the ovarian activity by increasing number and size of OF and CL. Further efforts are needed to figure out role of Glu on recruitments follicles in the slimmed and fatten animals, and how Gl compensate lack of animal's appetite which occurs during hot summer in subtropical countries?

Conclusion

In order to resume the estrous activity during early summer, Damascus does goat are needed to be treated by glucose, since the treatment by Glu in the present experiment improved expression of estrus, aided in improvement of numbers and sizes of OF and Cl and increased progesterone production which will be useful in enhancement of early stage of pregnancy in future. Thus, treatment by energy-yielding nutrient (glucose injection) on ovulation rate in Damascus does goat may be recommended in periods of reproductive activity impairment.

INFLUENCE OF ACUTE PANCREATITIS INDUCTION ON ZYMOGEN GRANULES OF PANCREATIC ACINAR CELLS USING IMAGE PROCESSING AND NUMERICAL ANALYSIS APPROACHES

Waslat W. Elshennawy

Department of Biology and Geology, Faculty of Education, Ain Shams University, Roxy, Cairo, Egypt
dr-waslat@hotmail.com

Abstract: Acute pancreatitis (AP) is a mild to severe inflammation of the pancreas with a clinical picture of a self – limited illness that sometimes progresses to a severe state leading to multiple organ failure eventually causing death. The initiating event of AP may be anything that injures the acinar cell and impairs the secretion of zymogen granules which enclose the digestive pro-enzymes. Therefore, the aim of this work was to assess the effect of acute pancreatitis on the ultrastructure of zymogen granules and to analyze this effect using image processing and numerical analysis approaches. **Material and Methods:** Ten male albino rats weighing 150-200g were divided into two groups; group [I] was treated with physiological saline injections *i.p.* as a control group. Acute pancreatitis was induced into group [II] by two injections of 250mg/100g b.w. of L-Arginine *i.p.* in an one hour interval as 20% solution in 0.15M NaCl. Electron micrographs obtained from zymogen granules were examined then were processed with CIS technique for image analysis and histographic analysis. **Results :** Ultrastructural results of zymogen granules of group [II] (rats received L-Arginine) revealed changes with different severity as; depletion, arrest towards the nucleus, dilatation or fusion together, some of them showed an atrophy in size, rupture of membranous boundary and eventually irregular in shape with loss of their rounded configuration and degraded. Obvious varieties appeared in coloured images and numerical values analysis that obtained from microphages of group [II] comparing with those of control group [I]. **Conclusions:** Influence of acute pancreatitis provoked deleterious effects in zymogen granules as consequence of intense inflammation. Despite of current knowledge, many hypothesis and questions remain unanswered concerning the effects of L-Arg. Image processing and numerical analysis which are considered to be valuable approaches in this study, may resolve some of mistiness of the impact of pancreatitis on the exocrine pancreas. Application of this technique gave more details of pathological changes which were unable to be seen by electron microscope only. So, it can be applied as good techniques for early diagnosis in the field of pathology to illustrate the fine details beyond that of electron micrographs.

Key Words: Histographic analysis, image processing, L-Arginine, pancreatitis, rat, ultrastructure, zymogen granules.

1. Introduction:

Pancreatitis is a disease with a high mortality and no efficient treatment is available for it at present. Pancreatitis is inflammation of the pancreas, an organ that produces several enzymes to aid in the digestion of food. Pancreatitis may be either acute (sudden and severe) or chronic. Both types of pancreatitis can cause bleeding and tissue death in or around the pancreas. However, long-term damage to the pancreas is common, sometimes leading to malnutrition and diabetes. Necrotizing pancreatitis (in which pancreatic tissue dies) can lead to cyst-like pockets and abscesses (Schulz *et al.*, 1999; Urunuela *et al.*, 2002). Acute pancreatitis may occur when factors involved in maintaining cellular homeostasis are out of balance. Therefore, several possible causes of pancreatitis such as gallstones and certain drugs, including azathioprine, sulfonamides, corticosteroids, nonsteroidal anti-inflammatory drugs (NSAIDs), antibiotics such as tetracycline, cisplatin

anticancer drug and opioids (Kingsnorth and O'Reilly, 2006). Pancreatic acinar is specialized for the synthesis, storage, and release of digestive enzymes. Only in modeling studies, zymogen granule membrane constituents are likely to be essential for acinar cell function for two reasons. First, protein storing and packaging will, at least to some extent, depend on interactions between content and membrane components. Second, the granule membrane must contain trafficking proteins to ensure functioning of the zymogen granule as a trafficking organelle. The sequence of pancreatic acinar granules formation has been extensively studied (Seong *et al.*, 2000; Malatesta *et al.*, 2002; Andrzejewska *et al.*, 2005). Secretory components are packed in the Golgi complex; the pro-granules bud-off the transcisternae and then fuse to form an immature granule, i.e. the condensing vacuole. The latter changes its morphology and transforms into a mature electron-dense granule. The steps in granule formation involve

massive membrane shuttling, a process which may be expressed in changes in the structure of internal organelles. Finally, mature granules are stored in the apical pole of the acinar cell.

L-arginine is a semi-essential amino acid found in our diet, and it is engaged in several metabolic pathways within the human body. The body converts L-arginine into nitric oxide (NO), which is a powerful vasodilator (relaxer of blood vessels) and increases blood flow. In pancreas, L-arginine is used to release insulin. Recently, there are numerous animal studies reported about L-arginine-induced acute pancreatitis (Czako *et al.*, 2000; Tashiro *et al.*, 2001; Takacs *et al.*, 2002). Most of the authors, who studied the pathomechanisms of induced pancreatitis used 250mg/100g body weight of L-arginine twice at interval of one hour (Takacs *et al.*, 1996 ; Varga *et al.*, 1997; Czako *et al.*, 1998; Hegyi *et al.*, 2004). Therefore, this dose of L-arginine was applied in the present study to investigate the influence of acute pancreatitis induction on the zymogen granules of rat pancreatic acinar cells.

On the other hand, image processing is a technique for processing any image, it depends on the fact that the causes of colour in many structures are in response to the structural irregularities (Fortner and Meyer, 1997; Fraser *et al.*, 2003; Gendler, 2003; Rector *et al.*, 2004). Such use of this property can be considered as the key factor for mapping the way in which the electron beam of TEM interact with the internal structure of organelle to produce the digital image. This digital image was further used for better characterization of the differences in fine structural field. However, the digital image consists of a square array of image elements or pixels; at each pixel, the image brightness was sensed and assigned with an integer value (from 0 to 255 in the case of gray scale image) that was named as the gray-level. For better visualization of the image, the gray-level image is transformed into colour image and converted into hue, saturation and intensity (HIS) using a discoloured technique. The simplest way of obtaining a pseudo colour image from a gray-level image is to use the RGB mode. An RGB colour consists of three individual images exposed through Red, Green and Blue filters, which are eventually combined into a single composite colour image. Note that, the individual RGB images are not in colour. They will still be gray scale images until combine them into the final colour image. This is recognized by many of the popular image processing programs like Photoshop or Paint Shop Pro (Parker, 1997; Sonka *et al.*, 1998; Myler, 1999). These programs are excellent tools when you want to crop, resize and perform final adjustments to your colour images and hence. Also, it

can offer both more feasible and practical performance at simple tasks and good implementation, which would be impossible by TEM or other tools alone. However, the purpose of RGB colour model is to facilitate the specification of colours in some standard, generally accepted way, and is the most commonly used model in graphics devices (MacDonald, 1999; Lynch and Livingston, 2001). This model however, allows offering colour range for the pixels from an integer value 0 to 16777215 (number of colours: 256x256x256). This can be used as an additional parameter for identifying the fine details of the differences in the ultrastructure features.

On the light of this, the present study has been carried out to apply image processing and numerical analysis techniques on the TEM images to visualize the coloured images on the nanosize structure and to analyze numerically and histographically the zymogen granules ultrastructure post L-arginine – induced pancreatitis in pancreatic acinar cell.

2. Material and Methods

1. Experimental Animals and Ultrastructural Preparation of Pancreatic Acinar Cells

Ten male albino rats (*Rattus norvegicus*) ranging in weights from 150-200g were acquired from Schistosoma Biological Supply Program (SBSP) Theodor Bilharz, Research Institute, Cairo, Egypt. Housed in clear plastic cages (one rat/cage) with wood chips as bedding and were kept at constant room temperature (25°C) in a 12h light/dark cycle with free access to pellet rodent diet and water. After one week of acclimatization, the rats were divided into two groups: Group[I] was treated as control and received physiological saline injections *i.p.* In group [II] pancreatitis was induced with 250mg/100g body weight of L-Arginine (Sigma-Tec. El Salam City, Cairo, Egypt, under license of: Merck K GaA, Darmstadt, Germany) by injection *i.p.* twice at an interval of one hour as a 20% solution in 0.15M NaCl. All rats were scarified by decapitation 24h after the second L-Arginine injection.

The pancreas were rapidly excised and were processed for ultrastructural evaluation by electron microscopy as described previously by Dykstra *et al.* (2002) as follows: Freshly excised pancreas were cut into small blocks (1x1mm³) fixed in cold 4F:1G (i.e. 4% formaldehyde and 1% glutaraldehyde adjusted at pH 2.2) for 24h, and post fixed in 1% osmium tetroxide in 0.1M phosphate buffer (pH 7.3), dehydrated in an ethanolic series culminating in 100% acetone, and infiltrated with epoxide resin. After polymerization overnight at 60°C, semithin sections (0.5µm) were stained with 1% toluidine blue

in 1% sodium borate and examined with a light microscope. Areas of exocrine acinar cells were selected and the blocks trimmed accordingly. Ultrathin sections (80-90nm) were cut, placed on 200 mesh copper grids, and stained with uranyl acetate and lead citrate. The grids were examined and photographed using JEOL.JEM-1400EXELECTRON MICROSCOPE at the Central Laboratory of Faculty of Science, Ain Shams University, Cairo, Egypt. The photographs were printed on KODABROMIDE F5s GLOSSY Black and White- Schwarzweib- Kodak.

The determination of pathology was made blind from the electron micrographs that showed the most characteristic changes of L-Arginine-induced pancreatitis in rats of group [III].

2. Computer-assisted Examinations:

The electron micrographs of pancreatic acinar cells of the two groups were visualized and examined by applying Cartographic Information System software (CIS) technique (Shulei and Yufen, 2004). Combination of image processing; numerical analysis; artificial intelligent and expert system with general vision software were used to colourize; analyze and reveal the morphological and ultrastructural alterations in zymogen granules by using Adobe® ImageReady® CS Middle Eastern Version “8”.

3. Results

As illustrated in figure (1) of electron micrograph that obtained from group [I], pancreatic acinar cells of control rats are characterized by numerous zymogen granules varying in size, smoothly rounded formations with a homogeneous content of high density and are crowded mainly at the apical region of the cytoplasm towards the lumen. Image analysis of this electron micrograph after being processed by CIS technique reveals that each zymogen granule is blue in colour but in different degrees of blue density starting from deep to light, which reflect that colour image can elucidate the presence of different components in the granule (pro-enzymes) as seen in figure (2), while electron photograph displays only a homogeneous electron density.

Regarding histographic analysis, it is well known in CIS technique as reported by Rector *et al.*, 2004 and Shulei and Yufen, 2004, as previously mentioned in material and methods, that the colour which has appeared, is not randomly colour, but it is related to the formation of the structure, i.e. it means that the constituents of the structure is formed of its individual elements in different colours which combine and give the specific colour of the structure.

The histographic analysis is formed of two dimensions (2D); the X and Y axis. In this study, the

Y axis represented the amount or the concentration (quantitatively) of the elements or compounds, whereas X axis represented the different elements or compounds of the structure. Therefore, histographical analysis of a magnified zymogen granules that obtained from the coloured image and marked in white dots are coloured in blue having a value of 116.42 and pixelation area is 21210 as clearly shown in figure (3). The arrangement of the peaks of this histogram are green, yellow, red and blue, which may reflect that they are different types of pro-enzyme constituents in zymogen granules.

Ultrastructural results of zymogen granules of group [II] (rats received L-Arginine) demonstrate alterations with different severity as; depletion (i.e. decreased in number, as only ten zymogen granules are seen in the acinar cell), arrest towards the nucleus, dilatation or fusion together, some of them reveal an atrophy in size, rupture and explosion of membranous boundary and eventually irregular in shape with loss of their rounded configuration and degraded as clearly observed in figure (4). It is also noticed, that there are many electron dense particles participated all over the acinar cell, which may be due to a chemical reaction of L-Arginine with the chemical components of the cell.

The ten zymogen granules appear in the coloured image of this electron micrograph with light green colour intermixed with yellowish colouration as shown in figure (5), which is totally different from the colour of the control one. The histographical analysis of each individual granule after marked by dots gave the same arrangement of the peaks as red, green and blue similar to the other granules with a mean value of the same which is 150 and the pixelation area is 120000. The slight difference in number can be neglected as clearly noticed in figures (6-15). To prove that, a histographical analysis of three zymogen granules together (ZG 4,6,8) was applied and the result was in the same manner as obviously seen in figure (16).

These histograms of figures (6-16) insured that the ten fine structures which are seen in figure (4) of the electron micrograph are zymogen granules that were impaired due to the impact of pancreatitis induction.

An interesting observation is seen in these histograms of the ten granules, that the peaks of the three colours appear at the peripheral of the X axis as single lines in concentration intermixed with each others in a massy disturbance manner. These results may explain the hazardous effect of pancreatitis induction on the role of the zymogen granules for assemblage and storage the pro-enzymes in normal way, which reflects the external symptoms of inflammation.

Figure

Figure (1): An electron micrograph of the apical region of control pancreatic acinar cells (PAC), revealing normal architecture of numerous zymogen granules (ZG) varying in size, smoothly rounded formations with a homogeneous content of high density. At the center of the acinus, clear and rounded lumen (LU) is located. (scale bar 1cm = 500 nm)

Figure (2) : Coloured image of the previous electron micrograph of control rat designating the blue colouration of zymogen granules with an extend of various density of the colour in each granule.

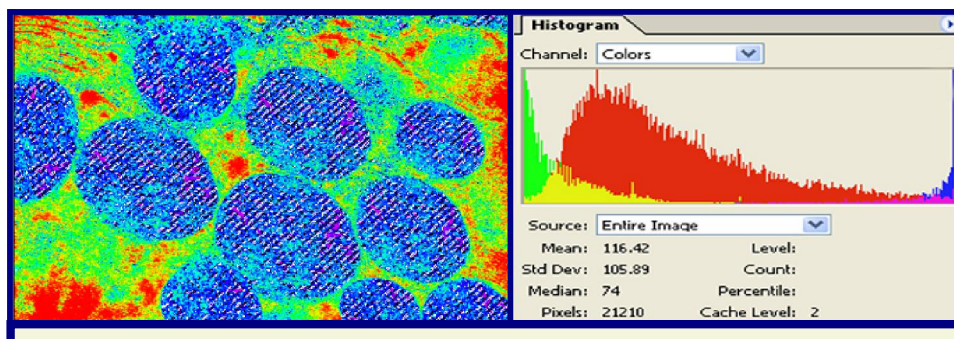

Figure (3): A magnified part of the previous coloured view of control zymogen granules after marked with white dots for histogrammic analysis, showing the arrangement of the peaks as green, yellow, red and blue with mean value of 116.4 and 21210 pixels.

