Marsland Press, New York, USA

The Journal of American Science

The *Journal of American Science* is an international journal with a purpose to enhance our natural and scientific knowledge dissemination in the world. Any valuable paper that describes natural phenomena and existence or any reports that convey scientific research and pursuit is welcome. Papers submitted could be reviews, objective descriptions, research reports, opinions/debates, news, letters, and other types of writings that are nature and science related. All the manuscripts will be processed in a professional peer review. After the peer review, the journal will make the best efforts to publish all the valuable works as soon as possible.

Editor-in-Chief: Hongbao Ma (mahongbao@gmail.com)

Associate Editors-in-Chief: Shen Cherng, Jingjing Z Edmondson, Qiang Fu, Yongsheng Ma

Editors: George Chen, Mark Hansen, Mary Herbert, Wayne Jiang, Chuan Liang, Mark Lindley, Margaret Ma, Mike Ma, Jagmohan Singh Negi, Da Ouyang, Xiaofeng Ren, Ajaya Kumar Sahoo, Shufang Shi, Tracy X Qiao, Pankaj Sah, George Warren, Qing Xia, Yonggang Xie, Shulai Xu, Lijian Yang, Yan Young, Mona Saad Ali Zaki, Tina Zhang, Ruanbao Zhou, Yi Zhu

Web Design: Jenny Young; Hongbao Ma

Introductions to Authors

1. General Information

(1) Goals: As an international journal published both in print and on internet, *The Journal of American Science* is dedicated to the dissemination of fundamental knowledge in all areas of nature and science. The main purpose of *The Journal of American Science* is to enhance our knowledge spreading in the world. It publishes full-length papers (original contributions), reviews, rapid communications, and any debates and opinions in all the fields of nature and science.

(2) What to Do: *The Journal of American Science* provides a place for discussion of scientific news, research, theory, philosophy, profession and technology - that will drive scientific progress. Research reports and regular manuscripts that contain new and significant information of general interest are welcome.

(3) Who: All people are welcome to submit manuscripts in any fields of nature and science.

(4) Distributions: Web version of the journal is opened to the world. The printed journal will be distributed to the selected libraries and institutions. For the subscription of other readers please contact with: editor@americanscience.org or americansciencej@gmail.com or editor@sciencepub.net

(5) Advertisements: The price will be calculated as US\$400/page, i.e. US\$200/a half page, US\$100/a quarter page, etc. Any size of the advertisement is welcome.

2. Manuscripts Submission

(1) Submission Methods: Electronic submission through email is encouraged and hard copies plus an IBM formatted computer diskette would also be accepted.

(2) Software: The Microsoft Word file will be preferred.

(3) Font: Normal, Times New Roman, 10 pt, single space.

(4) Indent: Type 4 spaces in the beginning of each new paragraph.

(5) Manuscript: Don't use "Footnote" or "Header and Footer".

(6) Cover Page: Put detail information of authors and a short title in the cover page.

(7) Title: Use Title Case in the title and subtitles, e.g. "Debt and Agency Costs".

(8) Figures and Tables: Use full word of figure and table, e.g. "Figure 1. Annual Income of Different Groups", "Table 1. Annual Increase of Investment".

(9) References: Cite references by "last name, year", e.g. "(Smith, 2003)". References should include all the authors' last names and initials, title, journal, year, volume, issue, and pages etc.

Reference Examples:

Journal Article: Hacker J, Hentschel U, Dobrindt U. Prokaryotic chromosomes and disease. *Science* 2003;301(34):790-3.

Book: Berkowitz BA, Katzung BG. Basic and clinical evaluation of new drugs. In: Katzung BG, ed. Basic and clinical pharmacology. Appleton & Lance Publisher. Norwalk, Connecticut, USA. 1995:60-9.

(10) Submission Address: editor@sciencepub.net, Marsland Company, P.O. Box 21126, Lansing, Michigan 48909, The United States, 517-980-4106.

(11) Reviewers: Authors are encouraged to suggest 2-8 competent reviewers with their name and email.

3. Manuscript Preparation

Each manuscript is suggested to include the following components but authors can do their own ways:

(1) Title page: including the complete article title; each author's full name; institution(s) with which each author is affiliated, with city, state/province, zip code, and country; and the name, complete mailing address, telephone number, facsimile number (if available), and e-mail address for all correspondence.

(2) Abstract: including Background, Materials and Methods, Results, and Discussions.

(3) Key Words.

(4) Introduction.

(5) Materials and Methods.

(6) Results.

(7) Discussions.

(8) References.

(9) Acknowledgments.

4. Copyright and Responsibility of Authors to their Articles: When the manuscript(s) is submitted to the journal, the authors agree the following: All the authors have participated sufficiently in this work; The article is not published elsewhere; Authors are responsibility on the contents of the article; The journal and author(s) have same right for the copyright of the article and either of the journal or author(s) can use it by anyway without noting the other party.

Abstract: Importance of women issue at Iran especially rural area, at one side face with fast population growth and mass of unemployed at process of access to rural growth and development, and at other side with limitation of facilities and productive resources. Rural women at all production level of agriculture products and livestock productions work alongside men and generally, development is multidimensional process and contains different economic, social, cultural and political dimensions. Women's participation at this process is active and affective participation, and main aspect of this participation was its economic dimension for rural women. Rural women have key role as a producer at agriculture activities, rural sources and services at rural area. rural women most efficient women of society and among people who are active at productive occupations, so it is obvious that attention to rural women as a strong arm at rural development can follow positive and undeniable affects, in this purpose.

Abstract: Human in the last 20 years climate change has faced a lot of his works on display touches gradually. Dust (size 4 microns) resulting from natural phenomena in which these changes occur, the mitigation of harmful effects is very difficult and almost "out of control And why is Iran being on the belt of this phenomenon (geographical location and latitude 24 40 °) regions of the country constantly, especially "the South have faced with this phenomenon but in recent years the amount, concentration of suspended solids, number, time stability and the establishment, expansion and influence of this phenomenon has increased. Spread and persistence of dust caused climate change in terms of amount of These changes on plant metabolism and .light received, changes in air temperature and relative humidity changes in the amounts directly and carbon dioxide and oxygen is indirectly Dust particles are no moisture absorption and potential abundance of .affects the performance characteristics of qualitative and quantitative Morphophysiology and affect the plants Dusts on plant surfaces are green and the moisture levels, reduced water .water that attracts humidity and dry air over the process of expanding leaf surfaces and limit plant growth On the other hand placing the green plants on the surface, disrupting the process of receiving light and can reduce plant .pressure are limited turgid growth will intensify With low growth, reduced plant height and dry matter .photosynthesis and are dark spots on plants and garden products to create a market-friendly to reduce the intensity accumulation, especially "in plants such as sorghum and alfalfa hay spatial and reduced product sweep sorghum south province reduced panicle length, have a severe drop Radasith According to estimates made phenomenon to about 40 to 50 percent crop damage are: for example, "reduce product pomegranates from 6 tons to two tons and reduce .product product from 50 to 60 pounds below the five kilogram PJ per tree in 2009 resulting this is a phenomenon. Because of the dust early harvested crops such as pomegranates reduce Dust phenomena addition to reducing the impact of harvesting dates is .serious product and its quality is low. The amount of the paste processing and production quality is very low seriously diminish the quality of this product is too. At present rates of harvest dates in Khorramshahr is faced with a significant decrease. In 2009 only six thousand and 500 tons of palm groves of palm harvest and harvest dates grade level to zero level and harvest dates Palm owners only grade 2 and below have hope. Dust phenomena in addition to increasing .sequence s pests, reducing rates of photosynthesis and quality Field dates will be

Abstract: Biological products that are organic fertilizers include different types of microorganisms have the ability to convert the elements of the form unavailable to available form through biological processes have them. Biological fertilizers increased microbial activity of microorganisms and intensify them to make food available in forms which are easily absorbed by the plant are. Huomic acid as an organic acid from humus and other natural resources through the hormonal effects of improved nutrient absorption and increased root and shoot biomass is. Therefore, it seems, especially biological fertilizers Huomic acid increased root biomass, increased solubility of nutrients in the soil and can increase the absorption is increased yield. Germination of seeds is a complex physiological process triggered by imbibitions of water after possible dormancy mechanisms have been released by

appropriate triggers. Organic matter due to the beneficial effects on physical properties, chemical and biological soil has an important role in soil fertility, plant nutrition and crop yield have increased. Humic acid humus material that is part of the property due to the complex hormonal and audience an important influence in increasing crop production and supply is balanced. Effect of micro-fertilizers in the new debate is the speed and germination. Humic micro elements like iron and acid compounds or elements Clat Humic complete micro or treatment Humic Clat, complete micro and macro elements on the speed of germination and affect. These substances cause a change in speed and percentage germination for causing water absorption and osmotic regulation are. The purpose of this experiment was how to effect of micro fertilizers on germination. After three days of testing, counting and investigation was initiated seeds results indicate that the five treatments applied after the third day: 10 numbers in the control of the number 5 seed was germinated but in treatment Humic Clat magnesium and calcium from number 10 seed did not do any germination.

Abstract : General purpose of testing conditions to get the best crop production figures for comments in order to get maximum yield is. Appropriate distribution of plants per unit area in one of the most consistent factor is to increase yield. In order to study the effect of different densities on bean cultivars, experimental farm in 2008 Farm Research, Islamic Azad University of Ahvaz was executed. Factorial experiment in randomized complete block design with three replications was formed. The first factor consists of three densities (45, 55, 65) plants m and the second factor consists of three digits (ZOHREH, SHAME and JAZAYERI) were. The results showed that between different varieties of grain yield and all yield components (seed number per pod and NO. pod) statistically significant difference in the level of 5 percent there. ZOHREH figure was superior to other cultivars and varieties having SHAME with little JAZAYERI showed no statistical difference. Grain yield in different cultivars ZOHREH, SHAME and JAZAYERI, respectively 1523.33, 1372.67, 1352 kg ha was. Most biological functions in the plant density of 55 3042.89 kg/ha obtained the density of levels with other significant difference at 5 percent showed. Highest harvest index and density of about 55 plant varieties ZOHREH m according to the results the best varieties for planting varieties bless and best density, density of 55 plants per square meter is.

Abstract: Dry matter accumulation patterns in most grains are sigmoid-type curve. In the first stage of this model is that if growth is slow, then there is a rapid phase after the flowering stage is followed by growth that is in pod formation stage. Studies have shown that leaf area development and dry matter accumulation in most cereal grains, especially cold for a long period after transplantation is very slow. Accordingly, in order to effect the kinds humic acid plant growth and bean seeds under climatic conditions of Ahvaz in the form of a split-plot experimental design with randomized complete block design based on years of farming 2010 was designed and executed. Factor with three bean varieties ($V_1 =$ Barekat, $V_2 =$ Jazayeri, $V_3 =$ Shame) in the main plot factor with four types humic acid ($F_0 =$ control, $F_1 =$ humic acid, $F_2 =$ full macro humic acid, $F_3 =$ acid Micro humic full) rate of 2 ppm in the sub-plots were placed. The results showed that the use of acid in all varieties humic increased plant growth parameters such as crop growth rate (CGR), plant height, grain yield, harvest index and biological function has been compared to the control. the highest total dry weight of the acid treatment Humic full macro level was 5909 kg per hectare and the lowest rate to the control was 4332 kg per hectare Effective grain filling period (*EFPP*) The increase in the treatment process itself revealed. Varieties planted in the province and the third type humic acid with a control rate at 2 ppm was placed in sub-plots. The highest and lowest average number of lateral roots in this experiment in order Humic acid treatments and control macro level 241.7 and 136 numbers were obtained. Note that between the number of acid root treatment and between macro and micro humic acid and acid micro Humic significant difference was found. the highest root dry weight to macro Humic acid treatment with a mean 4.22 grams of control treatment and lowest with mean 2.63 has been hot Total root number from 592 to 899 in number in the control humic full macro will increase the number of roots, a positive regression ($r^2 = 0.89$) with the amount of biological fixation (percentage of nitrogen nodules) showed. [Simin Haghghi, Tayeb Saki Nejad, Shahram Lack. Calculate the growth dynamics of root and shoot of bean plants. Journal of American Science 2011;7(6):19-26]. Effect of drought stress on stomata resistance changes in corn

6

Tayeb Saki Nejad

- Assistant Professor Department of Agronomy Physiology, Islamic Azad University, Ahvaz branch
 Corresponding Arthur: saki1971@iauhvaz.ac.ir

Abstract: To evaluate the effects of drought stress in different periods growth stomata behavior, research using factorial experiment design, randomized complete block with four replications and two factors with four levels of water stress as the first factor and three levels of growth periods As the second factor in the three crop years (1999-2000 & 2000-2001 and 2001-2002) the Islamic Azad University Research Station at 3 km south of Ahwaz, Ahwaz city was designed and executed. Analysis of variance at 1% showed in all three years of water stress treatment, periods of growth and interaction of these two stomata resistance and lower leaf surface supernatant separately showed significant effect. by applying different levels of water stress, stomata resistance and lower leaf surface increased supernatant Duncan test was at 5% level in three years of the three groups presented mean that

treatment (severe water stress treatment) and the highest treatment (control, no water stress) the lowest stomata resistance showed. Duncan test at 5% level one to two average growth for the period presented the highest stomata resistance in all three years and the treatments were obtained and lowest stomata resistance was observed in treatment. Duncan test at 5% level interactions show treatments with treatments that apply the lowest stomata resistance values were the other words in the early stages of plant growth when water is enough to provide resistance, stomata express that little but more severe stress in the course of Growth stomata resistance was increased considerably, the underside of leaf stomata resistance levels much higher than the leaf supernatant

[Tayeb Saki Nejad, Effect of drought stress on stomata resistance changes in corn. Journal of American Science 2011;7(6):27-31]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Abstract: In order to effect hormone gibberellins acid on properties such as bean plants Morphophysiology: internodes' length and stem number, plant height, leaf growth dynamics and crop growth rate research as a factorial experiment in randomized complete block design with three replications in crop year 2010 Farm Research HASHEMI located in the city HAMIDIEH province was conducted, first factor hormone gibberellins acid on four levels, respectively, treated (d0) control (no hormone gibberellins acid) treatments and d₃, d₂, d₁, respectively, 5, 50 and 250 ppm and the second factor included three plant growth periods: (vegetative phase= s₀, Flowering phase = s₁ and pod set phase = s₂) for the hormone gibberellins spray on beans were considered. Dose 50ppm hormone gibberellins acid, more leaf area index (*LAI*) with 1.98 in comparison with other surfaces have been in the treatment group a was used Hormone gibberellins acid applied best courses in the vegetative period before flowering leaf dry weight, 752.2 kg/ha been in a treatment group were. And the flowering period to Pod set treated with 678.3 kg/ha-level statistical treatment Pod set b to aggregation with 666.6 kg/ha c level was statistically. Dose of the hormone gibberellins acid maximum height of internodes 4.07 inches compared to other hormone levels have been in statistical was. Other doses differ quite significantly with this level did not have the lower levels were. The results showed that the hormone gibberellins acid increased crop growth rate to 35 percent in d₃ = 20.15 g/m²/day treatment than control treatment was d₀ = 14.5 g/m²/day. Hormone gibberellins acid effects on bean plant stem internodes' distances showed that on average 2.2 inches were added to the internodes' length. Especially the increase in the lower internodes bean plant stems were most evident in the treated internodes' d₂S₀ height d₀S₀ than the control treatment was significant. [◊Somaye ghalandari, Tayeb Saki Nejad, Shahram Lack. Effect of GA₃ hormones on growth dynamics of Bean. Journal of American Science 2011;7(6):32-39]. Abstract: As addiction affects not only on addict person but also on family members, so relationship behaviors is an important part of codependents' life which needs to recover in order to achieve health promotion. This study investigates to find whether the "12-Step Program" empowers families of addicts/alcoholic in term of relationship with others or not. In other words, this study aims to find differences of relationship behaviors by comparing families of addicts/alcoholics who practice the "12-Step Program" and who do not. Theory of empowerment is the key theory to conduct this study. The findings of this study indicate that the "12-step program" is an effective program to enables codependents to improve their relationship with others in comparison with those who do not practice this program (control group). In other words, independent samples t-test reveals that codependents' relationship behaviors are recovered duo to practicing the "12-Step Program" in Al-Anon/Nar-Anon groups in Iran.

Abstract Due to poor land of Khuzestan and land pollution due to application of chemical fertilizers, use of materials that can no harmful effects on the environment, planting with very low doses, had positive effects on plants have quality performance, it seems necessary. Why research in this area in order to affect hormone levels and time use gibberellins acid (GA₃) on the process of change and increasing amounts of protein bean seeds, bean seeds to increase the quality performance (Vicia FabaL.) were performed. The research farm located in the city Hamidieh hashemi research during the season and in 2010 was done, figure used in this experiment using BARAKAT variety. Use design was factorial experiments in randomized complete block design with three replications. Factors tested included four concentrations of the hormone gibberellins acid: (no hormones = d₀, d₁ = 5 ppm, d₂ = 50 ppm and d₃ = 250 ppm) and the second factor the third period, hormone sprayed: (phase of eruption = s₀, Flowering = s₁ and phase pod set = s₂), respectively. Measuring grain protein levels indicated that the hormone gibberellins acid spray treatment growth period increased grain protein and the greatest amount of protein in the amount of treatments d₂S₀ d₁S₀ and 29.28 percent, respectively. [◊Somaye ghalandari, Tayeb Saki Nejad, Shahram Lack. Effect of different doses of the hormone gibberellins acid on the process of protein changes in bean plants. Abstract: The production of surface active compounds or biosurfactants by microorganisms has been a subject of increasing interest in recent years especially due to the potential applications in enhanced oil recovery. A number of studies have indicated that the type of medium and growth conditions can influence the type and yield of biosurfactants. The present work demonstrated that the isolated bacteria, *Pseudomonas sp* from used edible oil was able to utilize the used edible oil as carbon and energy source to produce rhamnolipid at a concentration of 7.6 g/L. The temperature, incubation period, and nitrogen source optima of biosurfactant production was found at 36 °C, 72 hr and sodium nitrate respectively. [Soniyaamy A.R., Praveesh B.V., Vimalin Hena J., Kavithakumari P., Lalitha S and M Palaniswamy. Enhanced Production of Biosurfactant from Isolated Pseudomonas Sp Growing On Used Edible Oil. *manalfareed2008@yahoo.com

Abstract: Interferon related side effects need extensive researches especially the management strategies of these side effects are available. This study was carried out to assess the effect of nursing management protocol on selected side effects of Interferon and Ribavirin among hepatitis C patients. A convenience sample of 60 hepatitis C patients of both sexes in liver out patient clinic at Shebin El- Kom teaching hospital was selected for data collection. Tools for data collection included Tool 1: Structured interview questionnaire. It includes 3 parts to assess medical data and knowledge of patients. Tool 2 : Fatigue severity scale to measure fatigue severity among studied sample. Tool 3: Anxiety scale to assess the anxiety level of studied sample. All studied sample had several complains related to Interferon before giving the nursing management. Also there were statistical significance differences in all laboratory findings and body temperature before and after the study by 8 weeks. There were statistical significant improvement of these knowledge after 4 and 8 weeks from beginning of the study. Also, there was significant improvement in anxiety and fatigue level after 8 weeks from beginning of the study. It is concluded that: nursing intervention and knowledge about chronic hepatitis C, its treatment and management of Interferon related side effects seemed to have positive effects on improving patients knowledge about diseases and managing side effects of treatment and self care modalities that reflected by improvement in laboratory findings, vital signs, patients complains, anxiety level and fatigue level. It is recommended that: Promotion & enhancement of the self care modalities to the patient; a strict written instruction with pictures about disease process, prohibited and allowed foods, rest and physical activities and follow up should be continued after termination of the treatment through a rehabilitation program.

*Corresponding author: sharif11070@yahoo.com

Abstract: Any activity that gets your students involved makes the learning experiential. This includes small group discussions, experiments, role playing, skits, building something at their table or desk, writing or drawing something specific – activity of any kind. Activities also keep people energized, especially activities that involve getting up and moving about. Most adult students are in your classroom because they want to be. Some of them are there because they have Continuing Education requirements to keep a certificate current, but most are there because they've chosen to learn something new. This principle is not about why your students are in your classroom, but about why each thing you teach them is an important part of the learning. I'll use my own pickle-making lesson as an example.

Abstract: adult who is able to recognize their needs. He is who knows what will. Refers to individual adults in their lives cross and understand their responsibilities and has accepted the role is social. Adult learners are often those that distinguish each other and have many different targets at the same time and will follow a common challenge to fulfill the goals of building self motivation vectors as educational materials to learn and use the forge. Adult illiteracy is like a disease that infects virtually every dimension of Kentucky life. Adult illiteracy saps the energy and capability of Kentucky's people and its economy. Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Though rarer today than in the past, some teachers discount the importance of learning styles. They continue to teach in their one major method without trying to vary instructional methods. This is a mistake that will lead to less learning in the classroom. On the other hand, many students and to a lesser degree some teachers make the mistake of thinking that they cannot learn using methods that are not focused on their learning style. This is also a huge mistake that in the end will result in less learning. If teachers do not help their students find ways to be successful learning information presented in any style, they are not helping them succeed in the future. The fact is that students will be faced with many different styles of teaching during the educational career. Only by finding ways to adapt and learn using other styles, will students end up succeeding.

*Corresponding author: saba11085@yahoo.com

Abstract: There exist different methods of data collection and analysis, each with its own strengths and weaknesses. Through time, more appropriate and refined methods have been developed. In the context of rural development, information regarding the communities, their livelihoods, their beliefs, the physical environment in which they live, and their resource endowments need to be gathered and interpreted in a manner that identifies their priorities with a view of developing better understanding of their status and designing appropriate intervention projects directed at resolving their problems. The different ways of data collection and interpretation can be seen under two perspectives (IUCN, 2001): qualitative versus quantitative, and participatory versus top down. While the quantitative methods generate information that can be captured numerically, the qualitative methods generally do not generate specific numbers. Qualitative methods are concerned with exploring meanings, processes, reasons, and explanations.

ABSTRACT: The data for diesel fuel energy consumption on tillage, planting, cultivation, irrigation, harvesting and grain hauling as well as electricity for pumping water from wells obtained by questioners for four western provinces of Iran. The data was analyzed by SPSS software and then compared with the calculation results for the similar activities. Calculations were run for the worst case situation that is the hardest soil type for tillage, lowest forward speed and field efficiency for all. The results showed that the least energy consumption for every one of the practices was higher than the calculated figures; in some cases more than triple. The energy used for irrigation was the dominating. More energy was put into the water wells than for the hardest soil tillage. Statistics showed that the farmers in these provinces used 24.10-38.98 GJha⁻¹ to produce one hectare of irrigated wheat compared to 23.67 GJha⁻¹ calculated for the worst case. International data for semi tropical area in India for the drought years was cited as 15.289 GJha⁻¹. Experimental data for energy consumption for every practice was separately analyzed and compared with the calculated figures. Tillage with an average coefficient of 57.38 lha⁻¹ and planting with an average 34.16 lha⁻¹ showed no significant differences between the provinces at 5% probability level. Energy coefficient for the other activities that is cultivation, irrigation, harvesting and grain hauling did show significant differences between some of the provinces. The average energy consumption for these activities was 1.045, 21.268, 1.406 and 2.99 GJha⁻¹ respectively. The worst case calculated values were 0.232, 18.813, 0.680 and 1.748 GJha⁻¹ respectively. The energy coefficient per ton of produced wheat was also obtained.

Abstract: One of the challenging topics in image processing is extracting the shapes from noisy backgrounds. There are some methods for doing it from different kinds of noisy backgrounds. In this paper, we are going to introduce another method by using 4 steps to extract circular shapes from impulse noisy backgrounds. First step is applying median filter to disappear "salt and pepper" noise. This step causes edge smoothing. So, as the second step, a laplacian sharpening spatial filter should be applied. It highlights fine details and enhances the blurred edges. Using these two steps sequentially causes noise reduction in an impressive way. Third step is using Canny edge detection for segmenting the image. Its algorithm is talked during the paper. Finally, fourth step is applying Circular Hough Transform (CHT) for detecting the circles in image. At the end of paper different use cases of this method is investigated.

Abstract: In the modern world that the lives are going to have an online aspect in addition to traditional life, having suitable websites for different purposes plays a big role in social communications. High quality communication is the product of good interaction, and a good online interaction is the product of a good website.

In this paper, we want to introduce some basic steps that can help to provide a guideline for designing a suitable website. We have tried to cover both technical and psychological

aspects of a website. These steps are divided into 3 parts: pre-design, design, and post-design steps. Each one of them is consist of some steps that are described in details through the paper.

Abstract: In this paper, we intend to introduce a new heuristic algorithm to apply maximum minimization to Boolean functions with normal SOP form. To implement the proposed algorithm, we use the graph data structure and define the adjacencies. Also, we demonstrate some conditions to achieve the maximum minimization. Through this paper, the problem of shared vertices in more than one adjacency is talked, and the solution is presented. Karnaugh map is used to clarify the matter.

Abstract: In this paper, we intend to introduce a steganography algorithm for embedding a message into a RGB 24-bit color image. It will be done by using the concepts of linked list data structure. It will help us to achieve some important advantages. First, we can create a “stego-key” by the address of message blocks. Second, it makes the detection of message harder. Also, there will be other benefits that are mentioned during the paper.

Another point about the presented algorithm is the flexibility. For example, it could be written in recursive way. To prove it, we wrote a recursive function called “Read()” for extracting the message from the cover image. At the end of paper, characteristics of this algorithm will be talked.

For embedding data, LSB (Least Significant Bit) technique is been used.

Abstract: User interface is a general connection tool for getting the request of user and give back the responses. A special type of user interface is GUI (Graphical User Interface), which is very important in computer world, and you can't find any application without it. Designing a suitable GUI is definitely an important part of designing any application. Due to this, there are some principles that help to create an appropriate GUI. In this paper, we are going to talk about the necessity of a suitable GUI for an information system. So, the goals of GUI will be investigated. Then we will get into common characteristics of a proper GUI.

22 **Non-steroidal anti-inflammatory phonophoresis versus topical application in improvement of hand grip strength in psoriatic arthritic patients**

Amal M. Abd El Baky and Intsar S. Waked*

Department of Surgery, Faculty of Physical Therapy, Cairo University, Giza, Egypt

intsarahmed@hotmail.com

Abstract: The purpose of this study was to compare the efficacy of ibuprofen phonophoresis versus topical application of ibuprofen in improvement of hand grip strength in psoriatic arthritic patients. Methods: Forty patients who had asymmetrical psoriatic arthritis in hand participated in this study. Their ages ranged from 30 to 50 years. Patients were classified randomly into two groups of equal numbers; group (1) (control group) received routine physical therapy (hot therapy, stretching and strengthening exercises), in addition to sham ibuprofen phonophoresis, while group (2) (studied group): received routine physical therapy, in addition to ibuprofen phonophoresis. Each patient was evaluated for grip strength, tender and swollen joint count before and after one month of treatment. The results revealed that there was a significant difference between both groups regarding to grip strength, tender and swollen joint count, with the percentage of improvement in group 1 were 56%, 54%, and 55% ,while in group 2 were 82%, 80% and 76% respectively. It is concluded that the results of the current study confirms the effectiveness of phonophoresis as a therapeutic modality enhancing the delivery of ibuprofen so increasing the percentage of improvement of grip strength in the studied group .

23 **Biodegradation of PAH Compounds in the Rhizosphere of *Tamarix nilotica*: A Salt tolerant wild plant**

Eman A. Diab and Reham K.A. Badry

Department of Plant Ecology and Range Management, Environmental Pollution Research Unit, DRC, Cairo, Egypt

Abstract: During a scientific visit to a coastal area at Suez, Egypt, it was observed that *Tamarix nilotica* plant naturally dominated on oil polluted site in this area, indicating that this plant is a tolerant of the combined adverse effects of salinity and petroleum pollutants. This observation stimulated a study to investigate the rhizosphere effect of this plant on the degradation and removal of petroleum aromatic hydrocarbons (PAH) compounds from this coastal saline soil. Accordingly, samples were collected from the rhizosphere and from the non-rhizosphere soil and studied. The results show that the rhizosphere soil of *Tamarix nilotica* was rich in total heterotrophic bacteria and oil-degraders. In the rhizosphere soil oil-degraders were of higher percentage (30.7%) compared to the non-rhizosphere soil (4.6%). Residual total petroleum hydrocarbons (TPH) in the non-rhizosphere soil was 2.25% (w/w), while in the rhizosphere soil the percentage was 0.9% (w/w). This indicate a reduction of 60% of the TPHs. The saturates fraction in the rhizosphere as compared to the non-rhizosphere soil was reduced by 87.5%, while the aromatics were reduced by 60.7%. It is of interest to find that the non-degradable asphaltenes and resins were reduced in the rhizosphere by 1.1% and 2.5% respectively. As a total the amount of PAHs (mgkg⁻¹ soil) were 1073.5 and 541.94 in the non-rhizosphere and rhizosphere soil respectively, i.e. with a loss of 49.5% in the rhizosphere. Chrysene and dibenzo(a)anthracene as compared to the other PAHs were more frequent in the non-rhizosphere soil. These two compounds were reduced by 55.7% and 24.3% respectively in the rhizosphere. As a total the four-ringed PAHs as compared to other PAH groups were highly reduced (60.3%) in the rhizosphere, this was followed by the three-ringed PAH group (52.5%). The five-ringed and the six-ringed groups were weakly reduced (37.8% and 33.8% respectively). The 8 carcinogenic PAH group were collectively reduced in the rhizosphere by 49.1%. A particular notable distinction of the rhizosphere of *Tamarix nilotica* is the greater efficiency to degrade the carcinogenic PAH compounds especially flouranthene (75.4%), benzo(a)anthracene (63.4%) and pyrene (60.2%). Results of Gas Chromatography (GC) analysis for the detection of the accumulated PAHs in the shoot tissue of *Tamarix nilotica* plant growing in the polluted area as compared to that growing in non-polluted area show that the identified peaks in the tissue of both plants were 15 and 14 peaks respectively. The sum of the 15 PAHs was 528 mgkg⁻¹ dried tissue, whereas the sum of the 14 PAHs was 769 mgkg⁻¹ dried soil. This result indicate an accumulation value of 1.46.

[Eman A. Diab and Reham K.A. Badry. Biodegradation of PAH Compounds in the Rhizosphere of *Tamarix nilotica*: A Salt tolerant wild plant. *Journal of American Science* 2011;7(6):115-124]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Abstract: The present study was designed to evaluate the effect of low level laser therapy on alveolar bone remodeling and rate of tooth movement secondary to application of orthodontic forces. 42 male Guinea pigs were used in this study. The animals were divided into two groups (each group contains 21 animals), group (1) received soft laser therapy at the treatment site and group (2) as a control group. The orthodontic device was cemented to the lower central incisors to be activated once only. Daily measurements were taken directly from the oral cavity to record the rate of tooth movement of the experimental groups. Seven animals of each group were sacrificed at 3 days, 2 weeks and one month. Radiographic assessment was carried out at these intervals using Radio-Visio-Graphy (RVG), with its personal computer (PC) based version, to monitor the changes in the bone density mesial to each lower central incisor. The lower jaws were histologically treated to obtain mesiodistal sections of the lower incisors with their supporting structures and stained by H & E. Conclusion: Soft laser can enhance the rate of orthodontic tooth movement due to stimulation of bone remodeling.

25 **Nucleotide variations of 16S rRNA gene of VacA positive *Helicobacter pylori* strains isolated from human Gastric Biopsies in Saudi Arabia**

Milyani MR

¹Department of Biological Sciences, Faculty of Science, King Abdulaziz University, Jeddah, Saudi Arabia
*Corresponding author: rajaamilyani@hotmail.com

ABSTRACT: Three isolates of *Helicobacter pylori* (*H. pylori*) were originally isolated from gastric biopsies taken from patients complaining of gastric disorders in Makkah City, Saudi Arabia. The isolates that previously revealed to be vaculating cytotoxin A positive were identified by 16S rRNA gene as *H. pylori* using a primer pair designed from the similar sequences within consensus regions of GenBank *H. pylori* to amplify the 163 bp fragment. Sequence alignments of 16S rRNA gene were performed and total numbers of 46, 55 and 40 nucleotide positional differences with base-pair substitutions were identified for these isolates compared to GenBank strains of *H. pylori*. Phylogenetic analyses based on 16S rRNA gene sequences showed that the three *H. pylori* strains formed a phylogenetically distinct group, separate from all other species of *H. pylori*. The three isolates were hence coined as *H. pylori* Milyani-1, -2 and -3 at GenBank database under the accession numbers HQ877021, HQ877022 and HQ877023, respectively. The obtained results evidently indicated a large diversity with unique characteristics of the three Saudi Arabian *H. pylori* strains from all the other established strains.

Giza, Egypt
bbnaggar@hotmail.com

Abstract: In this article the disk-rim flywheel is suggested for light weight. The mass of the flywheel is minimized subject to constraints of required moment of inertia and admissible stresses. The theory of the rotating disks of uniform thickness and density is applied to each the disk and the rim independently with suitable matching condition at the junction. Suitable boundary conditions on the centrifugal stresses are applied and the dimensional ratios are obtained for minimum weight. It is proved that the required design is very close to the disk with uniform thickness

Abstract: Data for variability, heritability, genetic advance and path coefficient analysis for oil yield and related characters were conducted on 15 genotypes of sweet basil at two seasons in complete randomized block design. The results revealed that analysis of variance showed highly significant differences among genotypes in studied characters. Ranges of herb dry yield (HDY) (68.40 – 86.30 gm.), oil content (2.30-2.90 ml.) and oil yield (1.22-2.24 ml.) were obtained. Overall, the highest values of genotypic coefficients of variation (G.C.V %), genetic advance (GA%), and broad sense heritability (h²b) were obtained for stem dry weight (SDW), linear growth (LG), herb dry weight (HDW) and leaf dry weight (LDW). Path coefficient analysis for oil yield exhibited variation from season to other and slight variation was found among cuts. The highest direct effects on oil yield were observed for herb dry yield followed by stem dry weight and essential oil content; hence, the study reflected the importance of herb dry yield and essential oil content as selection criteria for improvement of oil yield in sweet basil.

28 **Antihepatotoxic Effects Of *Ficus Vogelii* Ethanol Leaf Extract On The Liver Function Indices Of CCl₄ –Induced Hepatotoxicity In Rats.**

[Full Text](#)

EGBUNA, P. A. C.; JOSHUA, Parker Elijah and CHIGBO, Maureen Ujunwa

Department of Biochemistry, University of Nigeria, Nsukka, Enugu, Nigeria

ABSTRACT: This study was conducted to evaluate the anti-hepatotoxic effect of intraperitoneal administration of ethanol extract of *Ficus vogelii* (600mg/kg) in CCl₄-induced hepatotoxicity in male albino rats. Phytochemically, the leaf extract contains tannin, alkaloid, flavonoid, carbohydrates, protein, saponin, steroids, terpenoids, fats and oil. The administration of the *Ficus vogelii* extract was at one phase of the experiment according to the body weight of the test animals. The ethanol extracts of *Ficus vogelii* significantly reduced (p<0.05) the level of activity of the hepatic enzyme markers in the serum (Alanine amino transferase (ALT), Aspartate amino transferase (AST), alkaline phosphate (ALP) and total bilirubin) which occurred due to induced oxidative stress. Relative to the control group, treatment with CCl₄ significantly raised the levels of ALT, ASP, AST and total bilirubin in the serum. The animals that received *Ficus vogelii* showed not only reduced hepatocellular degeneration but also of hepatocellular regeneration when compared to the liver of those exposed to CCl₄ alone. Thus the histopathological studies also supported the anti-hepatotoxic action of the ethanol extract of *Ficus vogelii*. The results of this study clearly indicate that *Ficus vogelii* ethanol extract has a potent anti-hepatotoxicity action against carbon tetrachloride induced liver damage in rats.

Abstract: Power Purchasing Agreements (PPAs) are the recent contracts between Generation Companies (GENCOs) and Independent System Operator (ISO). After restructuring in power system, lack of motivations for Independent Power Producers (IPPs) to partnership in power generation and long term maintaining energy have affect the long horizon expansion planning. In this area, long term contracts can help the market entities to hedging their risks in satisfying the future demands and ensuring the return of their investment cost. From an IPP point of view, clarifying the rate of return of investment has an important role in his financial decision making. In competitive power market, each GENCO would offer in the market and some of them could exercise market power in power market. One of the proposed ways to controlling the market power is PPA. In this paper the PPA and some proposed PPAs are introduced and clarifying the weak and strong point of the PPAs are presented.

Abstract: The aim of this research is to evaluate differences in growth and chemical composition of *in vitro* grown seedlings (10, 20 and 30 days old) of *Rumex vesicarius* L. (Polygonaceae) on either solidified MS medium or agar. Percentage of germination increased with time from 2 days till 16 days in case of seedlings grown on MS medium, and 10 days in case of seedlings grown on agar. Variations in seedlings length at 10, 20 and 30 days were non significant. Seedlings grown on agar were longer than seedlings grown on MS medium. Shoot: root ratio (%) decreased with time from 10 to 30 days, shoot: root ratio of seedlings grown on agar was less than these of seedlings grown on MS medium. Variation in shoot: root ratio of seedlings grown on either solidified MS medium or agar was highly significant. Fresh and dry weights of these seedlings increased with time in 10, 20 and 30 days old seedlings. Variations were highly significant in both fresh and dry weights. Fresh and dry weights of seedlings grown on MS medium were higher than seedlings grown on agar. Phytochemical screening of 10, 20 and 30 days old seedlings showed variations in the presence and / or amount of some biologically active constituents under investigation such as: flavonoids, saponins, alkaloids and tannins, chlorides and Sulphates, these variations indicated that, the formation of these active constituents is positively or negatively related to time. Regarding total phenolics, of seedlings grown on MS medium, 20 days old seedlings had the maximum concentration (3.833±0.334 mg GAE_g/g F.W.), followed by 10 days old seedlings (1.910±0.334 mg GAE_g/g F.W.), while 30 days old seedlings were found to contain the least amount of phenolics (1.167±0.334 mg GAE_g/g F.W.). Variations in the amount of total phenolics within different seedlings were non significant. Seedlings grown on agar contained low amount of phenolics till 30 days old, compared with seedlings grown on MS medium. Total flavonoids were determined also, highly significant variations were found between 10, 20 and 30 days old seedlings grown on either MS medium or agar. The maximum amount of total flavonoids was found to be in 10 days old seedlings grown on agar (106.350±3.849 µg/g F.W.); flavonoidal contents were negatively related to time. In wild young plantlets of *Rumex vesicarius* L. at vegetative stage, total phenolics were found to be lower than *in vitro* grown seedlings. Plantlets roots were found to be the richest organ (1.695± 0.178 mg GAE_g/g F.W.), however roots contains about less than half amounts found in *in vitro* grown seedlings on MS medium at 20 days old (3.833±0.334 mg GAE_g/g F.W.). Wild young plantlets were rich in flavonoids. There were highly significant variations between plantlets parts. Leaves were found to contain the highest amount of flavonoids (2835.000 ± 305.757 µg/g F.W.).