Figure (4) : Electron micrograph of a pancreatic acinar cell (PAC) obtained from group (II) of rats received L-Arginine revealing deleterious changes in zymogen granules with different severity as; arrest at the nuclear region, decrease in number, since only 10 granules are seen (ZG1 - ZG10) which reflect a sort of depletion. Some of them display an atrophy in size (ZG3, ZG6 & ZG9), while some others dilate or fuse together (ZG1, ZG4, ZG7 & ZG8) with loss of their rounded configuration. Also (ZG10) showing rupture and explosion of its membranous boundary. Many dense particles are obviously noticed all over the cell. (scale bar 1cm = 500 nm)

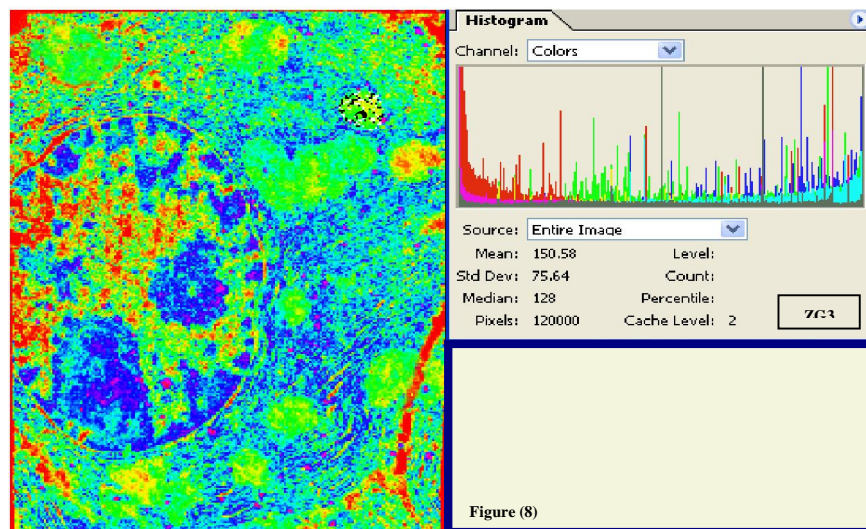

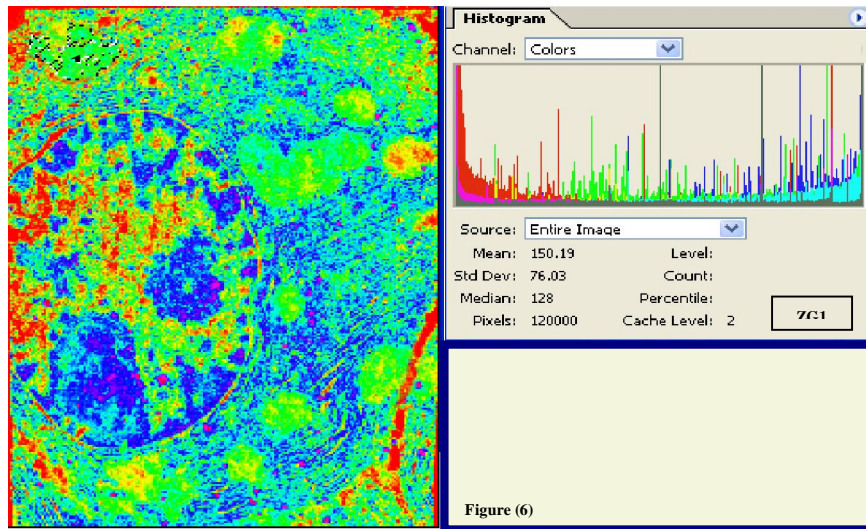

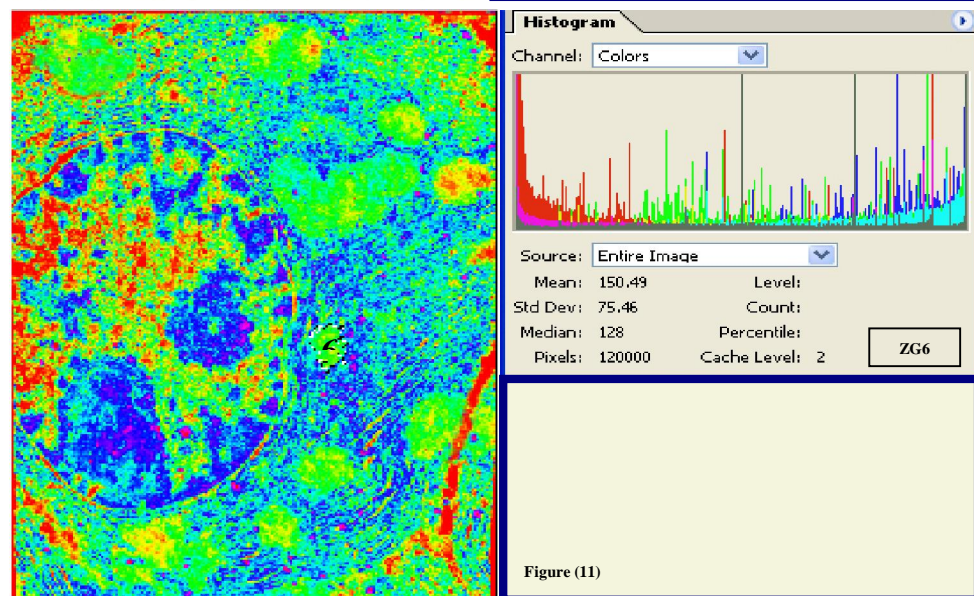

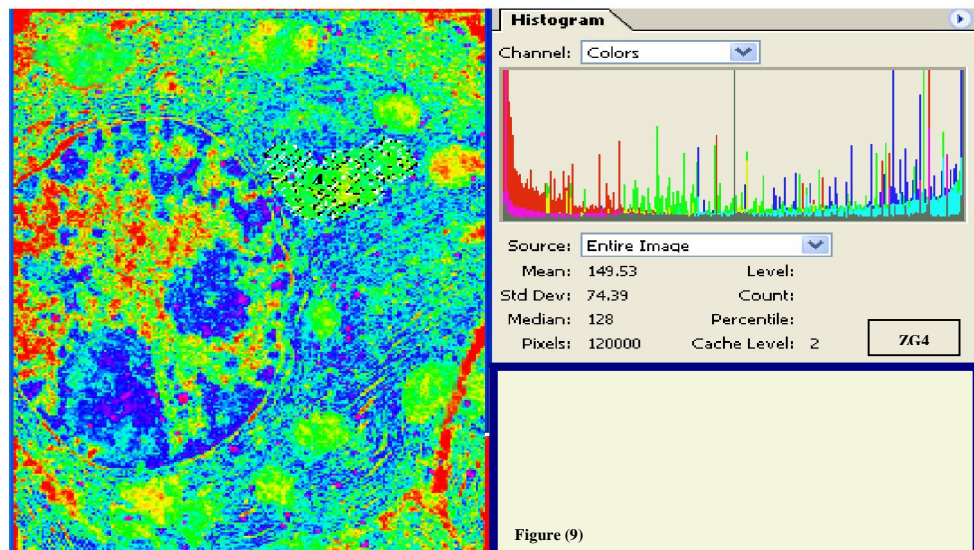

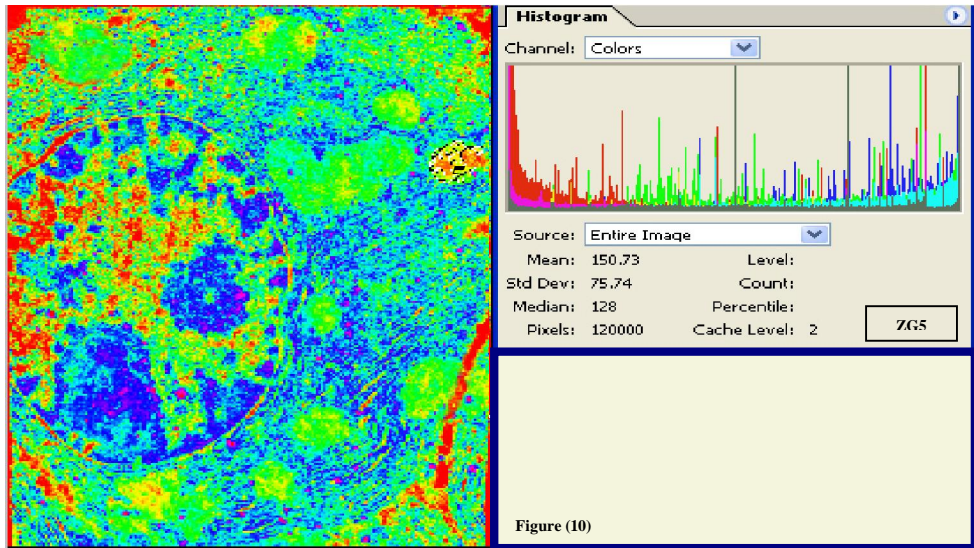

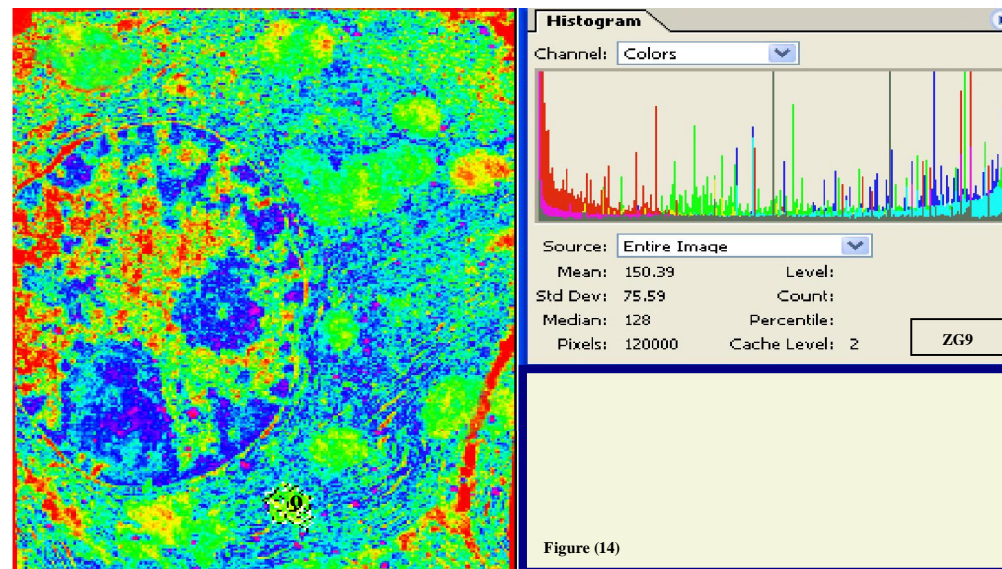

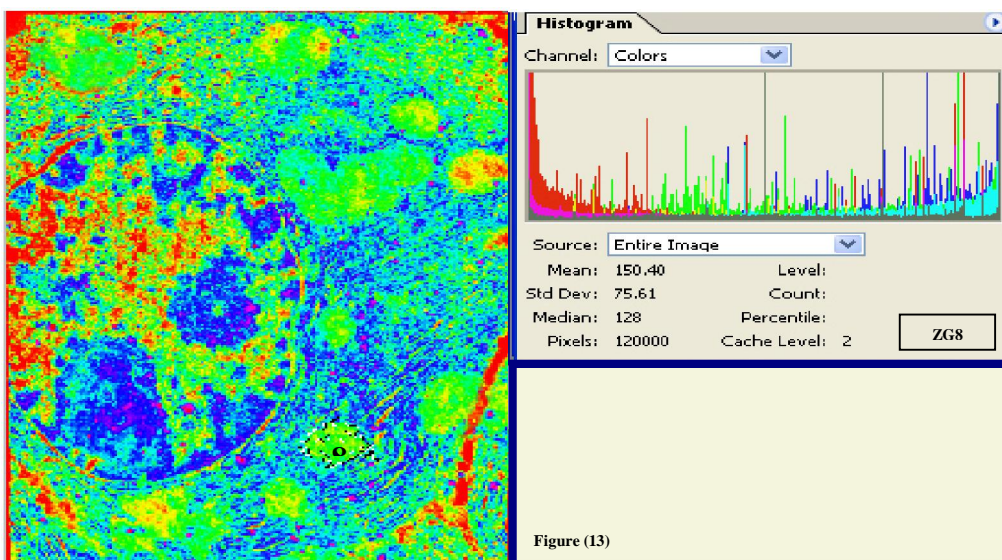

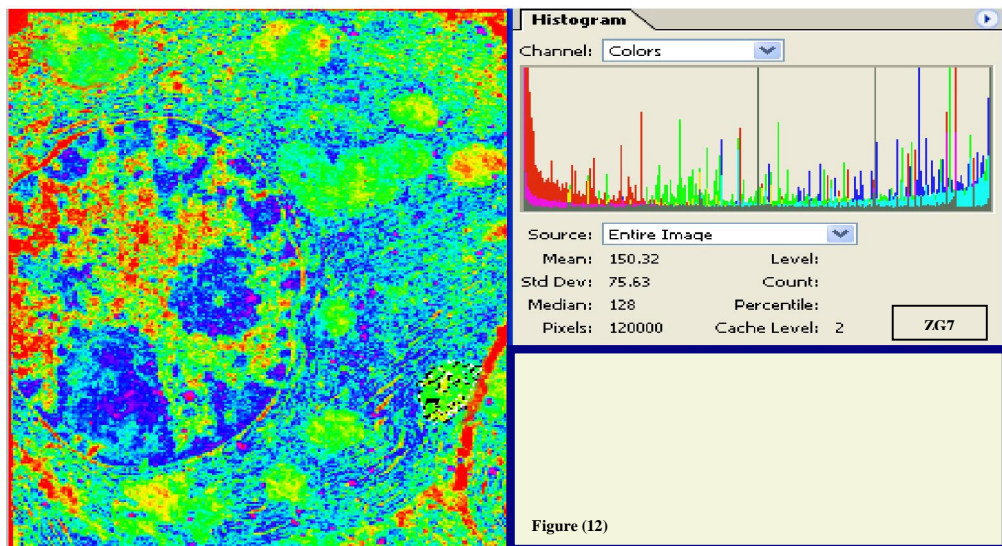

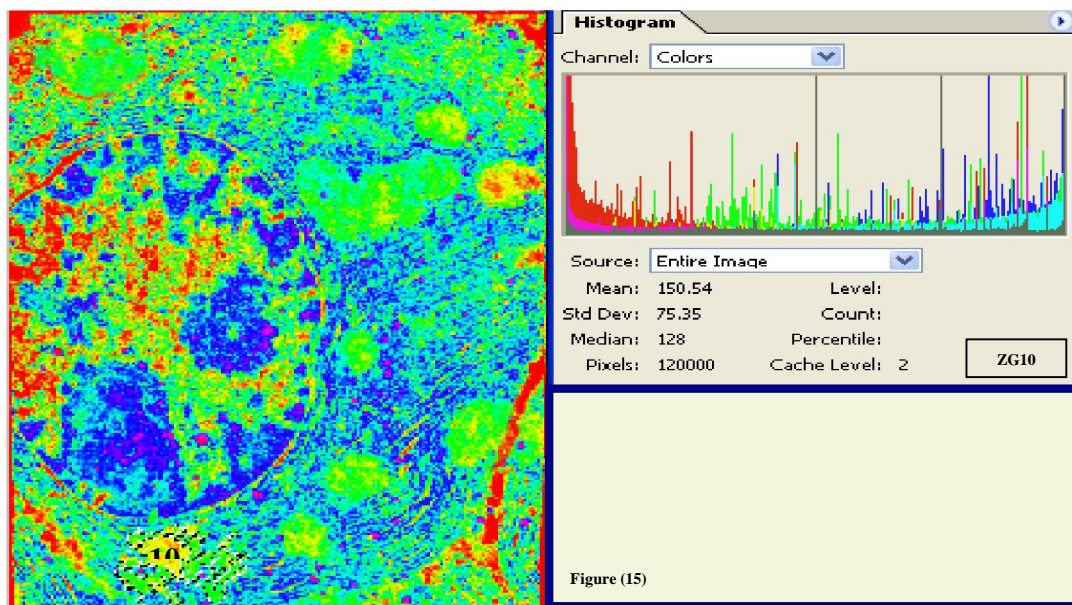

Figure (5): Coloured image of the previous micrograph of L-Arginine group displaying light green colour of the ten zymogen granules intermixed with some yellowish colouration.

Figures (6-15): Illustrating histographical analysis of the ten zymogen granules (ZG1 – ZG10) respectively. Each granule in its figure with marked dots give the same results as the others in arrangement of the peaks as red, green and blue with mean value of 150 and 120000 pixels. The slight difference in number can be neglected. Notice, that the three colours in all figures are intermixed in a messy disturbance manner at the peripheral part of X axis.

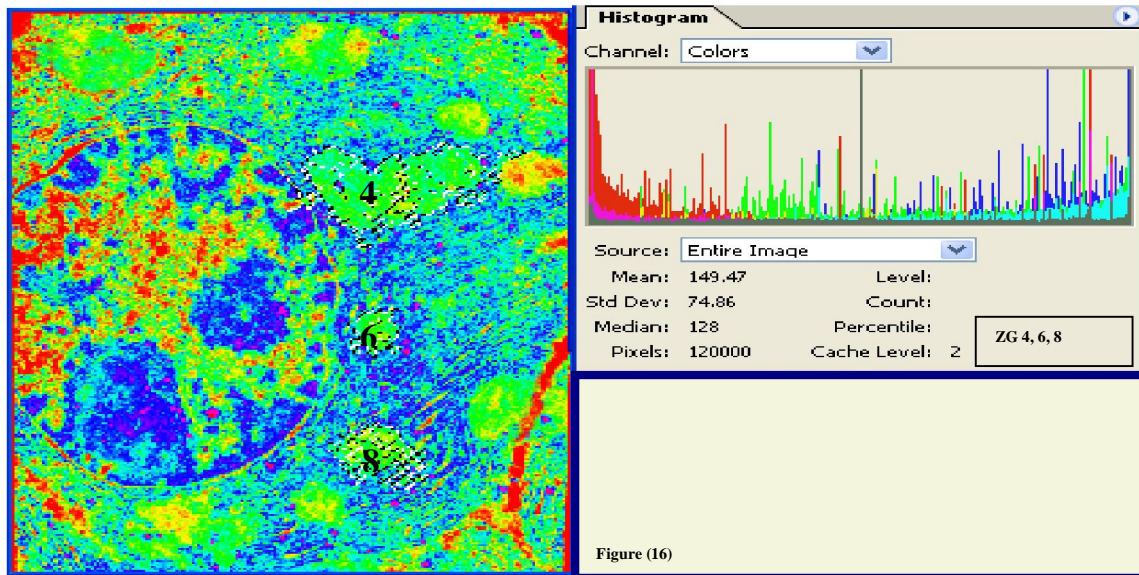

Figure (16) : Displaying the histographical analysis of three zymogen together (ZG4, ZG6 & ZG8). They give the same results of the arrangement peaks and of numerical value as the individual histogram of each one of them.