31 **The importance of indigenous knowledge in agricultural development**

Esmail Ghorbani¹ and Fatemeh Bakhtiar²^{1,2} Darab Branch, Islamic Azad University, Darab, Iran*Corresponding author: abbasrezazadeh80@yahoo.com

Abstract: Different definitions were presented about indigenous knowledge by experts that each of them present their idea about this knowledge from their viewpoint. Each of them emphasis on a special aspect of indigenous knowledge according to their viewpoint. Oxford vocabulary define the word indigenous knowledge such this" it is created naturally in a region which is related to the people of that region. Indigenous knowledge is a knowledge that has been grown in a long time and has transferred from one generation to other generation in hereditary form . Williams and Molina have defined indigenous knowledge such this: indigenous knowledge is the learning methods, understanding and attitude to the world which is the result of experience and solving problems according to test and error by the people who are active and have used their available resources on its suitable time. Chambers with emphasizing on people's role in development process, believed that the phrase rural people's knowledge is more sensible than the other phrase such ethnic ecology, ethnographic knowledge, ethnic classification. He also believed that indigenous knowledge is a knowledge that is created naturally and is emanated from geographical circle.

32 **Decentralization in agricultural extension: implications and priorities**

Abbas Emami¹ and Esmail Ghorbani²

^{1,2} Darab Branch, Islamic Azad University, Darab, Iran
*Corresponding author: hossein11070@yahoo

Abstract: Over the past two decades many countries have undertaken to decentralize government functions and transfer authority and responsibilities from central to intermediate and local governments, and often to communities and the private sector. Decentralization is potentially important to agricultural knowledge and information systems, but decentralization is not an end in itself, and successful decentralization strategies must address three challenges—establishing a national framework for decentralization, developing subsector approaches, and enhancing capacities of various participants for coproduction of decentralized goods and services. Agricultural extension services are under increasing pressure to become more effective, more responsive to clients, and less costly to government. Decentralization is an increasingly common aspect of extension reforms. Field extension advisory services are well suited to decentralized approaches, but a comprehensive extension system requires a range of extension support services and programs, some of which (strategy formulation, training, monitoring and evaluation, specialized technical support) are often best carried out at the central level. The prime challenges in the traditional public extension systems enlisted as outdated, top-down, paternalistic, inflexible, subject to bureaucratic inefficiencies that results less ability to cope with the dynamic demands of modern day agriculture (World Bank, 2002; Obaa et al., 2005). In some countries the change is occurring with its natural pace but in many developing countries these have been accelerated by structural adjustment reforms.

33 **Using of E-learning in agricultural education**

Esmail Ghorbani

Darab Branch, Islamic Azad University, Darab, Iran
E-mail: leila11070@yahoo

Abstract: Distance education places students and their instructors in separate locations using some form of technology to communicate and interact. The student may be located in the classroom, home, office or learning center. The instructor may be located in a media classroom, studio, office or home. The student may receive information via satellite, microwave, or fiber optic cable, television (broadcast, cable or Instructional Television Fixed Services (ITFS), video cassette or disk, telephone - audio conferencing bridge or direct phone line, audio cassette, printed materials - text, study guide, or handout, computer - modem or floppy disk, and compressed video. Recent rapid development of technology has resulted in systems that are powerful, flexible, and increasingly affordable. The base of available information technology resources is increasing with dramatic speed. Much has been learned about connecting various forms of technology into systems, so that the ability to link systems is growing. Most distance learning systems are hybrids, combining several technologies, such as satellite, ITFS, microwave, cable, fiber optic, and computer connections. Interactivity is accomplished via telephone (one-way video and two-way audio), two-way video or graphics interactivity, two-way computer hookups, two-way audio. Interactivity may be delayed but interaction provided by teacher telephone office hours when students can call or through time with on-site facilitators. Classes with large numbers of students have a limited amount of interactivity. Much of the activity on computer networks is on a delayed basis as well. Possibilities for audio and visual interaction are increasingly wide.

¹ Department of Social & Development Science, Faculty of Human Ecology, University Putra Malaysia

² Department of Resource Management and Consumer Studies, Faculty of Human Ecology, University Putra Malaysia. babaei1973@gmail.com

Abstract: This meta-analysis aims to assess the influence of social capital on the Human Development Index, Human Poverty Index, and Gender-related Development Index in Iran. The results reveal a positive and significant relationship between social capital and the human development index (HDI). The effect of social capital on the Human Poverty Index (HPI) was negative and significant. However, no significant relationship was found between social capital and the Gender-related Development Index (GDI).

35 **The Influence of Life Skills with respect to Self-Help Approach on Relapse Prevention in Iranian Adolescents Opiate Addicts**

Samira Golestan^{1*}, Hajar Namayandeh¹, Ali Anjomshoa¹

¹Islamic Azad University, Kerman Branch, Iran,
Email Address: Samira_Golestan@yahoo.com H/P: 00989133436185

Abstract: This study explores the importance of three elements of life skills, i.e. problem solving, critical thinking and ability to abstinence, on drug use and its effects on the prevention of relapse among male adolescent opiate users in Kerman, Iran. Life skills are one of the important factors that affect the recovery of addicts and presuppose relapse among adolescents. The lack of life skills is an operative factor to relapse among adolescents. The development of life skill was recognized as a factor that could help the adolescents in their efforts to avoid relapse. Iran is in the process of developing options concerning drug abuse treatment for opiate and other drug dependent patients while nearly 60% of its population is under the age of 25. Scholars emphasize the critical role of life skills to prevent relapse in adolescents and highlight the lack of life skill as a factor leading to relapse among adolescents ADDIN EN.CITE ADDIN EN.CITE.DATA (Barr & Parrett, 2001; Gorski, 2001; Gouws, Kruger, & Burger, 2000; Mc Whirter, 2004; Van Niekerk & Prins, 2001). Focusing on this issue, this research explores a new examination area and finally reinforces the result of the previous relevant studies in its own contribution. In this research 226 adolescents between the ages of 13 to 20 in ten rehabilitation centers were selected to answer the self-administered questionnaire. Benefiting from Pearson Correlation analyses, the findings represent a significant moderate negative relationship between life skills and relapse ($r = -0.453$, $p < 0.01$), i.e. the lack of life skills significantly raises the risk of relapse among adolescents. The study proposes some suggestions in order to prevent relapse after treatment in adolescents.

Immediate Vascular Photochemical Reactions to Infrared Laser Irradiation in Normal Volunteers

Mohammed H Saïem Al-Dahr¹ and Enas Elsayed²

¹Department of Medical Laboratory Technology, ²Department of Physical Therapy

Faculty of Applied Medical Sciences, King Abdul-Aziz University

[*drinaselsayed@yahoo.com](mailto:drinaselsayed@yahoo.com)

Abstract: Background: There are evidences that low level laser therapy (LLLT) stimulates wound healing. Objective: The study aimed at investigating the exact vascular mechanisms through which infrared (IR) laser acts to promote wound healing. Participants: Thirty normal female volunteers were selected from the female section, Faculty of Applied Medical Sciences, King Abdul-Aziz University. They were randomly divided into three equal study groups (G1, G2, and G3). Methods: Five ml. of whole blood were collected in a plane tube from all volunteers for the analysis of lipid profile including cholesterol (Chol); triglyceride (TGL); low density lipoprotein (LDL) and high density lipoprotein (HDL). Other five ml of blood were collected for the performance of glycated hemoglobin (HbA1c), hemoglobin (Hgb) and red blood cells (RBCs) count before and immediately after receiving continuous IR laser (810 nm, 100 mW). The irradiation doses were 12 J/cm² for 120 sec, 6 J/cm² for 60 sec and 1.4 J/cm² for 14 sec in groups one, two, and three respectively. Results: There was a significant increase in Chol, TGL, HbA1c%, Hgb concentration and RBCs count after irradiation. On the other hand, there was no significant difference in LDL or HDL concentration in the three groups. Conclusion: Infrared laser was effective in increasing the levels of different blood components that are important for wound healing processes with the best results obtained from laser dosage of 12 J/cm².

Contraceptive use dynamics and effect of counseling on use- continuation of contraception in Assiut Governorate, Upper Egypt

Etemad A.A. El- shereef¹, Gamal H. S.², Abo Bakr A. M.², and Ahmed M.A.²

Public health & community Medicine Department¹ and Obstetrics & Gynecology Department². Faculty of Medicine, Assiut University. etemadelshreef@yahoo.com

Abstract: Background: Egypt's family planning programs have followed a similarly unsteady course. Debated by Egyptian social scientists since the 1930s, Egypt's high population growth became widely viewed as an acute problem in the 1960s, when the government acknowledged the serious economic and social problems associated with it. **Objectives:** analyzing the factors associated with contraceptive methods discontinuation among women aged 15- 49 years in study area and contraceptive use dynamics. We also examined the effect of counseling on percent of continuation. **Study design:** A cross sectional survey was carried out among the eligible women. **Study setting:** The study areas included Assiut Governorate family planning units in different places providing contraceptive methods. **Study population:** One thousand and ten women in reproductive age from 15-49 who used contraceptive methods once or more, has one child or more were included. **Study tools:** An interview questionnaire were constructed including data about used contraceptive methods, discontinuation and its causes, failure and its fate. We asked about ten steps of counseling. Data entry –after revising and editing -was done via Excel software while data analysis was carried out via SPSS program version 11. **Results:** the most commonly used modern method was IUD (43.0%). The results revealed that (69.7%) of methods had been stopped within 2 years of starting for various reasons. The percent of discontinuation decreased significantly with increasing age. Discontinuation was the lowest when there were four or more living children and increased significantly by decreasing number of living children. It decreased significantly with increasing the number of sons. As regards infant deaths, discontinuation was insignificant among those who did not experience infant deaths, and presence of one and two deaths respectively. University graduated women showed least discontinuation level. As regards causes of discontinuations, side effects and health concerns was the most common reason of discontinuation. Most of method failure as expressed by pregnancy ended in live births. The results indicated that a higher score on counseling was significantly associated with continuation. **Conclusion:** Counseling should emphasize the possibility of side effects, stressing the fact that most will be transient, and the need to identify a backup method. Follow-up visits should be scheduled for 1 to 2 months after a prescription is written.

[Etemad A.A. El- shereef, Gamal H. S., Abo Bakr A. M., and Ahmed M.A. Contraceptive use dynamics and effect of counseling on use- continuation of contraception in Assiut Governorate, Upper Egypt. Journal of American Science 2011;7(6):209-219]. (ISSN: 1545-1003). <http://www.americanscience.org>.

saleh.elayouby@gmail.com

Abstract: This paper describes a newly observed phenomenon related to red blood cells (RBCs). We found that plasma from a healthy individual immune-reacted with hemolysates from the same person and from other individuals. This strongly suggested presence of antigens in RBCs and corresponding antibodies in plasma. Those RBCs' antigens are different from RBCs proteome. Those antigens can be separated using plasma / serum of blood from which RBCs were taken. It is found that those antigens consist of HLA antigens, tissue specific antigens, and foreign antigens. The foreign antigens can be fetus antigens in pregnant females, microorganisms' antigens, food, insects or other antigens from environment. The collection of those transported antigens represents a dynamic store. Consequently, RBCs may play role in tolerance through transporting those antigens to central organs of the immune system. The experiments, which have been done, reveal some of the antigens of the store, and show how this phenomenon can be exploited, for instance, in diagnosis of human tuberculosis (TB). In effect, this work opens a new avenue of research and hopes.

Rahimbeheshti@gmail.com

Abstract: The sperm cells protection against oxidative reactions during cryopreservation process done by antioxidant and amino acids agents. The purpose of this study was evaluation of the effects of vitamin E on Azerbaijan Buffalo bull's sperm cells after thawing. Therefore for definition the percentage of motility, acrosomal membrane integrity, and live ratio of sperm cells, ejaculations from five mature buffalo bulls after preparation in tris-yolk base medium was added with five levels of vitamin E (0.1, 0.5, 1 or 1.5 mM) separately and frozen process was performed. One month later, five piote selected randomly and after thawing in 37 °C water bath in twenty seconds, sperm cells motility evaluated with 37 °C warm plate microscope. On the other hand, the one step eosin-nigrosin staining for evaluation of live ratio percentage and formal citrate for acrosomal membrane integrity was performed, then slides evaluated with 1000x light microscope and 200 sperm per slide was counted. The result showed significant difference between blank and vitamin E groups and sperm motility was higher in vitamin E (P<0.05). On the other hand sperm motility in vitamin E 1.5 mM was higher than other vitamin E groups (P<0.05). Between vitamin E groups, the percentage of live-ratio was higher in vitamin E 1.5 mM and lower in vitamin E 0.1 mM (P<0.05) and the lowest was in control group (P<0.05).

Abstract: Supporting students' autonomy has many outstanding benefits. It promotes self motivation and satisfaction for students in various learning settings. The aim of this study was to identify the nursing students' perception of their clinical instructors autonomy support. A convenient sample was taken from Faculty of Nursing, Alexandria University at Maternity and Psychiatric Nursing Departments. Sample of this study consisted of 250 undergraduate students attended and studied Maternity and Psychiatric Nursing courses. Data were collected in the second semester of academic year 2009/2010. Two tools were used to collect the necessary data. One questionnaire sheet to obtain demographic data including gender, age, and academic achievement. Second questionnaire sheet was Learning Climate Questionnaire, to assess the perceived autonomy support among students at different learning settings. Results of this study showed that the majority of Maternity and Psychiatric nursing students perceived either low or moderate levels of autonomy support and no statistically significant difference was found. Significant differences were only found between students' perception of clinical instructors autonomy support and gender differences among both groups. Teaching programs will be recommended to train clinical instructors in both specialties to display more autonomy-supportive behaviors.

41 Concurrent External Radiotherapy And Doxorubicin Based Chemotherapy In Breast Cancer Patients Any Cardiac Side Effects?

¹A.A. Adenipekun, ²O. Oladapo, ¹T.N. Elumelu

¹Department of Radiotherapy, University College Hospital, Ibadan.

²Cardiology Unit, Department of Medicine, University College Hospital, Ibadan.

adenipek2000@yahoo.com

Abstract: Doxorubicin, has for long been a major component in the combination chemotherapy for Breast Cancer. At a cumulative dose of 400 and 600mg/m² cardiomyopathies and electrocardiographic changes have been reported which may be worsen in patients who receive external beam radiation treatment to the left chest wall. This study aimed at examining presence of cardiac sequela that may result from concurrent use of Doxorubicin based chemotherapy and external beam radiotherapy to the chest wall in our breast cancer population. Sixty-five (65) patients with cancer of the breast on combination therapy who received 50mg/m² of Doxorubicin in four divided three weekly doses and had 50Gy of external beam radiation in 25 daily fractions over 5 weeks were evaluated. The patients also had 5-fluorouracil 1000mg/m² and Cyclophosphamide 1000mg/m² as part of the combination chemotherapy. All patients had ECG and Echocardiography before commencement of treatment and at three and nine months post treatment. Only 55 were found evaluable at the end of the study with mean age of 48 years. Eleven patients had history of hypertension while none had any previous history of heart diseases. The pre and post-treatment ECG and Echocardiography were similar (p>0.05). The participants were also symptom free during the follow up period. Though this study suggests a safe combination of Doxorubicin-base chemotherapy and chest wall radiation within the period of evaluation, this may however, not exclude the possibility of long term complications.

[A.A. Adenipekun, O. Oladapo, T.N. Elumelu. Concurrent External Radiotherapy And Doxorubicin Based Chemotherapy In Breast Cancer Patients Any Cardiac Side Effects? Journal of American Science 2011;7(6):241-244]. (ISSN: 1545-1003). <http://www.americanscience.org>.

42 Effects of administration of industrial tannins on nutrient excretion parameters during naturally acquired mixed nematode infections in Moghani sheep

Majid ChaichiSemsari^{1*}, Naser MaheriSis¹, Mohammad Sadaghian², Behrad Eshratkha², Shahin Hassanpour¹

¹ Dept. of Animal Sciences, Shabestar Branch, Islamic Azad University, Shabestar, Iran

² Dept. of Veterinary Medicine, Shabestar Branch, Islamic Azad University, Shabestar, Iran

Majid.chaichi@gamil.com

Abstract: Tannins are one of the secondary metabolites of plants that tend to combine with protein and reduce parasitic properties in livestock and veterinary industry. The aim of this study was to investigate effects of different levels of Quebracho Condensed Tannins (QCT) on Crude protein (CP) and other excretion parameters during naturally acquired mixed nematode infections in Moghani sheep. Twenty ewes (6-12 months years-old) with average body weight (26.5 ± 3.5 kg) were selected randomly and divided into four experimental groups: Control, A, B and C (were given 0, 1.5, 2 and 2.5 g/kg body weight QCT, respectively) in summer 2010. In order to reduce the undesirable effects of tannins, it was used as a single oral dose drenches. Faecal samples were taken at 24 and 48 hour after treatment. Our result showed that protein excretion has a significant difference in all treatment groups compare to control group after 24 hours from drenching ($P < 0.05$). Also, 48 hours after drenching, CP excretion was significantly decreased in treatment groups ($P < 0.05$) and the QCT has no significant effect on faecal excretion of dry matter (DM), organic matter (OM) and ash ($P > 0.05$). Our results indicate that high levels of tannins intake were decreased protein excretion and increased retention of nitrogen in animal body.

[Majid ChaichiSemsari, Naser MaheriSis, Mohammad Sadaghian, Behrad Eshratkhal, Shahin Hassanpour. Outcome of Mild and Moderate Preterm Newborns Admitted to NICU of Assiut University Children Hospital, Relation to Birth Weight

Hanaa A. Mohammad¹, Nafisa H R Abd ElAziz¹, and Randa shams Eldeen²

¹Pediatric and ²Public Health Departments, Faculty of Medicine, Assiut University, Assuit, Egypt

Abstract: Prematurity and intrauterine growth restriction continues to be the major determinant of neonatal morbidity and mortality. The aim of this study was to assess morbidity and mortality of mild and moderate preterm newborns admitted to NICU of Assiut University Children Hospital, and to find out the effect of birth weight on these outcomes. Three hundreds and six preterm cases were included of which 194 were mild preterm (34-36 gestational weeks) and 112 were moderate preterm (32-33 gestational weeks). Cases with birth weight $< 10^{\text{th}}$ percentile on growth charts were classified as small for gestational age (SGA). Cases were followed during the admission period for neonatal mortality and/or morbidity including respiratory distress (RD), need for mechanical ventilation, sepsis/meningitis, intraventricular hemorrhage (IVH), and necrotizing enterocolitis (NEC). The length of hospital stay was also recorded. Results showed that moderate preterm group had significantly higher susceptibility to RD and IVH, and higher need to mechanical ventilation than the mild preterm group. Furthermore, they showed higher rate of death and longer hospital stay than the mild preterm. There was a significant negative correlation between gestational age and length of hospital stay. According to birth weight it was noticed that SGA moderate preterm showed higher mortality rate and higher rate of IVH and sepsis/meningitis than the corresponding AGA group, while SGA mild preterm newborns had significantly lower rate of RD and higher rate of IVH and sepsis/meningitis than the corresponding AGA group. Both SGA subgroups had significantly longer hospital stay than the corresponding AGA groups. In conclusion, preterm infants especially SGA are at greater risk of neonatal morbidity and mortality. Management strategies and guidelines should be settled to prevent spontaneous preterm deliveries and to early diagnose and manage intrauterine growth restriction.

¹: PhD Candidate of Control Engineering, Amirkabir University of Technology, Tehran, Iran

² Professor of Electrical Engineering, Amirkabir University of Technology, Tehran, Iran

m.shafiee@aut.ac.ir

Abstract: In this paper a new Linear Matrix Inequality (LMI) based switching controller for multiple Bottleneck packet switching Network has been considered. The main goal is to illustrate the effects of the Switching Control methodology on the congestion control problem of the packet switching Networks with dynamically varying parameters such as Link capacity and time delays. The congestion dynamic for congested network is presented and LMI based switching controller is being discussed. Then, the proposed control method has been applied on a case study in ATM Congested Network and simulations are conducted, and simulation results will be compared with old method..

Designing Affordable Solar Dryer for the Small Scale Holder

Nnorom ACHARA PhD

MDPGA, Ministry of Defence, Wethersfield, Braintree, United Kingdom

nnoromeluwa@btinternet.com

Abstract: The local farmer preserves the farm produce either by drying over the cooking tripod flue or by the use of natural sunlight. The quantity of produce that can be accommodated over the cooking flue is limited and the traditional solar drying is inefficient because the produce is exposed to vagaries of nature, birds and occasionally to rodents. The produce is preserved for use during the lean period, sold when the price is right and stored to provide seeds for the next planting season. The cost of building the typical glass covered solar dryer is generally beyond the means of the average rural farmer. There is therefore a need to find cheaper construction materials to replace the major cost components such as glass. Two solar dryers with glass and plastic covers have been designed and constructed for the purpose of assessing the suitability of plastic sheet as a replacement for glass. The drying performance of the two dryers has been compared. The results from the plastic covered solar dryer compare favourably with those of the glass dryer. It is therefore concluded that glass can be replaced with plastic sheet without significant performance loss.

Abstract: PRA requires researchers / field workers to act as facilitators to help local people conduct their own analysis, plan and take action accordingly. It is based on the principle that local people are creative and capable and can do their own investigations, analysis, and planning. The basic concept of PRA is to learn from rural people. Chambers (1992) has defined PRA as an approach and methods for learning about rural life and conditions from, with and by rural people. He further stated that PRA extends into analysis, planning and action. PRA closely involve villagers and local officials in the process. Similarly, Rapid Rural Appraisal (RRA) reflects the new thinking about development, needs, and people oriented responsibilities. It is a process that is highly systematic and structured, relying on interdisciplinary teamwork and special strategies for data collection and analysis such as triangulation, probing, and iteration. Some critics consider RRA to be a quick and dirty technique. There are a wide range of participatory tools and techniques available. People can use these tools and techniques according to their situation or needs. Generally, the application of different tools may vary from one situation to another. However, the process for conducting RRA/PRA remains the same.

Abstract: In conventional face to face education, as far as teaching approaches are concerned everything is left up to the teacher concerned. Though the infrastructure is available the problem lies in its proper communication. In order to gauge the distance perceived across various aspects in the educational system, the researcher conducted the present study. After consulting the literature, nineteen factors were identified and an opinionnaire was accordingly prepared for teachers of Economics from the conventional face to face education. The nineteen factors and the teachers' opinion show how conventional educational system has not taken into consideration the communication aspects which would hamper overall performance of teachers as well as students. It has taken for granted that no communication distance can be present because of physical proximity between teacher and students and institution. Therefore there is a need to reconstruct the conventional curriculum taking into consideration the factors and compensate for them. To compensate for this distance, one can look towards the distance education mechanisms. The face-to-face education has thus a number of lessons to learn from distance education. In distance education, distance is presumed and attempts are made to create devices to compensate for it. As this study has showed, there is no reason to believe that the face-to-face education does not have any communication distance. It is a rather serious matter that most of the teachers in the face-to-face system perceive a communication distance.

Abstract: Food mutagens one of the major factors can contribute to human cancer risk and different health adverse effects. Heterocyclic amines (HCAs) are important class of food mutagens/carcinogens that can be formed in cooked meat, chicken and fish. The quantity and types of HCAs is dependent on cooking method, heating temperatures and time of cooking. In the present study, the effect of cooking method (charbroiling, wet boiling and smoked chicken luncheon) on formation of HCAs in Egyptian cooked chicken was studied using three short-term mutagenicity assays; yeast D7, somatic mutation and recombination test in *Drosophila* and rat bone marrow chromosomal aberrations assay. Mutagenic/carcinogenic heterocyclic amines (HCAs) are formed at low levels during heat processing of protein-rich food; therefore blue rayon was used as effective extraction and purification method. The results of mutagenicity tests indicated that used cooking methods for charbroiling and smoked chicken luncheon in this study were capable of forming food mutagen(s) and gave positive significant mutagenic effects in all tested assays. No HCAs were detected in wet boiling chicken extract, where it gave negative effects in all used bioassays.

Abstract: This study was carried out to determine the chemical composition and estimation of nutritional value of cherry tree leaves in the ruminant nutrition. In this study *in vitro*

gas production and *in situ* techniques were used to evaluate nutritional value of cherry tree leaves. Cumulative gas production was recorded at 2, 4, 6, 8, 12, 24, 48, 72 and 96 h of incubation also, *in situ* disappear of dry mater for experimental samples was measured at 0, 4, 8, 16, 24, 36, 48, 72 and 96 h of incubation. Chemical composition including dry matter (DM), crude protein (CP), crude Ash (Ash), ether extract (EE), neutral detergent fiber (NDF), acid detergent fiber (ADF) and tannin compounds, 91.11, 2.76, 9.3, 8, 27.6, 20 and 2.185 percent, respectively measured. Gas production test and *in situ* rumen degradability with of three Taleshi native male cattle rumen fistulae were performed. Digestibility of organic matter (OMD) 65.74 percent and metabolizable energy (ME) 10.27 (MjKg⁻¹) were estimated. The Polyethylene Glycol (PEG) supplementation had also a significant (p<0.05) increase in the estimated parameters of gas production, OMD and ME of samples. Potential degradation (a+b) for dry matter and Effective rumen degradable (ED) at a rate of 0.05/h were estimated, 84.12 % and 52.20% respectively.

Abstract:The aim of this research were to evaluated effect of canola oil on the EPA and DHA fatty acid contents in the abdominal fat of Iranian native turkeys. A total of 90 turkey chicks were randomly divided into 3 experimental treatments with 3 replicates were arranged in a completely randomized design. The experimental period lasted 20 weeks. Experimental diets consisted of: Basal diet with 0% canola oil; basal diet with 2.5% canola oil and basal diet with 5% canola oil. Results show that different level of canola oil could not affect significantly EPA and DHA content but DPA percent significantly increased in experimental treatments compare with control group.

51 **Investigation of dip coated ZnO thin film: X-ray reflectivity and Fourier analysis**

Ghahraman Solookinejad

Department of Physics, Marvdasht Branch, Islamic Azad University, Marvdasht, Iran
ghsolooki@gmail.com

Abstract : In this study we fabricated Zinc Oxide thin film by sol-gel dip coating method on glass substrate. X-ray reflectivity (XRR) and its optimization have been used for characterization and extracting physical parameters of the film. Genetic Algorithm (GA) has been applied for this optimization process. Independent information was exploited from Fourier transform of Fresnel reflectivity normalized X-ray reflectivity. The Auto Correlation Function (Fourier transformation of X-ray reflectivity) yields thickness of each coated layer on substrate. This information is a starting point for constructing optimization process. Specular X-ray reflectivity optimization yields structural parameters such as thickness, roughness of surface and interface and electron density profile of the film. Acceptable agreement exists between results obtained from Fourier transformation and X-ray reflectivity fitting.

52 **New look to indigenous knowledge in developing countries**

Abbas Emami

Darab Branch, Islamic Azad University, Darab, Iran
E-mail: hossein11070@yahoo

Abstract: in the process of agriculture renovation in the third world that is indeed unavoidable, the indigenous agriculture knowledge and local methods in management of agriculture resources is to be destroyed and simultaneity environmental regions are on the verge of destruction. Modern agriculture prefers huge profit from resources and didn't pay attention to environmental, cultural, social and economic varieties of traditional agriculture. So incongruities of agriculture development plans are not compatible with rural needs and talents and also rural conditions. By recognizing indigenous agriculture features such as traditional classification for identifying plant and animal species and using of indigenous practices like simultaneous cultivation of compatible crops, we can get useful information about suitable ways for agriculture. Surely these guidelines will be more compatible with rural needs and agriculture and environmental features of each region and won't be reckless to social, economic and environmental complex issues.

53 **The role of distance learning tools in Increase the efficiency of adult education**

Akram Ghaffari

Darab Branch, Islamic Azad University, Darab, Iran
Email: sharif11070@yahoo.com

Abstract: Adult learners are often those that distinguish each other and have many different targets at the same time and will follow a common challenge to fulfill the goals of building self motivation vectors as educational materials to learn and use the forge Adult illiteracy is like a disease that infects virtually every dimension of Kentucky life. Adult

illiteracy saps the energy and capability of Kentucky's people and its economy. Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Adult illiteracy severely hinders the life chances of young children, undermines school reform, and limits the opportunities for postsecondary education. Despite landmark reforms in public schools, too many Kentuckians continue to drop out of school, thereby perpetuating the chronic problem of adult illiteracy. Too many young Kentucky parents are unable to read and lack the basic literacy necessary to provide the necessary stimulating, supportive family environments for young children. It is known that children's literacy levels are strongly linked to the educational level of their parents and that children of parents who are unemployed and have not completed high school are five times more likely to drop out. To be successful, the Commonwealth's strategies must energize and gain the commitment of all the state's political, education, business, and civic leaders. No strategy will succeed unless it engages leaders in each community and county to identify needs and develop programs and services appropriate to the community's unique circumstances.

Assessing relationship between rural women empowerment and employment

Akram Ghaffari

Darab Branch, Islamic Azad University, Darab, Iran
E-mail: sharif11070@yahoo.com

[Full Text](#)

Abstract: Rural women constitute about half of the world's population and in the world production supply they have energetic communion and constitute a great part of agriculture workforce. They constitute% 50 of the workforce and they participate in the production of half of the foods in the agriculture section. As an example the rural women constitute about 70 to% 80 of agriculture workforce in sub-Saharan Africa, %65 in Asia, %45 in Latin American & Caribbean, %80 in Nigeria & Tunisia and %80 in India, but their role in production system is the men's supplements roles and this causes a big responsibility inside their mother & wife duties and it takes a great time and energy of them. Studies in this field show that women spend about two thirds of their time for production, management & organize of their house as the men spend only one third of their time for such things. In the development countries, rural societies which are poverty for geographic reasons such as being far from urban societies or because of mountainous of zone and also as the roads are impassable and some other reason, they became deprived of many human development programs. Unfortunately these societies are suffering of mortality because of poverty but what is clear here is that we can't attribute such privation to geography and nature of the zone. Every country is trying to solve such critical conditions by applying depoverity policies.

Importance of educators' knowledge about teaching methods in adult education

Fatemeh Bakhtiar

Darab Branch, Islamic Azad University, Darab, Iran
E-mail: abbasrezazadeh80@yahoo

[Full Text](#)

Abstract: Complex role of adult learning and training process is significant, his role gradually changed from the donor information and active for many years will assume that the principles and techniques that are used in teaching children to contribute equally in the adult learning process On the other hand is effective in children for adult education teachers were employed. Later that person was well trained (ie the experts), who could well slow or a group leader to manage the program, was selected as an adult educator. Thus learners directly in adult education programs that are based on experience were used, and adult As a mature child which has its own characteristics and is unique is that the principles and techniques of the different techniques used for the education of children is needed. As a result the role of adult educator gradually from non-skilled person without the expertise of individual specialists and trained to be changed and Instructors for training and educational opportunities were provided at all levels are therefore unable to work for educators from institutions with short-term training courses for users of the guidance program (project leaders) through summer workshops for professional leaders through programs Training of Master and PhD levels in schools of higher education courses were provided. other procedures, where the role of teacher has changed the theoretical concepts first, an understanding of adult learning was unfounded on the principle that the concept of adult education is based on transferring knowledge to them and saying what they should know or duty to interpret absorption educator their training. In recent years the practice has changed and the role of educator as a "change agent" and reform as a donor and an "auxiliary roles" or "facilitators" were raised as his understanding of adult personal and community among people.

The role of information and communication technologies (ICT) in distance education

Fatemeh Bakhtiar

Darab Branch, Islamic Azad University, Darab, Iran
E-mail: abbasrezazadeh80@yahoo.com

[Full Text](#)

Abstract: Technology transports information, not people. Distances between teachers and students are bridged with an array of familiar technology as well as new information age equipment. What sets today's distance education efforts apart from previous efforts is the possibility of an interactive capacity that provides learner and teacher with needed feedback, including the opportunity to dialogue, clarify, or assess. Advances in digital compression technology may greatly expand the number of channels that can be sent over any transmission medium, doubling or even tripling channel capacity. Technologies for learning at a distance are also enlarging our definition of how students learn, where they learn, and who teaches them. No one technology is best for all situations and applications. Different technologies have different capabilities and limitations, and effective implementation will depend on matching technological capabilities to education needs. Distance education places students and their instructors in separate locations using some form of technology to communicate and interact. The student may be located in the classroom, home, office or learning center. The instructor may be located in a media classroom, studio, office or home.

58 **The role of Distance education in improving adult education**

Maryam Zandieh ¹ and Mona Habibi²

^{1,2} Bojnourd Branch, Islamic Azad University, Bojnourd, Iran
*Corresponding author: allahyari121@yahoo.com

Abstract: Distance learning is one of the fastest-growing components of higher education. Almost 3.5 million students were enrolled in at least one distance learning course in the fall of 2006 and online enrollments are increasing every year. The convenience of taking classes at any time from any location appeals to today's adult learner, especially those who work, have families or live in rural areas. Today a growing number of paralegal and legal secretarial programs have a distance learning component (no law schools currently grant credit for distance learning studies). However, not all distance learning programs are of equal quality. Moreover, the increasing popularity of distance learning programs have led to "diploma mills" or "accreditation mills" that offer bogus degrees and certificates. Choosing a distance learning program requires careful research and evaluation. Below are several important factors to consider in choosing a distance learning program. In evaluating distance learning paralegal programs, determine if the school is accredited by one of the regional accrediting bodies and by the American Bar Association (ABA). ABA-approval signifies that the school has met certain standards in terms of academics, facilities and instruction. Graduating from an ABA-approved school may give you an advantage in the legal job market.

[Maryam Zandieh and Mona Habibi. **The role of Distance education in improving adult education.** Journal of American Science 2011;7(6):327-331]. (ISSN: 1545-1003). <http://www.americanscience.org>

59 **Rural women empowerment and rural development**

Nooshin Javadi ¹ and Mona Habibi²

^{1,2} Bojnourd Branch, Islamic Azad University, Bojnourd, Iran
*Corresponding author: saba11085@yahoo.com

Abstract: in the rural community of Iran, there are gaps between the ruling class (capital owners) and villagers, between literate and illiterate, and between men and women. Especially in villages women have fewer possibilities in terms of investment and less power and credit. Role of rural women, over of men, is more influenced with differer economic, social, cultural and ecologic factors. Rural women are considered as a noticeable potential in the community either directly (crops production, livestock, handicraft: cottage industries) or indirectly by helping the agricultural sector (as labor). About 5.6 million women are involved in agricultural production, and activities related to planting, harvesting, preparation of animal food, and taking care of livestock and poultry and some certain activities related to trading and marketing are all different fields of rural women' role and participation. Based on current statistics, women in rural area participate about 50% in conversion industries, 22% in producing crops and livestock, 75% in handicrafts an in areas related to planting...harvesting , respectively, 25, 24 and 4.26. And also in activities related to livestock, they handle 23% of livestock grazing, 42% of animal care and 10 percent of total poultry in the village. Therefore their role in achieving food security is undeniable. But, like most developing countries, this crucial role in society and in process c rural development, is not obvious. In Iranian rural community, about 80% of women work, but they are mostly considered as housewives, unpaid employment, domestic workers: family workers, or independent employers. The statistics often do not take into account seasonal, part-time, unpaid employment, and housekeeping activities. In economics and socia sciences, those of women's activities that have emerged out of house and affected national economy, are the ones to be noticed. In most research and statistics men are known as th heads of household and they are also the owners of lands and fields. That only 1% of the rural lands are belonging to women does confirm such matter.

*Corresponding author: allahyari121@yahoo.com

Abstract: Among developing countries, millions of women always are in farms and lands, work in engaged industries, keep the cattle, store firewood and water and earn livelihood and participation in economic activities is one of their important characteristics. But Despite their widespread presence in economic activities and benefits associated with it, they always face with discrimination. The discrimination has never tired them, but as a major force in economic activities is discussed around the world. In Semi-desert areas in Africa, women traditionally are active in keeping poultry and Vegetarian animals and wild plants and trees fruit collected. In Turkey, women are employed to produce vegetables and dairy products. Among Indians, agricultural activities of women include the region around the home and caring small animal, garden products and collective activities such as spinning, weaving, wool weaving, and the cheese production. In China, when the job opportunity outside the farm is not available, the men are trying to produce crops and women are keeping

livestock, doing crafts and spending to food products. In that case, women are responsible for all the agricultural tasks and do some activities such as the poultry production. 61 Adult learning principles

Nooshin Javadi¹ and Maryam Zandieh²

^{1,2} Bojnourd Branch, Islamic Azad University, Bojnourd, Iran

*Corresponding author: saba11085@yahoo.com

Abstract: adult education in the local agricultural education program is an essential component of the "total" program. Offering adult education programs helps to keep farmers and agribusiness employees better informed of current trends and provides them with opportunities to learn new skills and improve existing ones. Teaching adults can be very challenging, but also very rewarding. Most teachers would agree that the benefits derived from a successful adult education program in agriculture far outweigh the costs. In addition to the direct benefits to adult participants, the teacher, the school, the community, and the secondary program also benefit from a quality adult education program in agriculture. Adults in agriculture use a number of sources to gain new information that can be used to help them solve problems. Persons employed in agriculture utilize newspapers, magazines, newsletters, radio, television, government publications, internet, and meetings to gather information which can be directly utilized in their business activities. In many communities, the agriculture teacher is the primary source of agricultural information.

64 Utilization of micro-credit for rural women and improving livelihood

¹ Fakhteh Ghahramani and ² Zahra Kaveie

^{1, 2} Damavand Branch, Islamic Azad University, Damavand, Iran

*Corresponding author: fakhteh1358@yahoo.com

Abstract: In the countries that credits are provided in a proper financial manner, not only it has increased production and income but also it has encouraged poor to save a part of their income. These savings can be an important support for the institutes providing micro-credits and can be a financial base for more loans and all these result in institutes' finance dependence. With the new way of micro-credit payments, in addition to covering poor's financial needs, a combination of other services and facilities are available for them; such saving accounts, educational services, and cooperation possibilities. If rural women can work through receiving credits, loan and others finance facilities at favorite jobs and

through earned income (as it called "self-reliance and independence") , so undoubtedly we would see changes in social, economic and cultural relations of village. However the actions caused that women stand in good economic condition and also gain self reliance and rely themselves with no help from husbands, but dominant cultural space on villages may create some disorders. At most of villages in Iran, patriarchal with all features dominate and women's financial self reliance may not being pleasant for some human and rural groups.

65 **Using Participatory Rural Appraisal (PRA) in rural research**

¹ Fakhteh Ghahramani and ² Zahra Kaveie
1, 2Damavand Branch, Islamic Azad University, Damavand, Iran

*Corresponding author: fakhteh1358@yahoo.com

Abstract: Robert Chambers (2004) describes PRA as "a growing family of approaches, methods, attitudes and behaviours to enable and empower people to share, analyze and enhance their knowledge of life and conditions, and to plan, act, monitor, evaluate and reflect". While RRA focuses on data collection or extraction, PRA focuses on empowerment. It needs to be noted that although RRA and PRA carry the term "rural", they can both be and have been applied in urban settings. To make it more inclusive and to emphasize the empowerment aspect, the term Participatory Learning and Action (PLA) is used interchangeably with PRA. PRA has many sources. The most direct is rapid rural appraisal (RRA) from which it has evolved. RRA itself began as a response in the late 1970s and early 1980s to the biased perceptions derived from rural development tourism (the brief rural visit by the urban-based professional) and the many defects and high costs of large-scale questionnaire surveys. PRA has much in common with RRA but differs basically in the ownership of information, and the nature of the process: in RRA information is more elicited and extracted by outsiders as part of a process of data gathering; in PRA it is more generated, analyzed, owned and shared by local people as part of a process of their empowerment. The term Participatory Rural Appraisal (PRA) is being used to describe a growing family of approaches and methods to enable local people to share, enhance and analyze their knowledge of life and conditions, to plan and to act.

[Fakhteh Ghahramani and Zahra Kaveie. **Using Participatory Rural Appraisal (PRA) in rural research.** Journal of American Science 2011;7(6):362-366]. (ISSN: 1545-1003). <http://www.americanscience.org>.

66 **The role of indigenous knowledge in Reaching to sustainable development**

¹Zahra Kaveie and ²Fakhteh Ghahramani
1, 2Damavand Branch, Islamic Azad University, Damavand, Iran

*Corresponding author: leila11070@yahoo.com

Abstract: Indigenous knowledge is local knowledge that is restricted to one specific culture and/or certain society. Indigenous knowledge is different with scientific knowledge that was established by universities and scientific communities. This knowledge is basis for decision making at field of agriculture, health, education, food and natural sources . Indigenous knowledge is set of all knowledge and skills that people enjoy in one geographical area (in one environmental conditions) that most of their skills and knowledge be transmitted to next generation , and new generation would be adapted with them and add to it. Since, each knowledge is consequent of individual interaction with environment, so indigenous knowledge is consequent of indigenous people interaction with their environment. Chambers with emphasis on people's role at development process believes that "rural people's knowledge" term is more eloquent than other terms for indigenous knowledge. Our purpose of rural people are producer farmers , input buyers , agriculture production sellers and etc. "people" in above phrase emphasis that this knowledge is more verbal and less has been written . This word also referred to whole knowledge system which contains concepts, beliefs, and attitudes and also contains gain, store and transmitting knowledge process.

67 **Financial self-reliance of rural women through micro-credit**

¹ Maryam Nikmanesh and ² Mina Abarashi
1, 2 Damavand Branch, Islamic Azad University, Damavand, Iran

*Corresponding author: allahyari121@yahoo.com

Abstract: If rural women could provide a job for them by getting credits, loan and other financial convenience, through their income they can get self-reliance or financial independency and we will see social, cultural & economic change in village. The question here is that if these changes have positive or negative aspects in the village? It's natural that every change in social phenomenon has both positive and negative aspect, but which is Important here is that which aspect is more than the other and it depends to different condition in various societies. In our rural society there is an especial social & cultural kind that it's outcome maybe different and in some case inconsistent. With these actions rural women could be in idealistic economic condition and they could live without dependency to their husband's income. In most of the villages in Iran there is patriarchy in the families which is not acceptable for the most of the rural people and groups. When rural women became financially independent, it's acceptable to see its cultural & social outcomes. Giving the right that women make decision, independency to their family, increasing the cultural knowledge among them& making relation with new institutions, having independency in making decision about marriage, occupation, migration & something like this are the right that women have got it.

68 **Status of indigenous knowledge in rural (in developing countries)**

Maryam Zandieh ¹ and Nooshin Javadi²

^{1,2} Bojnourd Branch, Islamic Azad University, Bojnourd, Iran

*Corresponding author: allahyari121@yahoo.com

Abstract: Indigenous agriculture is base on farmer's cooperation with nature. Sustainable agriculture that inspired by indigenous systems would rectify most of deficiencies of

modern agriculture. Indigenous agriculture systems is production of centuries of cultural and subsistence revolution. These systems are collections of farmer's experiences that haven't enjoy sources except inputs, capital and indigenous knowledge. And consequently they accessed to such sustainable agriculture that just is dependent on using restricted local resources and existing humane and animal power. At indigenous agriculture, culture diversity and frequency would minimize possibility of loss crops in spite of simple technology. These systems despite of limitation of sources enjoy merits of sponsors traditions and intelligent methods of using animals, fields, and compatible crop species. Thus ecological agriculture scholars consider these systems as unique samples to determine sustainability standards in agricultures activities. This knowledge would rise at different fields such as language, botanical and zoology and also skills and manual and agriculture professions that all are product of human efforts in his environment. This information contain best, useful and consistent collocation of exploiting methods and living in special environment which be transmitted through verbal and empirical way from one generation to another.

Importance of using information and communication technologies (ICT) in education

Dr. Mahmoud Safari

Department of Educational Management, Damavand Branch, Islamic Azad University, Damavand, Iran

Abstract: ICT provides access to only a small part of the action is created equal. Equal attention should also be applied to ensure the technology really "is used by learners and ways of how well their needs will cure. An educational program that reinforced this approach shows the overall program is bilingual. The program seeks to establish technology learning centers for bilingual teachers, students, teachers, parents and community members. Technical teams from each center three students, two teachers and the director of the Center with at least one female student and a teacher are female. Another example of a general approach to the application of ICT in education, radio education project Gobi Women of Mongolia, which seeks to provide professional and educational structure of women's favorite courses around the nomads and their opportunities for income generation. It contains topics such as livestock rearing, family support (family planning, health, nutrition and health) to create income in the application of local raw materials and basic skills for the job is a new market. Policy makers and service providers have increasingly come to view information and communication technologies (ICT), and particularly the Internet, as an important tool in providing disadvantaged groups and areas with access to information, services and markets that would otherwise be inaccessible. The concept of development of the rural, today, is not just project initiatives and governance; it is much more beyond that. This paper uncovers a whole plethora of ICT emergence as a technology of the new millennium.

Abstract: In order to study of different levels of fertilizer treatment (K , Zn, S) on increase tolerance to cold on quality characteristics on genotypes of rapeseed in delayed planting , an investigation was carried out with factorial in random complete block with three replications and 36 treatment ,in Varamin - Pishva university field research (Ghaleh – sin) in 2008-2009. Factors were genotypes in three levels(Hyola -42 , SLM046 , Zarfam) and fertilizer treatment in 4 levels (1-Control , 2- C+ K, 3- C, K+Zn, 4- C, K, Zn +S). Planted seed at 10th November were delayed planting .The highest grain yield achieved from (C,K,Zn,S,SLM046)with 6564.6 Kg/ha ,That had 72 % grain yield further of (Control, Zarfam) genotype with 1807.65 Kg/ha. Also the highest number of pods per plant, number of grain per pods and biological yield with 156.97, 20.7 and 17384.9 Kg/ha respectively was obtained from Hyola-42 Hybrid and use of C, K, Zn, S. In this research the lowest these amounts were achieved for Zarfam genotype with Control fertilizer. In conclusion Slm046 genotype with C, K, Zn, S fertilizers was suitable for delayed planting (Cold Stress) for Varamin condition.

Prevalence of Adenocortical Insufficiency in Patients with Liver Cirrhosis, Liver Cirrhosis with Septic Shock and in Patients with Hepatorenal Syndrome

Mohamed Badr Mohamed¹, Gamal Hamed², Ayman Heikal² and Hisham Darwish^{1*}

¹Intensive Care Department, Theodor Bilharz Research Institute (TBRI)

²Critical Care Medicine Department, Cairo University

*drwesh123@yahoo.com

Abstract: Critical illness is accompanied by the activation of the hypothalamic-pituitary-adrenal (HPA) axis, which is highlighted by increased serum corticotropin and cortisol levels. In patients with severe sepsis, the integrity of the HPA axis can be impaired by a variety of mechanisms. These patients typically have an exaggerated proinflammatory response and are considered to be relatively corticosteroid insufficient. This complex syndrome is referred to as critical illness-related corticosteroid insufficiency (CIRCI) which manifests with insufficient corticosteroid mediated down regulation of inflammatory transcription factors. Similar to type II diabetes (relative insulin deficiency), CIRCI arises due to corticosteroid tissue resistance together with inadequate circulating levels of free cortisol. Numerous papers have reported a high incidence of adrenal failure in critically ill patients, including those with end stage liver disease and liver transplant recipients. The term hepatoadrenal syndrome e.i, Adrenocortical insufficiency in patients with liver cirrhosis has been used to describe such an association between liver disease and adrenal failure and the definition of this term extends beyond the occurrence of sepsis, which is a frequent complication of liver failure. Aim of work to assess: The prevalence of hepatoadrenal syndrome (HAS) among the Egyptian cirrhotic patients, the prevalence of HAS among those complicated with septic shock or hepatorenal syndrome and to find significant predictors for HAS. Patients and methods: Our study was a cross sectional study, conducted on 45 patients admitted to the liver intensive care unit and hepatology ward of Theodor Bilharz Research Institute (TBRI) in the period between November 2009 and

February 2010, who were fulfilling the criteria of Child Pugh classification. Patients were divided into three groups. Group A included 15 patients with liver cirrhosis, with neither septic shock nor hepatorenal syndrome, Group B included 15 patients with liver cirrhosis and septic shock, but not associated with hepatorenal syndrome, Group C included 15 patients with hepatorenal syndrome. The adrenal function of all patients was assessed by the conventional dose, short synacthen test (250 ug.iv) which was performed within the first 24 h of admission. Blood samples to measure plasma cortisol levels were obtained before and 30 minutes after synacthen administration. Results: Our study revealed that adrenocortical insufficiency (ACI) was found in 33 patients out of the 45 patients subjected to this study (73.3%). Receiver Operating Characteristic (ROC) curve was done and showed that the MELD score may be a good predictor for ACI in liver cirrhosis patients. ROC curve showed also that the serum bilirubin may be a good predictor for ACI in liver cirrhosis patients. Conclusion: Adrenocortical insufficiency is common in patients with cirrhosis and in patients complicated with hepatorenal syndrome. According to our study MELD score and serum bilirubin level may be good predictors for Hepatoadrenal Syndrome. Recommendation: We recommend To make further studies with greater number of patients to detect hepatoadrenal syndrome and to study its effect on the prognosis, the complication of liver cirrhosis and mortality. [Mohamed Badr Mohamed, Gamal Hamed, Ayman Heikal and Hisham Darwish. 72 **Design and Development of a Portable Banana Ripeness Inspection System**

Mahmoud Soltani*, Reza Alimardani and Mahmoud Omid

Department of Agricultural Machinery Engineering, Faculty of Agricultural Engineering and Technology, University of Tehran, Karaj, Iran. *mahmoodsoltani39@yahoo.com

Abstract: Automatic control of environmental conditions is an important problem of banana ripening treatment. In this study, a capacitive sensing system was designed and developed. In this method banana fruit is placed in the capacitive sensor as a dielectric material and then the capacitance of sensor is measured. Experiments were carried out with 10 kHz to 10 MHz sinusoidal frequencies. A consistent decrease of ϵ_s had occurred at 100 kHz and 1 MHz frequencies when banana had been ripened. A high correlation was observed between ϵ_s and ripening period ($R^2 = 0.96$) at 100 kHz frequency. This system has the following characteristics: rapid response, simple operation, non-destructive measurement, and low cost.

73 **Effect of Chitosan on Oxidative Stress and Metabolic Disorders Induced In Rats Exposed to Radiation**

N. E. Mohamed

Biological Applications Department, Nuclear Research Center, Atomic Energy Authority, Cairo, Egypt, P.O.13759
nelshahat@yahoo.com

Abstract: Radiation is one of the most widespread sources of environmental stress in living environment which cause oxidative stress and metabolic changes. Chitosan is widely distributed in nature as a component of bacterial cell walls and exoskeletons of crustaceans and insects. The present study aims to evaluate the antioxidant effect of chitosan against gamma rays induced oxidative stress and metabolic disorders in rats. The study was conducted on forty eight (48) female rats which were classified into four equal groups. Group 1: Control group, rats administrated orally 1.0 ml vehicle solution for forty days. Group 2: Chitosan group, rats administrated orally (intragastric intubation) 1.0 ml of chitosan solution (100mg/kg b.wt. / day for 40 days). Group 3: Irradiated rats, rats were subjected to whole body γ irradiation to dose 4 Gy delivered as single exposure dose. Group 4: Combined treatment: rats administrated orally 1.0 ml of chitosan solution (100mg/kg b.wt. / day) for 40 days. At day 35 of chitosan treatment the rats were irradiated at dose level of 4Gy. Rats inspected after 1st and 5th days post irradiation and liver, spleen, lung and blood samples were collected. The animals exposed to gamma radiation had significant increase in TBARS, LDH, glucose, cholesterol, triglycerides, LDL-C, copper, iron, urea, creatinine, AFP and non significant increase in Mg. Also, significant decrease in GSH, CAT, HDL-C and estradiol was recorded. Administration of chitosan to rats prior and post gamma radiation improved the tested parameters so it is a therapeutic alternative for oxidative stress, hyperlipidaemia and hormonal changes. In this way, chitosan may be contributed to the prevention of atherogenic processes and contribute as safe functional fiber food.

On Early Discovery of Mathematically Creative Children using Artificial Neural Networks Modeling (with a case study) 74

H.M. Mustafa

Faculty of Engineering, Albaha University, KSA
mustafa_hasan47@yahoo.com

Abstract: Learning creativity is an interesting educational phenomenon usually observed at children classrooms. Early discovery of individual children having mathematical creativity is a challenging interdisciplinary research issue. This piece of research focuses on quantitative analysis and evaluation of mathematical learning creativity on the basis of acquired "Subjective Domains of Experiences" (SDE) inside children's brain. Acquisition of (SDE) assumed to modify a children's stored experience via application of various multimedia Computer Assisted Learning (CAL) packages (modules). Accordingly, fairly assessment of mathematical learning time response has been adopted herein for analysis and evaluation of learning creativity acquired by (SDE). By some details, early discovery of creativity could be performed well in accordance with obtained learning assessment results. That is after solving correctly a suggested mathematical topic (at children classrooms). Furthermore, interactive interference between Reflective and Spontaneous Vorstellungen* during mathematical education has been simulated using supervised and autonomous Artificial Neural Network (ANN) learning paradigms. * The German word Vorstellungen is used in replacement of the vague English expression "internal representation"

Corresponding author's email: mhashemina@riau.ac.ir

Abstract: Rice product after wheat has special importance as the second agriculture strategic product. Rice weevil as one of the most important stored pest has the main role in losses of stored product. So in this research, the pest effects was studied on 4 common varieties of rice in Guilan province "Taroum, Hashemi, Ali kazemi and Dylamani" in two conditions of facultative and obligatory nutrition. Results showed that Taroum variety was the most sensitive variety in conditional of facultative and obligatory nutrition and after it Hashemi variety was in the second category and had significant difference with Taroum variety. Ali kazemi and Dylamani varieties didn't have significant difference with together and had the lowest sensitive.

76 **Investigating the Strategies to Achieve Success in Human Resource Planning**

Masoud GhorbanHosseini¹

¹PhD student, Department of Management, Saveh branch, Islamic Azad University, Saveh, Iran
masoudghorbanhoseini@yahoo.com

Abstract: Human resource planning has traditionally been used by organizations to ensure that the right person is in the right job at the right time. Under past conditions of relative environmental certainty and stability, human resource planning focused on the short term and was dictated largely by line management concerns. Increasing environmental instability, demographic shifts, changes in technology, and heightened international competition are changing the need for and the nature of human resource planning in leading organizations. Planning is increasingly the product of the interaction between line management and planners. In addition, organizations are realizing that in order to adequately address human resource concerns, they must develop long-term as well as short term solutions. As human resource planners involve themselves in more programs to serve the needs of the business, and even influence the direction of the business, they face new and increased responsibilities and challenges.

[Masoud GhorbanHosseini. Investigating the Strategies to Achieve Success in Human Resource Planning. Journal of American Science 2011;7(6):435-439]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Masoud GhorbanHosseini¹

¹PhD student, Department of Management, Saveh branch, Islamic Azad University, Saveh, Iran
masoudghorbanhoseini@yahoo.com

Abstract: Human resource management can be defined as the process of acquiring, training, developing, motivating, and appraising a sufficient quantity of qualified employees to perform the activities necessary to accomplish organizational objectives; and developing specific activities and an overall organizational climate to generate maximum worker satisfaction and employee efficiency. While the owner-manager of a small organization is likely to assume complete responsibility for human resource management, larger organizations use company specialists called human resource managers to perform these activities in a systematic manner. The position is becoming increasingly important because of increased competition, government intrusion, emphasis on cost control, complex wage and benefit programs, and a changing work force. This article reviews the perspectives and the important considerations over the HR management and what HR managers should care about to achieve better Performance Measures.

[Masoud GhorbanHosseini. A Survey on the Human Resource Management Perspectives as an Emerging Managerial Function. Journal of American Science 2011;7(6):440-444]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Arminmahmoodi97@yahoo.com

Abstract: The study deals with the issue of investigating the relationship of psychological hardiness and self-esteem in a sample of 151 University students. Psychological Hardness Scale by Nowack (1990) and self-esteem Inventory by Coopersmith (1981) was used to assess psychological hardiness as well as global hardiness. Further, high self-esteem University students were found to possess significantly higher commitment, perceived greater sense of control on themselves, had higher challenge- accepting tendency and were harder as compared to their low self-esteem counterparts. The paper calls for the implementation of intervention strategies for development of hardy personality and self-esteem among university students.

Armin Mahmoudi¹

Assistant Professor, Department of Studies in Education, Yasouj branch, Islamic Azad University, Yasouj, Iran

Arminmahmoodi97@yahoo.com

Abstract: This paper aims to present the perception of secondary school teachers in Bangalore city (India) and Shiraz city (Iran) regarding Total quality Management (TQM) in education. It is an attempt to understand how these perceptions vary by demographic variable such as, gender & subject specialization (Arts and sciences). Data were collected from 326 high school teachers in BANGALORE (India) and SHIRAZ (Iran) on the Bonstingles conceptualization of Deming's 14 points Total Quality Management (TQM) in Education (1992) and were analyzed using SPSS version 16.0. Multivariate Analysis of variance (MANOVA) was employed to find out the significance of difference between variables subscales. The results obtained by the researcher indicated that there is significant difference between male and female teachers in the perception of total quality management. It is further showed that, Female teachers had higher mean score than male teachers in both the countries. It is also found that, there is no significant difference between ARTS and sciences secondary school teachers from both the countries in the perception of TQM in education. [Armin Mahmoudi. 80 **Could Preeclampsia Affect The Maternal Serum Chorionic Gonadotrophin and Plasma Adenosine Deaminase Levels?**

Mohamed A. El hadi Farag (MD), Mohamed Abd El-Salam (MD), Ashraf I. El Mashad (MD), Ibrahim El-Maghawry (MD) *

Obstetrics & Gynecology and * Medical Biochemistry Departments, Benha & * Zagazig Faculties of Medicine

Benha & * Zagazig Universities

*elmaghawry21@hotmail.com

Abstract: The current work aimed to study the effect of preeclampsia on maternal serum level of beta subunit of human chorionic gonadotropin and maternal plasma level of adenosine deaminase. Ninety pregnant women with gestational age 24 - 26 weeks were selected for this study, they were classified into three groups: group 1 consists of 30 women with normal pregnancy, group 2 consists of 30 patients with mild preeclampsia and group 3 consists of 30 patients with severe preeclampsia. Maternal serum level of beta subunit of human chorionic gonadotropin, and maternal plasma adenosine deaminase level were measured. Maternal serum level of beta subunit of human chorionic gonadotropin was significantly higher in severe preeclampsia compared with the mild preeclampsia group and normal pregnancies. Maternal plasma adenosine deaminase level was significantly higher in the severe group compared with the mild preeclampsia and normal groups. Maternal serum level of beta subunit of human chorionic gonadotropin and maternal plasma level of adenosine deaminase might be useful as markers of the severity of preeclampsia.

82 **Decentralization of agricultural extension**

¹Mina Abarashi and ²Maryam Nikmanesh

1, 2 Damavand Branch, Islamic Azad University, Damavand, Iran

*Corresponding author: saba11085@yahoo.com

Abstract: Agricultural extension is one of the main institutional components of agriculture as it promotes the transfer and exchange of information that can be converted into functional knowledge. It is better to say that extension is the instrument, which is helpful in developing enterprises that promote productivity and generate income in the present climate of change, which ultimately reduce poverty in developing as well as developed countries. Un-fortunately in developing as well as low income countries agricultural extension has failed in diffusing new technology to its ultimate users and further deterioration witnessed with the passage of time. The failure of agricultural extension services for last decades is under constant pressure to be responsive to ever-growing challenges of food production. Agricultural extension is a non-formal type of education that provides advisory services by the use of educational approach in acquiring knowledge and skills to deal with the growing needs of global world. Diverse agricultural extension funding and delivery arrangements have been undertaken since the mid-1980s by governments worldwide in the name of "privatization." When agricultural extension is discussed, privatization is used in the broadest sense – of introducing or increasing private sector participation, which does not necessarily imply a transfer of designated state-owned assets to the private sector. In fact, various cost-recovery, commercialization, and other so-called privatization alternatives have been adopted to improve agricultural extension. The form and content of decentralization has dominated development discourse and public sector reform agenda in Kenya in the last two decades.

83 **Sperm nuclear deoxyribonucleic acid denaturation in diazinon/diazoxon sprayer men**

Sherif MH El-Kannishy(PhD)⁽¹⁾, Rizk M El-Baz(PhD)⁽²⁾, Soma Sh Abd El Gawad(MD)⁽³⁾, Hamdy F Marzook(MD)⁽³⁾, Samia A Hassan(MD)⁽⁴⁾, and Abdelhamid A Metwali (MD)⁽⁵⁾

(1) Analytical Toxicology - Emergency Hospital, (2) Genetic Unit – Pediatric Hospital, (3) Clinical Pathology Dept., (4) Forensic Medicine & Clinical Toxicology Dept., and (5) Internal Medicine Dept. Faculty of Medicine, Mansoura University, Egypt. somaabdelgawad@yahoo.com

Abstract: Objectives: Excessive exposure of agrochemical male workers to organophosphate (OP) pesticides may induce morphofunctional changes in their sperms. The aim of this study was to explore sperm nuclear deoxyribonucleic acid (DNA) reaction to in vitro incubation with or in vivo chronic exposure to diazinon or diazoxon. **Methods:** Fixed volumes of every semen sample of ten healthy volunteers were incubated at 37°C for one hour with rising serial volumes of 60% of either diazinon (DZ) or diazoxon (DZO). Induced sperm morphological alterations were determined by microscopic examination of direct fresh, Papanicolaue stained and eosin-Y exclusion smears while sperm nuclear cytotoxicity was assessed by DNA fluorometric examination. On the other hand, sperms of 20 chronic agriculture DZ/DZO spraying workers were directly examined for their quality and DNA denaturation state. **Results:** Normal human spermatozoa showed unfavorable increasing alterations in their quality and DNA integrity after their incubation with serially rising volumes of either diazinon or its oxon. Induction of sperm nuclear DNA denaturation by DZO was more severe both qualitatively and quantitatively than after DZ treated testing. Similar alterations but to lesser extent were found in sperms' DNA of chronic DZ/DZO spraying workers without exogenous OP treatment. **Conclusion:** In vivo DZ/DZO chronic exposure induced unfavorable effects in seminal quality and sperm DNA integrity but were lesser in strength than in vitro testing.

Abstract: This paper investigates the temperature distribution in porous fins in natural convection condition and compares it with temperature distribution in conventional fins. To formulate the heat transfer equation, the energy balance and Darcy's model used. This study is based on finite-length fin with insulated tip. The porous fin allows the flow infiltrate through it. The theory section addressed the derived governing equation. The effect on porosity parameters "S" and convection parameter in porous fin "n", and convection parameter in conventional fin are discussed. The result suggests that by increasing "S" the heat transfer increase but in some cases it has exemption.

Abstract: A new synthetic fabric composed of a mixture of two biomaterials, polyamide 6.6 and polyester, was manufactured with specific tensile characters to serve in the reconstruction of the patellar ligament rupture in dogs. Twelve skeletally mature mongrel dogs with no evidence of clinical signs of lameness were used in the present study. Patellar ligament rupture was induced by severing the mid portion of the right ligament of each limb. Surgical intervention was performed by primary suturing of the severed patellar ligament ends and applying a synthetic fabric to act as a supportive internal splint. Satisfactory results were obtained concerning the tendon healing and the return to limb normal function without complications. It was found that the polyamide polyester fabric proved to be a suitable reconstructive biocompatible material that allowed primary ligament repair with adequate support by and give an excellent outcome in cases of patellar ligament ruptures in dogs.

86 **Effect of Methanol intoxication on the Function of Retina of Rabbit**

Alaa El-Din A. Gawad and Amal E. Ibrahim

Biophysics and Laser Unit, Research Institute of Ophthalmology

Abstract: Methanol is an ideal candidate to replace fossil fuels. However, alterations in the retinal function are primarily associated with methanol intoxication. In the present work, chronic methanol intoxication was carried out in New Zealand rabbits previously depleted of foliates with methotrexate. We analyze the effect of long-term alcohol consumption on oxidative stress parameters of the rabbit retinas and its correlation to retinal function. We show that methanol has a toxic effect on rabbit retina associated with oxidative stress. Decreases in retina glutathione concentration and increases in catalase activity in whole retina homogenate significantly correlate with ERG a- and b-wave decrease. We show also a marked change in the molecular structure and orientation of rhodopsin in cell membranes of the retina. Chronic methanol consumption induces oxidative stress in rabbit retina associated with an impairment of ERG and molecular changes of membrane proteins.

Abstract: Studies have shown that in the contrary of loss productivity of traditional sources (money, land and ...), knowledge is really a source of increasing economic performance. Basically, managers of companies are forced to correct and improve production methods, marketing, innovations and ultimately increase productivity and economic efficiency by considering prevailing economic conditions constantly. One of the main ways to improve economic conditions and increase competition for successful factories which can reach to the potency of competition, is the use of creative thinking that without the recognition and protection of intellectual capital will not be possible. In this study, elements and components of intellectual capital are independent variables as human, Structural, and relational capitals. Economic performance indicators (dependent variables): profit and cash earnings are considered. Methods of research in doing is descriptive - correlation of covariance analysis of structural equation model. The results were analyzed with the Lisrel & SPSS software, and finally the relationship between intellectual capital were confirmed and it has been found that relational and structural capital directly and human capital, indirectly, impress economic performance by structural effects.

*E .mail: quietasever@yahoo.com

Abstract: The effect of delay after slaughter on microbial quality, proximate composition and sensory scores of raw catfish, *Clarias gariepinus* (Burchell, 1822) was evaluated. A total of 52 live catfish weighing $700.0 \pm 7.0g$ were used. Ten freshly slaughtered fish samples each were selected for organoleptic assessment at 0, 4, 8 and 12 hours post-slaughter, while three fish samples each were selected for chemical and microbial analyses. Microbial load on fish samples increased significantly ($P < 0.05$) with increase in length of delay after slaughter, LODAS. Bacteria isolated included *Escherichia coli*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Bacillus spp* and *Staphylococcus aureus*. Percent protein and ash contents of fish samples increased with increasing LODAS, while moisture content decreased and lipid was not affected. It was observed that raw *C. gariepinus* retained most of its physical attributes up to 4 hours post-slaughter. These quality attributes except colour and odour of gills, deteriorated significantly ($P < 0.05$) at every successive four-hour post-slaughter interval. Significant negative correlation existed between LODAS and sensory quality of raw fish (eyes, $r = -0.966$, $P < 0.05$; gills, $r = -0.980$, $P < 0.05$; skin, $r = -0.998$, $P < 0.01$; and odour, $r = -0.994$, $P < 0.01$). This study established that quality of raw *C. gariepinus* deteriorated with increasing LODAS and that raw *C. gariepinus* was not totally unacceptable when delayed for 12 hours after slaughter at ambient temperatures.

Faculty Of Educational Studies, Universiti Putra Malaysia, 43400 Serdang, Selangor, Malaysia
aminah@ace.upm.edu.my

Abstract: This study examined the extent of work-family conflict experienced by married female junior physicians and the coping behavior of the physicians in managing the conflict. The sample of this study consisted of married female physicians (with at least one child) aged 40 and below working in fourteen public hospitals in Malaysia. Data were gathered from a sample of 231 female junior physicians using self-administered questionnaires through the drop and collect method. The two major strategies used by the physicians were personal role redefinition which involved changing their own attitudes and perceptions of role expectations, and reactive role behavior which involved careful planning, scheduling and organizing their role activities, and working harder to meet all their role demands. The least frequently used strategy was structural role redefinition which entails an active attempt to deal directly with role senders and lessen the conflict by mutual agreement on a new set of expectations. Implications of the findings and suggestions for future research were discussed.

Is salinity tolerance of rice lines related to endogenous ABA level or to the cellular ability for ABA synthesis under stress?

[Full Text](#)

Saeed Saeedipour¹

¹Department of Agronomy, Shoushtar Branch, Islamic Azad University, Iran

saeeds79@gmail.com

Abstract: As the plant hormone abscisic acid (ABA) is involved in responses to salinity stress. We tested its putative relationship with the degree of tolerance to this abiotic stress. For this purpose we examined the responses of sensitive (IR29) and tolerant (IR651) varieties of indica rice (*Oryza sativa* L.) to a range of salinity (0 (control) and 100 mM NaCl).

Shoot and root dry weight was reduced and leaf Na concentration increased in response to salinity for both cultivars with a **higher** extent in sensitive. Tolerance of IR29 to saline stress was generally improved by ABA treatment and leaves Na content reduced to their respective control treatment. This ABA effect was evident in IR29 with low tolerance, as their ability to recover from stress increased up to seven fold. Independent of the saline treatment, the absolute endogenous leaf ABA content in sensitive variety was significantly more than tolerant one. However, upon stress, the increase in endogenous ABA synthesis was higher in tolerant than in sensitive varieties. These data together with those obtained by using Fluridone, an inhibitor of ABA synthesis, suggested first, there was differential sensitivity to ABA in the tolerant and sensitive leaves cultivars and enhanced concentrations at tolerant levels acted primarily to maintain root and shoot growth salt stress and second, the differences in the level of tolerance to saline stress is related to their different capacity of ABA synthesis under stress conditions.

Abstract: The karyotype and chromosomal characteristics of (Chush Snow barbel) *Schizothorax labiatus* from River Jhelum Kashmir were investigated. The analysis of 80 metaphase plates revealed the chromosome number of this fish $2n=98$ and a fundamental arm number (FN) =142. The diploid complement comprised 12 metacentric pairs, 10 submetacentric pairs, 1 subtelocentric pairs and 26 telocentric pairs (24m+20Sm+2St+52t). Total length of the haploid complement equalled 157.5 μ m with a range in the length of shortest and longest chromosome between 2-8 μ m. The arm ratio and the centromeric index ranged between 1- ∞ and 0-50 respectively. No heteromorphic sex chromosomes were found. The present study is the first to describe the chromosomal characteristics of *Schizothorax labiatus* from The Kashmir Valley.

Abstract: Does social capital generate positive influences on poverty reduction? This question has important theoretical and policy implications for the contemporary world, especially for the developing countries. This study assesses social capital in poverty reduction in rural areas of Marvdasht, Iran. Data were collected using survey questionnaire. Results indicate that although there is strong communication and social cohesion for poverty reduction, but communities still face challenges and constraints which hinder their contributions in poverty reduction.

Abstract: This study aims to investigate the relation between organizational structure and entrepreneurship which is of discretionary – correlational type, done by the field method among all the physical education (PE) teachers and employees of Eastern Azerbaijan's Islamic Azad Universities (n=63). Two questionnaires about organizational structure and entrepreneurship, whose reliability was achieved by the experts, and Pearson and T correlational coefficients, were used to test and analyze the data. The results showed no relation between organizational entrepreneurship and complexity but showed a negative and significant relation among entrepreneurship and formality and concentration. Eventually, no difference was observed between organizational entrepreneurship of the (male or female) teachers and employees.

94 **Ceramic Tile Border Defect Detection Algorithms in Automated Visual Inspection System**

Ehsan Golkar¹, Ahmed Patel^{2,3}, Leila Yazdi⁴, Anton Satria Prabuwono⁵

¹ Department of Computer, Science and Research Branch, Islamic Azad University, Tehran, Iran

^{2,4,5} Centre of Artificial Intelligence Technology (CAIT) Software Technology and Management Research Center (SOFTTEM), Faculty of information science and technology, University Kebangsaan Malaysia,

Abstract: Automated Visual Inspection Systems (AVIS) are becoming increasingly popular due to low cost maintenance and high accuracy. Ceramic tile factories, for example, are very much interested in these sorts of systems. This paper introduces a different strategy in ceramic tile inspection system to reveal four major problems, namely, edge curvature, thickness, size measuring and edge crack defects. It is believed that this method will cover edge curvature defects and thickness measuring of ceramic tiles in AVIS with recommending an individual algorithm for each defect based on line feature extraction techniques. In addition, it is assumed that our model makes size measuring and edge defects detection easier and more accurate rather than previous approaches. This proposed model will allow ceramic tile companies to perform quality control inspection without costly measuring tools or error-prone inspection by humans. Moreover, factories have to install and apply Flatness Control Machine (FCM) to measure the flatness curvature of ceramic tiles. This machine keeps the ceramic tiles in fixed position to investigate the upper surface only. But our strategy is independent of a specific position through inspection in various angles from top and side views. We hope that our model, which is prominent in low cost implementation, will enable companies to apply this method in different situations in their manufacturing production line systems. Hence, it will assist them to produce not only more accurate reports on defects but also permit improved manufacturing of quality products. Abstract: Nowadays, the issue of brand extension strategy has emerged as one of the most crucial topics for marketing management. Previous studies report extraordinarily high failure in brand extension strategies. Hence, this study present a practical framework for evaluation critical factors of brand extension strategy of product based on appropriate criteria and Fuzzy Analytical Hierarchy Process technique. For obtaining critical factors, the key published papers are employed to derive those initially important factors firstly, 15 factors are identified. These factors have been discussed and publicized in academic and management fields and can be summarized as three aspects and fifteen initially factors. Consequently, the proposed Fuzzy AHP approach is used to measure relative weights for evaluating these factors. The proposed methodology implemented as an actual case in the biggest automobile manufacture in Iran. Finally, the results of this study shows that “Quality”, “Services after sale”, “Determining the suitable strategies in Brand field”, “Top management commitment and support” and “Advertisement” is the top five critical factors.

Fourier Transformer Infrared Spectroscopy for Quality Assurance of Tomato Products

Mohie M. Kamil^{1*}, Gamal F. Mohamed¹ and Mohamed S. Shaheen²

¹Food Science and Technology Department, National Research Center, Dokki, Cairo, Egypt

+Flavour and Aromatic Department, National Research Center, Dokki, Cairo, Egypt

*ResearchTeamMMK@yahoo.com

Abstract: FT-IR spectroscopic technique was used to evaluate the chemical composition, lycopene, β -carotene and some adulterants (starch, allura red pigment and paprika) of tomato products as a fast technique in comparison with standard methods. The results indicated that, sensory evaluation and color parameters of Hunter measurements (L^* , a^* & b^*) represent color value but the quality of tomato natural pigment (lycopene) not identified. FT-IR spectra of adulterated tomato paste with starch showed spectral peaks at (1137 cm^{-1} and 1040 cm^{-1}) while, in adulterated paste with paprika revealed some peaks at 641 for stretching (CH_2 , CH) and at 1520 cm^{-1} for vibrational stretching of ($\text{C}=\text{C}$). Ketchup was characterized with stretching ($\text{C}-\text{O}-\text{C}$) at 1279 cm^{-1} . Adulterated tomato paste with paprika characterized with total 1 phenolic compounds (42.7 ± 2.3) and high antioxidant activity ($78.3.8\%\pm 2.9$). The effect of processing on the volatile components present in tomato paste, ketchup and adulterated tomato paste with starch or paprika has been studied by gas chromatography (GC) and gas chromatography-mass spectrometry (GC/MS). The most predominant volatiles were saturated and unsaturated 6-carbon aldehydes and alcohols. Hexanal and (Z)-3-hexen-1-ol, (Z)-3-hexenol, 5-methyl-5-hexen-2-ol and 1-hexanol were present in significant concentrations in all samples. Methyl-(2-hydroxy-3-methyl)-valerate and methyl-(2-OH)-iso-methyl valerate were generated in tomato paste with high concentration (1.0 and 4.25%), respectively.

Detecting Adulteration of Durum Wheat Pasta by FT-IR Spectroscopy

Mohie M. Kamil^{1*}, Ahmed M. S. Hussien¹, Gamal H. Ragab¹, and S.K.H.Khalil²

¹Food Technology Dept. and ²Spectroscopy Dept., National Research Centre, Cairo, Egypt

*ResearchteamMMK@yahoo.com

Abstract: Hard wheat flour and durum of different extraction level (whole meal, 82% and 72%) and their pasta products were evaluated by the ordinary methods in parallel with FT-IR spectroscopy. Chemically, there was considerable difference between hard wheat flour and durum in protein and crude fiber contents. Durum whole meal, hard wheat flour (72%) and durum adulterated with hard wheat flour 72% (1:1) were used to prepare high quality pasta and adulterated pasta, respectively. Color analysis showed that, addition of hard wheat to durum increased the lightness values but decreased the redness and yellowness values. Also, pasta processed from these raw materials had the same character except

lightness. Cooked pasta had no significant differences in lightness and redness values while there were significant differences in yellowness values of the cooked pasta. Sensory evaluation of pasta made from durum and hard wheat and their mixture showed that, there were significant differences between them in all sensory properties. Cooking quality of pasta revealed that, the weight of hard wheat pasta increased more than durum pasta, while, the volume of durum pasta was higher than hard wheat pasta. Cooking loss was very lower in durum pasta than hard wheat pasta. Since, wheat and their products contain different polar functional groups such as lipids, carbohydrates and proteins, FT-IR spectroscopy was used as a beneficial tool for detecting adulteration of pasta. The FT-IR results showed that hard wheat (72%) was recognized from durum (72%) by presence of three specific bands at 1420 and 1374 cm^{-1} which are nearly disappeared in durum, while durum was characterized by two absorption bands at 2860 and 1744 cm^{-1} . FT-IR spectral analysis of durum pasta and adulterated ones showed the same results of durum and wheat flour raw materials.

[Mohie M. Kamil, Ahmed M. S. Hussien, Gamal H. Ragab, and S.K.H.Khalil. **Detecting Adulteration of Durum Wheat Pasta by FT-IR Spectroscopy**. Journal of American Science 2011;7(6):573-578]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Optimizing Browning Capacity of Eggplant Rings during Storage before Frying

*Hatem S. Ali, Mostafa T. Ramadan, Gamal H. Ragab, Mohie M. Kamil and Hesham A. Eissa

Food Technology Department, National Research Centre, 12622 Cairo, Egypt

Hamin_essa@yahoo.com

Abstract: Deterioration of fresh eggplant rings was demonstrated as a rapid increase of enzymatic browning and with an obvious browning. The effect of thermal and chemical pretreatments on enzymatic browning and frying quality of eggplant rings were investigated. Thermal pretreatment using water or steam blanching; and chemical pretreatment by dipping in different concentrations of SO_2 , chitosan, carboxy methylcellulose (CMC) or sodium chloride. Changes in enzymatic browning in fresh eggplant rings during storage at 25°C for 24 hrs were investigated by determining rings colour as a capacity of browning and colour parameters. Best colour values of eggplant rings were found in SO_2 and steam blanching pretreatments; hence the quality of fresh eggplant rings was able to maintain for up to 24 hours at 25°C. The inhibitory effect of various thermal and chemical pretreatments on eggplant rings was found to decrease in the following order $\text{SO}_2 > \text{steam blanching} > \text{water blanching} > \text{coated chitosan} > \text{coated CMC} > \text{sodium chloride}$. Frying eggplant rings at 180°C/4 min for SO_2 , chitosan or steam blanching was able to optimize the quality of eggplant rings regarding to L^* , a^* , C^* , BI, ΔE -values and non-enzymatic browning (A420 nm). The fried pre-treated eggplant rings with SO_2 or water blanching gave higher mean panel scores (7.8–8.6) in all sensory characteristics compared to other pre-treated samples.