4. Discussion

Primarily, it should be recalled that the most of the work carried out on pancreatitis have been emphasizing mainly on its medical application together with some physiological and biochemical aspects. A little attention has been paid to investigate the possible impact of pancreatitis on the fine structures of the body organ - in general- and exocrine pancreas - in particular. Despite medical treatment, the lethality of severe acute pancreatitis is still high (20-30%). Therefore, it is very important to characterize the events of this severe disease on the level of the fine structure of the acinar cell, specially zymogen granules which are the main sites of assembling and storage of the digestive enzymes.

L-arginine is considered a good choice for inducing pancreatitis in animal models like rats. Arginine has gained recent attention in critical care nutrition and is considered a conditionally essential amino acid. Arginine is the specific precursor for nitric oxide production and a potent secretagogue for anabolic hormones such as insulin, prolactin, and growth hormone. Under normal conditions, arginine is considered a nonessential amino acid because it is adequately synthesized endogenously via the urea cycle (Saka *et al.*, 2004).

L-Arginine – induced pancreatitis is a slowly developing experimental model in which characteristic laboratory changes are observed 24h after induction of the disease. By this time, administration of high doses of L-Arginine can cause severe necrotizing pancreatitis confirmed by the significant elevations in the serum amylase level, as observed by Szabolcs *et al.* (2006). Acinar cell ultrastructure after taurine treatment in rat acute necrotizing pancreatitis was studied by Ates *et al.* (2006) and they found degree of injury in rough and smooth endoplasmic reticulum, Golgi apparatus, mitochondria and nucleus of acinar cells.

On contrary, recently, some authors illustrated that exogenous L-Arginine intake has multiple beneficial pharmacological effects when taken in doses larger than normal dietary consumption, as reported by Gad (2010) who illustrated that L-arginine has a positive role as an anti-aging. Also, El-Demerdash *et al.* (2010) assessed the positive effect of modulation of nitric oxide (NO) on peptic ulcer healing using L-arginine as NO precursor.

On the other hand, many cases had been reported of acute pancreatitis due to different drugs as explained by (Singh *et al.*, 2004; Memis *et al.*, 2005; Trivedi and Pitchumoni, 2005; Magill *et al.*, 2006).

Some authors were concerned with the impact of acute pancreatitis on other organs rather than pancreas, such as Camargo *et al.* (2008) who

elucidated that acute pancreatitis provoked deleterious effects in endothelium-dependent relaxing response for Ach in mesenteric rings that were strongly associated with high plasma NO level as consequence of intense inflammatory responses, and they found that the subsensitivity of contractile response to PHE in mesenteric and pulmonary rings might be due to the complications of pathological condition in the early stage of pancreatitis. Moreover, Abd-Hady *et al.* (2010) found that high level of Asymmetric Dimethyl L-arginine (ADMA) as an endogenous inhibitor of nitric oxide (NO) synthase in congestive heart failure, can explain endothelial dysfunction in heart failure in spite of increased total NO production. In addition, the effects of splenectomy on spontaneously chronic pancreatitis in mice with alymphoplasia / alymphoplasia (aly/aly) mutation were studied by Wang *et al.* (2010) and they reported that inflammation and development of the pancreatitis in aly/aly mice were suppressed effectively after splenectomy.

So, it is obvious, on the light of collecting data from these reports that the impact of pancreatitis on the fine structure of zymogen granule did not receive good attention despite of its important role in storage, docking and transient of the digestive enzymes present in pancreatic juice to a specialized plasma membrane structures called porosomes or fusion pores, to discharge its vesicular contents.

In conclusion, the present investigation indicated that pancreatitis provoked deleterious effects in zymogen granules as consequence of intense inflammation. It is therefore, worth mentioning that the present study tried to illuminate new aspects, concentrating on the fine structure of zymogen granules and determinate the pathological changes of acute pancreatitis that affected it by using image processing and numerical analysis techniques as a new method to colourize the control and treated TEM images of zymogen granules and to analyze histographically their numerical values which give good results for detection of pathological changes that occurred in their morphology and their inner fine structure which were unable to be seen in electron micrographs. Therefore, this method may resolve some of mistiness of the impact of pancreatitis on the acinar cells of exocrine pancreas, and it may be applied for early diagnosis in the field of pathology to illustrate the fine details beyond that of electron micrographs.

Abstract: New Growth Theory helps us make sense of the ongoing shift from a resource-based economy to a knowledge-based economy. It underscores the point that the economic processes which create and diffuse new knowledge are critical to shaping the growth of nations, communities and individual firms. In all too many contributions to New (Endogenous) Growth Theory – though not in all – central reference is made to ‘a stock of knowledge’, a ‘stock of ideas’, etc., this variable featuring centre-stage in the analysis. Yet it is immediately apparent that this is far from being a crystal clear concept. The difficulty and uncertainty of being able to capture the value associated with knowledge is a real problem. The intent of this paper is introducing new thinking and theorizing about the knowledge and its measurability in new growth theory. Moreover the study aims to synthesize various strain of the literature with a practical bearing on knowledge concept. By contribution of institution framework which is found within NGT, we can indirectly measure the knowledge concept. Institutions matter because they shape the environment for production and employment of new knowledge.

[Hadi Ghaffari, Mohammad Ali Molaei. A New Measurable Definition of Knowledge in New Growth Theory. Journal of American Science 2011;7(6):905-910]. (ISSN: 1545-1003).

<http://www.americanscience.org>.

Key Words: New Growth Theory (NGT), Knowledge, Institution Framework.

1. Introduction

The central notion behind New Growth Theory is increasing returns associated with new knowledge or technology. New Growth Theory is a view of the economy that incorporates two important points. First, it views technological progress as a product of economic activity. New Growth Theory is often called “endogenous” growth theory, because it internalizes technology into a model of how markets function. Second, New Growth Theory holds that unlike physical objects, knowledge and technology are characterized by increasing returns, and these increasing returns drive the process of growth.

New Growth Theory helps us make sense of the ongoing shift from a resource-based economy to a knowledge-based economy. It underscores the point that the economic processes which create and diffuse new knowledge are critical to shaping the growth of nations, communities and individual firms.

No amount of savings and investment, no policy of macroeconomic fine-tuning, no set of tax and spending incentives can generate sustained economic growth unless it is accompanied by the countless large and small discoveries that are required to create more value from a fixed set of natural resources (P. M. Romer, 1993, p. 345).

In all too many contributions to New (Endogenous) Growth Theory – though not in all – central reference is made to ‘a stock of knowledge’, a ‘stock of ideas’, etc., this variable featuring centre-stage in the analysis. Yet it is immediately apparent that this is far from being a crystal clear concept.

Yet again, the relevant literature frequently presents equations in which (dA/dt) is set equal to some power of A (A presents stock of knowledge) multiplied by other variables. These equations too are meaningless unless A is cardinally measurable. And yet they are never supported by any indication of how such a cardinal measure may be found or constructed. This is certainly not ‘measurement without theory’; it is theory without the minimal conceptual clarity required to make that theory worthy of attention. No amount of ‘sophisticated’ mathematical analysis can turn conceptual confusions into meaningful conclusions (Steedman, 2001).

The intent of this paper is introducing new thinking and theorizing about the knowledge and its measurability in new growth theory. Moreover the study aims to synthesize various strain of the literature with a practical bearing on knowledge concept.

2. Materials and Methods

Difficulty in Knowledge's Pricing

The centerpiece of New Growth Theory is the role knowledge plays in making growth possible. Knowledge includes everything we know about the world, from the basic laws of physics, to the blueprint for a microprocessor, to how to sew a shirt or paint a portrait. Our definition should be very broad including not just the high tech, but also the seemingly routine.

The standard approach which economists use has been to divide the world into two parts: private goods—excludable and rival, and produced by markets—and public goods—non-excludable, non-rival, and produced by government, or other non-market means, like charities. While an important exception to the rule that markets produce optimum results, public goods tended to be viewed as a very limited exception: we can rely on markets to produce the overwhelming majority of goods and services, and turn to the public sector only in a few special cases.

But not all ideas are pure public goods. While they are non-rival—many people can use them at once without depriving others of their use—economically valuable ideas are at least partially excludable. And most importantly, their excludability is more a function of socially determined property rights than it is a function of the intrinsic character of the idea.

The non-rival quality of ideas is the attribute that drives economic growth. We can all share and reuse ideas at zero, or nearly zero cost. As we accumulate more and more ideas, knowledge about how the world works, and how to extract greater use out of the finite set of resources with which the world is endowed, we enable the economy to develop further.

But in the case of knowledge, markets may not send the right price signals. The social benefits and the private costs of new knowledge creation diverge. Because additional use of knowledge has zero marginal cost, once the knowledge is created, any positive price for knowledge is too high. Because knowledge isn't fully excludable, entrepreneurs get paid less than the social value of their knowledge, and they don't have sufficient incentives to distribute it widely or invest in creating more (Cortright, 2001).

The difficulty and uncertainty of being able to capture the value associated with an invention is a real problem.

The gap between the social returns of research investment and their private returns is evidence of the inability of firms to capture the benefits of their research (Nelson & Romer, 1996). Careful econometric studies have repeatedly shown that the social rate of return to research (the value of all of the economic benefits received by society) is typically two to five times higher than that private rate of return (the profits accruing to the individual or the company that pioneered the innovation)(Jarboe & Atkinson, 1998).

Shortcoming of knowledge's Measurement

Conceptual Confusion of Knowledge

Romer's (1990) paper makes little advance over (1986) with respect to the issues at hand. At first we find a rather abstract discussion of the relations where A represents non-rival inputs and X rival inputs.

$$F(A, X) > F(A, X)$$

we are reading of non-rival knowledge and of A as 'the benefits of research and development'. Are 'knowledge' and 'the benefits of R & D' synonymous expressions? Either way, are there cardinal measures of these magnitudes? The 'existing stock of knowledge' is an input in the research sector; is the 'stock of knowledge' the same thing as the 'index of the level of technology'? Can a 'stock' be an 'index'? If they are not the same thing, how are they related? In any case, the product of the research sector is designs for new producer durables or, by the next page, 'new designs or knowledge'. Romer produces new terms (for the same thing?) at an impressive rate! At this stage in Romer's analysis A becomes an integer; but he is not really claiming to have produced a cardinal measure of the level of technology/knowledge/designs, of course. The integer nature of A is a mere artifact. Subsequently, in equation:

$$A = H A \cdot A$$

where HA is human capital in research and A is 'the total stock of designs and knowledge'. This equation is meaningless unless there are cardinal measures for both HA and A. Aghion and Howitt make it perfectly clear that the problem is not a purely empirical or data problem: 'It would be more accurate to say that formal theory is ahead of conceptual clarity. As the English side of the Cambridge capital controversy used to insist, the real question is one of meaning, not measurement. Only when theory produces clear conceptual

categories it will be possible to measure them accurately' (Steedman, 2001).

These shortcomings of Knowledge's measurement also exist in models such as Young/ Peretto/ Aghion-Howitt/ Dinopoulos-Thompson and all offering for example (non-) constant-returns and variable marginal products with respect to variables one of which – the stock of knowledge – has not been shown to be, and may well not be, cardinally measurable. Such a cavalier approach does the profession little credit, for conceptual confusions cannot yield convincing conclusions (Steedman, 2001).

Explicit Knowledge versus Tacit Knowledge

But if we look more closely, it's possible to measure entire part of knowledge. To understand why, it is helpful to divide knowledge into two types, codifiable knowledge—that which can be written down—and tacit knowledge—which is learned from experience and can't easily be transmitted from one individual to another. Credit for the distinction between these two types of knowledge is generally given to Michael Polanyi." (Polanyi, 1967). Codifiable knowledge is blueprints, mathematical formula, operations manuals, and tables of statistics, organization charts and facts.

Tacit knowledge is how to hit a baseball, ride a bicycle or know how to work with a specific group of people on a team. At key part of our knowledge is tacit in the sense that we can figure out whether to safely pass another car on a two-lane road without stopping to solve the system of simultaneous equations needed to prove that a collision will not occur (Dosi, 1996).

The distinction between tacit and explicit knowledge has drawn increasing attention among those studying business and the economy. Management experts studying innovation and competitive strategies of Japanese manufacturing firms noted the role of the development of tacit knowledge as a key step in designing new products. One of the keys to successful product development has been encouraging employees to understand and develop their tacit knowledge of particular problems and their solutions (how to knead bread) and then to work to translate and codify this information so that it can be used by the entire organization (to design a bread making machine) (Nonaka & Takeuchi, 1995).

Tacit knowledge is clearly different. Because it is embedded in the minds of individuals and the routines of organizations, it doesn't move easily

from place to place and create more difficulty in its measuring methods.

The distinction between codifiable and tacit knowledge helps explain why technology doesn't completely erase the importance of proximity in transmitting ideas. Simply having access to codifiable information doesn't mean you have knowledge. A formula specifying the solution to Fermat's last theorem—a centuries-old mathematical puzzle—would be information, but it wouldn't be knowledge unless you were one of the few hundred mathematicians who possessed the tacit knowledge to understand it (Dosi, 1996). With respect to Dosi puzzle, quantity of knowledge is ambiguous.

Empirical data also support the notion that evaluating of knowledge creation tends to be under real value. As a result of the interdependence between codifiable and tacit knowledge, even explicit innovations like those covered in patents don't flow freely from one nation to another. Frequently, in order to take full measurement of the insights provided in a patented (codified) invention, one needs also to have the complementary tacit knowledge to apply it to a particular product or process (Pavitt, 1992).

Abrupt steps in New Growth Theory Leads to an Approximate of Real

The conventional view of economics, crystallized by Alfred Marshall in the late 19th century was of the economy as a well-balanced system, always tending toward equilibrium. All of the forces acting on the economy generated signals or reactions that tended, over time, to push the economy toward an optimal state. A shortage of some particular good or service was associated with a rise in its price, which in turn called forth additional resources to produce it, ultimately triggering a greater supply and a reduction in its price. The view of economic change afforded by this model of the economy is one of smooth and continuous adjustment.

This view was challenged by Joseph Schumpeter, who argued that economic change was almost exactly the opposite: abrupt and discontinuous, rather than smooth and orderly. Schumpeter proposed that the search for higher than normal profits (quasi-rents, in economic jargon) led individuals and firms to innovate, to seek unique new practices and technologies. New products, almost by definition, give the businesses producing them a monopoly, if only a temporary one and enable firms to earn higher profits until their product is successfully imitated by a

competitor or displaced from the market by yet another new product. New businesses, with new ideas, changing the definition of markets, not simply lowering the price of some commodity, are the driving force behind change.

New Growth Theory leads us first to think differently about the role of history in shaping economic growth. The increasing returns associated with knowledge produce "path dependence": future options are constrained by past actions. New Growth Theory is also broadly consistent with an evolutionary view of how the economy changes. This evolution, moreover, happens not smoothly but in abrupt steps, as new ideas and new businesses replace old ones in a process of creative destruction. In other words, abrupt process can lead to some disability of measurement tools (Cortright, 2001).

In the view of the evolutionary economists, change isn't the smooth and continuous adjustment at the margin, but is rather the abrupt and often uneven displacement of the one technology by another. Economic growth is a disequilibrium process, and as the competitive environment changes, development and improvement of new techniques and changes in markets cause some firms to grow and others to shrink. Economies move ahead by successively generating new experiments and trials. A critical policy implication of this work is that encouraging experimentation and learning is essential to economic progress. A corollary is that a diversity of firms and institutions helps encourage and sustain experimentation (Nelson & Winter, 1982).

Such evolutionary theory is closely related to path dependence. As Arthur points out, the nonlinear qualities of increasing returns models of the economy have distinct parallels to the evolutionary theory of punctuated equilibrium (Arthur 1989). Because development is path dependent and the future cannot be predicted with any precision, business managers will have to emphasize adaptive behavior rather than optimization (Arthur, 1996). Consequently with absence of equilibrium point and abrupt steps in new growth theory, Role knowledge evaluation is an approximate of real.

3. Results and Discussion

Institutional Framework and New Definition of Knowledge

The most important job for economic policy is to create an institutional environment that supports

technological change Portland (P. M. Romer, 1994, p. 21).

Are governments obstacles to economic growth or instigators of growth? Is the government that best befits the economy one that gradually withers away, or a strong one? Much economic theory gives the impression that governments are needed only when markets won't work, to address market failures, or provide public goods like national defense, and to achieve purely social aims, like taking care of the poor and elderly. Governments that do more than the minimum, the conventional wisdom goes, sap the economy of its strength. New Growth Theory gives us a new view of the role of institutions in creating the necessary conditions for growth in an economy driven by new knowledge (Cortright, 2001).

What are institutions and why should they matter? If we think of the economy as a game, institutions are the rules of the game and the processes by which rules are determined and enforced. Formal rules, like constitutions, statutes and regulations, and governmental bodies, like courts and legislators, are institutions. So too, are informal rules that shape and limit transactions, like common business practices, cultural attitudes and values, and reputation, and the social constructs that guide and enable interpersonal and business relations.

History influences the pace and trajectory of knowledge creation. But knowledge creation is not purely the product of market forces. Non-market forces, particularly institutions can also influence what kinds of knowledge are created. A number of economists have begun to consider the role that different institutional arrangements play in economic development. Then by considering numbers of institution which are engaged in growth process and their effectiveness coefficient, knowledge measuring will be more realistic(Cortright, 2001).

Ignorance of dynamic adjustment and institutions in new growth theory leads definition of knowledge to an ambiguous environment. Institutions shape the creation of knowledge and adaptive efficiency indicates that changes of new knowledge take place over time.

Creation of New Knowledge and Institution

The cumulative learning of societies, reflected in culture and the shared mental models of how the world works, guide people's interpretations of economic and political problems and opportunities. Beliefs about the value of new

knowledge, risk taking, and the trust in social institutions influence the rate and type of economic growth in a society. The structure of incentives in society is shaped by institutions, which means that ultimately the effectiveness of markets is dependent on collective, political processes. Markets alone cannot produce the set of conditions needed for the efficient function of a market economy (Olson, 1996).

Many important institutional innovations deal with the creation and diffusion of knowledge. Some of these institutions, like patents and copyright law, have relatively long histories. Universal public education is a relatively recent development. So too are public land grant universities, peer-reviewed academic research and public-private research partnerships. As Paul Romer points out, there are many conceivable sets of institutional arrangements that can be developed to encourage the further development and deployment of economically valuable new ideas (P. M. Romer, 1993).

Importance of institutional arrangement in economic development leads to importance of institution as a key variable in measuring entire knowledge.

Dynamic Adjustment and Institution

The ability of institutions to adapt to the changing economic situation, and to develop new rules and practices to guide transactions shapes the ability of economies to continue to progress. North argues that it is this adaptive efficiency, the ability of economies and institutions to change over time to respond to successive new situations—and not static efficiency, the optimization of the allocation of resources at any given time—that is the critical factor shaping economic development. North explains:

Adaptive efficiency . . . is concerned with the kinds of rules that shape the way an economy evolves through time. It is also concerned with the willingness of a society to acquire knowledge and learning, to induce innovation, to undertake risk and creative activity of all sorts, as well as to resolve problems and bottlenecks of the society through time. We are far from knowing all the aspects of what makes for adaptive efficiency, but clearly the overall institutional structure plays a key role to the degree that the society and the economy will encourage the trials, experiments and innovations that we can characterize as adaptively efficient. The incentives embedded in the institutional framework direct the process of learning by doing and the development of tacit

knowledge that will lead individuals in decision-making processes to evolve systems that are different from the ones that they had to begin with (North, 1990, pp. 80-81).

One critical element in adaptive efficiency is the tolerance for new ideas. As Schumpeter observed, change often entails the creative destruction of the existing economic and political order. The willingness of societies to tolerate new ideas that challenge the current arrangements of business and government has varied over time, and still varies considerably among (and within) nations. In a historical sense, the openness of the West to new knowledge in the Renaissance and the Enlightenment produced the new ideas that led to the industrial revolution; the particular institutional arrangements of the United States (the Constitution, the interstate commerce clause) led to the development of a national economy. Similarly, among nations today, the relative openness to new ideas in some nations (Singapore, Taiwan) may have much to do with their recent economic success.

Governments have a crucial role to play in setting up the right structures for economies to evolve over time. Many of the most critical changes will deal with the incentives for knowledge creation. As technologies change and economies grow, our institutions will continue to need to devise new arrangements and solutions for economic problems, from allocating the electromagnetic spectrum to refining the law governing patents (Thurow, 1999).

New Growth Theory emphasizes the central role that new ideas play in driving economic progress. The careful study of history and contemporary international comparisons of development highlight the role that new ideas for arranging institutions can play in shaping the direction and pace of economic development. Then institution framework help researcher to measure knowledge's quantity accurately (Cortright, 2001).

4. Conclusion

In all too many contributions to New (Endogenous) Growth Theory – though not in all – central reference is made to ‘a stock of knowledge’, a ‘stock of ideas’, etc., this variable featuring centre-stage in the analysis. Yet it is immediately apparent that this is far from being a crystal clear concept. Really no amount of ‘sophisticated’ mathematical analysis can turn conceptual confusions into meaningful conclusions.

The real question is one of meaning, not measurement. Only when theory produces clear conceptual categories will it be possible to measure them accurately. We should now perhaps establish that our critical remarks are not directed to a pure figment of our imagination – and recognize that worries about the measurement of knowledge can indeed be found within the NGT literature. In historical order – which will make it clear that there has not been clear cut progress in conceptual clarity about measuring knowledge!

By contribution of institution framework which is found within NGT, we can indirectly measure the knowledge concept and no more directly possible to measure stock of knowledge. Institution matter because they shape the environment for production and employment of new knowledge. New Growth Theory emphasizes the central role that new ideas play in driving economic progress. The careful study of history and contemporary international comparisons of development highlight the role that new ideas for arranging institutions can play in shaping the direction and pace of economic development. Then institution framework help researcher to measure knowledge's quantity accurately.

Vegetative and Reproductive Characteristics of Iranian Gole-Gav-Zaban (*Echium amoenum* Fisch & C. A. Mey) Accessions Cultivated in Mazandaran Province

Elham Daneshfar¹, Ali Kuhkheil¹, Reza Omidbaigi¹ and Akhtar Zand¹

1- Department of Horticulture, Agricultural faculty, Tarbiat Modares University, Tehran, Iran
elham199danesh@yahoo.com

Abstract: Iranian Gole-Gav-Zaban (*Echium amoenum* Fisch & C. A. Mey) belonged to Boraginaceae family and is considered as a valuable Iranian endemic medicinal plant that has been used widely as traditional medicine since long times. Because of its convenience and being acceptance as a remedy for different sort of diseases by people. Use one of these (besides) side a little research has been ever done on this valuable endemic medicinal plant. There for is drastically short amount of available information about it. hence there is need of more work. By these descriptions, in present study, measuring of vegetative and reproductive character of Iranian Gole-Gav-Zaban was aimed. For fulfilling these aims (objects), accessions were planted in a completely randomized design with three replications in June 2010. Bushes characteristics were observed and documented. In the vegetative phases there weren't considerable difference among accessions. But from the aspect of flower field character, the difference was significant.

[Elham Daneshfar, Ali kuhkheil, Reza Omidbaigi and Akhtar Zand. Vegetative and reproductive characteristics of Iranian Gole-Gav-Zaban (*Echium amoenum* Fisch & C. A. Mey) accessions cultivated in Mazandaran province. Journal of American Science 2011;7(6):911-914]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: *Echium amoenum*, Vegetative phase, Reproductive phase, Oil

1. Introduction

Echium genus (Boraginaceae) has four species in Iran (Mozaffarian, 1996) and only *Echium amoenum* Fisch & C. A. Mey has medicinal usages (Akbarinia *et al.*, 2007). In Iran, the dry violet-blue petals of it has long been used as tonic, tranquillizer, diaphoretic, cough suppressant and a remedy for sore throat and pneumonia in traditional medicine (Amin, 1991; Hooper, 1937). In spite of this fact, *E. amoenum* is totally known as a traditional herb by costumers not only in Iran but as a recently exported product which is gradually founding its right place in the past few years. Sufficient investigation has not taken place (carried on) on it. Various phytochemical petals' studying proved the existence (presence) of some compounds for instance anthocyanins, flavonoids aglycones, saponins, unsaturated terpenoids, sterols and the least amount of essential oil (Shafaghi *et al.*, 2002; Mehrabani *et al.*, 2005; Heidari *et al.*, 2006). But still there is a gap to be filled. This study is just a small step to uncover some of the characteristics of this plant. Investigation the effect of plant's accessions on bushes growth, flower yield and oil amount are considered as the objects of this study.

2. Material and Methods

2.1. Field planting

The study area is the Foshkor basin which is (one mountainous region of Chalous, Alborz Mountain, Mazandaran province) located in the north of Iran,

between longitudes 36°15' E and latitude 51°18' N. Seeds of different accessions of *E. amoenum* were collected from different regions of Iran (Tehran, Zardband, Esfahan, Hamedan, Rahim Abad (Gylan province) plus native accession from Foshkor). Then they were planted in a field that was located in Foshkor in a completely randomized design with three replications in June 2008. The distance was 40 cm in and between rows. The soil characters are followed at the table number 1.

The seed planting depth was 1-1.5 cm. At the first year of planting, the herbs didn't flower (and therefore or consequently) no seed was produced. In the first year, germination time and four-leaf stage were documented. After, completing chilling requirement, the bushes at the end of March regrow and at the beginning of April they passed rosette phase and produced flowering stems. In the second year (2009), time of stem, full blossom, bushes height at full blossom, number of flower for each bush, dry to wet flower weight rate were considered. The first picking up was done on May 8th. This way was continued up to the middle of August. In full blossom period, flowers were picked every other day and dried in room temperature isolated from sun shine. In each time, picked flowers were numbered and dried to wet flower weight rate were measured. Grinded petals were used as experiment samples. Mature seeds were collected. The weight of 1000 seeds of (for) each accession was measured.

Table 1. Soil characteristics of cultivation region

Character	Measure
Sand (%)	46
Loam (%)	38
Clay (%)	16
Soil Texture	Loam
EC (mMho)	0.602
pH	6.6
Potassium (ppm)	192
Phosphor (ppm)	28.4
Total N (%)	0.3
Organic carbon (%)	3.43

2.2. Oil extraction

Seeds were cleaned and grounded. For each accession, ten grams of the prepared seeds powder were measured and the oil was extracted by soxhlet type apparatus for 6-7 hours. Hexane was used as solution (4). The solvent was removed under vacuum in a rotary evaporator (EYELA, N.N. Series, Rikakikai Co. Ltd., Tokyo, Japan) (Azadmard-Damirchi and Duta, 2005).

2.3. Statistical analysis

Analysis of plural was done with SAS9.1 software and differences among treatments were tested with Duncan test (Level of significance $p < 0.05$).

3. Results and discussion

3.1. Effect of accessions on vegetative characters

All the cultivated accessions had been stemmed and they started flowering at the same period so the differences between them were not considerable. Full blooming time and height at the full blooming didn't show any considerable difference.

Since there is a lack of information on this plant phenotype (morphology), we present some of our observations below.

- *E. amoenum* (its seed) germinates epigeal and the cotyledons came out of the ground.
- It is a long-day plant. In first year its form is rosette. By the increase in day time length and temperature, it produces flowering stem and begins flowering. *E. amoenum* needs a cold temperature period in order to flower. Because of this character, sowing in spring does not lead to flowering in the following summer.
- Flowering stem comes out from the angle between leaf and stem.
- Main Flower stem and secondary Flower stems start to grow from angles between leave and the stem and plant around respectively.
- It is a perennial and hardy plant. The leaves keep their greenish under the snow for a while.
- The inflorescence is raceme. At the end of calyces, limpid sticky sweat liquid gathers. Two flowers from the inflorescence often bloom at the same time. So the first flowers produce seed while the upper flowers are still blooming. This lead to seed dropping.
- To produce seed there is an absolute need for pollen from another bush. Self-pollination cannot lead to seed production. Pollination takes place by insects.
- Seed is in acne form with four, three and sometimes two and rarely with single seed. They are stick in tight calyces. The seed coat is hard and groove.

Table 2. Mean comparison of vegetative and reproductive characteristics of various accessions of Iranian Gole Gav Zabab at the first year by using Duncan test in 5% level

Accessions	Characteristics			
	Days to germination	Days to four-leaf stage	Days to stem flowering	flowering
Tehran	47 ^a	100 ^a	- _b	- _b
Hamedan	48 ^a	99.3 ^a	149.6 ^a	159.6 ^a
Esfahan	47 ^a	97.7 ^a	148.3 ^a	158.3 ^a
Roodbar	37.7 ^a	98.7 ^a	158 ^a	166 ^a
Rahim Abad	48.7 ^a	102.3 ^a	- _b	- _b
Zardband	49 ^a	105 ^a	152 ^a	161 ^a
Ezzat Abad Sofla	47.7 ^a	102.7 ^a	161 ^a	164 ^a
Feshkoor	*	*	- _b	- _b

*The native accession was collected from the natural habitat and then transplanted to the field, due to this, time of its germination and four-leaf stage were vague.

In the first year, Esfahan accession stemmed sooner than others and the native accession was the last accession which stemmed. In total, the difference was not punctual. Among other vegetative characters, the differences were not significant neither.

Table 3. Mean comparison of vegetative and reproductive characteristics of various accessions of Iranian Gole Gav Zaban at the second year by using Duncan test in 5% level.

Accessions	Characteristics					
	Days to stem	Days to flower bud appearance	Days to First Flower	Days to full bloom	Plant Height at the beginning of flowering	Plant Height at the full bloom
Tehran	55 ^{ab}	59.66 ^a	64 ^a	72 ^a	38.3 ^{ab}	63.33 ^a
Hamedan	52 ^b	59 ^a	60.66 ^a	70 ^a	36.66 ^{ab}	66 ^a
Esfehan	49.66 ^b	55.3 ^a	61 ^a	72 ^a	33 ^b	66.33 ^a
Roodbar	52.33 ^{ab}	58 ^a	62 ^a	70.33 ^a	37 ^{ab}	68.66 ^a

Zardband	54.33 ^{ab}	58.66 ^a	63.66 ^a	72.66 ^a	44.33 ^{ab}	70.66 ^a
Ezzat Abad Sofla	57.33 ^a	61.33 ^a	65.66 ^a	76.66 ^a	39 ^{ab}	62 ^a
Feshkooor	58 ^a	61.66 ^a	65.33 ^a	74.66 ^a	39 ^{ab}	66.33 ^a

3.2. The effect of accessions on yield and wet to dry weight rate

The flowers numbers were counted in each picking up. Among the accessions Tehran accession occupied the first rank. The lowest amount was observed in Rodbar accession. Flowering yield had not shown difference in 5% level. Wet to dry weight rate for each accession was measured and it did not revealed considerable difference.

Table 4. Mean comparison of flower's yielding characteristics of various accessions of Iranian Gole Gav Zaban by using Duncan test in 5% level

Accessions	Characteristics		
	Flower number in plant	Flower yielding (in g/6m ²)	Ratio of dry weight to fresh
Tehran	1922 ^a	1133.8 ^a	6.61 ^a
Hamedan	1665 ^a	1006.2 ^a	7.26 ^a
Esfehan	1626 ^{ab}	804 ^{ab}	8a
Roodbar	1145 ^c	581.6 ^c	7.55 ^a
Rahim Abad	1573 ^{ab}	981.5 ^{ab}	6.57 ^a
Zardband	1601 ^{ab}	886.6 ^{ab}	6.52 ^a
Ezzat Abad Sofla	1247 ^{bc}	744.8 ^{bc}	6.42 ^a
Feshkooor	1269 ^c	669.7 ^{bc}	8.33 ^a

3.3. 1000 seeds weight and oil percentage

The result showed that 1000 seeds weight and oil percentage among the repetition and treatments in 5% level of Duncan test weren't meaningful. 1000 seed's weight and oil amount are shown at the table number 5.