Chlamydia Pneumonia Infection and Possible Relationship to Childhood Bronchial Asthma

Nisreen El-Abiad*, Wagdi M.Hanna, Amira Ahmed+, Hisham Waheed and Olfat Shaker**

Departments of Child Health, National Research Centre, * Pediatrics, **Medical Biochemistry, Faculty of Medicine, Cairo University, + Neonatology, Al Galaa Teaching Hospital

hishamwb@yahoo.com

Abstract: Background: Asthma is a leading cause of chronic illness in childhood. Respiratory tract infections with viruses and mycoplasma pneumonia are considered the most common triggers of asthma in all age groups. Recently Chlamydia pneumonia infection has been suggested to play a role in pathogenesis of asthma. **Objective:** The aim of this work was to evaluate the possible role of Chlamydia pneumonia in the development or aggravation of childhood bronchial asthma. **Patients and Methods:** This study included 50 asthmatic patients divided into 2 groups; group (1) composed of 20 new wheezier who denied previous wheezing and were evaluated during initial wheezing episode, group (2) composed of 30 chronic asthmatic children who had recurrent episodes of/persistent wheezing. Also 20 healthy children were included as a control group. Qualitative estimation of Chlamydia pneumonia infection in nasopharyngeal swabs using polymerase chain reaction (P.C.R) technique was done to all cases and controls. **Results:** In the new wheezier group 8 cases (40%) were Chlamydia pneumonia PCR (+ve), in the chronic asthmatic group 9 cases (30%) were PCR (+ve), while in the control group only 2 cases (10%) were PCR+ve. The infection rate of Chlamydia pneumonia among patients were 17 (89.5%) and among controls 2 (10.5%) with a statistically significant difference ($P = 0.041$) between patients and controls. There was an increase in asthma severity and severity of exacerbation in PCR+ve than in PCR-ve patients for C. pneumonia but it didn't reach statistical significance. Also there was a significant increase in PCR+ve males (58.8%) than PCR+ve females (41.2%), while there were no significant statistical difference between PCR+ve and PCR-ve patients as regards age, residence, seasonal variation, atopic manifestation and family history of atopy. **Conclusion:** The incidence of C. pneumonia infection among new wheezier and chronic asthmatics is high pointing to its possible role as a triggering factor for asthma in new wheezier and continuation of symptoms in spite of proper treatment plan in chronic asthmatic children.

Corrosion inhibition of lysine as basic amino acid on 316L stainless steel in 0.5 M H_2SO_4 solution

Azza El-Sayed El-Shenawy

Department of Chemistry, Faculty of Science (Girls), Al-Azhar University, Cairo, Egypt

Dr.azza2010@hotmail.com

Abstract: The corrosion inhibition of 316 L stainless steel in 0.5 M H_2SO_4 by lysine was investigated using open-circuit potential measurements, potentiodynamic polarization measurements and scanning electron microscopy (SEM) techniques. The open circuit potentials were measured in the absence and presence of different concentrations of lysine. It was found that the open circuit potential becomes more positive with increasing the concentration of lysine. Potentiodynamic polarization measurements showed that the presence of lysine in acidic solution effects mainly the cathodic process and decreases the corrosion current to a great extent and shifts the corrosion potential towards more negative values. Results revealed clearly that lysine is a good cathodic type inhibitor for 316L stainless steel in 0.5 M H_2SO_4 . The maximum inhibition efficiency of lysine was achieved at $(7 \times 10^{-2} \text{ M})$. Analyses of the surface by SEM confirm these results.

*emanmma@yahoo.com

Abstract: Neonatal period is the most hazardous period of life because of various problems/ diseases which a neonate faces. There is great overlap between the risks associated with morbidity and mortality in the perinatal and neonatal periods. The present study aimed to identify the profile and risk factors for neonatal mortality among neonates admitted to neonatal intensive care unit in pediatric Assiut University Hospital (AUH). A prospective study was conducted in NICU of pediatric AUH. Study population included all neonates admitted to NICU over a period of one year. The data collected included detailed antenatal and natal histories, details of clinical examination, primary diagnosis, progress during the hospital stay and outcome. The outcome measure was in-hospital death. Survival was defined as the discharge of a live infant from the NICU. Differences between deceased and survived neonates were estimated by the chi-square test and t-test. The association between risk factors and neonatal mortality were estimated by relative risk. The significance level used was p-value of less than 0.05. A total of 990 neonates were included in the study, of which 582 neonates (58.8%) died during their hospital stay. The mortality rate decreased with the increase in birth weight, as well as gestational age. Respiratory distress was the commonest primary diagnosis (94.5%) among all admitted neonates, followed by very low birth weight (VLBW) (36.7%), congenital malformations (8.2%), and infections (4.4%). Significant variables (P<0.05) associated with neonatal mortality were: maternal diabetes, obstructed labour, vaginal delivery, multiple births, neonatal respiratory distress, prematurity, low birth weight (LBW) and congenital malformations. It is concluded that majority of the causes of neonatal mortality are preventable. Surveillance programs for neonatal death should include preventive actions and interventions for the perinatal period. Focused initiatives for quality improvement may also be necessary.

[Eman M. Mohamed, Asmaa M. A. Soliman, Osama M. El-Asheer. Predictors of mortality among neonates admitted to neonatal intensive care unit in pediatric Assiut University Hospital, Egypt. Journal of American Science 2011; 7(6):606-611]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Spousal violence against Egyptian women and its impact on reproductive indicators

[Full Text](#)

Eman M. M. Monazea and Ekram M. Abdel Khalek

Public Health and Community Medicine Department, Faculty of Medicine, Assiut University, Egypt

habeba2002eg@yahoo.com

Abstract: Domestic violence against women is increasingly recognized as a global problem. It poses a direct threat to women's health and has serious reproductive health consequences. The study aims to identify the relationship between women exposure to spousal violence and some reproductive health indicators. Data from the 2005 Egyptian Demographic and Health Survey (EDHS) were secondary analyzed for 5,613 ever-married women aged 15-49 years. The results revealed that more than three in ten women had an experience with any form of spousal violence. Fertility was higher among women who have experienced violence than among women who have not (mean number of children ever born was 3.4±2.1 versus 2.9 ± 2.4). Total family planning need was higher among women who have experienced violence than among women who have not. Self reported prevalence of sexually transmitted infections was higher among women who have ever or recently experienced violence than women who have not (21.4%, 26.1% versus. 18.5%). It is concluded that marital violence is related to various negative reproductive health outcomes. Violence against women is a vicious circle that needs to be broken. Actions must be taken to make women and men understand that violence against women is not legitimate or acceptable and that everybody pays a high price for it.

[Eman M. M. Monazea and Ekram M. Abdel Khalek. Spousal violence against Egyptian women and its impact on reproductive indicators. Journal of American Science 2011; 7(6):612-622]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Abstract: Guava seeds flour (20 mesh) characterized with its higher contents of crude fiber, fat and lowest moisture if compared with semolina flour. Farinograph parameter indicated that, water absorption, arrival time and dough weakening increased and stability decreased by increasing supplementation level of guava seeds flour compared to semolina flour. Supplemented pasta with guava seeds flour (10 & 20%) characterized with its higher volume than control pasta; and cooking loss not affected with replacement of 10% if compared with control pasta. Sensory evaluation showed that, stickiness, appearance, flavor and tenderness not affected with replacing level up to 30%, 20%, 10% and 10%, respectively, while color of different replacement level affected. Chemically, supplemented pasta with guava seeds flour caused an acceptable gradual increase in moisture, protein, fat, ash and crude fiber; and decrease in carbohydrates. Guava seeds flour characterized with its higher essential mineral if compared with semolina.

Preparation of Layer Nano-Silicate/Alumina Castable Composites

[Full Text](#)

M. Khomeini, H. Rastegar, H.R. Hafizpour

Department of Materials Science, Saveh Branch, Islamic AZAD University, P.O. Box 39187-366, Saveh – Iran. Hamid_hafiz@alum.sharif.edu

Abstract: The effect of adding nano scale particles on rheological and mechanical properties of ultra low cement alumina castables was investigated. After clay purification by mechanical methods and obtaining nano-silicate layers materials, the characterization was conducted by using XRD. Then, the produced nano-silicate particles were added to the ultra low cement Alumina castable containing microsilica and reactive Alumina. Mechanical and rheological properties of castable were studied before and after firing at 1500 °C. The results showed that d-spacing between nano-silicate layers was about 1.2 nm. Flow ability of the castables showed an increase of 5%, indicating decreasing the presence of some filler materials such as microsilica and reactive Alumina. Finally XRD results of fired samples indicated the existence of mulite as a desired phase in the samples. [M. Khoeni, H. Rastegar, H.R. Hafizpour. Preparation of Layer Nano-Silicate/Alumina Castable Composites. Journal of American Science 2011;7(6):630-634]. (ISSN: 1545-1003). <http://www.americanscience.org>.

elma3dawi@yahoo.com

Abstract: Crystallization of calcium sulfate dihydrate (CaSO₄.2H₂O) in sodium chloride solutions at different supersaturation ($\delta = 1.2 - 2$), pH =3, ionic strength (I = 0.5 M) and at 80°C was studied. The influence of aluminum and magnesium nitrates having very low concentrations (10⁻⁷ mol dm⁻¹) on the rate of crystallization at different supersaturation was investigated. The rate of crystallization was found to be dependent of the stirring rate suggesting diffusion mechanism. The addition of Mg⁺² or Al⁺³ retarded the rate of crystallization to an extent proportional to their amounts present. Furthermore, the retardation effect was enhanced as the supersaturation decreases. The results also revealed that the increase in both pH (3 –10) and crystallization temperature (20 –80 °C) brought about an increase in calcium sulfate crystallization rate.

[N. S. Yehia, M. M. Ali, K. M. Kandil and M. M. El-Maadawy. **Effects of some parameters affecting the crystallization rate of calcium sulfate dihydrate in sodium chloride solution**. Journal of American Science. 2011;7(6):635-644]. (ISSN:1545-0740). <http://www.americanscience.org>

peyman_mikaili@yahoo.com

Abstract: *Cynodon dactylon* regarded to possess various medicinal properties as an anticancer, antidiabetic, anti-inflammatory and antioxidative agent, but there are a few studies on its antibacterial effects. The aim of the present study was the evaluation of the antibacterial activity of *Cynodon dactylon* on 100 Multi Drug Resistant isolates of *S. aureus*, *A. baumannii*, *P. aeruginosa*, *Klebsiella* and *E. coli*. *Cynodon dactylon* samples were collected from the fields of North West of Iran. Plant roots were cut, and powder was prepared. Powdered roots were extracted by maceration at room temperature for 72 hours. Bacterial isolates were collected from clinical specimens from different wards of educational hospitals in Urmia, Iran during a 12 months period. The susceptibility of isolates to *Cynodon dactylon* root extracts was determined using a broth microdilution method. Considering to the wide application of ciprofloxacin in treatment of bacterial nosocomial infections, the antibacterial effects of ciprofloxacin on isolates also determined. All the multi- drug resistant bacterial isolates were sensitive to different concentrations of *Cynodon dactylon* root hydroalcoholic extract, the most sensitive bacterial isolates to *Cynodon dactylon* root extracts were *P.aeruginosa* isolates, however 69% of isolates were resistant to ciprofloxacin. Results demonstrate that this herbal drug could represent a new source of antimicrobial agents, for the control of hospital acquired infections. However, more adequate studies must be carried out to verify the possibility of using it for fighting these bacteria in human body infections.

Abstract: Veterinary holds a great and long experience among the Turkish people like the other nations especially in folkloric literature and the part of literature which has prolonged among the villagers and conserved its own existence but its terms have not registered in their written forms. In a glimpse over the terms like rabies, enterotoxaemia, foot and mouth disease, contagious agalactia and lots of other disease put an apparent persistence on its long experience among native Azerbaijani people (Iran) in its veterinarian aspect. We try our best to have a good clarification over these terms.

The Effects Of Long Term Physical Activity On The Changes In The Rates Of In Apo Proteins A And B In Nonathlete

Abstract: The Present study aims to evaluate the effects of a one-year-long volleyball practice on the changes in the rates of Apo proteins A and B in the blood serum of non-athlete men. In order to do so, 30 subjects were selected randomly from among non-athlete male students and then were divided into two control and experimental groups. The experimental group on average aged 23±2. Their average height was 172.2 ± 3 cm and the average weight was 69.6 ± 3.1kg. On the other hand, the control group aged on average 22 ± 2 and their average height and weight were 170.3 ± 3.8 cm and 69.3 ± 2.7 kg. The experimental group went through a one-year-long volleyball exercise program in which they had to practice for 90 minutes three times in a week. The control group did not have any special practice. The covariance analysis was used to probe the rates of Apo A and B and analyze the data. The rates of Apo proteins, measured before the test in both groups, were taken as the covariate to correct the groups' mean, increase the test's precision and lessen the error risk. The test results revealed that in the experimental group a one-year-long sport exercises has meaningfully changed the level of Apo A in the blood (P= 0.01). There was not a significant difference in the rates of Apo A in the posttest measurements in both groups (P= 0.01). The amount of Apo B was also meaningfully different in pre and posttest in the experimental groups but the changes in the rates of Apo B in both control and experimental groups did not differ meaningfully. 109 **Relationship Between Geopotential Height Anomalies Over North America and Europe and the USA Landfall Atlantic Hurricanes Activity**

Yehia Hafez

Department of Astronomy, Space Science & Meteorology, Faculty of Science, Cairo University, 12613, Egypt

d_hafez@hotmail.com

Abstract: The present paper investigates the relationship between geopotential height anomalies at level of 500 hpa over North America and Europe, and the USA landfall Atlantic hurricanes activity. The decadal data of the number of hurricanes by category which stroked the mainland USA for each decade through the period (1851-2006) are used through the present study. The daily NCEP/NCAR reanalysis data composites for geopotential height at 500 hpa level over North America and Europe for the period of (1949-2006) are used too. Hurricane datasets and anomalies in geopotential height are analyzed and correlated together. The results revealed that there are significant positive correlations between the anomalies in geopotential height over North America and East Europe simultaneously, and existence of Atlantic hurricanes of category 3 that strike USA. In addition to that, significant positive correlations between the anomalies in geopotential height over North America and existence of major hurricanes (category 3, 4 and 5) that landfall USA is found too. However, significant negative correlations between the anomalies in geopotential height over North Atlantic and existence of all USA Landfall Atlantic Hurricane categories are existed else category 1. In general one can conclude that anomalies in geopotential height at 500 hpa level over North America and Europe are control the USA landfall Atlantic hurricanes activity.

[Yehia Hafez. Relationship Between Geopotential Height Anomalies Over North America and Europe and The USA Landfall Atlantic Hurricanes Activity. Journal of American Science 2011;7(6):663-671]. (ISSN: 1545-1003). <http://www.americanscience.org>.

110 **The Effects of Micronutrient application on soybean seed yield and on seed oil and protein content**

Abed vahedi

Department of Agronomy and Plant Breeding, Faculty of Agricultural and Natural Resources, Qaemshahr Branch, Islamic Azad University, Qaemshahr, Iran.

Email: av1790@hotmail.com

Abstract: In order to study the effects of applying the micronutrients zinc, manganese, and boron, and to compare the effects that incorporating them in the soil and spraying them on the crop on seed oil and protein contents and percentages, a study was conducted based on the factorial design with the two factors of incorporating these micronutrients in the soil and spraying them on the crop, in 16 treatments and four replications (a total of 64 trials), in 2009-2010 in Dasht-e-Naz in Sari of northern Iran. The treatments were as follows: T1=control, T2=Zns, T3=Mns, T4=Bs, T5=Zns, T6=Zns+Bf, T7=Zns+Mnf, T8=Zns+Znf, T9=Mns, T10=Mns+Bf, T11=Mns+Mnf, T12=Mns+zmf, T13=Bs, T14=Bs+Bf, T15=Bs+Mns, T16=Bs+Znf. Results obtained showed that the highest seed oil percentage (25.03%) was achieved by spraying zinc on the crop, and that the biggest seed oil yield (359.31 Kg.h) was obtained by applying manganese to the soil. Results of the comparison of the means indicated that the highest seed protein content (36.12%) was achieved by spraying boron on the crop, and the greatest seed protein yield (545.54 Kg.h) was obtained when manganese was added to the soil. These results also showed that the largest number of total pods per plant (71.05), and the biggest seed yield (152.9 g.m⁻²) were achieved by applying manganese to the soil. In the comparison of the interaction effects of the data, it was also shown that, although the highest seed oil percentage belonged to the spraying of zinc on the crop, yet the greatest seed yield among all the treatments (170.7 g.m⁻²) was that of the treatment of adding manganese to the soil plus spraying zinc on the crop, in which the greatest number of pods per plant (77.87) and the highest seed protein yield (631.1 Kg.h) and the highest seed oil yield (284.5 Kg.h) were obtained.

[Abed vahedi. The Effects of Micronutrient application on soybean seed yield and on seed oil and protein content. Journal of American Science 2011;7(6):672-677]. (ISSN: 1545-1003). <http://www.americanscience.org>.

111 **Effects of Water Infiltration to Soil in Increasing Yield and Water Use Efficiency in Peanut**

Ali Abdzad Gohari^{1*} and Ebrahim Amiri²

^{1*,2} Department of Agriculture, Lahijan Branch, Islamic Azad University, Lahijan, Iran.

aag_aligohari@yahoo.com

Abstract: An experiment was conducted to evaluate the Effects of water infiltration to soil in increasing yield and water use efficiency in peanut in Astaneh Ashrafiyeh, North of Iran. A was studied split-plot in a complete random block plan with 3 replications in the 2009 crop year. Irrigation management included no irrigation (dryland) and irrigations with

6, results of this research indicated that average final infiltration was 9.4 (cm/day) and the highest biomass, pods and seeds values for the 6 days irrigation management were 9453, 4093 and 2345 (kg/ha), respectively. The highest water use efficiency based on biomass, pods and seeds in the 6 days irrigation treatment were 2.88, 1.24 and 0.71(kg/m³). Volumetric moisture variations in different depths indicated that the moisture content in upper soil layers such as 0-20 cm and 20-40 cm was less than those of 40-60 cm and 60-80 cm layers which was due to water absorption in the first and second layers by the plant.

[Ali Abdzad Gohari and Ebrahim Amiri. Effects of Water Infiltration to Soil in Increasing Yield and Water Use Efficiency in Peanut. Journal of American Science 2011;7(6):678-682]. (ISSN: 1545-1003). <http://www.americanscience.org>.

112 **Blood Utilization for Elective Surgeries at Main University Hospital in Alexandria, Egypt**

Samaa Z. Ibrahim, Heba M. Mamdouh, Amal M. Ramadan

High Institute of Public Health, Alexandria, Egypt.

Abstract: This study aimed to determine the efficiency of blood ordering and transfusion practices for patients undergoing elective surgical procedures and to assess the compliance with the international blood transfusion clinical practice guidelines. Auditing of blood bank registers for patients who underwent elective surgical procedures was done at the Main University hospital in Alexandria governorate. The total number of adult patients who had elective surgery for which requests for cross matching were made was 4844; of them only 1788 patients were transfused. A total of 13389 units of blood were cross-matched, but only 3373 units were transfused. Only 25.2% of total blood cross matched was utilized, leaving 74.8% unutilized. The overall C/T ratio was 3.9, the overall %T was 36.9% and the overall TI was 0.69. The overall percentage compliance with Scottish Intercollegiate Guidelines was 27.7%. Institution-specific blood ordering schedules and protocols should be formulated to reduce exposure to transfusion and to screen for high-risk patient. Ongoing audit and monitoring of blood ordering and transfusion practices in the hospital are essential for improving the ordering, distribution, handling and administration of blood components.

¹ Islamic Azad University, Karaj Branch, Karaj, Iran

² University Putra Malaysia, Malaysia

kalantar.counseling@kiau.ac.ir

Abstract: Nowadays, Existential thought is considered to be a practical approach among psychologists and counsellors. Nevertheless, what seems to be ignored is paying thoughtful attention to all dimensions of Existential thought which is an essential matter among counsellors and psychologists. Moreover, some issues in Existential thought such as time are disregarded among marital counsellors as well as individual counsellors. The goal of this article is to allocate exhausting existential time to benefit marital counsellors. Findings show that existential time has full potential to be applied for marital counselling. Furthermore, review of the related literature demonstrates that there is not enough experimental and descriptive research to evaluate the effect of existential time on matrimony.

[Seyed Mohammad Kalantarkousheh, Siti Aishah Hassan, Rusnani Abdul. Kadir, Mansor Abu Talib. **Sparkle of Existential Time as a Sanctuary in Marital Counselling**. Journal of American Science 2011;7(6):690-694]. (ISSN: 1545-1003). <http://www.americanscience.org>.

114 **Discovering A Transformational Science of Marketing in Corporate, Social And Knowledge Perspectives: Is Not It About Time That A Marketing Scholar Becomes A Nobel Laureate?**

***Wael Kortam and Abeer Mahrous**

Department of Business Administration, Faculty of Commerce, Cairo University, Egypt

[*wakortam@gmail.com](mailto:wakortam@gmail.com)

Abstract: This paper is for marketers who strive to bring about a change in marketing to change this world. This paper aimed at fulfilling this far reaching end by configuring and devising a transformational philosophical logic. This logic is composed of transformational postulates reaching out to transformational edges of marketing as a science. Such process would be reflected within transformational domains to be magnified and streamlined by transformational edges of marketing theory and practice. Firstly, transformational postulates are illuminated by the backbone argument of pragmatic versus dogmatic marketing creeds. This gives rise to four subsequent core controversial arguments, contrasting the critical issues of empiricism, valorization, context specificity and multidisciplinary against their rival extremes of theorization, generalized universality, global transcendence, and original authenticity. Second, these heated intellectual polarizations take marketing ideologies on a journey of revisits and blurring, to reconsider transformational marketing edges consolidated in the boundaries of customer orientation, convergence marketing, value-based marketing, knowledge-based marketing, interdisciplinary marketing, and contextual marketing. Third, such revisits are expected to fulfill their full transformational potential when viewed through the lenses of transformational marketing domains including corporate, social and knowledge perspectives, which telescope (focus?) the transformational influences of marketing thought and practice. Fourth, and conclusively, the paper is a proactive endeavor to unleash the transformational leverages of marketing actions in order to perpetuate the transformational thrust of marketing research and practice through the deliberate adoption of, and capitalization on, transformational agendas, methodologies and deliverable outputs. Thus the authors propose a cohesive progressive philosophy of marketing science that optimizes its change-catalyst extremes in order to broaden the horizons of academic marketing breakthroughs and decision/policy initiatives. The aim is to justify a well-earned legitimacy for marketing scholars to be Nobel Laureates, for their contributions to transforming their economic, moral and scientific universes.

Abstract: Canola is one of the rapeseed varieties and is in temperate and cold climate areas. Contains 94% unsaturated fatty acid and 6% saturated fatty acid, thus, has best fatty acid composition among other oils. Canola oil causes alteration in pancreatic enzymes such as leucine aminopeptidase activity. The aim of this study was assessment of mucosal leucine aminopeptidase activity enzymes subsequently using of canola oil on turkey chicks diet. According to this survey results revealed that using of canola oil in turkey chick's diet causes increasing of leucine aminopeptidase activity (in 5% treatment than control and 2.5% treatments). It seems that use of different amounts of canola oil in turkey chick's diet causes increasing of leucine aminopeptidase activity, because this enzyme play a important role in protein hydrolyzing and this enzyme activity be more subsequently reducing of digesta transient ratio. [Jamshid Ghiasi Ghalehkandi, Ramin Salamat Doust Nobar, Abolfazl ghorbai, Ali Asghar Gharachorlu, Rahim Behesti, Alireza Fani. Abstract: in developed countries, adult education is a form of informal education for people above 24 years is presented. In fact, a means of expanding knowledge, skills and abilities of adults. In these countries, adult education helps adults to variable conditions of political, social, economic and cultural adjustment, and pay to fix their shortcomings. In developing countries and backward because the problems in primary education, lack of resources and facilities, poverty, social existence, economic and cultural concept of adult education is different. In such countries the concept of adult education, literacy education. The field of adult education and literacy is plagued by confusion about definitions. Over the years definitions have evolved from provisions in federal law and initiatives of groups advocating particular methodologies or the needs of specific adult populations. The result is that definitions tend to merge statements about the goals to be achieved (e.g., improving the literacy of a particular population) with a particular means (e.g., adult basic education) to achieve the goal.

Abstract: Direct or indirect application of ICT, in rural development sector has also been referred to as "Rural Informatics". Rural economies can be benefited from ICT by focusing on social production, social consumption and social services in the rural areas. The inculcation of a Citizen-to-Government (C2G) and Citizen-to-Citizen (C2C) interface would provide this link that would also lead to community participation in design and implementation of ICT interventions. This in return could promise better economic opportunities as well as social inclusion of rural people in the processes of governance. Such attributes in the social set up are essential prerequisites for good governance and rural development. Globalization and technological changes, the processes in the past fifteen years have been quickly lead to a new global economy have been driven with the reinforced technology and fuel (energy) that by providing information and knowledge. The global economy requires the kind of necessity and purpose of educational institutions. Since the current trend towards reducing incomplete information and access to accurate information is growing, other schools can not control time to transfer a set of prescribed information from teacher to student during a fixed time point are, but schools must to promote Culture of "Teaching for Learning For example, acquisition of knowledge and continuous learning skills which make possible during the individual's life.

The role of utilization Distance Education in adult education

¹Mehran Bozorgmanesh and ² Mojtaba Sadighi

1, 2 Damavand Branch, Islamic Azad University, Damavand, Iran

*Corresponding author: mehran11070@yahoo.com

Abstract: Distance education dictates changes in behavior for both the teacher and the learner. The successful student develops persistence and skills in self-directing work. The successful distance education teacher becomes conversant with new technology and develops new instructional styles, moving from creating instruction to managing resources and students and disseminating views. Administrative and faculty support for distance education are critical to the success of this instructional method. Administrators should take note that the implementation of a distance education program may allow access to a greater number of students. However, the time and work associated with teaching at a distance exceeds the normal requirements of campus-based instruction. Students in distance education settings perform as well or better on assignments, class activities, and exams when compared to campus-based students . Nevertheless, students must maintain persistence and a clear focus to succeed in a distance learning situation. Self-direction, a passion for learning, and strong individual responsibility are important influences on achievement. There are indications that distance education works best for more mature, motivated, well-

organized, and already accomplished learners . Distance education courses vary greatly in scope, level, and length. Some have a few assignments and require only a few months to complete, while others have a hundred or more lesson assignments requiring three or four years of conscientious study. Distance education is a method of education in which the learner is physically separated from the teacher and the institution sponsoring the instruction. It may be used on its own, or in conjunction with other forms of education, including face-to-face instruction. In any distance education process there must be a teacher, one or more students, and a course or curriculum that the teacher is capable of teaching and the student is trying to learn.

119 Income Bipolarization and Poverty: Evidence from Rural Nigeria
Oluwole I. Ogunyemi¹ & Omobowale A. Oni²

¹Agricultural Economics Department, University of Ibadan, Ibadan, Oyo State, Nigeria. woleoguns@yahoo.com

²Agricultural Economics Department, University of Ibadan, Ibadan, Oyo State, Nigeria waleoniayo@yahoo.com

Abstract: The disappearance of the middle class- income bipolarization could result into tension and social conflict. If such conflict starts in the rural area, the possible resulting revolts would clog the wheel of economic production and policy implementation and there is possibility of spreading to the urban area. The study therefore estimated income bipolarization in the rural area of Nigeria from 1980 to 2004 using Foster-Wolfson –FW- (1994) and Lasso de la Vega and Urrutia – LU- (2006) indices. Bipolarization linked poverty was estimated for the periods through the later and Foster-Wolfson bipolarization estimates were linked with the poverty status and other socio-economic features of the rural households by tobit regression analysis. Bipolarization was found to be on reduction from 1992 to 2004 moving in the direction of poverty level. FW Bipolarization was 0.6125, 0.4067, 0.4775, 0.4108 and 0.3529 in 1980, 1985, 1992, 1996 and 2004 while LU Bipolarization was 0.1676, 0.1430, 0.1610, 0.1460 and 0.1383 for the same years respectively. Poverty has highest significant positive effect on bipolarization with a marginal effect of 0.02520. The marginal effects of age was 0.00014, female head households was 0.00119. Household size, father’s education, mother education, married status, farming and wage employment have significant negative marginal effects of 0.00037, 0.00027, 0.00013, 0.00636, 0.000697 and 0.00105 respectively. Income bipolarization is higher among households located in the South than their base category, the north. Poverty and its covariates have higher sum total interactive positive effect on bipolarization than their base categories, the non-poor covariates. There is need to reduce poverty for bipolarization to decline. The southern part needs more attention in bipolarization reduction strategies. All variables that reduce poverty like education would have to be harnessed further to reduce bipolarization to guide against the occurrence of its consequences.

*Corresponding author: skhodamoradi2007@yahoo.com

Abstract: Nowadays, using computers has changed man’s life at all aspects. Done researches in relation to development programs of all countries, represent central role of information technology and communication at these programs. information technology and communication can be used as a powerful tool for improving quality and efficiency of education so that change traditional practices of education and no more physical presence at classrooms . If so far, education benefited just from teachers and trainers, books were considered as major informational sources for education, nowadays education has faced with new communicational tools and environments. Recent progress at computer industry and local information networks, regional and international information (especially Internet) , multimedia, communicational technologies, have placed new tools and practices against planners , programmers , managers and executers of educational programs. Influence of new informational technologies on educational centers (schools to universities) and even houses, have changed simple relationship between students and teachers completely.

121 **Prevalence of Depression among Elderly and Evaluation of Interventional Counseling Session in Zagazig District -Egypt**

Naglaa M. Abdo¹, Shereen Eassa¹ and Ahmad M. Abdalla²

¹Community Medicine and Public Health and ²Psychiatry Departments, Faculty of Medicine Zagazig University, Zagazig, Egypt. shereeneassa@yahoo.com

Abstract: P Depression is one of the most prevalent disabling and costly health problem among elderly. This work aimed to study the problem of depression among the elderly through determining the magnitude of depression among them, classifying the diseased according to the severity of depression, exploring some personal risk factors related to depression and evaluation an applied interventional counseling session for the diseased. This study is composed of two stages; the first one was a cross sectional design in which multistage random sample was applied to Zagazig District where 290 subjects were included in this study. The applied questionnaire included questions about sociodemographic status, some associated risk factors for developing depression and also Geriatric Depression Scale was applied to detect depressed patients and classify them according to the severity of the disease. The second stage was an interventional one applied to depressed elderly who were subjected to a counseling session educating them about the importance of counselling, follow up and recalling knowledge about treatment. Obtaining results revealed that the percentage of depression was 46.6 % and those with mild or moderate condition constitute 75.6%. Depression significantly increased with age, female (OR 2.56), not married (OR 4.47) and those having previous death event among the surrounding (OR 7.68). The severity increases among age group over 75 years and more (OR 4.52) and those of low socioeconomic condition (OR 8.8). The applied counseling session had a significant impact on recalling knowledge about the prescribed drugs (60.7%), how to manage the missed doses (71.4%), using drug correctly (75.0%) and recalling medication name (75.0 %) (p<0.05). In conclusion depression is an undiagnosed public health problem. It significantly increases with age, female sex, not married subjects, and those having history of death event in their relatives. Moreover the severity of depression increases with age and low socioeconomic condition. The applied intervention counseling session had a good effect on improving drug knowledge and probably the attitudes of the depressed patients. So increasing the role of geriatric medicine in primary health care system and introduction of counseling session at outpatient clinics to increase compliance to treatment are good recommendations from that work.

Perceived reproductive morbidity and treatment seeking behavior among ever married women in Siwa Oasis, Egypt.

Ola A. Akl¹, Hala K. Ibrahim², Heba M. Mamdouh²

¹ Department of Primary Health Care, High Institute of Public Health, Alexandria University; ² Department of Family Health, High Institute of Public Health, Alexandria University. hebamamdouh74@gmail.com, ola_akl@yahoo.co.uk

Abstract: Information about reproductive morbidity in developing countries is scanty and mainly based on information obtained from clinics or hospitals which are not usually reflecting the true magnitude of the disease burden. A cross-sectional study were conducted to assess the self-reported reproductive morbidity and the factors affecting it and to investigate the health seeking behavior among a sample of women in Siwa (Oasis), Egypt. A total of 340 ever-married women in the reproductive age group of 15 to 49 years were interviewed using a pre-designed questionnaire. About three quarters of women reported having any obstetric (72.6%) or any gynecological morbidity (75.6%). The most commonly reported obstetric problem was symptoms of severe anemia (43.8%), while symptoms of lower RTIs (51.2%) and UTIs (35%) were the commonest gynecological problems. Overall, 58.5% of participants had sought treatment for any morbidity with the majority had sought services of the public sector facility (80%). Regression analysis showed that education, age at first pregnancy and duration of marriage were the factors associated with women reports of any reproductive morbidity. The present results reveal a high prevalence of reported reproductive morbidity in Siwa, Egypt. Factors such as education, duration of marriage and women age at first pregnancy were associated with reported morbidity among the sampled women. This high reported rate in peripheral and remote areas needs to be explored further.

Abstract

Lavender has been used as a medicinal plant and to treat several diseases. Knowledge of moisture desorption isotherms is useful in food dehydration and drying. The equilibrium moisture content for *Lavandula officinalis* L. flowers were measured by using the gravimetric static method with water activity ranging from 11% to 85% and three temperatures of 30, 40 and 50°C. Five mathematical models (modified Henderson, modified Oswin, modified Halsey, modified Chung – Pfof and GAB equations) were used to fit the experimental data of desorption. The modified Halsey model was found to be the best model for describing desorption isotherms curves.

Abstract: In this paper, we incorporate information flow in a supply chain model. Also for decreasing the risk of the supply chain system, we first predict the customers' demands and then this forecasting is used as an input to the supply chain model. In this paper a markov chain model will be used to forecast the customers' demands. A simulated annealing (SA) algorithm is developed for solving the supply chain problem. The results indicate that the SA method and proposed markov chain model are efficient for a wide variety of problem sizes.

Status Inconsistency of Women: A Study in Hamadan, Iran

Hamidreza Babaei¹, Amir Hossein Zomorrodian¹, Sarjit S. Gill¹, Leila Falahati²

¹ Department of Social & Development Science, Faculty of Human Ecology, University Putra Malaysia

² Department of Resource Management and Consumer Studies, Faculty of Human Ecology, University Putra Malaysia. babaei1973@gmail.com

Abstract: This research investigates the status inconsistency among women in Hamadan province, Iran. The study was carried out in eight cities and 32 villages. Questionnaire was applied to collect data from 767 women from urban areas and 786 women from rural area. Data analysis was done by using SPSS software and multi-variable regressions. The results show considerable status inconsistency among women in Hamadan. In addition, with decreasing social status of women here, the status inconsistency increases and the rate of status inconsistency in the rural area was higher than the urban area.

Abstract: *Stevia rebaudiana*, Bertoni, a sweet, non-caloric natural source, perennial herb native to Paraguay and Brazil. A rapid better resolved HPIC separation of sweet glycosides of *Stevia rebaudiana* leaves and different biological activities were determined. Eight sweet ent-kaurene diterpene glycosides (SEDG) were quantitatively and qualitatively fractionated by HPLC from the butanol soluble fraction. Two major sweet glycosides were chromatographically isolated. Acid hydrolysis and chemical degradation of the glycosides were performed; their aglycones were also isolated and identified. Hypoglycemic effect of the glycosides on diabetic rats was estimated. Kidney function was revealed; by creatinine and serum urea. Significant decrease in the levels of serum fasting glucose, glycohemoglobin (HbA_{1c}), urea, creatinine, total cholesterol, total lipids, alanine and aspartate aminotransferases enzyme (AST&ALT). In addition, remarkable improvement in vitamins C, and E levels and antioxidant enzymes, glutathione, glutathione oxidase, glutathione reductase and lipide peroxides levels were observed in the liver tissues compared to diabetic controls. Histopathological investigations of the control diabetic rats were characterized. The kidney of diabetic rats treated with sweet glycoside showed mild protective effects as compared to the diabetic control rats.

¹ Department of Zoology, Faculty of Science, Menoufiya University, Egypt.

²Department of Zoology, Faculty of Science, Mansoura University, Egypt

Gamalmib2000@yahoo.co.uk

Abstract: Because of their analgesic and anti-inflammatory properties especially for patients with rheumatoid arthritis, nonsteroidal anti-inflammatory drugs (NSAIDs) are one of the most often ingested drugs during pregnancy. The aim of the present work was to evaluate and compare some of the maternal and neonatal toxicity induced by three presently marketing antirheumatic drugs namely meloxicam, celecoxib and leflunomide. The study revealed an ascendent retardation in the body weight gain of experimental dams during gestation compared to control in a drug dependent manner for meloxicam, celecoxib and leflunomide, respectively. Moreover, maternal atrophy of femur cartilage thickness associated with lacking of the integrity was observed in the treated dams. Significant retardation in weight, size and length of the maternally treated newborns was also detected compared to control. A number of congenital malformations associated with a significant decrease in ossified lengths of certain axial and appendicular bones and evident missing of ossification centers were observed in the maternal treated litters. The mentioned maternal and neonatal toxicity showed direct dependency on the applied drug. The results indicate that the tested drugs should be avoided during pregnancy and if necessary, this should be done with caution.

[Gamal M. Badawy, Hassan I. El-Sayyad and Eman E. Al-Shahari. Maternal and Neonatal Toxicities induced by three Antirheumatic Drugs in Albino Rats . Journal of American Science 2011;7(6):783-793].(ISSN: 1545-1003). <http://www.americanscience.org>.

128 **Curcumin Improves Insulin Sensitivity and Ameliorates Serum Pro-inflammatory Cytokines Levels in Diabetes Rat model Irrespective of type of Diabetes**

Mohamed Khaled Mohamed Mahfouz

Department of Biochemistry, Faculty of Vet Medicine, Benha University

drm_mahfouz@yahoo.com

Abstract: Objectives: To evaluate the impact of type of diabetes on serum levels of pro-inflammatory cytokines and the effect of chronic administration of curcumin on their levels in experimentally-induced diabetes in albino rats. The study included 60 (20 as control group) male albino rats; diabetes mellitus (DM) was induced using intraperitoneal injection of a single dose of 50 mg/kg of streptozotocin (STZ) after animals were maintained on high-fat diet for 2-weeks (20 rats) for induction of non-insulin dependent DM (NIDDM) or without dieting regimen for induction of IDDM (20 rats). One-week later, rats received oral curcumin (200 mg/kg). Homeostasis Model Assessment of Insulin Resistance (HOMA-IR) and rapid insulin sensitivity test (RIST) were used for clinical assessment. Two fasting venous blood samples were obtained after induction of diabetes and prior to initiation of therapy and at 6-wks after treatment for calorimetric estimation of fasting blood glucose (FBG) and ELISA estimation of fasting plasma insulin (FPI), serum interleukin (IL)-1 β and -6 and tumor necrosis factor- α (TNF- α). Results: Curcumin induced significant reduction of FBG levels, irrespective of type of diabetes and in NIDDM animals, post-treatment FPI levels were significantly lower compared to their pre-treatment levels. Diabetes, irrespective of its type, induced significantly higher pre-treatment serum levels of pro-inflammatory cytokines in both study groups compared to control group. However, curcumin significantly lowered serum levels of estimated cytokines at 6-weeks after treatment compared to pre-treatment levels. In group II, post-treatment RIST index was non-significantly higher compared to control index. In group III, pre-treatment HOMA-IR index was significantly higher compared to control index, while post-treatment HOMA-IR index was significantly lower compared to pre-treatment levels, despite still being significantly higher compared to control group. It is concluded that chronic administration of curcumin improves insulin sensitivity and thus imposing an anti-diabetic effect manifested as decreased FBG levels with concomitant decreased FPI and ameliorated the increased serum levels of pro-inflammatory cytokines and such effects are manifested in both types of diabetes.