Table 5. Mean comparison of 1000-seed weight and oil content of various accessions of Iranian Gole Gav Zaban using Duncan test in 5% level

Accessions	1000-seed weight (g)	Oil content (%)
Tehran	7.75 ^a	35.98 ^a
Hamedan	8.41 ^a	32.33 ^a
Esfehan	8 ^a	35.37 ^a
Roodbar	8.6 ^a	32.2 ^a
Rahim Abad	9.2 ^a	36.14 ^a
Zardband	8 ^a	34.4 ^a
Ezzat Abad Sofla	8.76 ^a	35.3 ^a
Feshkooor	8.76 ^a	33.1 ^a

It was revealed that with 7 irrigation period the dry weight of flower would be 420 kilograms per hectare (Akbarinia and Pileforush, 2009) but in this study the yield were dramatically more than their report. This huge amount of difference could be explained by the impact of different climate, because the field was located in a mountainous region with rainy and foggy days (almost every day) this condition led to more lateral stem, more flowers and it prolonged flowering period as well. As mentioned before, due to the little amount of research on this plant, there is a limitation for comparison the results with other reports. Although it is acceptable that secondary metabolites are basically made beside (under the control of) plants genetic and it considered as an important factor, but the synthesis of secondary metabolites is clearly under the effect of the environmental conditions. It has already seen the major effects of the environmental conditions on the medical plant on the growth progress of medical plant quantity and quality of the active substances (Omidbaigi, 2007). Hence when it said that among different accessions at their 1000 seeds weigh and extracted oil amount, no

considerable difference were observed, It could be related to the same climate that they were grown.

A Survey on the condition of Micro Facies, Sedimentary Environment and the Cretaceous Deposits (With Particular Reference to Central Iran)

Mehran Arian¹, Hamideh Noroozpour²

¹Associate Professor, Department of Geology, Science and Research branch, Islamic Azad University, Tehran, Iran

²Young Researchers Club, Department of Geology, Science and Research branch, Islamic Azad University, Tehran, Iran (Corresponding Author)

Hamideh.Noroozpour@yahoo.com

Abstract: Micro continent of central Iran is a part of middle Iran that is bounded with ophiolitic suture zones in Sistan, Nain, Baft, Doruneh fault and Kashmar – Sabzevar ophiolites and is classifiable into Lut block, Shotori upland, Tabas subduction, Kalmard upland, Posht Badam block, Biaze - Bardsir basin and Yazd block by means of long faults which are dextral strike – slip faults and have westwards inclination. In many regions of Iran, except to Zagros, in approximate boundary of early and late Cretaceous, it is observed evidences of tectonic events which are mainly as land generating and can be compared with worldwide Austrian event, in everywhere in Iran except to rare cases (east of Tehran and Yazd). Upper Cretaceous beds in Iran do not have identical facial characteristics and it seems that in contrast to equal sedimentary condition in early Cretaceous, sedimentary basins in upper Cretaceous have been separated from each other and special condition has been dominated in each basin. As a result of that, lithostratigraphic units except to Zagros and Kopet Dagh have not been named and or have local names in upper Cretaceous of Iran. This article is an overview of the condition of Micro-facies, sedimentary environment and the Cretaceous deposits in central Iran.

[Mehran Arian, Hamideh Noroozpour. A Survey on the condition of Micro Facies, Sedimentary Environment and the Cretaceous Deposits (With Particular Reference to Central Iran)). Journal of American Science 2011;7(6):915-924]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Cretaceous deposits, central Iran, Micro-facies, sedimentary environment.

1. Introduction

In past, micro continent of central Iran was known as a part of Central Iran zone but according to Stöcklin, this motioned area, after hardening of Precambrian bed rock, had characteristics of platform in Paleozoic and has been turned in a active zone in Mesozoic and Cenozoic. Nevertheless it should be said that major structural pattern in this micro continent is type of separated blocks with main faults which each of them have different characteristics and dynamic of micro continent is not same in everywhere. Current evidences demonstrate that:

Katangan orogeny in this area has been dominated since late Precambrian and prior to a platform regime. Except to Lut block and south western edge which have exposures from Tertiary magmatic rocks, Tertiary rocks have least abundance in other parts.

In Paleozoic strata in this region, there is important stratigraphic gaps that most important of them are stratigraphic gaps in beginning of middle Triassic (Eifelian Hiatus) and late Carboniferous (Stephanian Hiatus). (Harold G. Reading, 1996)

Widespread structural – sedimentary non equality has been resulted in dividing micro continent of central Iran into some blocks as follow.

Lut block, with a length of about 900 kilometers, is most eastern part of micro continent of

central Iran. Eastern boundary is specified with Nehbandan fault and flysch zone in east of Iran and western boundary with Naiband fault and Tabas block. On the tectonic map of Iran, (Stöcklin and Nabavi), northern boundary of this block is limited to southern Kashmar basin and southern boundary to Jazmurian subsidence. In 1968, Stöcklin divided this zone into two western and eastern parts which have been separated by Shotori Mountains. Next investigations demonstrate that geological characteristics of these two blocks are not analogical. For example, very thick igneous lava with a thickness of 2,000 – 3,000 meters in Lut block in Cenozoic is not observed in Tabas block. Also tectonic movements in late Cimmerian especially middle Cimmerian which is accompanied with metamorphism and relative stability of Lut block, have a few symptoms of land generating. That is why, especially because of new results, with a review in Lut block and then Tabas block, Jazmurian subsidence and Bazman Mountains, as magmatic arc, were eliminated from this block. (Prothero, Donald R.; Schwab, Fred, 1996)

2. Stratigraphic history

Stratigraphic history of Lut block is very similar to other parts of micro continent of central

Iran. However four characteristics is dominated on stratigraphy of Lut block.

- 1- Considerable impact of early Cimmerian orogeny (Paleobalouch – Rier and Mohafez, 1972) on the rocks older than middle Triassic.
- 2- Relatively vigorous Folding, volcanism and plutonism in middle Jurassic (middle Cimmerian) particularly in Dehsalam and Chahar Farsakh which are accompanied with hardening and stability of Lut block.
- 3- Abundant of volcanic rocks in Tertiary system, particularly in Eocene, which with a thickness of 2,000 meters has covered more than half of Lut block.
- 4- Lacustrine deposits, almost horizontal, in Pliocene – Pleistocene, named Lut formation which is representative of week operation of ultimate folding in this block.

“Tabas block” which is located between Naiband fault in east and Kalmard – Kouhbana fault in west, is a part of a structural territory where in its rims and bed is crossed by faults of bed rock so that it has different stratigraphic sequence, proportion to adjacent areas in Paleozoic and Mesozoic and at the end of Mesozoic due to operation of tectonical convergent stresses, most with a trend of east – west, is turned to lands as a result of elevation of lands and uplift of mountains (Ghasemi and et al, 1381). So there is this belief that current morphological – tectonical features of this block is as a result of reactivation of fault structures and old folding in tectonical cycle of Alp. (Siever, Raymond, 1988)

Tabas block is one of regions which its evolutionary trend in Paleozoic is not concordant to adjacent areas. For example:

- × Gap of Eifelian in this area is not completely clear.
- × Upper Carboniferous rocks which are not present in other regions, has been reported in this area.
- × Volcanic mafic and intermediate activities, even though negligible, are one of characteristics of Tabas block and from this aspect Tabas block can be compared to Alborz Mountains. Mineralization of Lead, zinc and copper in Permian, Triassic and Jurassic in Alborz has generality in Tabas block too which is evidence for similarity of these two zones.

* vigorous subsidence is one of characteristics of Tabas block. Before, it was assumed that this subsidence is limited to Shotori and Shirgasht but nowadays it is specified that most portion of block in Paleozoic, especially Mesozoic to Cretaceous, had considerable subsidence so that there is big volume of Phanerozoic rocks in this block which Paleozoic strata, among them, have a thickness of 2,000-3,000 meters and sometimes up to 10,000 meters in Mesozoic.

“Kalmard block” is a part of micro continent of central Iran which has a north easterly trend and is located between Kalmard fault in east and covered fault of Naiin in west. History of this upland implies to two long emergences, depend on Katangan and early Cimmerian. In other words, in two long time interval this block had had characteristics of upland. (Nichols, Gary, 1999) Oldest rocks of this upland are thick shale – sand stone deposits of Kalmard formation in Precambrian that have been folded due to Katangan event and have been covered by Ordovician deposits (Shirgesht Formation) by an angular unconformity that is evidence of first long sedimentary gap. In this block, Ordovician strata to middle Triassic, in addition to have several consequently sedimentary gaps, are a limited stratigraphic – structural unit among Katangan – early Cimmerian event which have been accumulated in shallow sedimentary environments and procedure of its evolution is completely different from Tabas block. Deposits of upper Triassic have not been reported here and it seems sedimentary gap, due to early Cimmerian, is longer in comparison with Tabas block. Jurassic strata are limited to lias – Middle Douger and lack of younger deposits from middle Douger (Badamo Formation) indicates that long second emergence of this upland has been occurred since middle Douger that orogeny event, in middle Cimmerian, is main inducement for that. (Cambridge, MA, H. G., 1978)

As a structural viewpoint, common trend of folds are north east – south west in northern mid of Kalmard upland that especially have distinct appearance in Paleozoic deposits. Dip of layers is high in eastern side and sometimes is overturned, but is gentler in western side. Operation of reverse longitudinal faults has caused considerable shear structures with similar trend to Kalmard block which Rahbar mountain is one of them. “Biaze – Bardsir subsidence” is located between Posht-e- Badam fault in east and Anar fault in west. Even though many of characteristics in this subsidence such as Precambrian metamorphic bed rock, Paleozoic – middle Triassic platform strata and sand stone - shale deposits in upper Triassic – middle Jurassic are similar to other parts of micro continent but this subsidence has two characteristics, one of them is more vigorous impact of late Cimmerian event which has been accompanied with widespread emersion and metamorphism. Another one, Flysch basins which are representative of basins with vigorous sunbidence and especially it can be observed its upper Cretaceous strata from east of Anar to North of Bardsir. (Reading, H. G, 1996)

“Yazd block” is western part of micro continent of central Iran which is limited to Dorouneh fault to the north and Naiin – Baft ophiolitic band to the west.

There are two specific characteristics in Yazd block. The First one is Anarak metamorphic rocks and second one is Triassic strata of Nakhlak. In Anarak which is named some times Anarak – khors massif, there are complex of pellet – psamite sediments with carbonate and volcanic rocks, pertaining to continental slope that have been metamorphosed as regional and in green schist and blue schist facieses and are accompanied as collided plates to ophiolites, pelagic limerocks and irregular sediments. Although Davoud Zade and Lench (1981) attributed Anarak ophiolites as a part of oceanic crust of former Tethys, in Harat, which has been exposed after rotation of micro continent in current location but Almasian(1977) believes that Anarak ophiolites are of upper Proterozoic age and they can be described related to oceanic back arc basins. Triassic strata of Nakhlak (Nakhlak group) have considerable facial differences with other parts of micro continent of central Iran. According to Davoud Zade and et al., Triassic strata of Nakhlak have similar facies to Aghdarband in Triassic (Aurasia) that as a result of rotation of micro continent in Central Iran, as much as 135° in anticlockwise, have been relocated into present position. It should be said that Nakhlak in Triassic and formations of Nakhlak group and even operation and amount of rotation of micro continent are questionable and needs to review completely.

3. Sediment

Sediment is naturally-occurring material that is broken down by processes of weathering and erosion, and is subsequently transported by the action of fluids such as wind, water, or ice, and/or by the force of gravity acting on the particle itself. Sediments are most often transported by water (fluvial processes), wind (aeolian processes) and glaciers. Beach sands and river channel deposits are examples of fluvial transport and deposition, though sediment also often settles out of slow-moving or standing water in lakes and oceans. Desert sand dunes and loess are examples of aeolian transport and deposition. Glacial moraine deposits and till are ice transported sediments.

Fig1. Sediment in a Gulf

4. Classification

Sediment can be classified based on its grain size and/or its composition.

Grain size

Sediment size is measured on a log base 2 scale, called the "Phi" scale, which classifies particles by size from "colloid" to "boulder".(Fig1) (Table1).

Table1: Classification of Sediment

ϕ scale	Size range (metric)	Size range (inches)	Aggregate class (Wentworth)	Other names
< -8	> 256 mm	> 10.1 in	Boulder	
-6 to -8	64–256 mm	2.5–10.1 in	Cobble	
-5 to -6	32–64 mm	1.26–2.5 in	Very coarse gravel	Pebble
-4 to -5	16–32 mm	0.63–1.26 in	Coarse gravel	Pebble
-3 to -4	8–16 mm	0.31–0.63 in	Medium gravel	Pebble
-2 to -3	4–8 mm	0.157–0.31 in	Fine gravel	Pebble
-1 to -2	2–4 mm	0.079–0.157 in	Very fine gravel	Granule
0 to -1	1–2 mm	0.039–0.079 in	Very coarse sand	
1 to 0	0.5–1 mm	0.020–0.039 in	Coarse sand	
2 to 1	0.25–0.5 mm	0.010–0.020 in	Medium sand	
3 to 2	125–250 μ m	0.0049–0.010 in	Fine sand	
4 to 3	62.5–125 μ m	0.0025–0.0049 in	Very fine sand	
8 to 4	3.9–62.5 μ m	0.00015–0.0025 in	Silt	Mud
> 8	< 3.9 μ m	< 0.00015 in	Clay	Mud
>10	< 1 μ m	< 0.000039 in	Colloid	Mud

• Composition

Composition of sediment can be measured in terms of:

- parent rock lithology
- mineral composition
- chemical make-up.

This leads to an ambiguity in which clay can be used as both a size-range and a composition (see clay minerals).

5. Sediment transport

Sediment builds up on human-made breakwaters because they reduce the speed of water flow, so the stream cannot carry as much sediment load. (Fig2)

Fig2. Glacial transport of boulders. These boulders will be deposited as the glacier retreats.

Sediment is transported based on the strength of the flow that carries it and its own size, volume, density, and shape. Stronger flows will increase the lift and drag on the particle, causing it to rise, while larger or

denser particles will be more likely to fall through the flow.

6. Fluvial processes: rivers, streams, and overland flow

Particle motion

Rivers and streams carry sediment in their flows. This sediment can be in a variety of locations within the flow, depending on the balance between the upwards velocity on the particle (drag and lift forces), and the settling velocity of the particle. These relationships are given in the following table for the Rouse number, which is a ratio of sediment fall velocity to upwards velocity. Where:

- w_s is the fall velocity
- K is the von Kármán constant

u_* is the shear velocity (Table2)

Table2: Relationships for the Rouse number

Mode of Transport	Rouse Number
Bed load	>2.5
Suspended load: 50% Suspended	>1.2, <2.5
Suspended load: 100% Suspended	>0.8, <1.2
Wash load	<0.8

If the upwards velocity approximately equal to the settling velocity, sediment will be transported downstream entirely as suspended load. If the upwards velocity is much less than the settling velocity, but still high enough for the sediment to move (see Initiation of motion), it will move along the bed as bed load by rolling, sliding, and saltating (jumping up into the flow, being transported a short distance then settling again). If the upwards velocity is higher than the settling velocity, the sediment will be transported high in the flow as wash load. As there are generally a range of different particle sizes in the flow, it is common for material of different sizes to move through all areas of the flow for given stream conditions.

7. Fluvial bed forms

Sediment motion can create self-organized structures such as ripples, dunes, antidunes on the river or stream bed. These bedforms are often preserved in sedimentary rocks and can be used to estimate the direction and magnitude of the flow that deposited the sediment. (Figs.3-5).

8. Surface runoff

Overland flow can erode soil particles and transport them downslope. The erosion associated with overland flow may occur through different methods depending on meteorological and flow conditions.

- If the initial impact of rain droplets dislodges soil, the phenomenon is called rainsplash erosion.
- If overland flow is directly responsible for sediment entrainment but does not form gullies, it is called "sheet erosion".

If the flow and the substrate permit channelization, gullies may form; this is termed "gully erosion".

Fig 3. Modern asymmetric ripples developed in sand on the floor of the River. Flow direction is from right to left.

Fig 4. Sinuous-crested dunes exposed

Fig 5. Ancient channel deposit in the Stellarton Formation

9. Key fluvial depositional environments

The major fluvial (river and stream) environments for deposition of sediments include:

1. Deltas (arguably an intermediate environment between fluvial and marine)
2. Point bars
3. Alluvial fans
4. Braided rivers
5. Oxbow lakes
6. Levees

7. Waterfalls

Aeolian processes: wind

Wind results in the transportation of fine sediment and the formation of sand dune fields and soils from airborne dust.

Glacial processes

Glaciers carry a wide range of sediment sizes, and deposit it in moraines. (Fig6)

Fig6. Glacial sediments

10. Mass balance

The overall balance between sediment in transport and sediment being deposited on the bed is given by the Exner equation. This expression states that the rate of increase in bed elevation due to deposition is proportional to the amount of sediment that falls out of the flow. This equation is important in that changes in the power of the flow changes the ability of the flow to carry sediment, and this is reflected in patterns of erosion and deposition observed throughout a stream. This can be localized, and simply due to small obstacles: examples are scour holes behind boulders, where flow accelerates, and deposition on the inside of meander bends. Erosion and deposition can also be regional: erosion can occur due to dam removal and base level fall. Deposition can occur due to dam emplacement that causes the river to pool, and deposit its entire load or due to base level rise.

11. Shores and shallow seas

Seas, oceans, and lakes accumulate sediment over time. The sediment could consist of terrigenous material, which originates on land, but may be deposited in either terrestrial, marine, or lacustrine (lake) environments; or of sediments (often biological) originating in the body of water. Terrigenous material is often supplied by nearby rivers and streams or reworked marine sediment (e.g. sand). In the mid-ocean, living organisms are primarily responsible for the sediment accumulation, their shells sinking to the ocean floor upon death. Deposited sediments are the source of sedimentary

rocks, which can contain fossils of the inhabitants of the body of water that were, upon death, covered by accumulating sediment. Lake bed sediments that have not solidified into rock can be used to determine past climatic conditions.

12. Key marine depositional environments

The major areas for deposition of sediments in the marine environment include:

1. Littoral sands (e.g. beach sands, runoff river sands, coastal bars and spits, largely clastic with little faunal content)
2. The continental shelf (silty clays, increasing marine faunal content).
3. The shelf margin (low terrigenous supply, mostly calcareous faunal skeletons)
4. The shelf slope (much more fine-grained silts and clays)
5. Beds of estuaries with the resultant deposits called "bay mud".

One other depositional environment which is a mixture of fluvial and marine is the turbidite system, which is a major source of sediment to the deep sedimentary and abyssal basins as well as the deep oceanic trenches. Any depression in a marine environment where sediments accumulate over time is known as a sediment trap. (Tanley, Steven M., 1999).

13. Environmental issues

Erosion and agricultural sediment delivery to rivers

One cause of high sediment loads from slash and burn and shifting cultivation of tropical forests. When the ground surface is stripped of vegetation and then seared of all living organisms, the upper soils are vulnerable to both wind and water erosion. In a number of regions of the earth, entire sectors of a country have become erodible. For example, on the Madagascar high central plateau, which constitutes approximately ten percent of that country's land area, most of the land area is devegetated, and gullies have eroded into the underlying soil in furrows typically in excess of 50 meters deep and one kilometer wide.[citation needed] This siltation results in discoloration of rivers to a dark red brown color and leads to fish kills. Erosion is also an issue in areas of modern farming, where the removal of native vegetation for the cultivation and harvesting of a single type of crop has left the soil unsupported. Many of these regions are near rivers and drainages. Loss of soil due to erosion removes useful farmland, adds to sediment loads, and can help transport anthropogenic fertilizers into the river system, which leads to eutrophication. (Cross, T. A.; Homewood, P. W., 1997)

14. Sedimentary depositional environment

In geology, sedimentary depositional environment describes the combination of physical, chemical and biological processes associated with the deposition of a particular type of sediment and, therefore, the rock types that will be formed after lithification, if the sediment is preserved in the rock record. In most cases the environments associated with particular rock types or associations of rock types can be matched to existing analogues. However, the further back in geological time sediments were deposited, the more likely that direct modern analogues are not available (e.g. banded iron formations). (Tables 3-5)

Table 3: Continental Sedimentary Environments

	ALLUVIAL FAN	FLUVIAL	LACUSTRINE	DESERT (DUNES)	PALUDAL
Rock Type	Breccia, conglomerate, arkose	Conglomerate, sandstone, siltstone, shale	Siltstone, shale, limestone, or evaporites (gypsum)	Quartz arenite (sandstone) or gypsum	Peat, coal, black shale, siltstone
Composition	Terrigenous	Terrigenous	Terrigenous, carbonate, or evaporite	Terrigenous or evaporite	Terrigenous
Color	Brown or red	Brown or red	Black, brown, gray, green	Yellow, red, tan, white	Black, gray, or brown
Grain Size	Clay to gravel	Clay to gravel (Finning upward)	Clay to silt or sand (Coarsening upward)	Sand	Clay to silt
Grain Shape	Angular	Rounded to angular	---	Rounded	---
Sorting	Poor	Variable	Variable	Good	Variable
Inorganic Sedimentary Structures	Cross-bedding and graded bedding	Asymmetrical ripples, cross-bedding, graded bedding, tool marks	Symmetrical ripples, lamination, cross-bedding, graded bedding, mudcracks, raindrop prints	Cross-bedding	Laminated to massive
Organic or Biogenic Sedimentary Structures	---	Tracks, trails, burrows	Tracks, trails, burrows, rare stromatolites	Tracks, trails	Root marks, burrows
Fossils	---	Rare freshwater shells, bones, plant fragments	Freshwater shells, fish, bones, plant fragments	---	Plant fossils, rare freshwater shells, bones, fish

15. Recognition of depositional environments in ancient sediments

Depositional environments in ancient sediments are recognised using a combination of sedimentary facies, facies associations, sedimentary structures and fossils, particularly trace fossil assemblages, as they indicate the environment in which they lived.

16. Depositional Environments

Landscapes form and constantly change due to weathering and sedimentation. The area where sediment accumulates and is later buried by other sediment is known as its depositional environment.

There are many large-scale or regional, environments of deposition, as well as hundreds of smaller sub-environments within these regions. For example, rivers are regional depositional environments. Some span distances of hundreds of miles and contain a large number of sub-environments, such as channels, backs wamps, floodplains, abandoned channels, and sand bars.

Table 4: Transitional Sedimentary Environments

	DELTA	BARRIER BEACH	LAGOON	TIDAL FLAT
Rock Type	Sandstone, siltstone, shale, coal	Quartz arenite, coquina	Siltstone, shale, limestone, oolitic limestone or gypsum	Siltstone, shale, calcilitite, dolostone or gypsum
Composition	Terrigenous	Terrigenous or carbonate	Terrigenous, carbonate, or evaporite	Terrigenous, carbonate, or evaporite
Color	Brown, black, gray, green, red	White to tan	Dark gray to black	Gray, brown, tan
Grain Size	Clay to sand (Coarsening upward)	Sand	Clay to silt	Clay to silt
Grain Shape	---	Rounded to angular	---	---
Sorting	Poor	Good	Poor	Variable
Inorganic Sedimentary Structures	Cross-bedding, graded bedding	Cross-bedding, symmetrical ripples	Lamination, ripples, cross-bedding	Lamination, mudcracks, ripples, cross-bedding
Organic or Biogenic Sedimentary Structures	Trails, burrows	Tracks, trails, burrows	Trails, burrows	Stromatolites, trails, tracks, burrows
Fossils	Plant fragments, shells	Marine shells	Marine shells	Marine shells

Table 5: Marine Sedimentary Environments

	REEF	CONTINENTAL SHELF	CONTINENTAL SLOPE AND RISE	ABYSSAL PLAIN
Rock Type	Fossiliferous limestone	Sandstone, shale, siltstone, fossiliferous limestone, oolitic limestone	Litharenite, siltstone, and shale (or limestone)	Shale, chert, micrite, chalk, diatomite
Composition	Carbonate	Terrigenous or carbonate	Terrigenous or carbonate	Terrigenous or carbonate
Color	Gray to white	Gray to brown	Gray, green, brown	Black, white red
Grain Size	Variable, frameworks, few to no grains	Clay to sand	Clay to sand	Clay
Grain Shape	---	---	---	---
Sorting	---	Poor to good	Poor	Good
Inorganic Sedimentary Structures	---	Lamination, cross-bedding	Graded bedding, cross-bedding, lamination, flute marks, tool marks (turbidites)	Lamination
Organic or Biogenic Sedimentary Structures	---	Trails, burrows	Trails, burrows	Trails, burrows
Fossils	Corals, marine shells	Marine shells	Marine shells, rare plant fragments	Marine shells (mostly microscopic)

These depositional sub-environments can also be thought of as depositional landforms, that is, landforms produced by deposition rather than erosion. Depositional environments are often separated into three general types, or settings: terrestrial (on land), marginal marine (coastal), and marine (open ocean). Examples of each of these three regional depositional settings are as follows: terrestrial-alluvial fans, glacial valleys, lakes; marginal marine-beaches, deltas, estuaries, tidal mud and sand flats; marine-coral reefs, abyssal plains, and continental slope. During deposition of sediments, physical structures form that is indicative of the conditions that created them. These are known as sedimentary structures. They may provide information about water depth, current speed, environmental setting (for example, marine versus fresh water) or a variety of other factors. Among the more common of these are: bedding planes, beds, channels, cross-beds, ripples, and mud cracks. Bedding planes are the surfaces separating layers of sediment, or beds, in an outcrop of sediment or rock. The beds represent episodes of sedimentation, while the bedding planes usually represent interruptions in sedimentation, either erosion or simply a lack of deposition. Beds and bedding planes are the most common sedimentary structures. Rivers flow in elongated depressions called channels. When river deposits are preserved in the sediment record (for example as part of a delta system), channels also are preserved. These channels appear in rock outcrops as narrow to broad, v- or u-shaped, "bellies" or depressions at the base of otherwise flat beds. Preserved channels are sometimes called cut-outs, because they "cut-out" part of the underlying bed. Submerged bars along a coast or in a river form when water currents or waves transport large volumes of sand or gravel along the bottom. Similarly, wind currents form dunes from sand on a beach or a desert. While these depositional surface features, or bed forms, build up in size, they also migrate in the direction of water or wind flow. This is known as bar or dune migration. Suspended load or bed load material moves up the shallowly inclined, upwind or upcurrent (stoss) side and falls over the crest of the bed form to the steep, downwind or down current (lee) side. If the bed form is cut perpendicular to its long axis (from the stoss to the lee side) one would observe inclined beds of sediment, called cross-beds, which are the preserved leeward faces of the bed form. In an outcrop, these cross-beds can often be seen stacked one atop another; some may be oriented in opposing directions, indicating a change in current or wind direction. When a current or wave passes over sand or silt in shallow water, it forms ripples on the bottom. Ripples are actually just smaller scale versions of dunes or

bars. Rows of ripples form perpendicular to the flow direction of the water. When formed by a current, these ripples are asymmetrical in cross-section and move downstream by erosion of sediment from the stoss side of the ripple, and deposition on the lee side. Wave-formed ripples on the ocean floor have a more symmetrical profile, because waves move sediments back and forth, not just in one direction. In an outcrop, ripples appear as very small cross-beds, known as cross-laminations, or simply as undulating bedding planes. When water is trapped in a muddy pool that slowly dries up, the slow sedimentation of the clay particles forms a mud layer on the bottom of the pool. As the last of the water evaporates, the moist clay begins to dry up and crack, producing mud cracks as well as variably shaped mud chips known as mud crack polygons. Interpreting the character of any of the sedimentary structures discussed above (for example, ripples) would primarily provide information concerning the nature of the medium of transport. Mud cracks, preserved on the surface of a bed, give some idea of the nature of the depositional environment; specifically that it experienced alternating periods of wet and dry. All clastic and organic sediments suffer one of two fates. Either they accumulate in a depositional environment, then get buried and lithified (turned to rock by compaction and cementation) to produce sedimentary rock, or they are reexposed by erosion after burial, but before lithification, and go through one or more new cycles of weathering-erosion-transport-deposition-burial. (Motiei, H., 1994).

17. Sedimentary structures

Sedimentary structures are those structures formed during sediment deposition. Sedimentary structures such as cross bedding, graded bedding and ripple marks are utilized in stratigraphic studies to indicate original position of strata in geologically complex terrains and understand the depositional environment of the sediment. (Fig7).

18. Soft sediment deformation structures

Soft-sediment deformation structures or SSD, is a consequence of the loading of wet sediment as burial continues after deposition. The heavier sediment "squeezes" the water out of the underlying sediment due to its own weight. There are three common variants of SSD:

- load structures or load casts (also a type of sole marking) are blobs that form when a denser, wet sediment slumps down on and into a less dense sediment below.
- pseudonodules or ball-and-pillow structures, are pinched-off load structures; these may

also be formed by earthquake energy and referred to as seismites.

- flame structures, "fingers" of mud that protrude into overlying sediments.
- clastic dikes are seams of sedimentary material that cut across sedimentary strata. (Fig8)

Fig7. Ripple marks in a siltstone

Fig8. Soft-sediment deformation in etched section of carbonaceous sandstone bed of Reedsville Formation

19. Secondary sedimentary structures

Secondary sedimentary structures form during the diagenesis of a sedimentary rock. Common secondary structures include Liesegang rings, cone-in-cone structures, raindrop impressions, and vegetation-induced sedimentary structures.

The term "Facies" can also refer to distinctive facial expressions associated with conditions such as Williams syndrome. (Fig9).

In geology, facies are a body of rock with specified characteristics. Ideally, a facies is a distinctive rock unit that forms under certain conditions of sedimentation, reflecting a particular process or environment. The term facies was introduced by the Swiss geologist Amantz Gressly in 1838 and was part of his significant contribution to the foundations of modern stratigraphy, which replaced the earlier notions of Neptunism.

Fig9. Eolianite carbonate facies (Holocene)

20. Facies types

Sedimentary facies

Sedimentary facies are bodies of sediment recognizably different from adjacent sediment deposited in a different depositional environment. Generally, facies are distinguished by what aspect of the rock or sediment is being studied. Thus, facies based on petrological characters such as grain size and mineralogy are called lithofacies, whereas facies based on fossil content are called biofacies. These facies types are usually further subdivided, for examples, you might refer to a "tan, cross-bedded oolitic limestone facies" or a "shale facies". The characteristics of the rock unit come from the depositional environment and original composition. Sedimentary facies reflect depositional environment, each facies being a distinct kind of sediment for that area or environment. Since its inception, the facies concept has been extended to related geological concepts. For example, characteristic associations of organic microfossils, and particulate organic material, in rocks or sediments, are called palynofacies. Discrete seismic units are similarly referred to as seismic facies. (Fig10)

Fig10. Middle Triassic marginal marine siltstone and sandstone facies exposed

21. Metamorphic facies

The sequence of minerals that develop during progressive metamorphism (that is, metamorphism at progressively higher temperatures and/or pressures) define a facies series.

Cretaceous

Name of Cretaceous system is derived from chalk deposits in Northern Europe which is longest period, 75 million years in Mesozoic. (Setudehnia, A., 1978)

22. Cretaceous in Iran

Boundary of Jurassic – Cretaceous has not been described properly In Iran and it is believed by all

geologists in Iran that this boundary is identified with late Cimmerian tectonic event which is type of orogeny event. But new results demonstrate that on the contrary of current imagination, in most of regions in Iran, boundary of Tithonian (late Jurassic) and Berriasian (early Cretaceous) epochs are transitional and representative of deep environments. In other words, this event that named early Cimmerian has occurred in beginning of early Cretaceous and after Berriasian epoch and probably in Neocomian (prior to Barremian) that has been resulted in widespread emersion of earth from water and dominance of continental situations. That is why except to Zagros, flysch - bearing basins in east of Iran and Makran are composed of red clastic deposits, after Cimmerian event, which has reached by a transitional passing to Orbitholin - bearing carbonate strata in Barremian - Aptian. These mentioned clastic strata (Shurijeh in Kopet Dag, Sangestan in Central Iran, Noghreh Formation and ...) do not have index fossil and as a stratigraphic viewpoint are known more of Neocomian age. Orbitholin - bearing limestone are most distinct strata from early Cretaceous of Iran which have considerable extent in Alborz (Tizkuh), Kopet Dag (Tirgan formation), Central Iran (Shahkuh and Taft Formation) and Zagros Mountains (Darrian and Fahlian Formation). In widespread zones (except to Makran - Zabol flysch zone), Orbitholin - bearing limestone in Aptian - Barremian with transitional passing, sometimes discontinuously (Zagros), reach to grey - greenish shale - marl deposits which have Ammonites as Beudanticeras in Albian that have been named Kajdomi Formation in Zagros, Dare Zanjir in Central Iran and Sarcheshmeh and Sanganeh in Kopet Dag. Nevertheless, there is no Albian shale in regions where erosional cycles, depend on Austrian events, are vigorous.