[Mohamed Khaled Mohamed Mahfouz. **Curcumin Improves Insulin Sensitivity and Ameliorates Serum Pro-inflammatory Cytokines Levels in Diabetes Rat model Irrespective of type of Diabetes**. Journal of American Science 2011;7(6):794-799]. (ISSN: 1545-1003). <http://www.americanscience.org>.

129 **Biochemical Determination of Tissue Ossification Markers in Experimentally-induced Myringosclerosis**

Ahmed Al-Shal¹, Nahla E. El-Azab², Mohamed Khaled Mohamed Mahfouz³

Departments of Otorhinolaryngology, Histology¹ & Medical Biochemistry², Faculty of Medicine & Vet Medicine³, Benha University, Benha, Egypt
drm_mahfouz@yahoo.com

Abstract: Objectives: To explore myringosclerotic tissue levels of two bone modeling markers: osteopontin (OPN) and osteoprotegerin (OPG) in experimentally-induced, histologically-confirmed myringosclerosis (MS). **Materials & Methods:** The right middle ear of 24 normal healthy growing male Wister rats was inoculated, via transtympanic access, by *Streptococcus pneumoniae* type 3, after a period of 8 weeks the tympanic membrane (TM) was examined Otomicroscopically for transparency and graded as normal TM, mild or marked opacification. Then, tympanic bullae were removed and a part of myringosclerotic plaque was excised for ELISA estimation of tissue extract levels of OPN and OPG and the remainder of the TM was stained with hematoxylin-eosin for light microscopic grading of TM inflammation according to extent of calcification into 5 grades. **Results:** 20 ears developed otoscopically defined myringosclerotic changes, 14 ears showed mild and 6 had marked opacification that was localized in 4 ears and diffuse in 2 ears. Histological examination reported inflammation of grade III in 7, grade IV in 13 and grade V in 4 specimens. Mean estimated tissue extract level of OPN and OPG in studied animals were significantly higher compared to control animals with a positive significant correlation between histological grading and tissue-extract levels of both OPG and OPN and a positive significant correlation between otoscopic grading and tissue-extract levels of OPG, but the correlation was non-significant with OPN **Conclusion:** Increased myringosclerotic tissue extract levels of both bone modeling markers indicated their possible role in initiation and/or progression of sclerotic changes in TM after chronic suppurative otitis media.

*totoali@hotmail.com

Abstract: Purpose: The aim of this work is to study angiogenesis of the liver of patients with chronic hepatitis, liver cirrhosis and hepatocellular carcinoma by assessment of microvessel density MVD-CD34 and VEGF in liver tissue. **Method:** Sixty patients with chronic liver disease and 30 patients with hepatocellular carcinoma (HCC) were subjected to clinical examination, laboratory investigations for hepatitis C, liver function tests and ultrasonography. Liver biopsy was performed for histopathological examination. They were 3 groups: chronic hepatitis [CH] (35), liver cirrhosis [LC] (25) and HCC (30) and ten healthy volunteers as controls with negative serological markers for hepatitis (C&B), HCC were 7 with grade I, 14 with grade II and 9 with grade III. Immunohistochemical staining for tissue vascular endothelial growth factor (VEGF) was done and MVD-CD34 was assessed by Image Analysis System. **Results:** In normal liver tissue specimen, both CD34 & VEGF were negative. MVD-CD34 was increased significantly from CH to LC to HCC and increased significantly in grade I to II to III HCC. VEGF showed a significant increase in LC compared to CH & insignificant in mean HCC compared to LC. With differentiation of HCC, MVD-CD34 increased for grade I, to II to GIII ($p < 0.01$). VEGF showed a higher expression in grade I and decreased in grade II & III. **Conclusion:** MVD-CD34 is more responsible of angiogenesis than VEGF with progression of chronic liver disease to HCC. Further research for other factors mediating and cells contributing to angiogenesis is needed, which may have therapeutic implications in the control of chronic liver disease and HCC.

131 **The Effect of Induction Therapy with Basiliximab on the Recurrence of Hepatitis C Virus in Living Donor Liver Transplantation (Retrospective Study)**

Wael Safwat^{*1} – Rasha Refaie² – Medhat Abdel Aal² – Ibrahim Mostafa¹ – Mahmoud and El Meteini³

¹Theodor Bilharz Research Institute ²Wadi Al Neel Hospital 3-Ain Shams University

*waelsafwat@yahoo.com

Abstract: Background: Hepatitis C virus (HCV) recurrence in HCV+ liver transplant recipients is almost inevitable and may be promoted by immunosuppression. Basiliximab, a high-affinity chimeric monoclonal antibody functions as an immunosuppressive agent, is effective in reducing acute rejection episodes in liver allograft recipients, but the influence on HCV recurrence might be a problem. **Objectives:** To study the effect of induction therapy with Basiliximab on HCV recurrence in adult living donor liver transplantation. **Methods:** This was a retrospective study to determine the effect of induction therapy with Basiliximab on the recurrence of HCV in the grafted liver. In this study 47 HCV patients were included who passed more than 6 month post-transplantation. All HCV recurrences were all proved histologically. All our patients received corticosteroids in addition to either tacrolimus (FK) or ciclosporine (Neoral), mycophenolate mofetil was given to all except 4 patients. **Results:** From the 47 transplanted patients 14 (29.8%) had HCV recurrence. In the group which used Basiliximab (Group I); the rate of HCV recurrence was 56.3%, while the group in which no Basiliximab was used (Group II); the rate of HCV recurrence was 16.1% ($P < 0.001$) highly significant. In patients who had HCV recurrence 64.3% of patients received induction therapy with Basiliximab, meanwhile in the non-recurrent group only 15.2% of patients received Basiliximab ($P < 0.001$) highly significant. To out rule the role of either FK or Neoral in recurrence of HCV, we found that the rate of HCV recurrence was as follows: in a group of patients who received Basiliximab and FK; HCV recurrence occurred in 54.50%, in patients who did not receive Basiliximab but received FK; HCV recurrence occurred in 21.7% ($P < 0.001$) highly significant. In patients who received Basiliximab and Neoral; HCV recurrence occurred in 60% and there was no HCV recurrence in patients who did not receive Basiliximab and received Neoral ($P < 0.001$) highly significant. We also compared two groups of patients; those who received FK and Basiliximab (54.5%) had HCV recurrence, and in those who received Neoral and Basiliximab (60 %) had HCV recurrence ($P > 0.05$) non significant. **Conclusion:** The rate of HCV recurrence in LDLT is more when Basiliximab was used as induction therapy in patients undergoing LDLT for chronic HCV related end stage liver disease.

[Wael Safwat^{*1} – Rasha Refaie² – Medhat Abdel Aal² – Ibrahim Mostafa¹ – Mahmoud and El Meteini³. **The Effect of Induction Therapy with Basiliximab on the Recurrence of Hepatitis C Virus in Living Donor Liver Transplantation (Retrospective Study).** Journal of American Science 2011;7(6):816-819].(ISSN: 1545-1003). <http://www.americanscience.org>.

Abstract: The present study aimed to investigate the impact of educational program among open heart surgery patients on minimizing the incidence of post operative infections. Data were collected from cardiothoracic surgery department, intensive care unit, and outpatient clinic at Assiut University Hospital. The study was conducted on 60 adult patients with open heart surgery (30 - study group and 30 - control group) who have been selected randomly. Data were collected through: four tools; (cardiac surgery patient needs assessment sheet, cardiac teaching program based on individualized patient needs assessment, cardiac post operative observation checklist sheet, and cardiac post operative wound site infection evaluation sheet). Results of this study concluded that, more than half of the patients in study group 53.3 % were females, 70 % were married, and 40 % their ages ranged from 18 - 29 years. While the majority of the patients in the control group 63.3 % were male, 46.7 % were married, and 33.3 % from 30-39 years. Conclusion; Significant differences for improvements throughout educational program phases among study group regarding total score of knowledge and practice about open heart surgery. The study recommended that, pamphlets and simple illustration booklet should be available for patients illiterate to with simple explain how to safely live after open heart surgery. The patients must understand the importance of oral hygiene and visiting a dentist regularly because dental infections can affect the valve prosthetic.

IMAGE PROCESSING AND NUMERICAL ANALYSIS APPROACHES OF POROSOME IN MAMMALIAN PANCREATIC ACINAR CELL

Waslat W. Elshennawy

Department of Biology and Geology, Faculty of Education, Ain Shams University, Roxy, Cairo, Egypt

dr-waslat@hotmail.com

Abstract: Pancreatic acinar cells have a particular role in the synthesis, storage and regulated secretion of the different digestive enzymes present in pancreatic juice. Recently a detailed understanding of the molecular machinery and mechanism of cell secretion has come to light. So, it is now an accepted belief, that the mechanism of cell secretion is quite different, and a highly regulated process. The secretory vesicles (zymogen granules) dock and transiently fuse at the base of specialized plasma membrane structures called porosomes or fusion pores. In the present study, TEM images and a computer-assisted morphometry approaches have been used to analyze quantitatively the shape and fine structure of porosome in pancreatic acinar cell of post-feeding rat. The electron micrographs illustrated the porosome as a distinct permanent, lipoprotein, cup-shaped structure at the cell plasma membrane of the pancreatic acinar cell, facing the lumen and varies in shape and structure according to the stage of secretion. The computer-assisted morphometry summarized the structural and morphological importance of the porosome and revealed its different shapes during the cell secretion. The coloured images have clearly shown the supramolecular tripartite lipoprotein structure of the plasma membrane and porosomes. Histogramic analysis showed the numerical values of the secreted materials and the three layers of both porosomes and plasma membrane which differed depending on the stage of cell secretion.

The effect of non-linear terms on the process of computing water hammer with regard to friction coefficients for different cast iron pipe

R. Daneshfaraz¹, S. Sadegh-Fam², M. Majedi-Asl¹

¹ Department of Civil Engineering, University of Maragheh, Maragheh, Iran

² Department of Civil Engineering, University of Kermanshah, Kermanshah, Iran

majedi1389@gmail.com

Abstract: Water Hammer problems are complex and time-consuming even with very simple calculation method and usual boundary conditions. The governing equations of water Hammer are partial differential equation and are expressed based on continuity and momentum equations. One of the important procedures for solving the governing equations of

$$V \frac{\partial V}{\partial x}, V \frac{\partial H}{\partial x}$$

unsteady flows is finite difference method. One procedure for simplifying the governing equations is neglecting the nonlinear terms such as $V \frac{\partial V}{\partial x}, V \frac{\partial H}{\partial x}$ without considering the amount of errors that are created with this process. Therefore in this paper, the phenomenon of water Hammer in the tank, pipe and valve system has been investigated in two manners, one with full equations and other with neglecting the nonlinear terms. For doing this, an FDM code has been written in MATLAB and the amounts of head along the pipe in sequential times and the differences between two manners have been given in diagrams. The obtained results indicate that for iron pipe with different friction coefficient (smooth, perennial and worn) by decreasing Chezy coefficient, wave damping increases and the effect of nonlinear terms decreases.

Psychological reflection on anguish in players

Ali Feiz Khademi¹, Saadat Hajipour¹

¹ Faculty Member of Izeh Branch, Islamic Azad University, Izeh, Iran
a.khademi1389@yahoo.com

Abstract: A great deal of the literature on the relationship between anguish and performance has come from a cognitive-behavioral perspective. This paper examines the relationship between the two constructs from a psychodynamic perspective. Included are a discussion of winning and the anguish of separation from an object relations perspective, the dread of success, self psychology, Freudian instinct theory, and the secondary gain that is found in defeat. Suggestions for future directions in treatment of anguish within the athletic context are offered as well as a postscript.

136 **The Effects of two different doses of Antioxidant Vitamin C supplementation on bioenergetics index in male college student**

Morteza Jourkesh¹, Iraj Sadri, Amineh Sahranavard¹, Ali Ojagi¹, Mohammad Dehganpoori¹

¹Department of Physical Education and Sports Science, Shabestar Branch, Islamic Azad University, Shabestar, Iran
mjourkesh@iaushab.ac.ir

Abstract: In order to study the effects of consumption of 2 regimes of vitamin C (500 and 1000 mg) on bioenergetics index (aerobic and anaerobic power) in 36 physical education college male students, were selected non – randomly procedure and they were set in 3 groups. Average of age, weight, height and Fat percentage of subjects was (22.48 ± 1.84) years, (64.93 ± 7.84) kg (175.4 ± 5.66) cm and (10.94 ± 5.29) mm respectively. The period considered for consumption of vitamin C by experimental groups, was a 3 weeks period that in this period the first group consumed dose of (500 m.g) vitamin c and second group (1000 m.g) vitamin C and third group (control group) consumed placebo. The tests which have been exerted in this research consist of: assessment of anaerobic power by RAST test. 2) Assessment of aerobic power by Cooper test. Result indicated that there was not a significant (p < 0.05) difference between 3 group in anaerobic and aerobic power. Therefore we concluded that daily consumption of 500 or 1000 m.g vitamin C for a period of 3 week does not have any effect on the basis of improvement of anaerobic and aerobic power in male college students. [Morteza Jourkesh, Iraj Sadri, amineh sahranavard, ali ojahi, mohammad Dehganpoori. golshan_sh@yahoo.com

² Department of Environmental sciences, Faculty of Natural Resource, Isfahan University of Technology, Isfahan, Iran

Abstract: This study intends to establish the usage of steel slag in absorption of Cu. Within this study the two types of blast furnace and converter slag were examined in laboratory conditions and the effects of parameters of time, concentration, solutions' pH on the amount of absorption were studied. Studying the experiments showed converter slag's absorption of Cu per gr was greater in a balance time of 15 minutes with high concentrations of metallic elements of 500 and 1000 ppm, but increase in pH did not alter the absorption. And the highest absorption of Cu was that of blast furnace slag with the same conditions. The only difference was that the more the pH increased the greater the absorption was, in a way that the greater amount of absorption occurred in a pH of 7. Considering the great volume of slag and its feature of absorbing Cu, usage of this absorbent can be taken into consideration as a method of quality treatment and complimentary filtration of effluent.

138 **The Efficacy of Different *Bacillus Thuringiensis* Formulations for the Control of the Cotton Leafworm *Spodoptera Littoralis* (Boisd.) (Lepidoptera: Noctuidae)**

Mona F. Abd-El Aziz^{*1}; Nehad M. El-Barkey¹ and Hassan. F. Dahi²

¹ Entomology Department, Faculty of Science, Benha University, Egypt

² Plant Protection Research Institute, Agricultural Research Center, Doki, Giza, Egypt.

[*dmonafawzy@yahoo.com](mailto:dmonafawzy@yahoo.com)

Abstract: The efficacy of three *Bacillus thuringiensis* formulations, Agerin, Dipel 2X and Dipel DF were tested against 2nd larval instar of *Spodoptera littoralis*. The three formulations were tested in the laboratory, field and semi field experiments. The 48 hour LC₅₀ for Agerin, Dipel 2X and Dipel DF were 0.18, 0.07 and 0.10 % for the three formulations, respectively. The results of the field experiment indicated that the general mean of reduction were 59.0, 55.9 and 58.6 % for the three *Bt* formulations (Agerin, Dipel 2X and Dipel DF, respectively). In addition, the general mean of mortality rate in the semi-field experiments were 60.3, 60.4 and 61.3 % for Agerin, Dipel 2X and Dipel DF, respectively. Moreover, the histopathological studies using ultrastructure microscopy were carried out on the midgut of 4th larval instar after the treatment of the second instars with LC₅₀ of the three formulations. These results therefore confirm the opinion stated that the toxicities of the different three formulations, are similar to each other. Therefore the Egyptian *Bacillus thuringiensis* strain (Agerin) can be used for control of *S. littoralis* as it is cheap and readily available.

139 **Effect of soybean on fertility of male and female albino rats**

Serag El Din, O.S.; *Batta, H., Abd El Azim; Abd El Fattah, N.

Abstract: This study aimed to investigate whether consumption of soybean is useful or harmful on reproductive hormones; ovary; uterus; mammary gland; testis and subsequent fertility. In the former experiment, male and female Wister albino rats were used in the present study. Each sex was randomly divided into 4 groups, control group fed on the basal diet (AIN93 G), three treated groups given 30, 60 and 90 gm cooked soybeans/70 kg human body weight (b.w.) for three months. Female rats showed that soybean significantly decreased free estradiol hormone (E2); progesterone hormone; follicle stimulating hormone (FSH); luteinizing hormone (LH); ovary weight and number of ovarian follicles. On the other hand soybean significantly increased total E2; sex hormone binding proteins (SHBP); uterus weight and caused uterus proliferation and cystic hyperplasia. The mammary gland showed gradual hyperplasia and mammary ducts showed proliferation. In male rats soybean significantly decreased free testosterone hormone; LH and FSH, meanwhile total testosterone hormone, SHBP, testes weight and testes diameter were significantly increased accompanied with spermatogenesis arrest. [Serag El Din, O.S.; Batta, H., Abd El Azim; Abd El Fattah, N.. Effect of soybean on fertility of male and female albino rats. Improving Reproductive Performance by Glucose Injection in Damascus Does Goat during Early Summer

Anas A. Salem¹, Hassan A. H.², Nasrat Abd El-Ati¹, and Gamal B. M.¹

¹Department of Animal Production, Faculty of Agriculture, Assiut University, Egypt

²Department of Theriogenology, Faculty of Veterinary Medicine, Assiut University, 71526 Assiut, Egypt

anas12eg@yahoo.com

Abstract: Goats are seasonally polyestrous having estrous activity during late summer, fall, and winter and showing no activity during summer and spring. The objective of the present study was to improve reproductive performance of Damascus doe goats in early summer including: estrous activity (EA), ovarian follicular (OF) growth, corpus luteum (CL) development, and progesterone (P₄) profile by injection of glucose (Glu). A total of twelve apparently healthy Damascus doe goats were used in this experiment and were classified randomly into two equal groups. Animals in group A were injected with Glu via the jugular vein; each animal of the treated group received 94.584 g Glu daily for nine days before the expected day of ovulation. The second group (B) was injected with saline solution and used as control. All animals in both groups were synchronized by PGF_{2α} (cloprostenol) three times (10 days between each interval and other) with notice that glucose was injected in the second interval. Blood samples were collected from each animal; the blood was then centrifuged and the serum was analyzed for progesterone. All does were subjected to ultrasonographic examination on days 5, 9, and 19 after the third injection of PGF_{2α} and post-treatment by glucose. The results revealed that glucose injection achieved estrous activity higher than in control (100% vs. 50 %, p>0.05). All animals showed the estrous activity through 24-72 hours after each dose of PGF_{2α} and post-treatment by glucose. The number of follicles (<5mm) in the treated group was higher than in control group (111 vs. 94 follicle, p>0.05), while the follicular diameter did not differ between the two groups. The ovarian activity on the left ovary was higher than on the right ovary (107 vs. 98 follicle, p>0.05). The ovulation rate as detected from the number of corpora lutea and progesterone level was higher in the treated group than control (p>0.05). Ovulation was significantly higher on the right ovary than on the left ovary (19 vs. 9 ovulation). Corpus luteum diameter in the treated group was significantly larger than in control group (1.2±0.11 cm vs. 0.97±0.13 cm, p>0.05). The average progesterone concentration increased significantly (2.36±0.84 ng/ml) in the treated animals than in the control (0.96±0.23 ng/ml). It could be concluded that glucose treatment led to improvement of number of estruses, ovarian follicles, corpora lutea and progesterone concentration in Damascus doe goats during early summer. Therefore, treatment with energy-yielding nutrient (glucose injection) on ovulation rate in goats may be recommended in periods of reproductive activity impairment.

INFLUENCE OF ACUTE PANCREATITIS INDUCTION ON ZYMOGEN GRANULES OF PANCREATIC ACINAR CELLS USING IMAGE PROCESSING AND NUMERICAL ANALYSIS APPROACHES

Waslat W. Elshennawy

Department of Biology and Geology, Faculty of Education, Ain Shams University, Roxy, Cairo, Egypt

dr-waslat@hotmail.com

Abstract: Acute pancreatitis (AP) is a mild to severe inflammation of the pancreas with a clinical picture of a self – limited illness that sometimes progresses to a severe state leading to multiple organ failure eventually causing death. The initiating event of AP may be anything that injures the acinar cell and impairs the secretion of zymogen granules which enclose the digestive pro-enzymes. Therefore, the aim of this work was to assess the effect of acute pancreatitis on the ultrastructure of zymogen granules and to analyze this effect using image processing and numerical analysis approaches. **Material and Methods:** Ten male albino rats weighing 150-200g were divided into two groups; group [I] was treated with physiological saline injections *i.p.* as a control group. Acute pancreatitis was induced into group [II] by two injections of 250mg/100g b.w. of L-Arginine *i.p.* in an one hour interval as 20% solution in 0.15M NaCl. Electron micrographs obtained from zymogen granules were examined then were processed with CIS technique for image analysis and histographic analysis. **Results :** Ultrastructural results of zymogen granules of group [II] (rats received L-Arginine) revealed changes with different severity as; depletion, arrest towards the nucleus, dilatation or fusion together, some of them showed an atrophy in size, rupture of membranous boundary and eventually irregular in shape with loss of their rounded configuration and degraded. Obvious varieties appeared in coloured images and numerical values analysis that obtained from microphages of group [II] comparing with those of control group [I]. **Conclusions:** Influence of acute pancreatitis provoked deleterious effects in zymogen granules as consequence of intense inflammation. Despite of current knowledge, many hypothesis and questions remain unanswered concerning the effects of L-Arg. Image processing and numerical analysis which are considered to be valuable approaches in this study, may resolve some of mistiness of the impact of pancreatitis on the exocrine pancreas. Application of this technique gave more details of pathological changes which were unable to be seen by electron microscope only. So, it can be applied as good techniques for early diagnosis in the field of pathology to illustrate the fine details beyond that of electron micrographs.

A New Measurable Definition of Knowledge in New Growth Theory

Hadi Ghaffari¹, Mohammad Ali Molaei²

1. Dept. of Social & Economic Sciences, Payame Noor University, Arak, Iran

Email: hghaffari2000@yahoo.com

2. Faculty of Industrial Engineering and Management, Shahrood University of Technology, , Iran.

Email: malimolaei@yahoo.com

Abstract: New Growth Theory helps us make sense of the ongoing shift from a resource-based economy to a knowledge-based economy. It underscores the point that the economic processes which create and diffuse new knowledge are critical to shaping the growth of nations, communities and individual firms. In all too many contributions to New (Endogenous) Growth Theory – though not in all – central reference is made to ‘a stock of knowledge’, a ‘stock of ideas’, etc., this variable featuring centre-stage in the analysis. Yet it is immediately apparent that this is far from being a crystal clear concept. The difficulty and uncertainty of being able to capture the value associated with knowledge is a real problem. The intent of this paper is introducing new thinking and theorizing about the knowledge and its measurability in new growth theory. Moreover the study aims to synthesize various strain of the literature with a practical bearing on knowledge concept. By contribution of institution framework which is found within NGT, we can indirectly measure the knowledge concept. Institutions matter because they shape the environment for production and employment of new knowledge.

Abstract: Iranian Gole-Gav-Zaban (*Echium amoenum* Fisch & C. A. Mey) belonged to Boraginaceae family and is considered as a valuable Iranian endemic medicinal plant that has been used widely as traditional medicine since long times. Because of its convenience and being acceptance as a remedy for different sort of diseases by people. Use one of these (besides) side a little research has been ever done on this valuable endemic medicinal plant. There for is drastically short amount of available information about it. hence there is need of more work. By these descriptions, in present study, measuring of vegetative and reproductive character of Iranian Gole-Gav-Zaban was aimed. For fulfilling these aims (objects), accessions were planted in a completely randomized design with three replications in June 2010. Bushes characteristics were observed and documented. In the vegetative phases there weren't considerable difference among accessions. But from the aspect of flower field character, the difference was significant.

A Survey on the condition of Micro Facies, Sedimentary Environment and the Cretaceous Deposits (With Particular Reference to Central Iran)

Mehran Arian¹, Hamideh Noroozpour²

¹Associate Professor, Department of Geology, Science and Research branch, Islamic Azad University, Tehran, Iran

²Young Researchers Club, Department of Geology, Science and Research branch, Islamic Azad University, Tehran, Iran (Corresponding Author)

Hamideh.Noroozpour@yahoo.com

Abstract: Micro continent of central Iran is a part of middle Iran that is bounded with ophiolitic suture zones in Sistan, Nain, Baft, Doruneh fault and Kashmar – Sabzevar ophiolites and is classifiable into Lut block, Shotori upland, Tabas subduction, Kalmard upland, Posht Badam block, Biaze - Bardsir basin and Yazd block by means of long faults which are dextral strike – slip faults and have westwards inclination. In many regions of Iran, except to Zagros, in approximate boundary of early and late Cretaceous, it is observed evidences of tectonic events which are mainly as land generating and can be compared with worldwide Austrian event, in everywhere in Iran except to rare cases (east of Tehran and Yazd). Upper Cretaceous beds in Iran do not have identical facial characteristics and it seems that in contrast to equal sedimentary condition in early Cretaceous, sedimentary basins in upper Cretaceous have been separated from each other and special condition has been dominated in each basin. As a result of that, lithostratigraphic units except to Zagros and Kopet Dagh have not been named and or have local names in upper Cretaceous of Iran. This article is an overview of the condition of Micro-facies, sedimentary environment and the Cretaceous deposits in central Iran.

Abstract: Predict of sediment transport and sedimentation rates are one of the main affecting in coastal areas management. Many tries with emphasis on effective reasons in sediment movements has been done to decide the rate of sediment transport, including the CERC formula. But accurately predict sediment transport rates and trends were affiliated

of different such as accuracy and precision statistics, basic and initial data's. Since that may not be possible such information in some areas, was necessary used other techniques such as coastline changes and morphology. In this paper, alongshore sediment transport trends were considered in parts of northern coast of Persian Gulf, by local wave data's, CERC formula, morphological landscapes and coastline changes at the headlands and breakwaters. Coastal morphology and coastline changes were expounded with CORONA (1964) and SPOT (2005) satellite imageries. Alongshore sediment transport was outcome by CERC formula. Based on results, all of morphological landscapes and coastline changes in the study area were confirmed alongshore sediment transport trends got from CERC formula. In some areas that have limit data or lack of substantial document and prepare field information should used coastline changes and morphological settings with empirical relationships, were impossible to inspect the output.

Abstract: In the present numerical study, by using the Fluent software, the ability of it to predict the complex flow conditions is presented. In this purpose, experimental data over a flip bucket in different hydraulic conditions were selected. To simulate the turbulence phenomenon, $k-\varepsilon$ Standard turbulence model was selected. Moreover to predict jet surface the VOF free surface model was employed. Finally by comprising the numerical model and available experimental results, a good agreement was observed.

Abstract: What prevents the strategies from getting operational in organizations is that, strategies remain at general level or general actions and orientations. To alleviate this problem, the researchers who proposed balanced score card model presented the concept of strategy map in this model. Strategy map tries to represent the organization's strategy in the framework of cause and effect relationships and demonstrate how the organization's strategy can be transformed into measurable objectives and specific operations which should be followed by organizational units and organization's staffs. To implement its strategies, the academic center for education, culture and research (ACECR) as one of scientific and research institutes in Iran requires a strategy map to be prepared which will provide the essential framework for implementation of the designed strategic plans. In order to design the strategy map in the present study, we made use of the related literature, references, and opinions of experts, and we prepared 40 indicators for different aspects of balanced score card model. Afterwards, we put these indicators into a questionnaire and asked the ACECR managers to let us know their opinion regarding them. Analysis of filled questionnaires by Friedman test resulted in selection of 30 indicators to be put into strategy map, and the resultant ACECR strategy map was designed deductively since no similar one existed. Subsequently, quantitative measures and objectives were considered for each indicator. Ultimately the status of this institution after the first year of implementing the strategy was analyzed using the obtained indicators and we proposed several strategies for successful implementation of the strategy and reduction of exiting gaps.

Abstract: In the present rapidly changing world, a massive amount of raw data is generated, collected and organized in databases. This data contains lot of useful and important information which is hidden and not directly accessible. There is vital need for in-depth data analysis tools which can turn raw data into knowledge. This situation is known as "data rich but information poor". It is very time consuming, slow and expensive to analyze and understand the huge volume of data manually specially when the data is in the form of text. Textual data need huge resources to preprocess it to make it ready for the data/text mining algorithms. In this paper we have proposed an effect preprocessing methodology for textual data which have produce quality data efficiently and reliably. [Dr. Muhammad Shahbaz, Dr. Syed Muhammad Ahsan, Maryam Shaheen, Muhammad Shaheen. **An Effective Preprocessing Methodology for Textual Data Classification**. Journal of American Science 2011;7(6):944-951]. (ISSN: 1545-1003). <http://www.americanscience.org>.

149 **Creation of next generation of Open Source Science Databases**

¹Syed Ahsan, ²Muhammad Shahbaz

^{1,2}Department of Computer Science, University of Engineering and Technology, Lahore
¹ahsan@hotmai.com, ²muhammad.shahbaz@yahoo.com

Abstract: From 1990s onwards, biological and chemical research in both the public and private sectors throughout the world has been transformed into industrial scale by the creation of databases with large amounts of high-quality, freely available DNA sequence data. These databases have not only enabled the comprehensive cataloging of human genes but have also accelerated the discovery of new forms of cellular regulation rendering biology and chemistry a discovery science thus providing the basis for novel experimental approaches. We however feel that the potential opportunities, accessibility and power of open source science and publicly available data have not transformed into gains and significant impact on scientific discovery. In this paper we have identified many issues with the existing conventional chemical biology and molecular biology databases and propose the development of ChemBank v3.

An Algorithm for the Removal of Redundant Dimensions to Find Clusters in N-Dimensional Data using Subspace Clustering

¹Dr. Muhammad Shahbaz, ¹Dr Syed Muhammad Ahsen, ²Ishtiaq Hussain, ¹Muhammad Shaheen

¹Department of Computer Science & Engineering University of Engineering & Technology, Lahore, Pakistan

²National Centre for Physics, Quaid e Azam University, Islamabad, Pakistan

¹m.shahbaz@uet.edu.pk, ahsan@hotmai.com, shaheen@uet.edu.pk

Abstract: The data mining has emerged as a powerful tool to extract knowledge from huge databases. Researchers have introduced several machine learning algorithms to explore the databases to discover information, hidden patterns, and rules from the data which were not known at the data recording time. Due to the remarkable developments in the storage capacities, processing and powerful algorithmic tools, practitioners are developing new and improved algorithms and techniques in several areas of data mining to discover the rules and relationship among the attributes in simple and complex higher dimensional databases. Furthermore data mining has its implementation in large variety of areas ranging from banking to marketing, engineering to bioinformatics and from investment to risk analysis and fraud detection. Practitioners are analyzing and implementing the techniques of artificial neural networks for classification and regression problems because of accuracy, efficiency. The aim of his short research project is to develop a way of identifying the clusters in high dimensional data as well as redundant dimensions which can create a noise in identifying the clusters in high dimensional data. Techniques used in this project utilizes the strength of the projections of the data points along the dimensions to identify the intensity of projection along each dimension in order to find cluster and redundant dimension in high dimensional data. [Dr. Muhammad Shahbaz, Dr Syed Ahsan, Ishtiaq Hussain, Muhammad Shaheen. An Algorithm for the Removal of Redundant Dimensions to Find Clusters in N-Dimensional Data Using Subspace Clustering. Journal of American Science 2011;7(6):956-964]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Competence of Nurses' Managers in Different Work Environment at Assiut University Hospitals

¹Kawther Abd El-Motagally Fadel, ²Samah Mohamed Abdalah, ²Fatma Rushdy Mohamed and ²Eman kamel hossny

¹Faculty of Medicine-Assiut University, ²Faculty of Nursing- Assiut University, Egypt

Abstract: Background: Healthcare providers are increasingly inclined to question the quality and efficacy of the care they provide. Nurse competence plays an important role guaranteeing the quality of nursing interventions and outcomes. It is claimed that a key responsibility of nurse administrators is to ensure staff nurse competence. Nurses should maintain and demonstrate competence throughout their professional career. Nurse Managers have to continuously assess safe patient care. Aim of the Study: to assess competence nurses' managers at different work environment at Assiut University Hospitals, and compare nurse's competence at different work environments at Assiut University Hospitals. SUBJECT AND METHODS: the present study is descriptive, was conducted in all units of Assiut University Hospitals. It included all nurses' managers who are working in different departments at the time of the study. A personal interview questionnaire sheet which consist of two parts: ¹st Personal characteristics data which include name, age, department, marital status, educational level, position, years of experience and years of experience of the present position (head nurse, supervisor, assistant director, director of nursing), ²nd Nurse Competence Scale (NCS) was consisted of seventy three items structured in seven competence categories: helping role (seven items), teaching- coaching (sixteen items), diagnostic functions (seven items), managing situations (eight items), therapeutic interventions (ten items), ensuring quality (six items) and work role competences (nineteen items). The Scoring System was four-point scale (0 = not applicable in my work, 1 = very seldom, 2 = occasionally and 3 = very often in my work). The levels of competence are measured with a Visual Analogue Scale (VAS 0-100 mm), which the total score of the VAS with 0 meaning a very low level of competence, 1-30 mild level of competence, 31-60 good level of competence, 61-99 excellent level of competence and 100 a very high level of competence. Results: the nurses' managers in main Assiut University Hospital are most competent than Pediatric and Women Health Hospital in all competence categories. The level of competence categories in emergency is highest than special & general, intensive care unit and operating room. The total VAS mean levels of competence of all categories ranged from 55.93 to 73.5. Conclusions: nurses' managers have excellent level of competence in work role category, followed by teaching coaching category, then in managing situation category. Main Assiut University Hospital nurses' managers are competent than Pediatric Hospital and Women Health Hospitals in all competence categories. The emergency units nurses' managers are competent than other different work settings following by operating rooms.

Online Classes and Traditional Classes in adult education

Mina Abarashi

Damavand Branch, Islamic Azad University, Damavand, Iran

Email: sharif1070@yahoo.com

Abstract: Distance education places students and their instructors in separate locations using some form of technology to communicate and interact. The student may be located in the classroom, home, office or learning center. The instructor may be located in a media classroom, studio, office or home. Distance education delivers classes (live or pre-taped) to students in their home, office, or classroom. It is used by K-12, higher education, continuing education and business. As the cost of delivering quality education increases,

institutions find that limited resources prevent them from building facilities, hiring faculty, or expanding curricula. They are using distance education to maximize resources and are combining their assets with others to produce programming. Distance education is offered internationally, nationally, regionally, and locally over all forms of conferencing technology. The student may receive information via satellite, microwave, or fiber optic cable, television (broadcast, cable or Instructional Television Fixed Services (ITFS)), video cassette or disk, telephone - audio conferencing bridge or direct phone line, audio cassette, printed materials - text, study guide, or handout, computer - modem or floppy disk, and compressed video. Recent rapid development of technology has resulted in systems that are powerful, flexible, and increasingly affordable. The base of available information technology resources is increasing with dramatic speed. Much has been learned about connecting various forms of technology into systems, so that the ability to link systems is growing. Most distance learning systems are hybrids, combining several technologies, such as satellite, ITFS, microwave, cable, fiber optic, and computer connections.

Distance Education and e-learning: Similarities and differences

Fatemeh Vahidi

Mahabad Branch, Islamic Azad University, Mahabad, Iran

E-mail: khaterehsivar@yahoo.com

Abstract: Challenges which faced the early users of distance education are still with us today. If distance education is to play a greater role in improving the quality of education, it will require expanded technology; more linkages between schools, higher education, and the private sector; and more teachers who use technology well. Teachers must be involved in planning the systems, trained to use the tools they provide, and given the flexibility to revise their teaching. Federal and state regulations will need revision to ensure a more flexible and effective use of technology. Connections have been established across geographic, instructional, and institutional boundaries which provide opportunities for collaboration and resource sharing among many groups. In the pooling of students and teachers, distance learning reconfigures the classroom which no longer is bounded by the physical space of the school, district, state or nation. Distance education can be used for some aspects of most disciplines. For example, several institutions of higher education already have developed certificate programs, undergraduate programs, and graduate programs in health and physical education that are delivered using distance education methods.

Effect of Chlorhexidine in Prevention of Oral Lesions in Leukemic Children Receiving Chemotherapy

Azza M. Darwish¹; Mostafa A. S. Salama²; Nehad S. Basiouny¹ and Noha M. Arafa¹

¹Pediatric Nursing Dept., Faculty of Nursing, Alexandria University, Egypt.

²Pediatric Medicine Dept., Faculty of Medicine, University of Alexandria, Egypt
nehadbasiouny@yahoo.com

Abstract: Leukemia is the most common childhood cancer. Untreated leukemia results in death from infections or hemorrhage. The primary treatment of ALL is chemotherapy which is usually associated with a number of side effects among which is oral mucositis (stomatitis). It is one of the most debilitating complications following chemotherapy treatment administration. These lesions may produce discomfort and pain which interfere with eating, patient compliance to treatment and potential risk of oral infection. Good and consistent oral hygiene is one of the basic roles of the pediatric nurse to prevent and reduce the complication of oral infection. It includes oral assessment before the initiation of chemotherapy treatment and during its administration followed by creating an oral care plan. Chlorhexidine gluconate is effective in the prevention of oral lesion and in decreasing the severity of stomatitis. The aim of the present study is to determine the effect of using chlorhexidine gluconate in the prevention of oral lesions in leukemic children receiving chemotherapy. The study was conducted at the Haematology Unit of Alexandria University Children's Hospital at EL-Shatby and at the Oncology department at the Health Insurance Student Hospital in Alexandria. The subjects of this study comprised 50 children of both sexes with acute lymphoblastic leukemia. Children were divided into two groups: group I (study group) received 0.1 % of chlorhexidine gluconate and group II (control group) who was left to the routine hospital care. Tool consisted of three parts to collect the study data: Children's Bio socio-demographic data; Children's Medical data; Oral assessment guide (OAG) tool. The main result showed that children among the study group had healthier oral cavity and lower degree of oral mucositis no one developed severe oral mucositis compared to the children in the control group following 10 days of chemotherapy administration. The main recommendation is to create an oral care plan to each child individually involving cleaning teeth by using a mouth wash with Chlorhexidine gluconate. This is important for preventing oral complications, decreasing severity of oral mucositis and treating gingivitis (swelling, redness and bleeding of the gums).

Posttraumatic Stress among Undergraduate Emergency Nursing Students

Hayam I. A. Asfour¹ and Fatma Hussein Ramadan^{*2}

¹Critical Care & Emergency Nursing Department, Faculty of Nursing, University of Alexandria.