23. Conclusion

In many regions of Iran, except to Zagros, in approximate boundary of early and late Cretaceous, it is observed evidences of tectonic events which are mainly as land generating and can be compared with worldwide Austrian event, in everywhere in Iran except to rare cases (east of Tehran and Yazd). Upper Cretaceous beds in Iran do not have identical facial characteristics and it seems that in contrast to equal sedimentary condition in early Cretaceous, sedimentary basins in upper Cretaceous have been separated from each other and special condition has been dominated in each basin. As a result of that, lithostratigraphic units except to Zagros and Kopet Dag have not been named and or have local names in upper Cretaceous of Iran. One of characteristics from late Cretaceous of Iran is iteration of tectonic

movements depend on events which can be compared with sub Hercynian cycle. That is why sedimentary gaps and erosional cycles as subformation are iterative in upper Cretaceous of Iran. Ultimate sedimentary gap in Cretaceous has been occurred after Maastrichtian which can be compared with Laramide event which has ended Cretaceous system. Besides sedimentary deposits, a part of Cretaceous rocks in Iran is as extrusive lava flows or intrusive bodies. (Yazdi, M., Bahrami, A., Vega, F.J., 2009) Volcanic rocks of Lower Cretaceous can be observed in Alborz and more in Sanandaj - Sirjan zone (Eghlid, Haji abd, Kabudasrahang, Orumieh, Mahabad). Volcanic rocks in upper Cretaceous have origin in mantle which has been formed in latest phases of formation of ophiolite and in deep basins and have formed a part of Cretaceous ophiolite sets of Iran. Intrusive masses, pertaining to late Cretaceous, have radiometric age as much as 64 - 70 million years which have exposures particularly in Sanandaj - Sirjan zone (Hamdan, Broujerd, Arak ...). Intrusive bodies of Bazman are also representative of beginning of subduction of Oman oceanic crust beneath Makran of Iran which has been active since late Cretaceous (64 million years ago). Besides magma activities, process of oceanogenesis, formation of oceanic crust, enclosing of suture zone of Neo Tethys in Zagros and Central Iran, thrusting of oceanic crusts over continental margins and finally mineralization process with magmatic origin imply to dynamism of Geodynamic of Iran in Cretaceous.

Abstract: Predict of sediment transport and sedimentation rates are one of the main affecting in coastal areas management. Many tries with emphasis on effective reasons in sediment movements has been done to decide the rate of sediment transport, including the CERC formula. But accurately predict sediment transport rates and trends were affiliated of different such as accuracy and precision statistics, basic and initial data's. Since that may not be possible such information in some areas, was necessary used other techniques such as coastline changes and morphology. In this paper, alongshore sediment transport trends were considered in parts of northern coast of Persian Gulf, by local wave data's, CERC formula, morphological landscapes and coastline changes at the headlands and breakwaters. Coastal morphology and coastline changes were expounded with CORONA (1964) and SPOT (2005) satellite imageries. Alongshore sediment transport was outcome by CERC formula. Based on results, all of morphological landscapes and coastline changes in the study area were confirmed alongshore sediment transport trends got from CERC formula. In some areas that have limit data or lack of substantial document and prepare field information should used coastline changes and morphological settings with empirical relationships, were impossible to inspect the output.

[Hamidreza Masoumi–Ahmad Motamed–Hamidreza Peyrovan– Jamal Tarrah. An investigation of alongshore sediment transport trend, using experimental relations, morphological landscapes and coastline changes in the Persian Gulf. Journal of American Science 2011;7(6):925-930]. (ISSN: 1545-1003).

1. Introduction

Coastal areas have various human activities potential, in the business for beach dwellers and very significant role in the world economies. Management and optimum utilization of these areas involves identifying the natural factors, which verified to the different perspectives of these factors of science related. In coastal engineering analysis of sediment transport issues have great importance. Determination of sedimentation rate and trend, and correct predict of coast changes is very sensitive and important in the construction of ports. A lot of damage associated with the incidence of sedimentation and erosion in coastal areas and especially in ports, despite of considerable advances in estimating the quantity and trend of deposition. Alongshore sediment transport from oblique waves fractures is the most important processes in the coastal morphology, erosion, sedimentation and indicated the beach stability. Although according to the wave specifications changes the rate and direction of sediment transport in certain parts of the coast, but the resultant rate of annual sediment transport, shows alongshore sediment transport predominant trend. To

review and estimate alongshore sediment transport presented the various experimental relations such as, Kamphuis, Van der Meer and CERC [19, 28 and 10]. Considering that, alongshore sediment transport studies used CERC formula in Iran, coefficients of this formula have been done in relation and extracted with wave climate and sedimentation to other coastal countries. Taking of this formula needs more hesitated to use on the Iranian shores (Afsharkaveh, N. and Soltanour, M. 2010). To this purpose, sediment transport investigation was not enough with using these relationships and achievement of information is essential from the natural conditions of each region. In this field, many studies from various perspectives, has been done by the researchers such as, Wang and et al (1998), White (1998), Wang and Kraus (1999), Masselink and Pattiaratchi (2001), LaValle and et al (2001), Camenen and Larroude (2003), Soulsby and Damgaard (2005), Patsch and Griggs (2008), Brown and Davies (2009), Soltanpour and Kaveh Afshar (2010).

Coastline known as the boundary between land and water (Dolan, R., Hayden, B.P., May, P., May, S., 1980, and Horikawa, K., 1988). In fact, periodically

change at time intervals in the beach location, due to alongshore and cross-shore sediment transport and these changes due to the dynamic movements of sea water in coastal areas, such as tide and waves. On the other hand, alongshore sediment transport is one of the influence factors to sediment supply along the coast. Any change in this trend, including changes in the quantity that cause the accretion and erosion trends in coastal areas. Changes of coastline are one of the important issues of coastal scientists and used in the coastal management and coastal engineering. Position and the history of coastline changes can be produce important information in the coastal protection, coastal development projects and to calibration and numericalization of coastal area models (Hanson, H., Gravens, M.B., Kraus, N.C., 1988). To analyse the trends and coastline changes, should be investigated those in time and space, based on fundamental principles coastal strip (Boak, E.B., Turner, I.L., 2005). Short-term changes in coastline are said to forward and backward displacement of the coast in decades timescale, usually due to erosion and sedimentation processes along the coasts and the changes in the beach profile. These changes are more pronounce in coastal structures limits and some morphological landscapes such as the capes. Thus, changing in coastline position could be used as an index to determine the alongshore sediment transport trend besides beach morphology changes. On changes in coastlines and its associated phenomena, can also mentioned to many studies such as, Frihy and Dewidar (1993), Camfield and Morang (1996), Storlazzi and Field (2000), Masselink and Pattiaratchi (2001), Gharibreza and et al (2004), Chen and Chang (2009) and Anfuso and et al (2011).

Investigation of sedimentation behind breakwaters and coastal structures and review of erosion and sedimentation pattern on the adjacent coastal areas is a method for estimating alongshore sediment transport rate. Thus, field data; such as hydrographic data's in different years and their studies can be benefited and analysed conclude of them with the results of laboratory models and empirical formulas. Then exist of dredging information in courses and the volumes and removal of material from coastal sediments, as the output of the coastal zone is necessary in the study period (U. S. Army Corps of Engineering. 1994). Nevertheless, in some areas, doing of this process if it is not possible due to weakness of base data, such as recorded field data, other techniques must be use to measured accuracy of the output of experimental relations. Since most ports of the study area due to limited data or lack of substantial documented field information (or with poor information), such as hydrographic concepts and sediment exit data, only using empirical

relationships for analysis of sedimentary processes will not be without critic. Therefore, in this research used the morphological landscapes and coastline changes, with alongshore sediment transport, as a natural constants and erosion and sedimentation functions.

2. Study area

In this research, has been investigated the mostly alongshore sediment transport rate by wave's data, satellite imagery, bathymetric maps, computing the sediment transport rate and GIS. Also, coastline changes investigated in the 41 years time-span, between the 1964 and 2005, during about 400 km of the north-eastern Persian Gulf coasts, from Berke Seflin Bay to Nayband Cape. These regions located between 53°, 34' E to 55°, 17' E and 26°, 29' N to 27°, 29' N, have morphology, geology and land use variation and several commercial and fishery port and, oil terminals (Fig. 1). These areas are one of the warmest in the Middle East (Anfuso, G. Pranzini, E. and Vitale, G. 2011), which has arid climate, with 80 to 200 mm mean annual rainfall (Meteorological yearbook of Iran. 2009). Theses coasts has Semi-diurnal tide, mean level was between 1.06 to 1.59 m (Aghtouman, P. 2008) and located along the Zagros mountain anticlines with the marls, siltstones, mudstones and limestones of Aghajari, Mishan and Gachsaran formations. In addition, conglomerates and limy sandstones of Bakhtiari formation and diapirs of salty Hormoz series have exposure in some coastal areas.

Widespread exploitation of these areas, including commercial, fishing, extraction and exploration of hydrocarbon, tourism and geotourism has caused, this part of the Persian Gulf coasts have remarkable growth and advances over the past decade. On the other hand, inattention to basic studies in these areas and do not implementation of comprehensive coastal zone management causes many problems among harmful coastline changes and sedimentation problem in ports.

3. Alongshore sediment transport trend

To estimation of alongshore sediment transport potential, has been used deep-water wave data, output of wave modelling Iran Seas project (General Directorate of Coast and Port Engineering. 2009). Extracted and used wave data parameters of 25 points that employed in CERC formula, such as wave height, wave period, occurrence and angle of waves. k coefficient in CERC formula considered 0.39 according to CEM recommendation (CEM Appendix A- Glossary of Coastal Terminology, 2003).

Fig 1: Study area and its major ports. a) Kong and Lenge ports coastal area. b) Sandy beach dunes and Shenah port. c) Bostaneh port coastal area. d) Hasineh port near the Hasineh salt domes. e) Charak port coastal area and Tangekhar river mouth. f) Aaftab port, Kalat salt domes and its alluvial fan. g) Chirouye coastal area and head. h) Mogham and Nakhilu coastal area and Khur river mouth. i) Nayband Cape in western of study area.

Thus obtained the net potential of alongshore sediment transport and extracted sediment transport overcome directions along the study coastal areas (Fig. 2). Based on the results, alongshore sediment transport pattern were divergent in Berke Seflin area so a trend is towards the East- South-east and the other one is to South-west. South-east trend were along to Shenah head and occurred convergence of currents in this region. This convergence pattern is because of the south-eastern current pattern between the Bostaneh coasts and Shenah head. Alongshore sediment transport pattern from the Eastern areas of Aaftab port is East and South-east and the trend seen to Bostaneh head that is converging currents. This divergence pattern causes Western alongshore sediment transport trend to the Chirouye head. Chirouye head is convergence location of this current trend with East South-eastern alongshore sediment transport current that flow from Nayband Cape. In addition, in Nayband Cape divergence of alongshore sediment transport currents occurred in to south-east and north to Nayband Gulf.

Fig 2: Pattern of alongshore sediment transport currents in coastal study area.

4. Coastline changes

The coastline changes have been considered in 41 years period between 1964 and 2005 by compared of CORONA and SPOT satellite imageries. CORONA is the first strategic management of Science and Technology Organization of United States satellite series, which has been built and used in cooperation with the USAF. At first, CORONA satellite was used with 24 inches camera, in height of 165 to 460 km from the earth that the cameras could be take images with less than 7.5 m resolution from the earth. This images out of the classified were reduces the accuracy at 2002 (NRO, 2010). CORONA and SPOT5 image that has 10 m spatial resolution have been based on compared periods shoreline positions. Noteworthy, 1964 CORONA images shows the coasts with the least interference of human impression such as ports and coastal structures, and this period have well capable of providing human effects in the coastal area. Coastline was considering the sea and land borders as exactly consistent mean high tides level (CEM Appendix A- Glossary of Coastal Terminology, 2003). The mean high tide level in different parts of the studied coastline is variable between 1.7 to 2.5 meters. Then, extracted mean high tide line from bathymetric maps and sketched waterline after corrections and cutting out errors from each one of the satellite images. These two lines were compared with separate and extract the shorelines. Mean high tide line provided by the interpolation of mean high tide levels in different parts of study area in the GIS tools, published by Iranian National Cartographic Centre (National Geographic center of Iran, 2004), and based on bathymetric maps zero line.

Accretion and regression pattern of shorelines has been obtain by comparison of two-term satellite imagery coastlines and set the critical points in the study area. Naturally, these critical points are located mostly at the limit of coastal structures such as breakwaters, and natural morphological landscapes such as heads and capes. In each of these points were calculated rate of coastline changes and used comply its results to alongshore sediment transport current trends. In this way were derived accretion and regression pattern of coastline at the limit of coastal structures and natural morphological landscapes (for example, Fig. 3). Based on these results have been determined the rate of shoreline accretion/regression within the meters scale (Table 1).

The results of coastline changes shows the accretion rate on the back of Javad al aemme, Mogham, Nakhilu, Charak, Hasineh and Shenah ports due to up drift (generally West - East) over the accretion rate due to down drift (generally East - West). Instead of this trend, the accretion rate due to up drift is less

than the accretion rate due to down drift in Aaftab, Lenge and Kong ports (Table 1). Also left coast of Chirouye head has erosional pattern and right coast of that has accessional pattern. This pattern is a way the top of head be displaced to east in study time-span (Fig. 3).

Table 1: coastline accretion/regression at the critical points in the study area (positive and negative values were respectively accretion and regression of shoreline)

Down drift accretion (m)	Up drift accretion (m)	Location	Down drift accretion (m)	Up drift accretion (m)	Location
+19	+43	Charak port	+43	+105	Javad al aemme port
+35	+122	Hasineh port	+82	+300	Moghham port
+127	+116	Bostaneh port	+33	+56	Nakhilu port
+33	+48	Shenas port	+83(right)	-45(left)	Chirouye head
+115	+57	Lenge port	+85	+54	Aaftab port
+127	+59	Kong port	+64	+90	Old Charak jetty

Fig 3: Extracted shorelines of Chirouye head base on CORONA (left), SPOT (mead) and sedimentation/erosion trend (right).

5. Morphological landscapes influenced of alongshore sediment transport

Coastal morphology directly affected by sedimentary processes, such as sediment supply by rivers and streams from land and coastal sediment transport currents. Alongshore currents as one of sediment transporters along the shorelines were putting order some natural morphological landscapes such as, alluvial sediments complex on drains mouths, river deltas, coastal sandbars and ridges. Thus, those be inclined over the time along the longshore currents and/or will have been special erosion or sedimentation patterns. These landscapes can be easily interpreted evaluation of satellite images. In this process have been used spot images. Therefore, morphological landscapes from Nayband cape to Chirouye head coasts indicate general alongshore trend to east. In these areas, small deltas of seasonal drains mouth (Fig. 4a) and some beach rims (Fig. 4b) have eastward trend. The morphological landscapes Between Chirouye head and Kalat bay coasts indicate general alongshore trend to west, so convergence of these trends causes Chirouye head (Fig. 4c). In these areas, small deltas of seasonal drains mouth of Kalat

bay western coast have westward trend (Fig. 4d). Kalat bay eastern coast observed reverse trend, as deltas of seasonal drains mouth have eastward trend (Fig. 4e). This eastward trend was observed to Bostaneh head coastal morphology. This scape evident clearly in the Tangekhur river mouth, Charak estuary (Fig. 5a) and drains led to the sea from Hasineh salt dome (Fig. 5e). The same evidence can be seen to Bostaneh head. In addition, morphological landscapes of Shenass western coast show the eastward trend, so that the drains mouth have eastward trend in this area. The arrangement pattern of transverse sand dunes at Shenass head indicate converge two currents and south-eastward growth of sand dune system and creation of this head (Fig. 5d). In the coastal areas from Shenass head to Berke Seflin bay, some morphological landscapes have eastward trend, so can be cited the deposition pattern of drains mouth (Fig. 5b). Morphological coastal landscapes such as mouth and bars of estuaries and spits are inclined to the east from Berke Seflin bay Eastern coast toward east to Khuran area at Mehran river delta (Fig. 5c).

Fig. 4: a) eastward trend of seasonal drains mouth of the Nayband Cape eastern coasts. b) Eastward trend of Chirouye northwestern sandy beaches. c) Growth pattern of Chirouye head due to convergence alongshore sediment transport currents. d) Westward trend of seasonal drains mouth of the Kalat bay western coast. e) Eastward trend of seasonal drains mouth of Kalat bay eastern coast.

Fig. 5: a) Eastward trend of seasonal drains mouth and bars of Charak estuary. b) Westward trend of led to the sea seasonal drains mouth from Kong salt dome. c) Eastward pattern of estuaries bars and spits of Khuran area. d) Eastward trend of seasonal drains mouth of Shenass head western coast and arrangement pattern of transverse sand dunes. e) Eastward trend of led to the sea seasonal drains mouth from Hasineh salt dome.