²Psychiatry Nursing and Mental Health Department, Faculty of Nursing, University of Alexandria.
fatma_ramadan45@yahoo.com

Abstract: Undergraduate emergency nursing students are often exposed to stress when helping patients in emergency situations. Emergency nursing students are vulnerable to the development of symptoms of post-traumatic stress Disorder (PTSD). Stress reactions among helpers can be regarded as a natural behavior and reaction when experiencing a traumatizing event and by the stress resulting from helping or wanting to help a traumatized or distressed person. Any trauma exposure can trigger post traumatic stress disorder. Selley reiterates that health workers as well as primary victims are at risk of developing PTSD. The aim of this study was to examine posttraumatic stress among undergraduate emergency nursing students. Methods: The sample of this study consisted of 250 undergraduate students attended and studied emergency nursing course during the period from February till May 2009. Two instruments were used to measure reactions to traumatic events, Impact of Event Scale Revised (IES-R) and the Post Traumatic Symptom Scale (PTSDS). Results: Of those who reported a traumatic situation the majority of them scored 30 or more on the IES-R subscale. Scores over 30 indicate a stress reaction with certain

likelihood of post-traumatic disorder. On the PTSDS-subscale the majority of students scored 5 or more, which indicates a relative strong reaction. Conclusion: The high prevalence of post-traumatic stress in undergraduate emergency nursing students indicates an inability to cope with stress in daily life.

156 **Prevalence and Outcome of Acute Kidney Injury in the intensive care unit according to RIFLE criteria: A single-center study**

Mohamed Fouad* and Mabrouk I. Ismail

Nephrology unit, Internal Medicine Department, Zagazig University Hospital, Zagazig, Egypt

[*Dr.M.Fouad@hotmail.com](mailto:Dr.M.Fouad@hotmail.com)

Abstract: Acute kidney injury (AKI) is common in the intensive care unit (ICU) and is associated with significant morbidity and mortality. This requires clinicians to be familiar with recent advances in definitions, diagnosis, prevention, and management of AKI in the ICU. The Acute Dialysis Quality Initiative (ADQI) represents the efforts of a workgroup seeking to develop consensus and evidence-based statements in the field of AKI. The ADQI group proposed a consensus graded definition, called the RIFLE criteria (Risk, Injury, Failure, Loss, and End stage). Objective: To estimate the prevalence of AKI in ICU and assess the ability of the RIFLE criteria to predict the outcome of AKI in ICU. Methods: We performed a retrospective cohort study in the internal medicine ICU, Zagazig University Hospital between January 2010 and December 2010. We excluded patients younger than 15 years, patients receiving chronic hemodialysis admitted to ICU, kidney transplant patients, length of hospital stay were <24 hours, or readmitted to the ICU during the study period. RIFLE criteria classified AKI patients into three stages of increasing severity Risk(R), Injury (I), and Failure (F). The outcomes of AKI patients in ICU were recovery, kidney loss, end stage renal disease (ESRD) or death. Results: The total number of ICU admissions during the study period was 8304 patients. After application of exclusion criteria, the number of the study became 5440 patients. According to RIFLE criteria 1885 (34.65%) had AKI. RIFLE criteria classified them into Risk 13.32%, Injury 11.91% and Failure 9.41%. The crude outcome of AKI patients as follows 77.24% recovered, 9% lost kidney functions and required renal replacement therapy (RRT), and 2.28% reached ESRD. The crude mortality of AKI patients was 20.47% versus 7.76% mortality in patients without AKI. The hospital recovery stratified by RIFLE criteria decreased with worsening RIFLE classes (R, I, F) 84.27%, 79.62% and 64.25% respectively. Patients' lost kidney functions and required RRT stratified by RIFLE criteria increased with worsening RIFLE classes 5.79%, 7.4% and 15.62% respectively. Patients reached ESRD stratified by RIFLE criteria increased with worsening RIFLE classes 1.2%, 2% and 4.1% respectively. The hospital mortality AKI patients stratified by RIFLE criteria increased with worsening RIFLE classes 14.48%, 18.36% and 31.64% respectively. The urinary output (UOP) criteria associated with lower mortality and higher recovery rate than creatinine criteria. Conclusion: The prevalence of AKI in the internal medicine ICU, Zagazig University Hospital according to RIFLE criteria is 34.65%. RIFLE criteria are useful in predicting the outcome of AKI patients.

[Mohamed Fouad and Mabrouk I. Ismail. Prevalence and Outcome of Acute Kidney Injury in the intensive care unit according to RIFLE criteria: A single-center study. Journal of American Science 2011; 7(6):1005-1012]. (ISSN: 1545-1003). <http://www.americanscience.org>.

¹Department of Physical Therapy for Obstetric and Gynaecology, Faculty of physical therapy, Cairo University, Egypt

²Department of Obstetrics and Gynaecology, Faculty of medicine, Al-Azhar University, Egypt.

awad18111972@yahoo.com

Abstract: This study was conducted to determine the postural changes during normal pregnancy. Forty normal primigravid women at first trimester of pregnancy (12 weeks' gestation) from the Out-Patient Clinic of Obstetric Department at Bab EL-Sheria Hospital, AL-Azhar University shared in this study. Their ages ranged from 20 to 30 years old and body mass index did not exceed 30 kg/m². Thoracic kyphosis angle, lumbar lordosis angle and pelvic inclination angle were evaluated by the formetric II at 12, 22 and 32 weeks' gestation in Spinal Shape Analysis Laboratory at Faculty of Physical Therapy, Cairo University. The obtained results showed a statistically highly significant increase (P< 0.001) in the thoracic kyphosis angle, lumbar lordosis angle and pelvic inclination angle between 12&22, 22&32 and 12&32 weeks' gestation. Accordingly, it could be concluded that there is a statistically highly significant increase in the thoracic kyphosis angle, lumbar lordosis angle and pelvic inclination angle during normal pregnancy.

158 **Predictors of Fertility among Egyptian Females at Reproductive Age at El-Manial Maternity Hospital**

Hanan Fahmy Azzam*

Lecturer of Maternal & Newborn Health Nursing, Faculty of Nursing, Cairo University

[*Hananha_azzamaz@yahoo.com](mailto:Hananha_azzamaz@yahoo.com)

Abstract: Background: The most common and well documented risk factors which can contribute to female infertility include over weight or underweight; hormonal imbalances; fibroid; reduced oocyte quality; chromosomal abnormalities; sexually transmitted diseases; age older than 27; history of pelvic inflammatory diseases; smoking and alcohol intake; and immune system disorders. **Aim** of this study was to explore the predictors that might affect Egyptian female fertility. **Subject & Methods. Design:** A Descriptive design was adopted in this study to explore the predictors that might affect Egyptian female fertility. **Sample,** a total of 300 married infertile women was recruited from the outpatient gynecological clinic at El Manial Maternity Hospital, Cairo University, Egypt according to the certain criteria. **Tools** utilized for Data collection were collected by using an interviewing questionnaire schedule. **Results of the present study** revealed that age of the woman (P=0.008); age at marriage (P=0.007); BMI (P=0.010); eat snacks (P=0.043); fatty saturated diet (P=0.029); polycystic ovary (P=0.040); cervicitis (P=0.012); utilized contraceptives methods (P<0.001); frequency of sexual intercourse/week (P=0.028) were a predictors that might affect the female fertility. **The study concluded that,** the women with the following profile: older age at marriage, overweight and obese, depending on fatty saturated diet, eat snacks, had history of polycystic ovarian syndromes, had cervicitis, used contraceptive methods, might be at risk for the occurrence of infertility. **Recommendation,** based on the findings of the present research the following recommendation is suggested: Raise women's awareness regarding to adopting healthy life style as follow dietary program and practice exercising.

^{2,3}Faculty of Medicine, Ain Shams University. Cairo – Egypt

*monakafoury@yahoo.com

Abstract: Background: For many years, conventional karyotyping has been used as the golden diagnostic tool for t(9; 22) (BCR/ABL) in chronic myeloid leukemia (CML). Recently, there have been an emerging generation of complex translocations and submicroscopic deletions involving BCR & ABL genes in addition to the classic t(9;22), which have a prognostic impact on the course of the disease, and require sensitive and specific molecular techniques for their detection. Objective: The present study aimed to explore the utility of extra signal fluorescence in situ hybridization (ES-FISH) compared to double fusion FISH(DF-FISH) and conventional karyotyping (CK); for detecting the incidence of typical and atypical patterns of *BCR/ABL* gene rearrangements and clarify their prognostic significance in CML. Subject and Methods: A series of 64 consecutive *BCR/ABL*⁺ Egyptian CML patients (42 chronic phase, 9 accelerated phase, 13 blastic crisis), were investigated for typical and atypical BCR/ABL rearrangements using extra signal and double fusion FISH probes. Results: ES-FISH and DF-FISH showed higher sensitivity for detection of Philadelphia chromosome (Ph) as a sole anomaly when compared to karyotyping in all phases of CML. ES-FISH was the most sensitive method for detection of ABL deletion (14.2% in chronic phase, 33.3% in accelerated phase, 30.8% in blastic crisis) when compared to DF-FISH and karyotyping. Interestingly, ES-FISH, was the only method capable for detection of minor BCR/ABL rearrangement in 1 patient in blastic crisis phase. On the other hand, DF-FISH showed superiority for detection of BCR deletion. Both DF-FISH and karyotyping were capable of detection of trisomy 9 and variant translocation, while ES-FISH yielded confusing atypical signals regarding them. There was a moderate agreement between D-FISH & ES-FISH (P<0.01), a strong agreement between D-FISH and CK, while no agreement was found between the results of ES-FISH and CK and (P>0.05). In conclusion, karyotyping is mandatory to be applied at diagnosis of CML. ES-FISH is the method of choice for detection of ABL deletions, despite it cannot detect neither BCR deletions nor variant translocations. Karyotyping coupled with ES-FISH are adequate for the diagnosis and therapeutic monitoring of CML with the classical t(9;22) and for cases with ABL deletion.

160 **Rural women and micro-credit programs**

Azita Zamani

Mahabad Branch, Islamic Azad University, Mahabad, Iran

E-mail: fereshteh12150@yahoo.com

Abstract: Rural women are among those major groups at society who previously were considered less by planners, due to specific reasons in the past. And this problem is more observable at developing countries. While, by looking at women's history of economic and social life, we can find that this great group, continuously have played basic role in forming economic condition of country. This great group consistent with men have had active role at areas of social-economic activities and always have had major part on economic production of society. Nowadays, supporting family supervisor women is adopted by universal society, as politic, economic a social concern and nearly all countries applied related approaches, and however these efforts have resulted in failure, in so many cases . By accessing to wide range of financial tools, families according to their priorities, invest on cases such as costs of education, healthcare, healthy and good nutrition or housing. Applicants for Microfinance resources mostly involved family supervisor women, pensioners, homeless people, frugal workers, small farmers and micro entrepreneurs.

Mehdi Nazarpour

Marvdasht Branch, Islamic Azad University, Marvdasht, Iran

E-mail: hossein11070@yahoo.com

Abstract: Being high and low of each one is depended on various conditions and terms so it is varied from one society to another society. In Iranian rural societies, cultural and social context is such that, consequences of these phenomena maybe being different and sometimes contradictory. However these actions caused that women stand in good economic condition and also gain self reliance and rely themselves with no help from husbands, but dominant cultural space on villages may create some disorders. At most of villages in Iran, patriarchal with all features dominate and women's financial self reliance may not being pleasant for some human and rural groups. When women gain financial independence in villages, impacts and social and cultural consequences would emerge.

¹Community, Occupational and Environmental Medicine Department, Faculty of Medicine, Zagazig University, Egypt.

² Radiology Department, Suez Canal Authority Hospital, Ismailia City, Egypt.

[*reemabbasabbas@yahoo.com](mailto:reemabbasabbas@yahoo.com)

Abstract: Violence in hospitals is becoming more frequent and more aggressive worldwide. Radiographers, as members of the frontline hospital personnel are at increased risk of workplace violence. So, this study aimed to determine the magnitude and the nature of workplace violence towards radiographers in hospitals, to identify its risk factors, and to study its impact on victims. All diagnostic radiographers in Ismailia Governorate Hospitals (n=123), except those who were on extended leaves or who had less than one year clinical experience (n=22), were invited to complete a standardized questionnaire designed specifically to study workplace violence in the health sector. Out of 101 radiographers, 94 agreed to participate in this study (response rate = 93.1%). The majority of the participants (79.8%) had experienced workplace violence of any kind. Verbal abuse was the most common type. Patients' relatives were the main perpetrators. Most of violent incidents were not reported. Easy public access, crowding and noise, understaffing, and long waiting times, were the potential factors contributing to hospital violence. Many negative consequences on the victims' psychological status and work performance have been revealed. It could be concluded that workplace violence towards radiographers is a significant problem in hospitals. So, effective preventive strategies for hospital violence should be implemented.

¹Department of Biostatistics and Epidemiology, National Cancer Institute, Cairo University

²Department Public Health, Faculty of Medicine, Cairo University

mailbox_mcs@yahoo.com

Abstract: Objective: To assess smoking behavior of medical workers in the National Cancer Institute (NCI), their knowledge and attitude towards smoking. Material and Methods: This is a cross-sectional survey with anonymous self-administered questionnaires for physicians and nurses. It included three sections; 1) demographic data, 2) questions about knowledge of smoking hazards, religious and lawful aspects and 3) questions regarding smoking status and attitude towards quitting and prohibiting smoking in work and public places. Results: Participants were 246; 185 responded (75.2%). Smokers constituted 25.4% of the sample. Responding current smokers were 37. The majority of smokers reported previous trials to quit, mainly due to health concern (73.3%). All workers know that smoking is harmful to health, the majority were positive about the hazard of passive smoking as well. Ever-smokers showed a negative attitude towards total prevention of smoking at workplace; however, current smokers react positively to smoking restriction in work and public places, about 2/3 stop immediately when confronted by a stop smoking sign. Twenty-seven workers (73%) reported less smoking in response to restriction. A large percent (73%) smoke in presence of nonsmokers, however nearly 92% respond to a colleague's demand to stop smoking. It is concluded that smoking remains a common habit among medical works in the NCI in spite of having a good knowledge about its hazards and direct contact with smoking victims. We should search for the suitable approach for this category of smokers to motivate them to quit other than talking about health hazards. [Manar M. Moneer, Nargis A. Labib and Maissa K. Noaman. **Smoking behavior, knowledge and attitudes among medical workers in the national cancer institute, cairo university**. Journal of American Science, 2011;7(6):1059-1064]. (ISSN:1545-0740).

Abstract: Hydrocortisone is a synthetic glucocorticoid utilized in the medical fields for the treatment Of Different Types Of Diseases In A Very Wide Scale. The Present Study Aimed To Investigate The Histological and ultrastructural alterations induced by administration of hydrocortisone on the testis of albino rat. Twenty adult male rats weighing 150-200g. were divided into two even groups; group I injected *i.m.* with 30mg/100g b.wt. of hydrocortisone sodium succinate dissolved in 0.6 ml of bacteriostatic water at 9am in a daily manner for 15 days. Whereas, group II were injected with 0.6ml of bacteriostatic water in the same manner. *Histologically*, adrenal cortex of treated rats displayed shrinkage in the thickness of its cortical zones, a mass of cortical cells projected out of its thickened capsule, beside zona glomerulosa, fasciculata and reticularis cells are compressed and lost their normal organization. Vacuolation and fibrotic areas are seen in the cytoplasm. The nuclei of some of these cells showing signs of pyknosis, karyorrhexis and karyolysis. *Ultrastructurally*, cortical cells are disarranged, compressed and possessed deformed mitochondria with abnormal type of cristae (i.e. lamelliform), lysosomes, in addition to numerous lipid droplets, collagen fibers and fingerprint-like configuration. Their nuclei showed clear signs of pyknosis, and engulfing blood cells were observed in blood sinusoids of the three zones. In conclusion, it seems that the destructive impacts of hydrocortisone sodium succinate on the adrenocortical cells reflected on their functions leading to much deficiency in their performance. So, it should be taken in consideration and great concern that such drug must be utilized under restricted precautions in the medical fields to protect the human health from its hazardous impact.

Abstract: The risk of adverse human health effects due to endocrine-disrupting chemicals is of growing concern. In recent years, ketoconazole, an imidazole derivative has been developed and currently used in the medical fields as an anti-fungal and steroidogenesis inhibitor drug. The present study aimed to investigate the influence of ketoconazole in the structural and ultrastructural characteristics of albino rat adrenal cortex. Twenty adult male rats weighing 150-200 g. were divided into two even groups; group I were *i.p.* injected

with 10mg/100g.b.wt. of ketoconazole dissolved in 1ml physiological saline solution in a daily manner at 9am for 15 days. Whereas, group II were injected with 1ml saline solution in the same manner. *Histologically*, adrenal cortex of treated rat displayed hypertrophy. Glomerulosa, fasciculata and reticularis cells were loaded with lipid droplets of variable sizes, occupying almost the cytoplasm thus displacing the nuclei eccentrically, which showed signs of pyknosis, karyorrhexis and karyolysis. *Ultrastructurally*, the three cortical zones displayed the presence of hypertrophied mitochondria filled with tightly packed tubular cristae, whereas the others having cavitation results in a complete loss of cristae, and mitochondria are identified by the remainder cristae adjacent to the inner boundaries of the limiting membrane, in addition to extensive accumulation of variable sized lipid droplets and nuclei showing pyknosis and karyolysis. In conclusion, it is noticed that the destructive impacts of ketoconazole on the adrenocortical cells reflected on their functions leading to much deficiency in their performance. So, it should be taken in consideration and great concern that this drug must be utilized under restricted precautions in the medical fields to protect the human health from its hazardous impact.

Cytopathic effect of coccoid forms of *Helicobacter pylori* in Albino rats and Swiss mice

Rajaa M. Milyani

Department of Biological Sciences, Faculty of Science, King Abdulaziz University.

*Corresponding author: helicobacter2011@hotmail.com

ABSTRACT: The effect of coccoid forms of a vaculating cytotoxin A positive *Helicobacter pylori* strain on *Mus musculus* (Swiss mice) and *Rattus norvegicus* (Albino rats) was studied. Two groups of Swiss mice and Albino rats were used. The first group of mice and rats was orally inoculated with coccoid forms of *Helicobacter pylori*, whereas, the second group of mice and rats were untreated and used as a control. The animals that had been orally inoculated with a total count of 7.0×10^5 bacterial cell / ml died after 5-7 days of inoculation (mice), whereas, rats died after 7-9 days. Symptoms of mouth ulcers, darkening of the ventral part and peripheries and loss of weight were apparent, in addition to slow movement and general weakness compared to the control group. Histological examination of the stomach of the inoculated animals showed marked degeneration of the epithelial lining membrane and dark dense bodies - most probably - coccoid forms inside gastric glands. In addition dilated blood vessel, degenerated, vacuolated fused cells with coccoid forms and intravascular haemolysis were observed. These findings may indicate the toxicity of coccoid forms of *Helicobacter pylori* and hence their possible pathogenic role in humans.

Protective effect of ginger (*Zingiber officinale*) against metalaxyl induced hepatotoxicity in albino mice

Hawazen A. Lamfon

Department of Biology, Faculty of Applied Sciences, Umm Al-Qura University, Saudi Arabia.

hlfamfon@yahoo.com

Abstract: The present work studied the effect of metalaxyl, an acylalanine fungicide, on the liver of albino mice and the possible role played by the aqueous extract of Ginger (*Zingiber officinale*) in attenuating the hepatotoxicity of metalaxyl. Metalaxyl treatment induced many histological changes in the liver including congestion of blood vessels, cytoplasmic vacuolization of the hepatocytes, necrosis and fatty degeneration. Metalaxyl caused marked elevation in serum ALT and AST. It also caused an increase in malondialdehyde and depletion of the activity of the antioxidant enzymes, catalase and superoxide dismutase in the liver. Treating animals with metalaxyl and ginger extract led to an improvement in both the histological and biochemical alterations induced by metalaxyl. Moreover, ginger reduced the level of malondialdehyde and increased the activity of antioxidant enzymes, SOD and CAT. These results indicated that ginger has protective effect against liver damage induced by metalaxyl and this may be attributed to its antioxidant and free radicals scavenging properties.

[Hawazen A. Lamfon. **Protective effect of ginger (*Zingiber officinale*) against metalaxyl induced hepatotoxicity in albino mice.** Journal of American Science, 2011;7(6):1093-1100]. (ISSN:1545-0740). <http://www.americanscience.org>

Low Intensity Laser Versus Synthetic Bone Graft To Increase Bone Density After Enucleation Of Large Cystic Lesions Of Jaws

Khaled A. Elhayes

Corresponding author: pdkae@yahoo.com

Ass. Professor Oral & Maxillofacial Surgery, OMFS Department, Faculty of Oral & Dental Medicine, Cairo University.

Abstract: Materials and Methods: This study included 27 patients of both sex (17 males & 10 females) aged 20 - 48 years. They were divided into 3 groups, each group contained 9 Patients. All patients in all groups were selected to have large cystic cavities in their dental arches of different etiological factors, ranged in diameter 1.5 - 3.5 cm, and not approaching any vital structures. They underwent surgical enucleation of these cystic lesions. Patients of group (I) have received bone substitute in form of Aligpore granules that were packed inside the bony cavities of enucleated cysts till complete filling. While Patients in group (II) have not received any grafting materials after cysts enucleation, but low intensity diode laser was applied to all of them in six sessions for each patient. Patients in group (III) ,control group, have not received any grafting materials after cysts enucleation. Radiographic evaluation of all patients was performed using digital radiography system (Digora). Radiographs were taken preoperatively and at intervals of 1 day, 6 weeks, 3 months and 6 months post surgically. The mean bone density at the same region of opposite side was also measured for comparison. **Results:** It was found that there was a significant higher bone density in Aligpore group than other two groups at 1 day and 6 weeks time intervals, while there was no significant difference between Aligpore and Laser groups at 3 months and 6 months post surgically. But both groups showed significantly higher bone density than control group at these 3 & 6 months time intervals. Furthermore, the bone density was significantly higher in Laser group than control group at 6 weeks time interval. In control group, there was no significant difference in bone density between all time intervals. In group I & II, there were significant increase in bone density in all time intervals compared with preoperative density, but, there were no significant difference in bone density between different time intervals in control group. **Conclusion:** Aligpore (CORALS) can be a dependable bone substitute material for grafting bony defects in both jaws, Low intensity laser has also the ability to significantly increase bone density of empty cavities of jaws after enucleation of large cysts, so, it is preferred than Aligpore specially with

cases having infected lesions .

Abstract: Taking a look at the asymmetry of the current data at the market, the present research tries to attain some conclusions regarding the stock share holders and investors' responses towards the financial leverage and issuing of audited financial reports within seven transactional days before event (issuing financial reports) Compared to seven transactional days after event. With the application of the nonparametric tests in two cross sectional and pooled method amongst the companies which are member of Tehran Stock Exchange organization from 13 industries, the reactions toward the prices was measured by making use of four liquidity Proxies within the period of 2002-2007. The results showed a weak relation between the leverage and the liquidity ranking, and other variables including the proportional spread of stock price, Stock Price Depth and number of stocks circulation times(Turnover Rate of Stock), did not demonstrate a significant relation. The results show that the capital structure is a related and dependent factor (even if the weak one) for decisions made by the investors and the shareholders. In fact, they consider the risk of cash flows resulted from debts in their decision-making process parameters. [Ali Ahmadzadeh and Ameneh Malekinejad. Abstract: Patient safety and the prevention of medical errors have become the focus of most healthcare providers. This study aimed to determine intervening variables of human errors in Iranian public hospitals. The data were collected via researcher-made questionnaire with the reliability coefficient 0.98. The questionnaire was scored by five point Likert Scale. Rotation method of Varimax with Kaiser Normalization was used via Factor analysis. The results of the study showed factor of healthcare provider explained 7.81 percent of total variance. It had twelve intervening variables affect medical errors in Iranian public hospitals. The most factor loadings (0.718) was related "Inadequate ability of healthcare provider to decision making accurately and timely" and the Least factor loadings (0.53) was related "Inadequate awareness/consciousness of health care providers (consume alcohol, Drowsiness)". The findings of this study revealed the systemic approach must be replaced in hospitals setting to ensure the provision of patient safety and showed the most important causes for the avoidance of the culture of blame.

171 **Carbon sequestration potential of Eucalyptus and Acacia plantation in central areas of Iran**

Seyed Armin Hashemi¹

¹Department of Forestry, Lahijan Branch, Islamic Azad University, Lahijan, Iran.

hashemi@liau.ac.ir

Abstract: Carbon sequestration potential of *Eucalyptus camaldulensis* Dehnh and *Acacia salicina* Lindl planted in 1980 was studied at the age of 30 years in the elevation plain areas of Iran. Two station of this plantation in province were selected the sample plots and the diameter at breast height of all trees was measured. At least, there trees from each diameter class were randomly selected and cut and different parts of the trees including, trunks, branches and leaves were separately weighed. The main roots of one tree from each diameter class were also nine collected and weighed. To estimate the man weight of litter per hectare, 40 sample plots of one square meter were randomly chosen and the amount of litter was determined. The percent of organic carbon in leaves and litter was also calculated in the laboratory. The amount of carbon sequestered in the soil of plantation area was calculated and compared with control. This study showed that the amount of carbon sequestered by *E.camaldulensis* in the productive site and poor site was about 8.2 and 1.73 ton ha⁻¹year⁻¹, respectively. On the other hand, for *Acacia salicina* in the poor site of this figure was 2.1 ton/ha in year. The highest the amount of sequestered carbon in *E.camaldulensis* was in 30 centimeter diameter class. This figure for *Acacia* was in 25 centimeter diameter class. The amount of carbon sequestered in different parts of the tree showed a significant difference at 0.01 also in *E.camaldulensis*, there was a significant difference in the amount of carbon sequestration between the suitable and poor sites. This study showed that there is a great potential of plantations in Fars province and similar areas of the country. This plantation will maintain suitable green areas and belts and produce wood materials for consumption in several ways. Forever planting trees will lead to the reduction of CO₂ in atmosphere which reduces the greenhouse effect, a program which is university promoted and partially sponsored by united nations and some industrialized countries.

*sahra_zaki_azer@yahoo.com

Abstract: The present study aimed to investigate the impact of educational program among open heart surgery patients on minimizing the incidence of post operative infections. Data were collected from cardiothoracic surgery department, intensive care unit, and outpatient clinic at Assiut University Hospital. The study was conducted on 60 adult patients with open heart surgery (30 - study group and 30 - control group) who have been selected randomly. Data were collected through: four tools; (cardiac surgery patient needs assessment sheet, cardiac teaching program based on individualized patient needs assessment, cardiac post operative observation checklist sheet, and cardiac post operative wound site infection evaluation sheet). Results of this study concluded that, more than half of the patients in study group 53.3 % were females, 70 % were married, and 40 % their ages ranged from 18 - 29 years. While the majority of the patients in the control group 63.3 % were male, 46.7 % were married, and 33.3 % from 30 - 39 years. Conclusion; Significant differences for improvements throughout educational program phases among study group regarding total score of knowledge and practice about open heart surgery. The study recommended that, pamphlets and simple illustration booklet should be available for patients illiterate to with simple explain how to safely live after open heart surgery. The patients must understand the importance of oral hygiene and visiting a dentist regularly because dental infections can affect the valve prosthetic.

A comparative study in Money Attitude among University Students: A Gendered View

Leila Falahati*

Department of Women Studies, Science and Research Branch, Islamic Azad University, Tehran, Iran *Corresponding author: L.falahati@gmail.com

Abstract: The paper aims to examine gender differences in money attitude among college students. Using the stratified sampling method, 2,340 college students from six public and five private colleges were studied. The findings indicate gender differences for different dimensions of money attitude, in which males were attached to money as a power/prestige tool while experiencing anxiety and having a retentive attitude toward money. Meanwhile female students were conservatively minded about money, as well as being attached to money for self-gratification purposes.

Time in Mullah Sadra's and Henri Bergson's thoughts

Goodarz Shateri ¹, Reza Davari Ardakani ¹

¹ Department of Philosophy, Islamic Azad University, Science & Research Branch, Tehran, Iran

shateri1389@yahoo.co.uk

Abstract: "Time" is one of the existential aspects of human and, Man always finds himself bounded by the time, as if man is its captive and has no way out of such captivity. Mulla Sadra and Bergson are two philosophers from two different philosophical schools, who have opened new horizons and masterminded new patterns in their interpretation of time. Mulla Sadra and Bergson believed that the reality of time should be interpreted in relation to existence. Mulla Sadra conceives time as a reality which is abstracted from the existence quality of material being; Bergson also conceives time as being synonymous with motion and calls it a duration (duree), which can be comprehended only through consciousness and pure intuition, and forms the foundation of our existence. In this paper, after elucidating time from viewpoints of these two philosophers, we will try to create proximity between these two points of view and open up a window for conjunction and adaptation.

Serum Levels Of Proinflammatory Cytokines (Interleukin 6 & Interleukin 15) And Adiponectin In Hashimoto's Thyroiditis With Different Thyroid Function States

¹Soha Z. El-Shenawy, ²Mahmoud H. Hemi and ³Hatem Attia

Departments of ¹Clinical Biochemistry & ³Clinical Pathology, National Liver Institute, Menoufiya University, Egypt

Department of ²Internal Medicine, Al- Azher Faculty of Medicine, Al Azhar University, Egypt

*sohazaki69@yahoo.com

Abstract: Hashimoto's thyroiditis is a localized autoimmune disease which is characterized by an overactive immune response of the body directed against its own tissues causing prolonged inflammation. Numerous cytokines have been identified at sites of chronic inflammation such as arthritis, thyroiditis and periodontitis as interleukin 6 and interleukin 15.

Adiponectin, adipocyte-derived proteins, have immunoregulatory properties and it controls immune responses and inflammation. This study aimed to determine the levels of adiponectin, interleukin 6 and interleukin 15 in patients sera of Hashimoto's thyroiditis with different thyroid functional states (hypothyroidism, euthyroidism and subclinical hypothyroidism). Subjects and methods: Seventy patients (8 males, 62 females) of newly diagnosed Hashimoto's thyroiditis (HT) in Al-Azhar University Hospitals were selected on the basis of high serum levels of anti-thyroid peroxidase antibody (TPO Ab). The patients were divided according to the thyroid function tests into three groups: Free triiodothyronine (FT3), free tetraiodothyronine (FT4) and thyroid stimulating hormone (TSH). The first group was patients with hypothyroidism (H) (3 males, 25 females with mean age 46.5 ± 6.23) with increased TSH and decreased both FT3 and FT4; the second group was patients with euthyroidism (E) (2 males, 16 females with mean age 48.77 ± 6.56) with normal TSH, FT3 & FT4 and the third group was patients with subclinical hypothyroidism (SH) (3 males, 21 females with mean age 48.95 ± 6.61) with increased TSH and normal both FT3 and FT4. The fourth group is a healthy control group (C) (2 males, 15 females with mean age 49.52 ± 7.55) with matched age, gender and body mass index (BMI) with the patient groups. TPO Ab, FT3, FT4, TSH, adiponectin, IL-6 and IL-15 serum levels were measured in all groups. Obtained results revealed a highly significant increase in the mean serum levels of TPO Ab, IL-6 and IL-15 were detected in each of the three patient groups compared to the control group. A positive correlation between adiponectin and each of BMI and WHR in group II (E) only was detected. Also, a highly positive correlation was found between IL-6 and IL-15 in the patient groups. On conclusion, IL-6 and IL-15 may have a possible role in the pathogenesis of Hashimoto's thyroiditis irrespective to thyroid function states. In contrast, the serum level of adiponectin may have no role in Hashimoto's thyroiditis.

[Soha Z. El-Shenawy, Mahmoud H. Hemida and Hatem Attia. 176 **Theoretical Study of the Tautomeric Preference and Self Association Processes of 2-Pyrrolidinone**

Ahmed M. El Defrawy*, Maii S. Mashaly^δ, Mamdouh S. Soliman

Department of Chemistry, Faculty of Science, Mansoura University, Mansoura, 35516, Egypt.

*ameldefrawy@mans.edu.eg

Abstract: Relative tautomerization energies, dipole moments for the tautomers of 2-pyrrolidinone was studied by quantum-chemical calculations, using the B3LYP level of calculation with the 6-311G(d,p) basis set in the gas phase with full geometry optimization. Entropies, enthalpies and Gibbs free energies for the tautomerization process of 2-pyrrolidinone was obtained using the RHF/6-31G(d) level of computation. The calculations showed that, the Keto form is the most stable form in the gas phase. The entropy effect on the Gibbs free energy change of the tautomerization process 2-pyrrolidinone is found to be very small, and has practically no significance for the tautomeric equilibria of the 2-pyrrolidinone. The enthalpic term is dominant in the determination of the equilibrium constant. The ability to form dimer, trimer and tetramer was investigated concerning the energetical changes; dipole moments using the RHF/6-31G(d) level of computation. The thermodynamic parameters at different temperatures were studied using the PM3 semiempirical method. The results showed that, there is a high interconversion process between the cyclic and open dimer. Also, the probability to form higher association forms is presumably rare. At room temperature 2-pyrrolidinone only could exist in a dimer form in equilibrium with the monomer. The results are in good agreement with the available experimental data.

[Ahmed M. El Defrawy, Maii S. Mashaly, Mamdouh S. Soliman. **Theoretical Study of the Tautomeric Preference and Self Association Processes of 2-Pyrrolidinone**. Journal of American Science 2011;7(6):1163-1172]. (ISSN: 1545-1003). <http://www.americanscience.org>.

mghelghalban@mans.edu.eg

Abstract: In this work optimal working conditions were established for the determination of trace levels of lead on hanging mercury drop electrode with Ammonium pyrrolidine dithiocarbamate (APDC) as a preconcentrating agent in acetate buffer media using square wave anodic stripping voltammetry. The optimized experimental conditions include pH, APDC concentration, accumulation time, accumulation potential, scan rate, pulse amplitude and SW frequency on the voltammetric response were studied. A linear relationship between the peak current and lead concentration was obtained over the range (5-40 ppb) with correlation coefficient of 0.99911. Detection limits of 0.89 ppb was obtained with standard deviation of 0.03706. The interference by metal ions which are of great significance in real matrices have been studied. The formation of complex formed between lead and APDC was investigated using both of SWASV and cyclic voltammetry technique. The method was successfully applied for the determination of lead in tap water samples.

Abstract: In this research, the shear resistance parameters of mixture of reinforced sand-kaolinite were determined with random distribution of polyethylene fibers (PEF). All samples were compressed to a certain density and then the direct shear test was done. The dimensions of direct shear set were 10×10×2 cm. Different materials such as sand, Kaolinite and polyethylene were used in the experiments. In these experiments, moisture content, amount of polyethylene (PEF), fiber size and speed of shear stress were variable. Test results show that by increasing fiber ratio the shear resistance parameters of sand-kaolinite mixture increase. Also, in reinforced mixture of sand-kaolinite the shear resistance increases by increasing the speed of shear stress.

Abstract: The paper aims to examine ethnic and gender differences in financial management among college students. Using the stratified sampling method, 2,340 college students from six public and five private colleges were studied. The findings indicate gender differences in financial management, in which female students performed greater financial management than male students. The results revealed significant ethnic differences in financial management, in which Malay students performed greater financial management than Chinese and Indian students. 181 **Histological And Ultrastructural Changes In Mammalian Testis Under The Effect Of Hydrocortisone**

Waslat W. Elshennawy* and Hanaa R. Abo Elwafa

Biology and Geology Department, Faculty of Education, Ain Shams University, Cairo, Egypt

[*dr-waslat@hotmail.com](mailto:dr-waslat@hotmail.com)

Abstract: Hydrocortisone is a synthetic glucocorticoid currently utilized in the medical fields for the treatment of various types of diseases. The present study aimed to investigate the histological and ultrastructural changes induced in mammalian testis under the effect of hydrocortisone. Twenty adult male rats weighing 150-200g were divided into two groups; group I, injected i.m. with hydrocortisone sodium succinate (30mg/100g b.wt.) , daily for 15 days. Whereas, group II were kept as control. (injected with 0.6ml of bacteriostatic water). Histologically, testes of treated rats displayed thickening of tunica albuginea, disruption of spermatogenesis evident, marked reduction in germ cells caused dilatation of intercellular spaces, detachment of Sertoli cells from the irregular basal lamina, in addition to necrotic Leydig cells with infiltration of the interstitial tissues. Ultrastructurally, treated testes showed thickening and irregularity of the surrounding basal lamina, cytoplasmic vacuolation of atrophied Sertoli cells, shrinkage and pyknotic nuclei of spermatogonia and primary spermatocytes, condensed Golgi apparatus and detachment of the acrosomal granule from the anterior hemisphere of the nucleus of rounded spermatids, and disappearance of elongated spermatids and spermatozoa. Also, necrotic Leydig cells were observed in interstitial tissue. In conclusion, hydrocortisone administration into adult male rats exerts a clear effect on testicular structure and ultrastructure, which leads to much deficiency in their performance. So, it should be utilized under restricted precautions in the medical fields to protect the human health from its hazardous impact.

Abstract: One of the most important subjects in management research is empowerment of employees. Many researchers have studied empowerment in different organizations, and presented different theories about it. In this paper in order to find relationship between management system and increasing employee's empowerment, one main and three sub-hypotheses have been posed: Main hypotheses: the existence of integrative management systems would effect on increasing the employ's empowerment system ISO14001 and occupational health management system ISO18001. The method of research is experimental and tools to gather the data is questionnaire. The statistical society of this research is the employees of Shazand Power Generation Management Co. the number of sample is that had responded to the questionnaire were 100 employees. After analysis the data by software SPSS the following results had been seen: The existence of management systems with 0.802 coefficient correlation would effectively and strongly impact the employ's empowerment increasing and also the result of this study indicated that the existence of environmental management system with 0.633 coefficient correlation, the existence of quality management system with 0.733 coefficient correlation and the existence of occupational health and Safety management system with 0.833 coefficient correlation have had the most effect on the employees' empowerment. 183 **The Potential Health Hazard of Tartrazine and Levels of Hyperactivity, Anxiety-Like Symptoms, Depression and Anti-social behaviour in Rats**

Mervat M. Kamel*, Heba S. El-Iethy

Department of Animal Hygiene and Management, Faculty of veterinary Medicine, Cairo University, Cairo, Egypt

*mevy58@yahoo.com

Abstract: The current research aimed to determine the influence of different doses of exposure to tartrazine on levels of hyperactivity, anxiety, depression and anti-social behaviours in rats. Forty five weanling male Wistar rats were randomly assigned into 3 groups of 15, divided on 2 replicates and administered our treatment daily in drinking water at different concentrations; 0, 1% and 2.5% for a 16 weeks period. Different animal models of anxiety; open field, elevated plus maze and dark-light transition tests were employed in our study. Tests for depression as well as social interaction were also used. Tartrazine-treated rats showed hyperactivity in open field test presented by increased horizontal locomotion. Anxiogenic effect of tartrazine was evidently observed during open field, elevated plus-maze and dark-light transition tests. Furthermore, tartrazine intake significantly promoted depression as expressed by prolonged immobilization during forced swim test. Impairment in social interaction test was also detected signifying the relevance of administered dose especially on numbers of bouts of social contacts. This study provides sufficient scientific evidence that a causal link truly exists between tartrazine and inflection of hyperactivity, anxiety and depression-like behaviours in rats and points to the hazardous impact of tartrazine on public health.

Importance of rural women as effective factor in rural households

¹ Ali Badragheh, ² Mohammad Abedi

^{1,2} Department of Agriculture and Natural Resource, Mahabad Branch, Islamic Azad University, Mahabad, Iran

*Corresponding author: abedi114@yahoo.com

Abstract: Importance of women issue at Iran especially rural area, at one side face with fast population growth and mass of unemployed at process of access to rural growth and development, and at other side with limitation of facilities and productive resources. Rural women at all production level of agriculture products and livestock productions work alongside men and generally, development is multidimensional process and contains different economic, social, cultural and political dimensions. Women's participation at this process is active and affective participation, and main aspect of this participation was its economic dimension for rural women. Rural women have key role as a producer at agriculture activities, rural sources and services at rural area. Rural women most efficient women of society and among people who are active at productive occupations, so it is obvious that attention to rural women as a strong arm at rural development can follow positive and undeniable affects, in this purpose.

[Sharareh Khodamoradi and Mohammad Abedi. **Importance of rural women as effective factor in rural households.** Journal of American Science 2011;7(6):1-6]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: rural women, rural households

Introduction:

Among developing countries, millions of women always are in farms and lands, work in engaged industries, keep the cattle, store firewood and water and earn livelihood and participation in economic activities is one of their important characteristics. But Despite their widespread presence in economic activities and benefits associated with it, they always face with discrimination. The discrimination has never tired them, but as a major force in economic activities around the world are discussed.

Therefore, their field of knowledge creation capabilities guide economic and social programs for women and their participation in various activities is essential. Role of women in rural areas higher than men on household economy and are responsible for activities within the home and community prosperity.

Women still further its position in world countries, especially developing countries as active citizens and enjoy the talent in the areas of economic participation - political - social and cultural activities and still have not lost women in economic calculation does not take into consideration And as they learn to be invisible workforce.

Very disappointing estimate the number of active women in rural and low estimation of women's participation in economic activities confirmed the lack of sufficient attention to the affairs of women and their added value.

Means participation of women in all stages of development, evaluate needs, identify problems,

planning, management, implementation and evaluation is. Equity participation in a patriarchal society was not easily achieved, such matter requires the participation of women, especially rural women in projects is the way that they are concerned. Rural population of Iran always different roles in the production and distribution have been responsible. Agricultural sector, supplier of about one third of employment, food needs of more than Chharpnjm country, half of exports, do not need the agricultural products industry and one-fifth of GDP countries.

In all communities, rural women as an important factor in achieving rural development goals were discussed and in fact, half of rural human resources development are needed, however, the rural population of Iran, the ruling class (the owners of capital) and rural people, between urban and rural, between literate and illiterate, between men and women, there is a deep cleft.

Women, especially in villages of fewer possibilities in terms of investment, credit and enjoy the power. Miran role of rural women more than men, influenced by various factors, conditions and economic, social, cultural and ecological is.

Rural women, either directly (production of crops, livestock, handicrafts and rural) or in terms of helping the agricultural sector (as labor) considerable potential in the community are considered. About 5/6 million women in the production Iran's agricultural sector involved. Activities related to planting, and harvesting, processing and preparation of animal feed, preservation and care of livestock and poultry and some related activities including marketing and

sales field role and participation of rural women to sue.

Rural women at development process:

History of development is ample and is contemporary with natural and social changes across world. From natural view, history of development is contemporary with geological changes and from social view, is equal with appearance of early human societies. First, discussion about more development was done by “development “and “progress” term. Development which mainly aimed for rural areas and it is necessary for programmers to consider follow issues (amiri, 2000):

- 1- development should “change” in order to improve conditions for majority of people
- 2- People who benefit from development should be more than loss ones.
- 3- Development should minimally ensure people to supply essential life needs or at least their minimum needs.
- 4- Development should be in harmonious and consistent with their needs.
- 5- Development should encourage self reliance.
- 6- Development should follow longstanding improvement.
- 7- Development shouldn't destruct natural environment.

While assessing historical flow of development , we find that trends to human dimensions after failure to fast industrialization , forced programmers and policy makers to revise their thoughts and consider occupation , population and adequate employing of workforce especially women who form half of population , as major goals of development(Fami, 2001).

Government and national organizations attention to this issue began from mid 1970's. After world conference in Mexico, year 1975 was named as “woman year” and after that year from 1975 until 1985 was named as “women decade”, and their certain needs were considered.

In this regard, vast studies were performed and it became clear that most of development programs including Green Revolution and high yielding varieties, as caused increasing productions, had negative affects on women's occupation and has increased their duties. At 1997, world conference on rural development (WCARRD) was held by participation of 145 representatives from different counties in Roma and identified problems which women faced with. Main goal of this conference was: to support rural women as producers and their certain preferences at access to productive sources especially technologies that be able to decrease extent and

hardship of their duties and lead to increase their efficiency (FAO, 1998).

Growing women's participation at labor market is one of development indexes of each society and represents increase of women's favorites to different aspect of participation at economic-social activities. Women's activities at its different dimensions at developed countries which rapidly changing by modern technology and difference at role and their functions is obvious even among poor countries. Attending to this point that women are at basic center of development, is very important. Because they control most of non-monetary economy by rearing generation, providing workforce and managing and performing family affaires and also subsistence agriculture. While always, women's productive role at agriculture has been introduces as concealed form and rarely manifested economically and socially, and maybe be most intangible participants at economic process (Emadi, 2001).

Although at all societies, rural women were introduces as one important factor for achieve to rural development goals but base on different economic, social and cultural reasons, they were considered less by programmers and practitioners, practically. Women as one intangible factor at agricultural economy, form great share of all human workforce needed for agriculture part, across the world (Ghaffari, 2000).

Rural women are considered either directly by producing livestock and agriculture products and rural industries and either by help to agriculture part as workforce and their share at third world countries is far more than other countries. Usually statistics about women's share at agriculture productions is less than real extent because largely, at these statistics seasonal job, part time job, no wage and housekeeping activities sere not considered. Nevertheless, they are forces for creating revolution and potential resources to progress rural economy and increase growth rate of food production (Nawab Akbar, 1997).

Conclusion and discussion:

According to the most important factor of economic population development and growth rate are human resources of that community and also each community consists of activist men and women that under the social interaction have direct influence on community economic and development therefore strategies are required to developed community base on more and active participation of women that include the half of society instruct in economic, political and social foundation. Women as an effective member of society, can crystalline their lead roles in various responsibilities formations. These

responsibilities include promoting the concept of participation and employment in life and building the suitable areas for freely activity and introduce the right of economic management, ownership and.... This requires that all fees and necessary training for women to be considered. Due to the fact that the concept of women's participation, is not necessarily the female employment, although certainly part of the participation of women will be crystallized in their employment, but in this context, home and family affairs by women and their role in nutrition and child growth and Their education are also many responsibilities that women often are responsible for them. Throughout history we have always been seen that women have always been active but in culture and tradition, this mentality largely exists that if the job exists, it would be for men. Because they are responsible for their families Economic or wherever there is a good opportunity for participation, men have a prior right.

Perhaps the reason that women are less important in the development is this thought and action. Because women are in occurred opportunities in the second stage, or even sometimes do not come into account. Rural women at agriculture activities have key role as producer. Rural women are most efficient among society women and are such individuals that work in productive occupations, thus it is obvious that attention to rural women as powerful force at rural development can have very positive impacts at this regard.

Mohammad Vahid Ghalafi, at one research, as “empowering women at rural development process” has put his main emphasis on agriculture part. so , first he , assessed rural women’s status and consequently their share at development process and economy of agriculture , thus he briefly analyzed different and multiple women’s role and their impact on agriculture part and related activities and through that he has determined their role at rural development process.

Mr. Aghaee in on research as “rural women’s role at economy of agriculture and their success at agriculture development programs “ further assessing their status at different countries and also emphasis on their participation at production activity of family , has expressed factors that led to ignorance of their role at economy of agriculture .

Lahsaee Zade at research as “assessing Iranian rural women’s role at economy arena: first assessed their position at occupation structure then has compared it with rural men’s occupation base. He expressed that rural women have equal importance compared to men.

Safiri, in his doctoral dissertation as “assessing quantitative and qualitative women’s occupation ant

its relation to economic development” has considered some of their problems of occupation due to obstacles which refers to structure of countries. And some contain social-economic and cultural obstacles.

Changizi Ashtiani in one research as “counting women’s share at production of country” addressed that studying historical process of social and economic development of countries represent that at development process , lagged countries are those which proper and favorite balance between men and women’s participation wasn’t created , and also there isn’t any fair and equal opportunities to flourish creativity .

Rasool Purarabi , in his thesis as “assessing women at economic activities in rural area of Ramsar “ has shown that more than 96% of rural women , at least had participated at economic activity that was supplement for family income . But they don’t participate at basic decision making of family, in spite of their affective role and vast attendance at economy of family, and also they enjoy owning production factors, less.

Development Realization is impossible without women’s participation at different social-economic aspect. Therefore, to understand unknown, researchers should strive and take basic step in this regard. Some programs should be provided at national level as long term projects at the field of education and Cultural Revolution in order to create needed knowledge in society and in women to identify their rights, education and extending modern techniques, creating infrastructure facilities and also rural development.

Since, village is suitable place for agriculture and additional related activities, so it can be said that women’s role at village and possibility to institutionalize proper infrastructure, we able to have suitable perspective toward development process.

Agriculture part as one of the most important productive parts of country have critical responsibility in preparing needed food security that can help this part to access its major goal according to efficiency of workforce up to proper level . In this regard, women play critical role. Nevertheless, they couldn’t represent their abilities at this field, due to various limitations which women face. Among this especial attention to this group of society and preparing them supporting, educational and extensional services for them can help to remove their vast future problems , according to major role of this forgot group at agriculture activities and finally lead to increase and improve their efficiency about agriculture and consequently lead to increase welfare and comfort of rural society .

In order to be able to remove obstacles and problems of women’s activity at villages , we should

reinforce stamina if women's work by one exact and codified programming in order to be able to progress at one correct direction.

Villager access to education at different level, possibility to enjoy suitable occupation opportunities and also industrial, technical and healthcare equipment has caused that cities go out from concentration and attraction of inside and outside capitals, and so possibility of fair distribution of resources and facilities between city and village be provided, and government instead of bear heavy cost of urban population, spend these costs for rural development and support rural women whom get more damage while face lack of facility and compared to men enjoy less migration rate and also have to adopt existing conditions and use available facilities. In today world, it is impossible to achieve development goals without applying abilities of half of people of society (i.e. women).

Women at most countries, have low access to economic resources at the field of economic activity. They should reinforce them at this field by supplying economic facilities. Another part that changed women's attendance at economic affairs is agriculture activities. Opportunities which they gain at this part can have important impact on economic function and related social relations

Same discussions were presented about identifying women's role on environment changes (especially in preserving natural sources) that related to women's life and job. Women's access to agriculture credits, because increasing and improving their efficiency at agriculture. Women's membership at cooperatives, also help them to receive facilities in order to supply needed inputs of agriculture, sale productions and make some production with aim of increasing efficiency. Most of researches found that women's education is related to their agriculture efficiency. Indeed, years which women used educational programs, related to their productions meaningfully. So, by identifying their needs, demands and interests and also by determining their issues, resources and preferences, we should prepare proper extensional and educational programs for them.

Also literacy programs and generally their basic education should be considered specifically with aim of better women's enjoyment of extensional and educational programs. And also access opportunities to different resources and needed inputs at agriculture activity should be provide for them. Development programs for rural women mostly have certain importance that should be considered at extension activity. Thus extensional programs should contain emphasis and trends on work with rural

women there are two ways that extensional programs can attract women:

- 1- Extension personnel can create interest in rural women by regular programs.

Women have certain problems and it is impossible to create interest through one program, because adult men of society are base of movement and needs at agriculture societies. At many countries, especial programs are under development for rural women that perform by female extension personnel. At field of issues such as internship in economy of family, especial training for girls to product vegetables and fruits, managing poultry and simple picking techniques and methods of how behave to spouse.

- 2- Extension personnel of agriculture, always should collect comments about important points and gain data from female leaders of society, and collect comments of women's club members and other affective and significant women. Women should have possibility to participate at programs of rural committee or other groups with assistance of performance factors of extension that through those local women's problems or every certain issue which can be helped through extensional services is clear.

Since, village is suitable place for farming and additional activities, so it can be said that women's role at villages, has been toward this point and by developing agriculture part and possibility to institutionalized appropriate infrastructure, we would have suitable attitude toward development process. Agriculture part has critical responsibility, as one of the productive part of country for supplying needed food security, that it can assist this part to access this main goal up to proper level, in accordance with workforce efficiency. To achieve this goal, women play main role, too. In spite of that, they couldn't represent their abilities in this field, because of limitations that they face.

Villager's access to education at different level, and their enjoyment possibility of suitable occupation opportunities and also industrial, technical and healthcare equipment, caused that cities go out from concentration and attraction of inside and outside capitals, and so possibility of fair distribution of resources and facilities between city and village be provided.

Government instead of bear heavy cost of urban population, spend these costs for rural development and support rural women whom get more damage while face lack of facility and compared to men enjoy

less migration rate and also have to adopt existing conditions and use available facilities . In today world, it is impossible to achieve development goals without applying abilities of half of people of society (i.e. women).

Empowering women is one of principal discussions of development process for many countries of today world. existing factors contain women's education , their ownership sample , their occupation opportunities and function of labor market but if we go beyond this rather classic variables , these factors also contain occupational relations nature , how to behave family and generally society with economic women's activity and economic and social conditions which encourage or prevent change at these moods .

Last conclusion is that men and women, play role at agriculture programs and rural development but each has different needs and knowledge base on kind of their activities, since total people activities were done to supply their needs and so governments should consider regional programming in their policy making and programming. This issue dose not achieved unless by identify climate, population, cultural, economic and politic constituents of each region and also kind of relation of these constituents with constituents outside village and region.

These kinds of study and recognition have provided causes of better programming and adopted with needs of region, and prevent loss of investment. If education, health, occupation, cure and ... facilities be provided in village and improving rural life level be considered, so migration would be regulated. At the other hand, protecting agriculture and livestock products and local industry, and attracting well condition markets for it, by governments, can be affective for villager's interest about rural life. Finally, positive attitude of development programmers, would help significantly to improve condition of one benefited rural family, and would act as a factor to diminish gap between urban family and rural family.

Abstract: Human in the last 20 years climate change has faced a lot of his works on display touches gradually. Dust (size 4 microns) resulting from natural phenomena in which these changes occur, the mitigation of harmful effects is very difficult and almost "out of control And why is Iran being on the belt of this phenomenon (geographical location and latitude 24 40 °) regions of the country constantly, especially "the South have faced with this phenomenon but in recent years the amount, concentration of suspended solids, number, time stability and the establishment, expansion and influence of this phenomenon has increased. Spread and persistence of dust caused climate change in terms of amount of light received, changes in air temperature and relative humidity changes in the These changes on plant metabolism and affects the .amounts directly and carbon dioxide and oxygen is indirectly Dust particles are .performance characteristics of qualitative and quantitative Morphophysiology and affect the plants no moisture absorption and potential abundance of water that attracts humidity and dry air over the process of Dusts on plant surfaces are green and the moisture levels, reduced .expanding leaf surfaces and limit plant growth On the other hand placing the green plants on the surface, .water pressure are limited turgid growth will intensify disrupting the process of receiving light and can reduce plant photosynthesis and are dark spots on plants and garden With low growth, reduced plant height and dry matter .products to create a market-friendly to reduce the intensity accumulation, especially "in plants such as sorghum and alfalfa hay spatial and reduced product sweep sorghum According to estimates made .south province reduced panicle length, have a severe drop Radasth product phenomenon to about 40 to 50 percent crop damage are: for example, "reduce product pomegranates from 6 tons to two tons and reduce product from 50 to 60 pounds below the five kilogram PJ per tree in 2009 resulting this is a phenomenon. Because of the dust early harvested crops such as pomegranates reduce serious product and its quality Dust phenomena addition to .is low. The amount of the paste processing and production quality is very low reducing the impact of harvesting dates is seriously diminish the quality of this product is too. At present rates of harvest dates in Khorramshahr is faced with a significant decrease. In 2009 only six thousand and 500 tons of palm groves of palm harvest and harvest dates grade level to zero level and harvest dates Palm owners only grade 2 and below have hope. Dust phenomena in addition to increasing sequence s pests, reducing rates of photosynthesis and .quality Field dates will be

[Tayeb Saki Nejad, Climate change caused by dust and its effects on the characteristics of Morphophysiology, quantitative and qualitative yield of plants in Khuzestan province. Journal of American Science 2011;7(6):7-9]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: climate change, dust, crops, Khuzestan (IRAN)

1. Introduction

Source of suspended particles of dust which is known as the Saudi desert, North Africa due to changes in water regime due to dam by Turkey, Syria, Iraq and Iran on the branches of the Tigris and Euphrates is. Also, the water transfer to the center of Iraq's Tigris and seasonal shortages of rainfall and drought some swamp areas and destroy vegetation exacerbate this phenomenon and new sources of dust in the West region of Iraq, Syria, Jordan and northern Saudi Arabia

offers. This should be as dust and pollution resulting from its recent low of 20 percent domestic origin is undesirable due to the use of water resources and drought is in the deserts of Khuzestan. Combination of physical and chemical analysis of dust in the atmosphere and other provinces of Khuzestan shows the dust consists of grains of sand are not merely, but a complex combination of chemical elements are. Elements in the dust composition of sodium, silica, carbon, calcium, potassium and some other elements in

soil organic matter and metals also exist, in July last year in Khuzestan province dust concentrations exceeding 840 micrograms per thousand cubic meters this rate was seven times standard.

Zrasvndy and Mokhtari (2009), referring to the year end from October 86 to 31 cases with mean dust phenomenon lasting 46 hours had occurred in Khuzestan, while the beginning of the year so far seen 22 cases of Khuzestan dust phenomena Mean survival was 60 hours, despite the chemical pollutants, microbial and radioactive, has stressed: Unfortunately our results Reviews on large samples of dust and soils in the city of Ahvaz near the border with Iraq and Iran confirm this. For example, the amount of elements like uranium, thorium, arsenic, lead, zinc, nickel and cobalt samples in little more than normal amounts of it. Samples tested in the third period and the amount of maximum visibility of the direct relationships between particle size and the distance over by them are; apparatus ICP-MS analysis have been given the frequent use of weapons of biological, chemical by Saddam's regime and use America's Depleted Uranium, the existence of pollution on great surprise. Another point to be noted that this type of soil and dust more than two types of clay and silt (quartz) is. Lighter clay and dust from the long distance makes it. Dust in remote areas of Khuzestan, which is seen more of this type. Due to high clay ability to absorb organic and inorganic chemicals, fine texture and the risks much more than this type of soil silt soil (quartz) grains that have large adsorption capability is less. On the other hand there in these studies high levels of bacteria and pollen have also been reported. Although the amount of nuclear, chemical and microbial contamination in dust is low but because the provinces are exposed to this pollution (Khuzestan, Fars, Boushehr and Isfahan, Lorestan) Supplier Home and garden crops also can minimal pollution entering food chain, huge risks for the health of the entire nation to create.

2. Results and discussion

Iran produces many agricultural products, especially garden products with comparative advantages and sometimes absolute, and numerous opportunities this feature has provided. Southern provinces of the country due to special climatic conditions it contains large groves, which caused side industries and become dependent on dates be formed in these provinces and agricultural economy of these areas, particularly city of Khorramshahr, Abadan, Shadegan and times productions palm side is the main

focus. But in recent years and following the climate change in these areas, water resources province and severely damaged the emerging phenomenon of static dust on the line and cause extensive groves of these areas the greatest loss of surface water invade the soil has undergone. Maher news agency reported deaths in the south as "South Palm die standing" writes: Palm southern Khuzestan all Iranian people and lush palm-resistant know, but this year's Palm owners in these areas due to salinity and "Palm" phenomena of drought and dust, with more than 50 percent reduction in the production of Palm and dates have been encountered. More, the report: In eight years war, many of the palm in these areas due to the Collections at the center of war and where military operations sides severely destroyed and damages were in some statistics announced that about 70 percent of Palm in the war and the effects Next caused it disappeared. However, action planning and paying for replacement planting of appropriate incentives to prevent the government from reducing the number did not receive palms. In the interim, Abadan and Khorramshahr cities due to palm abundance, despite the loss of countless trees during the war also produced Bellwether Palm and dates were in the country, but this year's excessive water salinity ""Palm" " about 90 percent water groves of these areas through streams radiating from its supplies, production Palm, and dates in the city of Abadan, Khorramshahr, Arvndknar and Mino Island with the loss of at least 50 percent has encountered.

Falling ratings in 2008, 38 countries in the world palm production advantages were a total of 6 million and 422 thousand tons of dates were produced in the world. Of these countries, five countries index, ranking the production of the palm of your had and thus Egypt produced one million and 130 thousand tons in the first rank, Iran producing one million tons per second, Saudi Arabia produces 970 thousand tons in third countries UAE and Pakistan, respectively, producing 755 thousand tons and 510 tons, ranking fourth and fifth production date stood. But now Iran's second position was unstable and produced a sharp decline in Iran last year or two notable advantage is lost and this concern by saying, "Mousavi Sydmjyd" province chief of Agriculture is obvious: this year Update two phenomena of drought and dust in the province in addition to reduced production of some dates, reducing the quality of this product have also associated. He adds: Last year (2006) over 160 tons of dates were produced in Khuzestan that amount this year reaches 110 thousand tons and 50 tons will be reduced along. In some areas such as staff, and the purchase price Shadegan dates due to poor quality products has decreased. Head of Agricultural Jihad Organization and Kohnuj Jiroft also reduce production 20 percent this year dates have expressed concern:

According to the forecast production rate in the region dates due to complications dates cluster is about 20 percent.

Pour Rokni (2009) Director of Agriculture Khorramshahr groves destroyed the false news knows, but reducing quality and quantity is confirmed dates: This year we produced 30 percent reduction and dust in addition to lower harvest dates, The impact on product quality and production this year has had a degree of dates and harvest will not second-class and mostly lower. He promoted the planting of grapes in Khorramshahr as robust and fruitful tree beside the palm trees and sent says: several thousand cuttings of the variety of grapes known to have distributed among farmers to help farmers, which is less than the damage caused by the loss of production dates to see the damage. Pour Idris (2009) Director of Agriculture also 50 percent reduction in Abadan harvest dates compared to last year's crop does and says: Last year, the Palm Groves of Abadan and Kharg Arvndknar about 60 thousand tons, Rtb and harvest dates, but this year We anticipate that this amounts to 30 thousand tons. His rising water EC (salinity) Bhmshyr island main reason for the drop in quality and quantity of palm knows Abadan and adds: groves of our grade 2 and 3 are

produced in ha about 3 tons and this figure is very low. "Idris pour" insurance plan free two million 700 thousand palm trees and it also says the government in support of Palm owners knows. Sami (2009) confirmed the managers said Agriculture Khorramshahr and Abadan says: Studies indicate that the dust this year and young groves irrigated with fresh water "Palm" planting in two or three years greatly increased the salinity cause of death of young palms has been the addition to seasonal storms and transient in Khuzestan occurs in young palm from being dug and removed it from the production cycle is effective. However, it seems disregarding the effects contaminating water sources and disregard province dust phenomenon in the province now, gradually and shows his palm proud of this territory has humiliated the Islamic homeland.

Keywords: Huomic Acid, micro & macro elements, Seed

1. INTRODUCTION

Biological products that are organic fertilizers include different types of living cells and microorganisms capable of converting nutrients inaccessible form accessible form through biological processes have the (32). This material increases the number Microorganisms and microbial activities increased to make food available in the form which are easily absorbed by plants are (27).

Huomic acid as an organic acid from humus and other natural resources through the hormonal effects of improved nutrient absorption and increased biomass and root shoots are (5). Is investigated in many Huomic acid reduces the need for fertilizers and improved ability to use them has been. In many cases, if the soil organic matter is enough to require chemical fertilizers can be eliminated completely, because the soil through microbiological processes

and plant nutrient producing humus need to be resolved (25).

Huomic acid on growth and root shoots of wheat cultivars were investigated. The results showed that the ratio of root to leaf area affected was significantly increased (5). In similar study (11) Huomic acid increases in root growth was lettuce .

Research (13) Four Huomic acid levels (0, 10, 20 and 30 g m) and four levels of sulfur (0, 125, 250 and 375 g m) on yield components and macro nutrients absorbed by plant spinach were studied. Huomic acid intake to yield 29% over the control (1810 g m) increased. Huomic acid intake increased dose, a significant increase in plant nitrogen was obtained. Huomic acid and sulfur significant effect on emergence rate and number of leaves did not. Increased acid consumption Huomic absorptions increased macro elements so that for phosphorus,

potassium, calcium and magnesium were 0.56, 6.30, 1.33 and 0.55kg in wet weight was spinach .

However, there are many studies that the ability of humus material in growth of aerial parts of different species in different growing conditions has been reported (19, 24 and 25). However, the mechanism of reaction to these substances is less known. Likely that the effects of acid Huomic through its early roots and activities - and nitrate divided between plant root and shoot growth may alter the starting Saytvknyn specified in division, and ABA poly amine root and shoot of is the effect on shoot growth (24). It seems that Huomic acid intake increased the enzyme activity was increased nitrate accumulation in the shoot and the root is reduced. The simultaneous significant increase in concentration and poly amine cytokine in shoot is observed (19 and 24) .

It seems that taking acid soil application and foliar application Huomic different results regarding the absorption of minerals from the soil to be (19 and 24). A Present (17) Huomic acid on plant growth and nutrient uptake by wheat at different concentrations of salt were studied. Huomic solid acid (0, 1 and 2 kg) one month before planting the soil was added and the acid liquid Huomic (0, 1 / 0 2 / 0 percent) in two stages 20 and 35 days after emergence of solutions were sprayed. Salinity reduces crop growth and dry weight loss and absorption of nutrients such as nitrogen and magnesium Krdd. Soil application of solid acid intake increased Huomic nitrogen and liquid intake that increases the absorption of phosphorus, potash, sodium manganese, zinc and cobalt were. However Huomic acid intake by increasing root growth was increased nutrient absorption (25, 27).

a. GERMINATION OF SEEDS

The seed of a higher plant is a small package produced in a flowering plant or gymnosperm containing an embryo and stored food reserves. Under favorable conditions rapid expansion growth of the embryo culminates in rupture of the covering layers and emergence of the radicle. Radicle emergence is considered as the completion of germination. The definition that a visible protrusion of radicle tip is the completion of germination is not only a definition issue of seed physiologists. This transition point is also characterized by the loss of desiccation tolerance and this is a molecular checkpoint, a developmental molecular switch from the germination program to the seedling program. The seed looks apparently dead. In fact, even with

biochemical tests for the metabolic processes we associate with life (respiration, etc.) the rate of these processes is so slow that it would be difficult to determine whether there really was anything alive in a seed. Germination is the resumption of growth of the dormant embryonic plant inside the seed; it implies complex physical and chemical changes that occur as the embryo begins to develop into a young shoot and root (seedling). The germinating seed sends its first root (radicle) into the soil and the first stem with the first leaves (cotyledon) toward the sunlight(1, 5,6).

b. GERMINATION IN DICOTYLEDONS

1. The primary root emerges through the seed coats while the seed is still buried in the soil.
2. The hypocotyls emerges from the seed coats and push its way up through the soil. The two cotyledons protect the epicotyls structures — the plumule — from mechanical damage.
3. Once the hypocotyl emerges from the soil, it straightens out.
4. The cotyledons spread apart exposing the epicotyls, consisting of the primary leaf (or leaves) and the apical meristem. In many dicots, the cotyledons not only supply their food reserve to the developing plant but also turn green and make more food by photosynthesis until they drop off (1).

c. Organic matter

Organic matters due to the beneficial effects on physical properties, chemical and biological soil have an important role in soil fertility, plant nutrition and crop yield have increased. Huomic acid humus material that is part of the property due to the complex hormonal and audience an important influence in increasing crop production and supply is balanced. Huomic products with micro and macro elements of plant needs in addition to quantitative and qualitative improvement in products of plant resistance against pests and diseases also increases

d. Huomic acid

Humus of different compounds, including acid Huomic Folic acid respectively to complex nutrients, their ability for plant uptake increases continuously as a result of plant nutrients during the growing season will reach. Huomic acid intake according to the plant increased quantitative and qualitative performance of the product is remarkable. The earth used as fertilizer, sprayed on plants and seeds and use in irrigation systems is usability (9).

e. Application advantages:

- 1 - Increased nutrient absorption.
- 2 - Increase beneficial soil microbial populations.
- 3 - Hormonal modification of soil physical properties.
- 4 - Hormonal and enzymatic effects on plant growth.
- 5 - Pests and diseases and reduce pesticide use.
- 6 - Plant resistance to drought and salinity stress.
- 7 - Increasing product quality.
- 8 - Increasing the percentage of seed germination.
- 9 - Balanced PH soil.

2. MATERIAL AND METHOD

Humic acid extracted in the application of plants in crop water uptake, germination rate and breathing increase. Similar results were obtained in soybeans. Speed of germination in barley, maize and wheat in the presence of acid was substantially increased Humic. Speed and germination of seeds treated lettuce and tomatoes in containers Humic acid extracted from oxidized Lignite increased. However Humic material evidence to show that seeds of life increases is still not observed. Beans treated with acid Humic as seed germination rate significantly increases.

Different amounts of acid in Humic obtained from urban wastes Humic acid derived from organic sources on tobacco seed germination of barley and found that Humic acid derived from urban waste regulators greater role in the germination rate and germination time was reduced . Humic in experimental acid and calcium on the germination of tomato seeds was examined and results showed that growth and Humic acid and calcium content of nitrogen applied and what amount of nitrogen and potassium increased the root.

.Humic micro elements like iron and acid compounds or elements Clat Huomic complete micro or treatment Huomic Clat, complete micro and macro elements on the speed of germination and affect. These substances cause a change in speed and percentage germination for causing water absorption and osmotic regulation are. The purpose of this experiment, how to effect of micro fertilizers on germination. Horse bean seeds were used in this experiment. 10 seeds were placed in each container separately. The treatments are:

- 1 – control**
- 2 - Iron treatment Huomic Clat**
- 3 - Clat Huomic zinc**
- 4 - Clat Huomic zinc and iron treatment**
- 5 - Magnesium and calcium treatment Huomic Clat**

This way the seeds first immersed into distilled water for 2 hours and then represented to within experimental treatments containing seeds are added at room temperature 25 degrees Celsius and the daily number of stored seeds germinated notes are all treatments and ultimately get results And brought in the formula are presented. The average time needed for germination (MTG): The average times needed for the germination index of germination velocity and acceleration are considered below were calculated from the relationship (Ellis and Robert., 1981):

$$MTG = \frac{\sum(nd)}{\sum n}$$

- n = number of seeds germinated during the day d
- d = number of days from beginning of germination
- n = is the total number of germinated seeds.

3. RESULT

After three days of testing, counting and investigation was initiated seeds results indicate that the five treatments applied after the third day:

- 1 - 10 numbers in the control of the number five seed was germinated.
- 2 - The number 10 seed in the treatment of iron Huomic Clat was germinated 5 numbers.
- 3 - Number 10 seed treatments Huomic Clat were germinated on 4 numbers.
- 4 - Number 10 seed treatments Huomic Clat and iron on number 6 was germinated.
- 5 - Number 10 seed treatment Huomic Clat magnesium and calcium did not do any germination.

Table1: MTG Result

Treatments	MTG
control	5.5
Huomic Clat Iron	5.1
Clat Huomic zinc	6.2
Clat Huomic zinc and iron	4.9
Magnesium and calcium Huomic Clat	n.s

Therefore, the effect of fertilizer containing macro and micro elements on germination is determined according to results of experiments on biological fertilizers bean seed was determined that probably the effect of fertilizers used in nutrient absorption, growth hormone stimulation increases the germination of seeds But actions are different

combinations of calcium and magnesium fertilizers prevent seed germination is.

4. DISCUSSION

Calat Humic acid produced by the different nutrient elements such as sodium, potassium, magnesium, zinc, calcium, iron, copper, and.... In order to overcome the shortage of nutrient elements, plant growth will increase due to the effects of hormonal compounds useful in increasing production and improving the quality of agricultural products are. Humic acid solution used in the diet increased the growth of branches, roots and nitrogen content in the aerial and the disappearance of chlorosis in corn leaves was Lupin. It also causes acid Humic high chlorophyll concentration, more lateral roots grow, improve nutrient uptake and high consumption and low consumption of other biological effects are large. In a three-year study of 3 with phosphorus acid Humic without it looked on the growth of potatoes. The results showed that phosphorus content of leaflets on treatments with acid levels Humic 0.03% increase. Humic gland treated with acid to more than 10 times in two to three years of study increase. The results showed that treatment with acid Humic lumps on density had no significant effect. Due to environmental considerations, most recently using a variety of organic acids to improve the quality and quantity, and garden crops has increased. Very small quantities of organic acids significantly effects on improving physical and chemical and biological properties of soil due to have beneficial effects on hormonal compounds to increase production and improve the quality of agricultural products have. Humus organic matter can be established to define which parts Humic acid, acid and humic & folic is composed. The most part the composition of soil humus acid and acid Humic folic form a variety of sources (terrestrial plants and vegetative resources) are obtained with regard to its source in molecular size and chemical structure together are different. Humic acid compounds naturally in soil, peat, coal, and ... There. Tests showed that adding humus to the soil in the planting material of barley and sugar beet, potatoes, watermelon, tomato, a significant performance increase was caused by Calat elements enhance absorption by the plant material and humus are caused storage long-term soil carbon, root and stem growth in plants, nitrogen uptake and storage, increased photosynthesis, increased resistance to disease and Be(10, 13).

Seeds from Ages and ages ago, since mankind have been considered. Due to the size at first was a practical aspect, because many seeds of a major

source of food in most parts of the world. Thus, information about their seeds nutritional value, chemical composition, changes in the composition of storing their acorns additionally, the ability to warehouse and stored seeds, viability, etc. holding power is concerned. Farmers and gardeners to factors that are related to the growing seeds are interested in large part because of the common agricultural contracts and associated with growth and plant breeding in order to obtain their seeds (2, 5).

Physiologists in order to study the effect of the seed temperature, moisture, oxygen, light and other factors affecting their growth and the emergence of transplant have been used. Most successful modern agriculture in the United States and Western Europe depend on the genetic quality of having good quality seeds and the ability to prove they tried growing emergence seedling transplant and strong growth, parallel to create pressure to increase food production around the world, using modified and quality has been emphasized, similarly, need to plant other products such as vegetable oils, textiles and industrial chemicals, excess demand for greater access to seed varieties and new varieties are created. Although the importance of quality seed is fully known and documented, but still clean and recognition of quality seeds for a scientific basis not sustain. Objective The present experiment discusses some recent research in the field of seed physiology and the impact on the metabolism of micro-fertilizers is germination. That is not working on it (6).

Abstract :General purpose of testing conditions to get the best crop production figures for comments in order to get maximum yield is. Appropriate distribution of plants per unit area in one of the most consistent factor is to increase yield. In order to study the effect of different densities on bean cultivars, experimental farm in 2008 Farm Research, Islamic Azad University of Ahvaz was executed. Factorial experiment in randomized complete block design with three replications was formed. The first factor consists of three densities (45, 55, 65) plants m and the second factor consists of three digits (ZOHREH, SHAME and JAZAYERI) were. The results showed that between different varieties of grain yield and all yield components (seed number per pod and NO. pod) statistically significant difference in the level of 5 percent there. ZOHREH figure was superior to other cultivars and varieties having SHAME with little JAZAYERI showed no statistical difference. Grain yield in different cultivars ZOHREH, SHAME and JAZAYERI, respectively 1523.33, 1372.67, 1352 kg ha was. . Most biological functions in the plant density of 55 3042.89 kg/ha obtained the density of levels with other significant difference at 5 percent showed. Highest harvest index and density of about 55 plant varieties ZOHREH m according to the results the best varieties for planting varieties bless and best density, density of 55 plants per square meter is .

[Somaye Ghadaksaz, Tayeb Saki Nejad, Alireza Shokohfar. Calculate dynamic changes in bean yield in different plant densities. Journal of American Science 2011;7(6):15-18]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: bean, density, variety, yield

1. Introduction

Grains of the main sources of protein-rich food for human and animal nutrition are known. About 22 percent in human nutrition of plant protein, 32 percent fat and 7 percent of carbohydrates are whole grains provide. Similarly, 38 percent of protein in animal feed plant, 16 percent fat and 5 percent of the carbohydrate source is provided. Some grains in addition to international trade oil production for different purposes are used in human and animal nutrition.

Among grains, soy, beans and peas in terms of acreage, respectively first to third place are met. Nightingale eyed beans in tropical countries especially African countries; the wide level is automatically assigned.

Density effect on yield and yield components

Salvador (2006) in testing the effect of population density on the yield of green pod bean showed plant growing season in both surveys. Randomized complete block design experiment with three replicates and densities 11-17-33 m cultivated plant varieties, including limited growth Test results showed that the green pod yield increased with increasing density and the best density for plant varieties in 33 m was recommended .

McEwen and Mafyt (1998) Effects of planting date and seed rate on yield reported that cultivation on suitable plant density increased from 12 to 36 plants m No. pod the plant from 6.6 to 6.4 reduced, but at the same density of pods per square meter was 177 to 235 .

Sabagh Poor (1996) reported quoting with increasing density and number of pods per plant, seeds per pod, although reduced amounts of these components per unit area can be accelerated .

Nori and Nabi Pur Kashani (2004) to evaluate the effect of plant density on growth, yield components and grain yield of mung bean in spring cultivation experiment with a factorial randomized complete block design with four replications. The first factor includes four row spacing (10, 15, 20 and 25 cm) equal to (80, 100 133 and 200 thousand plants per hectare) and the second factor includes three varieties of mung bean (Gohar, VC1973A and NM92) was. The results show that the highest grain yield with density 13.3 plants per square meter and 15 cm plant spacing (3010.1 kg per ha) and cultivar VC1973A 2976.4 kg per ha grain yield and minimum density of 20 plants m square distance of 10 cm 2645.2 kg per hectare and gem figure 2227.1 kg ha was obtained. Among yield components, pod number per square meter than other increase in yield explained .

Agha Alikhani Qlavndv Ala (2004) to investigate the effect of different planting densities of

10, 13, 20 and 40 plants m on yield and yield components of two varieties of gem-ray and a line (VC-1973A) Vetch Green experiment was performed. The results showed that VC-1973A lines yield the highest won and according to the earliness and ripening time than the other two varieties are preferred for mechanized harvesting. Mung bean planting density on yield very significant effect on the surface was a percentage, so that densities of 20 and 10 plants m highest kg / ha 2221 and the lowest kg / ha 1650 grain yield were produced. Among yield components, only the number of pods per plant was affected by the density. Correlation studies showed that the density of characters with the first pod height and distance from the ground and positive correlation with grain yield per plant, harvest index and number of branches and pods correlation was negative. Moreover, it seems, the number of pods that a high correlation (0.88 = r) with grain yield per unit area is the most important component is the yield of mung bean .

2. Materials and Methods

This test Crop in 2008 University Research Farm in three kilometers south of Ahwaz, Ahwaz city geographic 31 degrees 20 minutes North and longitude 48 degrees 41 minutes east and 18 m above sea level is located. To determine the physical properties and chemical field soil test before planting field soil sampling conducted Shadow following results were obtained .