Conclusion

According to the results of the coastline changes, can be settle the main alongshore sediment transport current along the coastal study areas. Attention to Javad al aemme and Nakhilu ports position, which sedimentation due to up drift was more than down drift in both of them, have eastward alongshore sediment current at Javad al aemme and Mogham areas and southward at Nakhilu area. Also eastward inclinations of morphological landscapes confirm this result in these areas, thus were established the result of the CERC formula. The arrangement pattern of transverse dunes, confirmed the regressional trend in the western coast and accretional trend in the eastern coast and this caused south-eastward accretion of the Chirouye head. This causes rotation of south-eastward sediment current along the eastern; towards the western coast and convergence with the south-westward sediment current in this head. This convergence was causing sedimentation and thus Chirouye head and its western coast has existed accretional model. Further, the results of the CERC Formula have shown convergence of these two currents within the Chirouye head. Attention to more accretion rate of shoreline due to down drift than up drift in Aaftab port and westward trend of mouths and small deltas of seasonal drains in western coasts of this area, the mostly sediment transport current in this region has east to west direction. Therefore, these settles conform to CERC formula results. Sedimentation within the Aaftab port pool also confirmed this trend (Fig. 6a), so the pool entrance built facing alongshore sediment transport current. However, coastal accretion trend and morphological landscapes have showed the west to east mostly sediment transport current in Hasineh and Charak areas. Based on morphological evidence, this current and westward current in Aaftab port area, divergence at Kalat bay. Thus, based on coastal accretions and sediment masses, alongshore sediment transport current were west-northwest to east-southeast in Charak port area, Tangekhur river mouth and Charak estuary and north to south in the Hasineh port area, which conform to current patterns resulted by CERC formula.

Fig 6: a) Sedimentation within the Aaftab port pool. b) Eastward trend of sand ridges on west coasts of Bostaneh port and sedimentation within its pool.

Westward mostly alongshore current was distinguished by more accretion rate of shoreline due to down drift than up drift and sedimentation on base of main breakwater in Bostaneh port conform to CERC formula results. On the other side, eastward morphological landscapes between Bostaneh port and head can sign up the west to east alongshore current (Fig. 6b), inconsistent with the CERC formula and coastline changes results. Noteworthy, the morphological landscapes such as sand ridges formed during the coastline changes study time period and inexistent in CORONA satellite image. This matter can be justified with build Bostaneh port, thus build that at 4 km away the Bostaneh head, and cutting the westward littoral drift by port, caused intensifies eastward currents effects, and the ridges formed after builds harbour. Eastward morphological landscapes from eastern coasts of Bostaneh to Shenah areas and arrangement pattern of Shenah head sandy dunes (Fig. 5d) point to occur alongshore current towards the east. Convergence of this current and south-westward current from the south-east coast of Shenah area, was created progressive shore with transverse dunes and formation of sedimentary Shenah head. All the morphological landscapes (Fig. 5b) and coastline changes from Shenah head to Berke Seflin bay (Table 2, coastline changes in Shenah, Kong and Lenge ports) conform to CERC formula results and despite the south-westward mostly alongshore currents. Meanwhile, construction of Shenah port facing to the south-westward alongshore currents has causing sedimentation in the pool. Turbulence between pool waters and waves is clearly visible in Fig. 5d. Because of the related to Qeshm island and existence of Mehran river great delta at the south-east and east of Berke Seflin bay, pattern of alongshore currents were shown rotation and dispersion in to south-east and south-west directions. Estuaries bars and spits were shown the existence of south-eastward current on the eastern coasts of Berke Seflin bay (Fig. 5c). Attention to results, in some area that limited data or lack of substantial documented and preparing the field information were impossible, to inspect the output should used coastline changes and morphological settings with empirical relationships. In-attention to vital and citing only empirical relationships may cause wrong conclusion in analysing the sediment transport currents. In this case, implementations of coastal construction projects and coastal protection programs have risks such as damaging erosion or sedimentation. Including such events, can be mentioned in the Aaftab and Shenah ports. Other benefits of combining the studies of morphology and coastline changes along the empirical relationships, was taken the results from natural processes that shape the coast over the time.

These reasons were results from the reacting all effective processes in coastal area, which referring and use such results would be useful. Thus, can interpret any of coastal area contexts, such as littoral sedimentary cell boundaries and effect of human. Meanwhile the use of tools GIS is affordable because of high-speed, low cost and good accuracy in the information against such interpretations of field data.

Abstract: In the present numerical study, by using the Fluent software, the ability of it to predict the complex flow conditions is presented. In this purpose, experimental data over a flip bucket in different hydraulic conditions were selected. To simulate the turbulence phenomenon, $k-\varepsilon$ Standard turbulence model was selected. Moreover to predict jet surface the VOF free surface model was employed. Finally by comprising the numerical model and available experimental results, a good agreement was observed.

[M. Jorabloo, R. Maghsoodi, H. Sarkardeh. **3D Simulation of Flow over Flip Buckets at Dams.** Journal of American Science 2011;7(6):931-936]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Flip Bucket; Fluent Software; VOF Free Surface Model; $k-\varepsilon$ Standard Turbulence Model.

1. Introduction

The energy dissipater structure for a spillway could be a flip bucket because it is generally the most economical solution. Improving in design parameters of a flip bucket will protect the tailrace from scouring of impacted jet. Analysis of flow with free surface which passes over a curved boundary by the gravity force is a challenging problem in hydrodynamics. From 1933 till 1954, United State Bureau of Reclamation (USBR) regarding to hydraulic model tests, covered a complete range of bucket sizes and tail water elevations, were conducted to verify the bucket dimensions and details and to establish general relations between bucket size, discharge capacity, height of fall, and the maximum and minimum tail water depth limits. Analytical studies on potential flows past spillway flip buckets were done by many researchers such as: Siao and Hubbard (1953), Tinney et al. (1961), Orlov (1968) Siao et al. (1988). Xie-Qing Xu and Xiao-Xia Sun (1990), by using the finite element method, obtained pressure distribution over spillway and flow bucket. Vischer and Hager (1998) proposed that flip buckets are used when energy has to be dissipated for a flow velocity larger than about 15–20 m/s. Roman Juon and Willi H. Hager (2000) and Valentin Heller et al. (2005) and Remo Steiner et al. (2008) performed some investigations on flip buckets, including scale effects in hydraulic models, bucket pressure distribution, and nappe trajectories with and without the presence of deflectors.

Regarding to the previous researches, in the present study by using the FLUENT Software, flow over the flip buckets at dams was numerically studied.

2. Experimental Data Collected

Selected experimental tests for this numerical study were conducted in a smooth channel by Roman Juon and Willi H. Hager (2000). The selected test cases include eight fixed-bed cases. All experimental tests were conducted in a flume with 499 mm wide and 700 mm deep with a total length of 7 m (Figure 1).

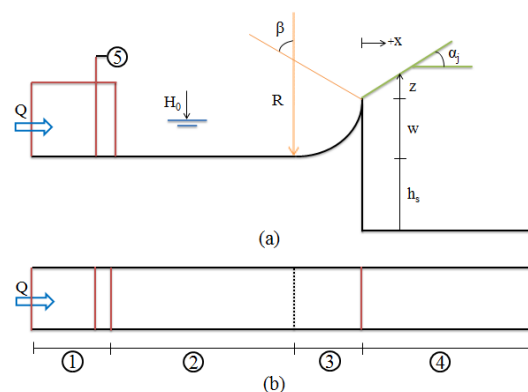

Figure 1. Schematic view of the selected experimental setup: (a) Side view (b) Plan view

In the Figure 1, notification numbers are as 1) Jet box, 2) Approach channel, 3) Flip bucket, 4) Downstream channel, 5) Start of chute. Other parameters are given in Table 1 ($F_0 = V_0 / (gH_0)^{1/2}$).

The channel had a PVC invert and right wall and a left glass wall. The flip bucket consisted of a 1 m long approach channel with a bucket of radius R and deflection angle β . The approach channel was inserted 250 mm above the original channel invert.

Table 1. Selected Experimental Parameters

	R (cm)	F ₀	H ₀
Test 1	20	5	5

Test 3	20	4	5
Test 4	20	3	6
Test 5	20	3	5
Test 6	25	5	5
Test 7	25	4	5
Test 8	25	3	5

3. Numerical Modeling

In this section the turbulence model which used in the present research is described. In Reynolds averaging for the velocity components:

$$u_i = \bar{u}_i + u'_i \tag{1}$$

Where \bar{u}_i and u'_i are the mean and fluctuating velocity components. Substituting expressions of this form for the flow variables into the instantaneous continuity and momentum equations and simplifying (and dropping the over bar on the mean velocity, \bar{u}):

$$\frac{\partial \rho}{\partial t} + \frac{\partial}{\partial x_j}(\rho u_j) = 0 \tag{2}$$

$$\frac{\partial}{\partial t}(\rho u_i) + \frac{\partial}{\partial x_j}(\rho u_i u_j) = -\frac{\partial p}{\partial x_i} + \frac{\partial}{\partial x_j} \left[\mu \left(\frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} - \frac{2}{3} \delta_{ij} \frac{\partial u_k}{\partial x_k} \right) \right] + \frac{\partial}{\partial x_j}(-\rho u'_i u'_j) \tag{3}$$

where equations 1 and 2 are called Reynolds-averaged Navier-Stokes (RANS) equations that $-\rho u'_i u'_j$ is called Reynolds stresses, must be modeled. by using the Boussinesq hypothesis (Hinze, 1975) relate the Reynolds stresses to the mean velocity gradients:

$$-\rho \overline{u'_i u'_j} = \mu_t \left(\frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} \right) - \frac{2}{3} \left(\rho k + \mu_t \frac{\partial u_i}{\partial x_i} \right) \delta_{ij} \tag{4}$$

The Boussinesq hypothesis is used in the k-ε models. In the present work the Standard k-ε model (Launder and Spalding, 1972) was used to simulate the turbulence phenomenon. For Modeling the effective viscosity:

$$\mu_t = \rho C_\mu \frac{k^2}{\varepsilon} \tag{5}$$

where C_μ is a constant, k is the turbulence kinetic, and ε is the turbulence rate of dissipation. The transport equations for the Standard k-ε model are as follow:

$$\frac{\partial}{\partial t}(\rho k) + \frac{\partial}{\partial x_i}(\rho k u_i) =$$

$$\frac{\partial}{\partial t}(\rho \varepsilon) + \frac{\partial}{\partial x_i}(\rho \varepsilon u_i) =$$

$$\frac{\partial}{\partial x_j} \left[\left(\mu + \frac{\mu_t}{\sigma_k} \right) \frac{\partial k}{\partial x_j} \right] + G_k + G_b - \rho \varepsilon - Y_M \tag{6}$$

$$\frac{\partial}{\partial t}(\rho \varepsilon) + \frac{\partial}{\partial x_i}(\rho \varepsilon u_i) =$$

$$\frac{\partial}{\partial x_j} \left[\left(\mu + \frac{\mu_t}{\sigma_\varepsilon} \right) \frac{\partial \varepsilon}{\partial x_j} \right] + C_{1\varepsilon} \frac{\varepsilon}{k} (G_k + C_{3\varepsilon} G_b) - C_{2\varepsilon} \rho \frac{\varepsilon^2}{k} \tag{7}$$

Standard constants of k-ε model are listed in Table 2 and were used in the model.

Table 2. Standard k-ε turbulence model constants

	C _{1ε}	C _{2ε}	C _μ	σ _k	σ _ε
Standard k-ε	1.44	1.92	0.09	1.0	1.3

The volume of fluid (VOF) method was employed as a powerful computational tool for the analysis of free surface flow (Hirt and Nichols, 1981). The tracking of the interface(s) between the phases is accomplished by the solution of a continuity equation for the volume fraction of one (or more) of the phases. In the present research, both structured and unstructured mesh was used (Figure 2).

Figure 2. Computational grid in the vicinity of flip bucket: (a) 3D view, (a) Side view.

Boundary conditions which were employed in this investigation are (Figure 3): Two different inlets were needed to define the water flow (Inlet 1) and air flow (Inlet 2) in the model domain. These inlets were defined as stream-wise velocity inlets that require the values of velocity. To estimate the effect of walls on the flow, empirical wall functions known as standard wall functions (Launder and Spalding, 1974) were used. The upper boundary above the air phase was

specified as a symmetry condition, which enforces a zero normal velocity and a zero shear stress.

Figure 3. Solution domain and boundaries for modeled flip bucket

Other considerations in this simulation in this section are presented. The PRESTO pressure discretization was selected because this scheme was showed the best convergence in this simulation. The momentum and turbulent kinetic energy equations were discretized by first order upwind. The PISO pressure-velocity coupling algorithm was also used. Using unsteady and free surface equations required fine grid spacing and small initial time steps. To do so, a sensitivity analysis was performed on grid spacing and finally a number of meshes equal to 200000 were selected as the best result. Time steps were selected equal to 0.001 to 0.01. Due to model runs, solution convergence and water-surface profiles were monitored. The value of VOF parameter was selected equal to 0.5 which is a common practice for volume fraction results (Fluent Manual, 2005 and Dargahi, 2006).

4. Verification

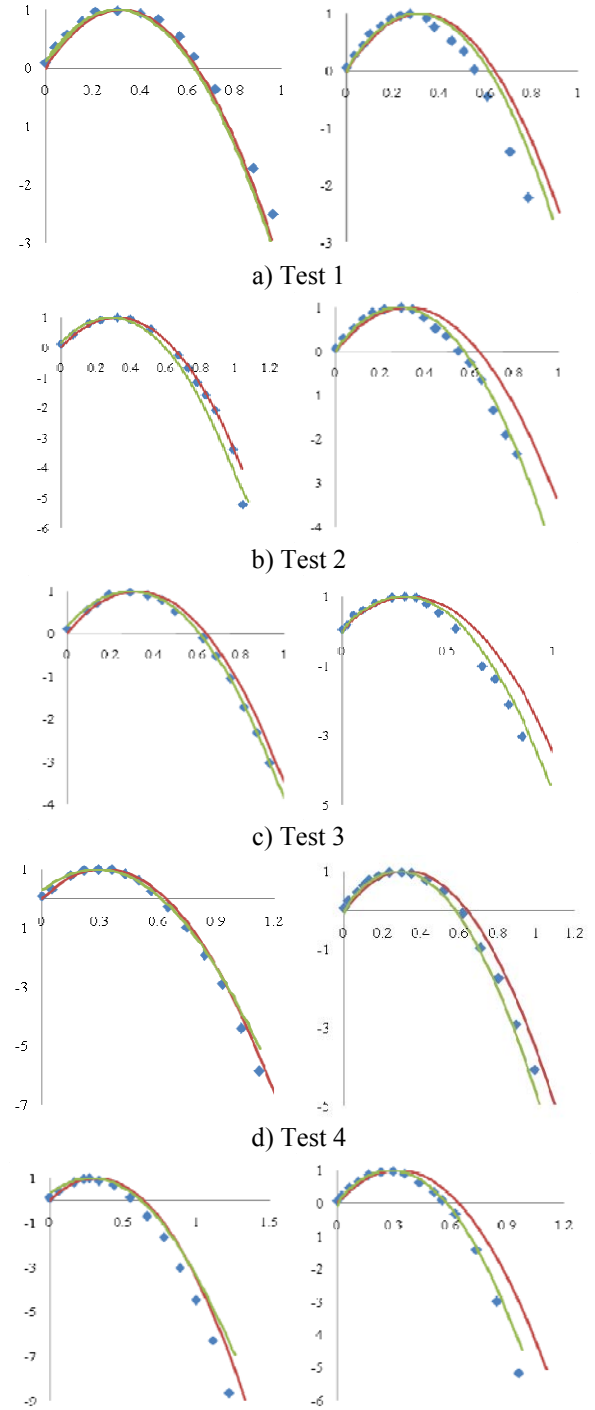

Before employing the numerical model, it is necessary to ensure about the accuracy of the numerical model. For this purpose, experimental cases which were mentioned in the previous section were employed. To evaluate the free surface, the first case was selected regarding the available flume data. Existing experimental results to validate the numerical simulation predictions included water surface profiles and pressure distributions. To calculate the jet trajectory by defining α_j as the takeoff angle and V_j as the takeoff velocity, the trajectory geometry $z(x)$ may be described for free jet flow as

$$z = z_0 + \tan \alpha_j x - \frac{g x^2}{2 V_j^2 \cos^2 \alpha_j} \tag{9}$$

By considering the flow depth across the flip bucket remains constant, takeoff flow depth at $x=0$ and so $z_0=h_0$ for the upper nappe and $z_0=0$ for the lower nappe. The takeoff velocity V_j is V_o at $h_0 \geq 5 \text{ cm}$. By introducing the normalized coordinates relating to the upper (subscript O) nappe profile as $Z_O = (z_0 - h_0)/(z_M - h_0)$ and $X = x/(h_0 F_0^2)$ where z_M , is the maximum (subscript M) nappe elevation above the takeoff elevation, results in

$$Z_0 = \tan \alpha_j X - \frac{1}{2} \frac{X^2}{\cos^2 \alpha_j} \tag{10}$$

Figure 4 shows the numerical results in comparison with experimental data $Z_O(X)$ for various flow configurations and produces agreement with equation 10 provided $\alpha_j=20^\circ$ is fitted. The data for the lower (subscript U) nappe trajectory were analyzed correspondingly using $Z_U = z_U/z_M$ and $X = x/(h_0 F_0^2)$.