Treatments were tested in compression as the main treatment and bean cultivars as sub-treatment is intended. In this review Tuesday Picks 45, 55 and 65 plants per square meter as the main factor was applied. That it will provide for easy order results with D1, D2 and D3 will be shown. The bean genotypes tested Tuesday as has been under cultivation, these figures include ZOHREH, SHAME and Jazayeri (V1, V2 and V3) were .

3. Results and Discussion

A- Yield

The differences in yield of different densities were significant at the five percent level (Table 1). Densities of 55 plants per square meter with 1658.89 kg of grain per hectare compared to other compression rates were highest. Appears to cause yield loss in density of 65 plants per square meter due to competitive absorption of radiation in plants, food and moisture, the grain yield also increased in density 45 plants per square meter than the density of 65 plants per square meter due to better distribution of inputs environment (light, nutrients, moisture) between plants, yield per plant (number of pods per plant) increased.. Perhaps one reason for high grain yield (pods) at plant

density of 55 square meters in total dry matter is more, the test results and Aspyng Naynhys (1998) on beans and bean showed that with increasing density of grain yield per plant reduced yield loss in high density increasing percentage of sterile flowers and pods severe loss and significant reduction in dry matter were attributed was consistent. (Shams and Zanganeh, 2004)

Analysis of variance of grain yield (Table 1) suggests that the cultivar effect on grain yield at 5% average means and comparisons with related Table 1 a significant difference between the figures does not show. Been blessed with grain varieties (1523.33) kilograms per hectare than the other two varieties are superior yield the lowest figure Jazayeri 1359 kg ha rate showed. Differences in yield characteristics and differences of cultivars and varieties of genetic material also allocate more productive and more reproductive parts of seeds per pod number were attributed to the ZOHREH. The test results Akynvla and Whitman (1988) were consistent .

Table1. Analysis of variance

Mean square		df	SOV
HI %	Seed yield		
9.60**	1603 ^{ns}	2	R
2160.06**	418882.11**	3	Density
68.314**	74839.00**	2	Cultivar
52.1**	94.974 ^{ns}	6	D * C
05.0	50.1151	16	E
9	10	-	%CV

B- Harvest index

Density effect on harvest index was significant at five percent. (Table 1) such that the highest rate of harvest index 70.3 percent owned density was 55 plants per square meter. Growth in the appropriate space density creates a balance between weight and total weight of the pods were dry, while the density of 45 plants per square meter competition, seed dry weight loss and increased biological function leading to decreased harvest index. Effect of variety on the harvest index, significant differences in the level of five percent did not show. Comparison of the results shown in 4-19, between SHAME and variety of JAZAYERI observed harvest index is not statistically different, but with the ZOHREH of both varieties showed significant differences. Jazayeri cultivars had the lowest harvest index due to reduced photosynthesis and reduced material handling light to penetrate the lower parts of the plant community and therefore economic yield in this figure dropped to reduce and eventually harvest index has shown .

C- Component Yield

C-1- Number of pods per plant

Analysis of variance table 1 that showed effect of density on NO. Pods are significant difference in the 5% level indicated. So the density of 45 plants per square meter pods per plant (11.01) and the density of 65 plants the number of pods per plant (9.08) was reduced. Table comparing mean density of the best in terms of number of pods per plant density of 55 plants (average densities) were observed. In fact, with increasing density of pods per plant is always less. Because it suggests that reducing plant density per unit area, increase the plant community is light in hand more space available for plant development plant placed. In this case, dominance of low-end buds and side branches begin to grow more plants and should develop with the development of active plant leaf area and plant more institutions take advantage of the environment (light, moisture and nutrients) increases And so the plant will produce more flower number and flower number increased because of increased pods are ultimately the number of pods per plant is greater. . Bennett et al and Graham in the eye beans nightingales and battery in soybeans reached similar results. Between cultivars as well as the number of pods per plant, significant difference at 5% level showed. Jazayeri than two digits and ZOHREH SHAME fewer pods per plant have produced but statistically between the two JAZAYERI and the variety SHAME there was much difference. It can be caused due to developmental differences and abilities enjoying the environment are different cultivars. ZOHREH number of pods per plant with an average 11.33 and 10.29 with a mean figure Jazayeri pods per plant, respectively, the highest and lowest No. Pod produced at the plant .

C-2- Number of seeds per pod

Based on Analysis of variance table 1 number of seeds per pod, plant density influenced statistical difference at 5% level indicated. Probably due to incorrect estimation error is tested. Most grain density 55 plants m average was 11.87. Lowest density of 65 seeds per plant was due to competition between plants for the use of environmental features is a plant that has been less developed and reduced yield per plant and blessed with an average number of seeds had the highest number 15.83 .

C-3- Seed weight

Compare different levels of congestion on the seed weight showed increased density of grain weight decreases with increasing density, which provides nutritional space per plant is reduced, competition between plants was more a result the amount of food

and reduced the share of each plant That's why the single-grain weight is reduced, statistically significant differences between different levels of congestion is not present. In this experiment, seed weight was not significantly affected by cultivar and statistically different between the treatments tested there was no significant difference. But between the three cultivars, varieties ZOHREH had the highest seed weight. The pilot reported that the pattern of cultivation on seed weight had no significant effect because the seed weight or seed has considerable stability .

4. Conclusion

General purpose of testing conditions to get the best crop production figures for comments in order to get maximum yield is. Appropriate distribution of plants per unit area in one of the most consistent factor is to increase yield. Grain yield components including No. pod, number of seeds per pod with a reduction in density from 65 to 55 plants per square meter increased. This indicates that the bean plants increased the available space to attempt to directory creation of conditions to be able in most exploited to enhance yield. Most grain density was 55 plants per square meter. Cultivars and the yield of its components had different variety than the ZOHREH of the other two varieties were superior. Harvest index was affected by the plant density and harvest index in the best density equivalent to 55 plants m 70.3 respectively. Figures of the harvest index were together statistical difference in terms of variety and ZOHREH to the other two varieties were superior .

Abstract: Dry matter accumulation patterns in most grains are sigmoid-type curve. In the first stage of this model is that if growth is slow, then there is a rapid phase after the flowering stage is followed by growth that is in pod formation stage. Studies have shown that leaf area development and dry matter accumulation in most cereal grains, especially cold for a long period after transplantation is very slow. Accordingly, in order to effect the kinds humic acid plant growth and bean seeds under climatic conditions of Ahvaz in the form of a split-plot experimental design with randomized complete block design based on years of farming 2010 was designed and executed. Factor with three bean varieties ($V_1 = \text{Barekat}$, $V_2 = \text{Jazayeri}$, $V_3 = \text{Shame}$) in the main plot factor with four types humic acid ($F_0 = \text{control}$, $F_1 = \text{humic acid}$, $F_2 = \text{full macro humic acid}$, $F_3 = \text{acid Micro humic full}$) rate of 2 ppm in the sub-plots were placed. The results showed that the use of acid in all varieties humic increased plant growth parameters such as crop growth rate (CGR), plant height, grain yield, harvest index and biological function has been compared to the control. the highest total dry weight of the acid treatment Humic full macro level was 5909 kg per hectare and the lowest rate to the control was 4332 kg per hectare Effective grain filling period (*EFP*) The increase in the treatment process itself revealed. Varieties planted in the province and the third type humic acid with a control rate at 2 ppm was placed in sub-plots. The highest and lowest average number of lateral roots in this experiment in order Humic acid treatments and control macro level 241.7 and 136 numbers were obtained. Note that between the number of acid root treatment and between macro and micro humic acid and acid micro Humic significant difference was found. the highest root dry weight to macro Humic acid treatment with a mean 4.22 grams of control treatment and lowest with mean 2.63 has been hot Total root number from 592 to 899 in number in the control humic full macro will increase the number of roots, a positive regression ($r^2 = 0.89$) with the amount of biological fixation (percentage of nitrogen nodules) showed. [Simin Haghighi, Tayeb Saki Nejad, Shahram Lack. Calculate the growth dynamics of root and shoot of bean plants. Journal of American Science 2011;7(6):19-26]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: growth dynamics, root, shoot, bean plants

1. Introduction

Beans as one of the most important sources of vegetable protein-rich grains, the second important source of human food are considered. This plant belongs to the legume family and lounges are below the butterfly family. Bean a member of the large genus with over 130 members *Vicia* are. Grains but the main diet of many poor people makes up the world because substantial amounts of protein quality in grain cereal products in combination with a compound can provide biologically valuable food (8). Amount of protein found in seeds 2-3 times more protein in cereal grains and 10-20 times more protein in glandular plants and forage legumes are also due to having high protein food value is high. Bean plant having 25-23% protein as well as in other food grains high value and having the ability to stabilize nitrogen, have very good effect that causes the periodic amplification and chemical and biological soil fertility is. Nitrogen fixation in grain

legumes by 56-112 kg per hectare a year have been reported (3).

Cereal cultivation based on FAO data (2006) over 7.5 million hectares have been. Bean cultivation in Iran is approximately 35 thousand hectares (4). Statistics suggests increasing importance and widespread as an important source of food grains in many countries and cultures have longstanding experience in Khuzestan is Bean (7). Product to achieve maximum week, despite the needed amount of nutrient elements in the environment and balanced distribution of bean roots is essential. Consumed at the absence of elements in plant growth and development is effecting the amount of nitrogen fixation (6). In 23.8 million hectares are salt and sodium, which causes the nutrient uptake by plants are (9). Organic matter due to the beneficial effects on physical and chemical properties and soil biology have an important role in

soil fertility, plant nutrition and increased functionality and are the product.

Influx molecular nitrogen in the surface of the Biosphere by Rizobium bacteria called biological nitrogen fixation. Humic acid substances, including the dual effect of biological influences on consolidation is a phrase that the root development and lead to more contact with the roots and the bacteria are Rizobium other hand has a positive effect on the activity of soil microorganisms and can increase biological nitrogen fixation in legumes is (13).

2. Material and Method

2.1. Land preparation and planting

In order to run tests in 2010 on land preparation operations include basic irrigation, deep plowing to 20 cm, 15 cm and depth of the disk was trowel. Urea nitrogen fertilizer rate of 30 kg per ha nitrogen as fertilizer while planting base land was given. After preparation, land plot plan map based on the dimensions of a plot scheme was tested was 6 × 4 m and 7 lines in each plot to kill took over six meters. The space between two rows of seeds on the distance of 60 cm and 15 cm rows were considered.

2.2. Plant growth analysis

Every 12 days once the two plants harvested per plot and then measure the height and number of lateral branches and leaf area index, samples in oven for 48 hours and the temperature 75 degrees to measure the parameters of dry matter accumulation and leaf area index were placed.

2.3. Grain growth analysis

In order to check the growth of seed pods form after every five days once the sample was taken and all pods from each plot by two plants collected during and after measured pods and seed number per pod in the oven 48 hours and temperature 75 ° C dried and then dry the seeds and pods were determined. The grain filling rate and the effective period of grain filling was calculated using the formula.

2.4. Root growth analysis

For review every 12 days once the root growth of two plants per plot completely removed and the roots as cylinders of soil were removed. After separating the roots of plants, their roots washed sub number; root dry weight and volume were measured. Rooted in the oven for 48 hours at temperatures 75 ° C were placed and then dry them this time was calculated. To calculate the size of the root count and root dry weight of lateral roots and the difference through the law of Archimedes cylindrical water volume, volume of roots was calculated.

2.5. Statistical calculations

Analysis of variance, split plot design computer software cholera *EXCELL2007*, *MSTATC* was done and for comparing characteristics of the LSD test was used.

3. Result

3.1. Calculate the growth dynamics shoot

3.1.1. Leaf area Index (LAI)

LAI is simply the product of leaf area than the land surface on the shadow throws. Chart review of the bean leaf area index in a sigmoid curve itself shows, the primary growth in all treatments were 55 days after planting LAI slow process and its value had nearly the number 0.8 show that this trend will expand the family LAI is Leguminoseae. But should note that taking acid types humic cause shorter periods of three varieties grow on bean plants has been tested. According to the diagram (1, 4) added to the macro elements Humic acid treatment than the other three acid Humic increase LAI and shorter growing period will have been getting.

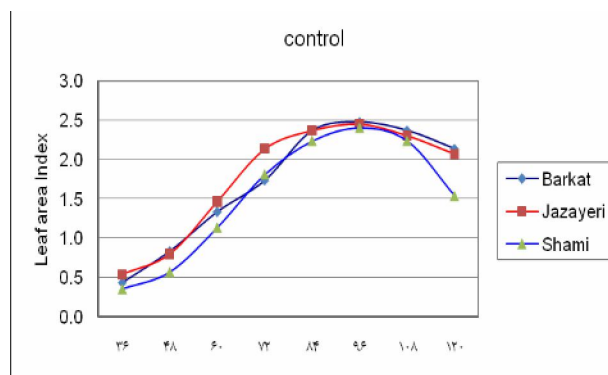

Fig1. Leaf area Index of cultivar in control treatment

Bean plants Foliar Spray in the eyes of nightingale's second trifoliolate stage with organic compounds have significant effects on vegetative growth found. Treated leaves and fresh mass were fresh led to higher photosynthetic activity (14).

Effect Humic sprayed acid on traits such as stem height, leaf number, shoot fresh weight, shoot and root dry weight accumulation and leaf NPK in eggplant and pepper seedlings found that stem diameter, number of leaves, shoot fresh weight, shoot and root dry weight significantly Humic acid application on pepper and eggplant seedlings increased(17).

The effect of variety on leaf area index, LAI maximum number Jazayeri the figures showed that between dinner and blessing with the numeric value 3.5 the maximum is reached. Jazayeri figure in the early stages of growth below the figure dinner LAI showed her and even to 50 days after planting cultivars had more leaf area index dinner. But the number of islands during this period of flowering and leaf area index had increased

considerably probably related to the plant and its potential impact has been the quality of fertilizers.

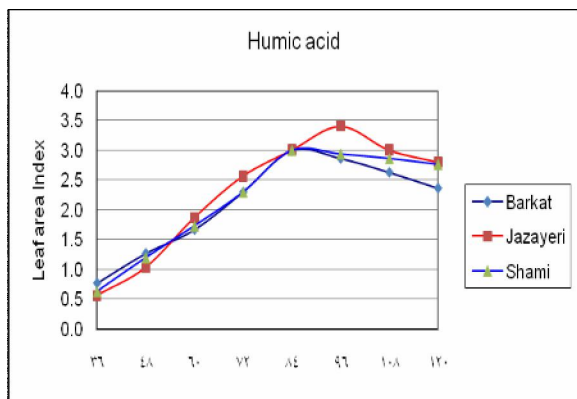

Fig2. Leaf area Index of cultivar in humic acid treatment

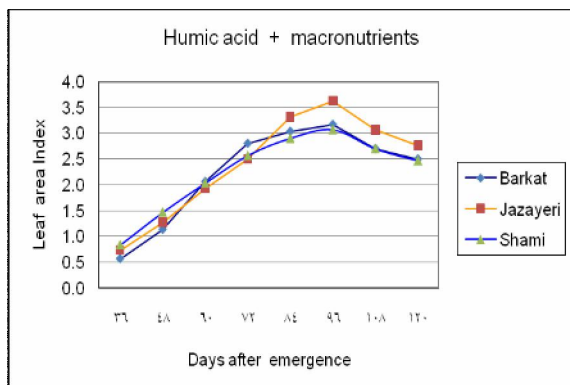

Fig3. Leaf area Index of cultivar in humic acid + macro treatment

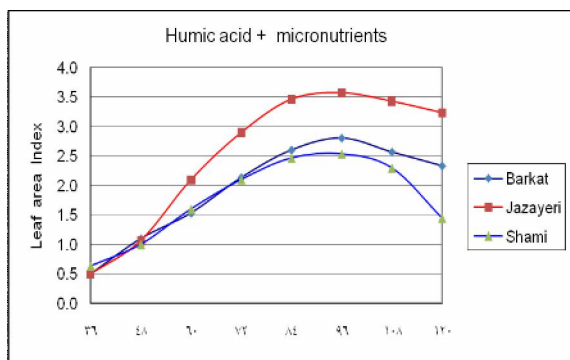

Fig4. Leaf area Index of cultivar in humic acid + micro treatment

3.1.2. Total shoots dry matter accumulation (TDW)

Results of variance analysis shows the effect of acid on dry matter accumulation of total Humic in different periods of significant growth at 5% has. This shows that the consumption of the kind Humic acid organic fertilizer

rich in carbon and increased leaf dry matter has increased LAI and increased absorption of radiation in order to increase photosynthesis and plant growth and ultimately improve the material increases dry has.

Fig5. Effect treatment on TDW

Results Comparison table shows the consumption of acid varieties humic significant effect on total plant dry matter accumulation has. So that the highest total dry weight of the acid treatment Humic full macro level was 5909 kg per hectare and the lowest rate to the control was 4332 kg per hectare. The process of dry matter accumulation totally dependent on leaf area index has expanded to include other phenomena, or any positive or negative effects of treatments on leaf area index components to put together TDW gives affected (Saki nejad, 2010)

The effect of variety on dry matter accumulation was significant and the most and the least performance figures associated with the numeric value Jazayeri 5543 kg ha blessed with a figure of 5260 kg ha dry matter respectively.

3.1.3. Dry matter accumulation of leaves (LDW)

Results of variance analysis shows the effect of acid on leaf dry weight Humic significant effect on levels of 5% is shown. In this experiment according to the diagram (6, 7) the highest leaf dry weight to humic acid treatment and the amount of macro elements 898.5 kg per hectare and the lowest rate to control treatment 644.9 kg per hectare was. Increasing the amount of leaf dry weight in this treatment could be due to increased LAI and increased photosynthesis and vegetative growth period in its result is the macro elements, nitrogen is available, the increase in leaf dry weight has been treated.

Bean plants Foliar spray materials humic nightingales' eye on vegetative growth of treated leaves showed no significant increase was LAI (15).

Fig6. Effect treatment on LDW

Humic by increasing nitrogen content, plant dry weight increase and leaf area is.

Increasing acid humic increase in nitrogen content and dry matter accumulation in the growth is. In the pilot was on acid humic oat dry weight was increased (3, 9). Experimental acid sprayed humic increase in wheat shoot dry weight was. These results are consistent with the results of these researchers (14).

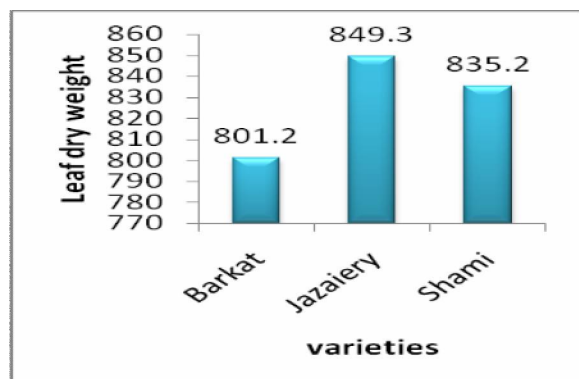

Fig7. LDW in cultivars

Analysis of variance showed that the effect of cultivar on leaf dry weight at 5% level was significant and the highest leaf dry weight to figure the amount of islands 849.3 kg per hectare and the minimum to figure Blessing rate of 801.2 kg per hectare respectively.

Greater amount of leaf dry weight in islands can figure because of genetic factors, including high fertilizer absorption properties (absorption of nitrogen) and the potential to produce more leaves than other varieties and character compatible with the environment is Khuzestan.

3.1.4. Dry matter accumulation of Stem

Analysis of variance humic acid effect on stem dry weight at 5% level is significant. Chart (8, 9 and 10) on shoot dry weight of most acid-related macro humic

numerical average 1798 kg per hectare and the lowest rate of 1471 kg per hectare to control treatment.

Urinary cultivar also shoot dry weight at 1% level was significant. Highest stem dry weight to number average number Jazayeri 1745 kg per hectare and the lowest figure blessing to the numerical average was 1617 kg per hectare. It can be inferred that due to the nitrogen in acid Humic enriched with macro elements that make more vegetative growth period and increase the number and height of secondary stems may be related. Most of the average shoots dry weight in the genetic characteristics of plant varieties to the islands, including the number of secondary stems and flexibility or adaptability of this cultivar is associated with the testing environment.

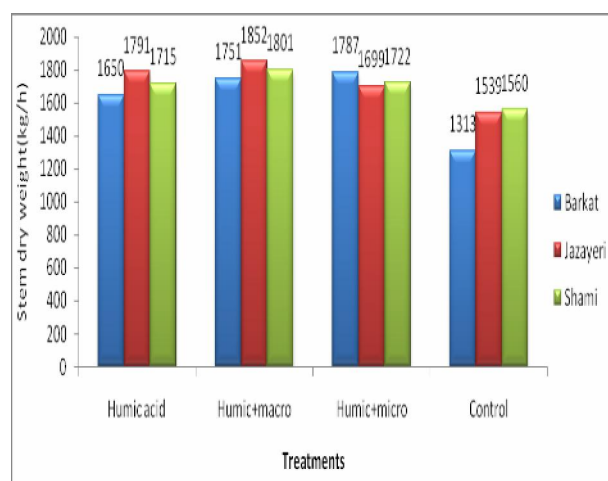

Fig8. Effect treatment on dry matter accumulation of Stem in cultivars

Acid and acid Humic Folic stem growth in plants stimulates different. Seeds treated humic acid solution 38% increase in stem dry weight demonstrated (21, 25).

Fig9. Effect treatment on dry matter accumulation of Stem

Increased stem dry weight can be due to an increase in plant height, he said. Humic acid increased with increasing enzyme activity robisco photosynthetic activity and thus plant growth is in (27).

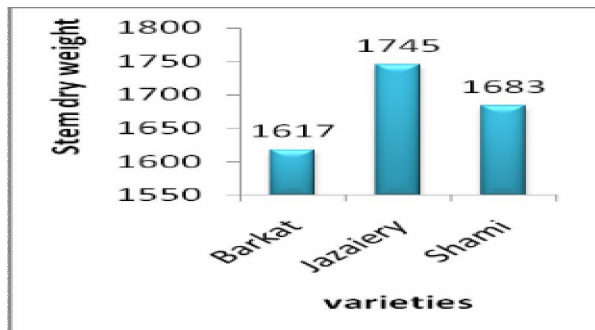

Fig10. Dry matter accumulation of Stem in cultivars

3.2. Calculate the growth dynamics of root

3.2.1. Dry matter accumulation of root

According to variance analysis table and figure humic acid effect on root dry weight, respectively, at 1% and 5% were significant. Comparison of treatments given, the highest root dry weight to macro Humic acid treatment with a mean 4.22 grams of control treatment and lowest with mean 2.63 has been hot.

Increased weight and volume and number of secondary roots Humic by acid can be a good indicator of the environment by limiting resources, plant and considered generally can be said that increasing the acid concentration Humic root biomass will increase significantly.

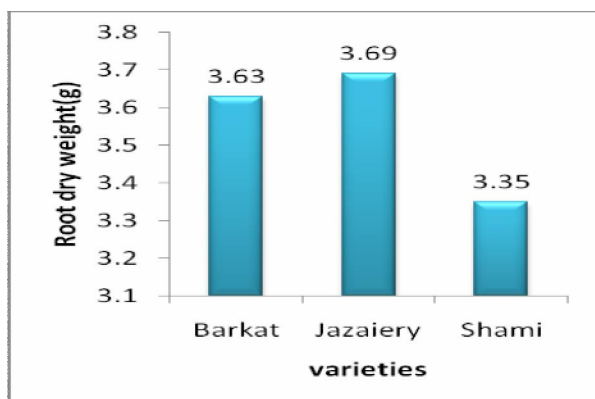

Fig11. dry matter accumulation of root in cultivars

Comparison between the average root weight highest figures related to the islands and the lowest figure to figure, respectively dinner averages 3.69 and 3.53 was hot. Also worth noting is that the average weight figure blessing roots have been significant.

Findings with the results of many investigators regarding the effect of acid on root growth Humic match.

Effect of Acid on Plant Humic Bent Grass Humic specifically found that the concentration of acid 400 mg significantly assimilation rate and root weight increase.

During the trial on wheat Humic acid levels 54 mg, 50% increase in length and 22% increase in dry matter to roots along.

Nitrogen uptake in the presence of acid Humic showed significant increase. Consumption humic acid solution or powder form in the soil increased root length and weight of carrots and whole plant growth were increased (15).

3.2.2. Number of root

The results of variance analysis table used humic acid types and the number of varieties of plant rootlet Bean significant effects at 5% level is. Humic acid increases the numbers of secondary roots are. The highest and lowest average number of lateral roots in this experiment in order Humic acid treatments and control macro level 241.7 and 136 numbers were obtained.

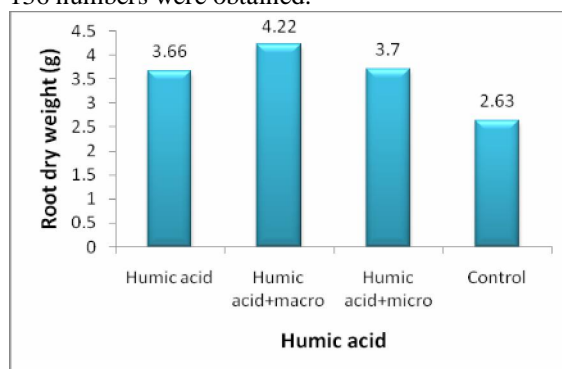

Fig12. Effect treatment on dry matter accumulation of root

Note that between the number of acid root treatment and between macro and micro humic acid and acid micro Humic significant difference was found. Foliar application materials Humic significantly antioxidant concentration in leaves increased and enhanced photosynthesis, respiration, nucleic acid synthesis and ion uptake and root growth is (23).

Treatment compared to the number of digits rootlet, to the highest and lowest average figures Chipset about the amount of islands and dinner 214.8 and 200.5 is the root number. But between the average number of secondary roots and dinner blessing figures differ significantly in terms of comparing test average there.

Most rooted in the interaction cultivar and cultivar Humic acid in acid Jazayeri Humic macro numerical value 254.3 the number of roots and the lowest figure in the control treatment mean blessing 7.126 numerical number allocated to the roots is.

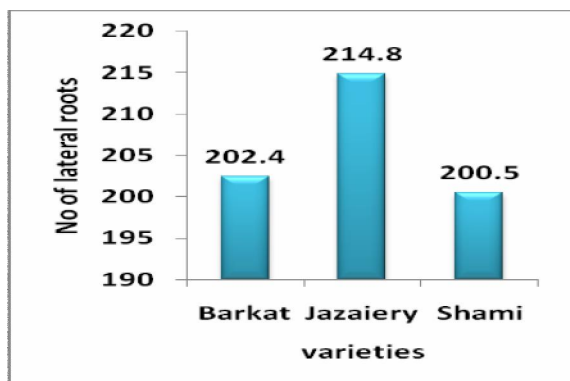

Fig13.No. root in cultivars

Research on the effect of acid on the elemental composition humic roots in bean plants was studied. The results showed that acid respectively humic significant increase in root dry weight of bean plants to the amount of 30.1% and 56.6% found. Also Humic acid increases sodium and potassium content of the roots, but significant effect of calcium and iron, and no significant decrease in copper, manganese and zinc contents were. (27). Foliar application materials Humic significantly antioxidant concentration in leaves increased and enhanced photosynthesis, respiration, synthesis of nucleic acids and ions were absorbed (11).

Fig15. Effect treatment on root volume

Effect of variety on the root volume is significant and the most and the least volume, respectively, to figure the volume of 10 islands and having dinner with volume number 9.25 is CC.

Based on comparisons with related tables mean the most to root volume and acid varieties Jazayeri Humic macro numerical value and the minimum to 12 digits in the control treatment having dinner with the numeric value is 7 cc.

Fig14. Effect treatment on No. root

3.2.3. Root volume

Results of variance analysis table shows the interaction of acid and acid Humic and varieties at 5% on increased volume of work has roots. Average based on comparisons with related tables to the highest volume of acid treatment Humic 11.22 macro numerical value to control treatment and lowest average number 2.63 cc respectively.

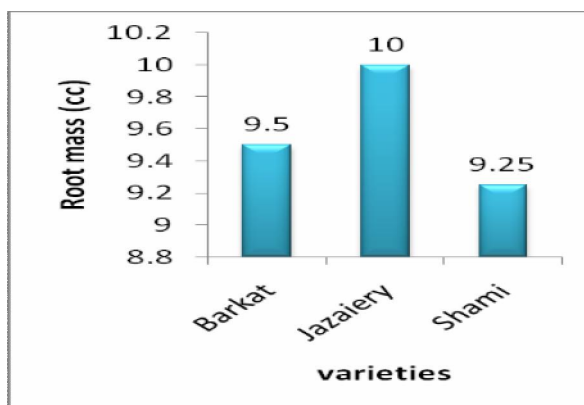

Fig16. Root volume in treatment

Size-dependent root is the root number. Because macro humic acid cultivar islands could not increase the number of roots after root large amount of time is allocated to.

Humic acid increases the numbers of lateral roots are in broad bean plants. the pilot plant showed that Bent Grass Humic acid concentration of 400 mg, root dry weight significantly increased the enzyme activity from 23% to 100%, which increased its increased root respiration and growth factors that were more. Researchers Humic material effect on the development of plant root systems of grasses and found Bennett Humic acid significantly in root dry weight of plants Bent Grass 1.5 g

control treatment to 2.5 g treatment increased with acid Humic was(4, 12)

4. Discussion

Review process of dry matter accumulation, leaf area index and net photosynthesis

Dry matter accumulation patterns in most grains are sigmoid-type curve. In the first stage of this model is that if growth is slow, then there is a rapid phase after the flowering stage is followed by growth that is in pod formation stage. Studies have shown that leaf area development and dry matter accumulation in most cereal grains, especially cold for a long period after transplantation is very slow (22).

A positive relationship was between total dry weight of aerial plant and grain yield there. However, the maximum total production of dry matter does not necessarily yield the most direct relationship with no. Route because the formation of biological function (TDM) and economic performance (dry seeds) are different. Maximum of dry bean yield in the physiological maturity stage is achieved. After this step, the total dry matter yield 10 to 20 percent and it decreases due to the shadow set of leaves, this transfer of nutrients to the roots and secrete various substances from roots to soil. According to comments bean LAI were 3.5 to 4 vary (8).

Effect of drought stress on stomata resistance changes in corn

Tayeb Saki Nejad

Assistant Professor Department of Agronomy Physiology, Islamic Azad University, Ahvaz branch
Corresponding Arthur: saki1971@iauahvaz.ac.ir*

Abstract: To evaluate the effects of drought stress in different periods growth stomata behavior, research using factorial experiment design, randomized complete block with four replications and two factors with four levels of water stress as the first factor and three levels of growth periods As the second factor in the three crop years (1999-2000 & 2000-2001 and 2001-2002) the Islamic Azad University Research Station at 3 km south of Ahwaz, Ahwaz city was designed and executed. Analysis of variance at 1% showed in all three years of water stress treatment, periods of growth and interaction of these two stomata resistance and lower leaf surface supernatant separately showed significant effect. by applying different levels of water stress, stomata resistance and lower leaf surface increased supernatant Duncan test was at 5% level in three years of the three groups presented mean that treatment (severe water stress treatment) and the highest treatment (control, no water stress) the lowest stomata resistance showed. Duncan test at 5% level one to two average growth for the period presented the highest stomata resistance in all three years and the treatments were obtained and lowest stomata resistance was observed in treatment. Duncan test at 5% level interactions show treatments with treatments that apply the lowest stomata resistance values were the other words in the early stages of plant growth when water is enough to provide resistance, stomata express that little but more severe stress in the course of Growth stomata resistance was .increased considerably, the underside of leaf stomata resistance levels much higher than the leaf supernatant [Tayeb Saki Nejad, Effect of drought stress on stomata resistance changes in corn. Journal of American Science 2011;7(6):27-31]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: corn, stomata resistance, drought stress

1. Introduction

Regulation of osmotic pressure, ions entering K^+ , increased Considerably finds that this increases the potential for pressure cells, particularly cells such protective stomata than cells around them and opening holes the search is, although under non-stress, entering the water, transport of ions K^+ into cells protection and stimulation causes stomata opening is. (14)

vegetative growth stage, on corn and sorghum low water potential could be in the leaf which in light are located, the openings to close, but close as complete is not conducted and resistance openings in bar 20 - = ten seconds cm was calculated, the reproductive stage, resistance to pore leaves in maize and sorghum with fluctuations water potential did not change, the openings in the reproductive stage to water stress, showed no sensitivity in maize stomata closure in bar 8 - = was starting. Stomata opening and closing of water stress, 15 to 20 minutes Smokes, compared to the effect of CO_2 concentration on stomata opening and closing, which is very fast and nearly 2.5 to 5 minutes, the time allocated to longer does. (19)

General hypotheses stomata opening and closing by different researchers has reported as follows:

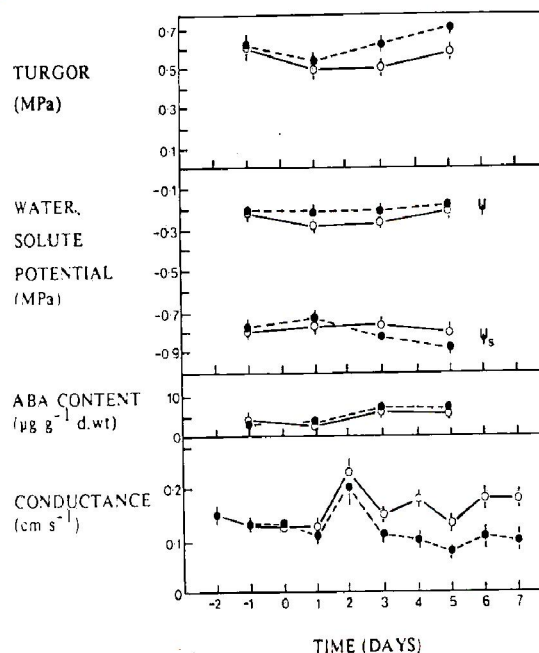

Figure 1: Changes in water potential, stomata conductance and ABA concentration of corn leaves in water available (0) and no water available (*) (15)

1 - Hypothesis converts starch to sugar in photosynthesis and accumulation of carbohydrates, causing water entry to openings that this phenomenon is the disappearance of starch and increase in the first hours of the day happens (Mansfield and Jones 1971)

2 - Active proton transport hypothesis, increasing the ion K +, causing the water entering the guard cells and open cells is (Fisher 1968, 1969 Sleet, Mac Liam 1965

3 - Proton transfer hypothesis (Van Kirk and Rashke 1978)

Stomata opening and closing the water affected if this expression that the synthesis of ABA prevents absorption of + K and H + release was followed by packing the holes are getting. Water deficit, ABA stimulates the synthesis and stomata closure is exacerbated (Figure 1).

the opening and closing holes on the effect of drought stress before flowering period, compared to other periods of corn growth was more complete and because of water shortage in this period, the CO2 entering for photosynthesis greatly reduced. (16)

Aperture size and number of plant species in very different and variable declared and measured the number of openings in the supernatant and lower levels in leaves of different plants, no significant difference demonstrated. (22)

2. Material and Method

2.1. Design model

Research was performed in Islamic Azad University research farm in southwest and 3 kilometers away from the city of Ahwaz factorial experiment in randomized complete block design. Research projects in the form of factorial experiment with the basic design with two randomized complete block with four replications factor and mathematical model was performed following a three-year basis;

$$X_{ijk} = \mu + \delta_i + \delta_j + \delta_k + \delta_{jk} + \epsilon_{ijk}$$

In this model, each view X_{ijk} value, the average population, the effect of first factor, the effect of the second factor, the effect of blocks, Interaction first and second factor and the effect of experimental error is. Because the use of a factorial

Experiment to prevent mixing of (soil × irrigation) and complete separation from the plot, to prevent water penetration to the adjacent plots and also the importance of the same first factor and the second is (Table 1).

Table 1: Review of different treatments tested

Main plot: Drought stress Levels	Sub-plots: Different growth phases
I₀ : Full irrigation point of FC, control, without water stress	S ₀ : growing phase, the establishment of the plant stem to the emergence
I₁ : 75% of the amount of irrigation treatments I₀, mild stress	S ₁ : natal phase: to stem the rise of coffee being resilient and end silk pollination
I₂ : 50% of the amount of irrigation treatments I₀, severe stress	S ₂ : grain filling phase: the end of pollen grain maturity and the emergence of black layer
I₃ : 25% of the amount of irrigation treatment I₀, very severe stress and point of PWP	-

2.2. Stomata resistance

Stomata resistance measurements as recorded in the field was conducted by device Prometer lower and upper levels of the three parts of each leaf base, middle and top leaf stomata resistance was measured

3. Result

Analysis of variance at 1% showed that the three years of water stress treatment, periods of growth and interaction of these two stomata resistance and lower leaf surface supernatant separately showed significant effects .

Fig2: Effect of drought stress on stomata resistance value (S / cm) of leaf area in 3 years

Applying different levels of water stress, stomata resistance and lower leaf surface increased supernatant and Duncan test at 5% in each experiment, three groups

of three years provided that the average treatment (severe water stress treatment) and the highest treatment (control, without water stress) the lowest stomata resistance showed. Duncan test at 5% level one to two average growth for the period presented the highest stomata resistance in all 3 years and the treatments were obtained and lowest stomata resistance was observed in treatment .

Fig3: Effect of drought stress on stomata resistance value (S/cm) in 3 years leaves behind the experiment.

Duncan test at 5% level interactions showed that treatment with low doses applied treatments stomata resistance had the other words in the early stages of plant growth when enough water is available, stomata resistance from its incidence was slightly But imposing severe stress during growth and stomata resistance was increased considerably, the underside of leaf stomata resistance levels much higher than the leaf supernatant .

Plants during vegetative behaviors such as being tube leaves, stomata resistance than the other courses was less a result, any stress modulates the incoming water could not be done.

Growing plant root system had not found a perfect result and limit the spread radius of the water absorption was very low, but the osmotic pressure regulating growth stages and appeared fully supported in terms of water supply for root shoots increased physiological behaviors such as percentage of the tube to increase leaf stomata resistance decreases in the intensity of stress was imposed, leaves and leaf water potential than the end of the primary leaves showed severe reduction of leaf relative humidity by applying different levels of water stress decreased leaf lowest percent relative humidity treatments and 75 percent were compared to control treatment, water stress decreased approximately 20 percent(21).

Stomata resistance in the supernatant and the back surface of leaves with increased drought stress, which leaves behind the increase in stomata resistance, was higher than the leaf. Stomata resistance during growth in the supernatant and lower leaf surfaces were much less than the periods of growth and the opinion

Hambl (1995) at the beginning of growth in terms of stomata physiology are the result of evolution without much resistance to water stress did not show, but with age and evolution of plant stomata guard cells, stomata resistance increased.

Stomata resistance in a combined analysis of variance and lower surfaces of leaves high in the three years of treatment effects, treatment year, in water stress, and periods of growth in the two year interactions were significant.

Fig4: the amount of stomata resistance (S / cm) on front and back of leaves in different periods of growth in three years

4- Discussion

With decreasing soil water potential, root and leaf water potential also decreased, soil water potential decreased in a constant process of different levels of water stress treatments showed root and leaf water potential against the resistance showed a decreasing trend of constant, although soil water potential decreased leaf water potential and root resistance to water stress treatments showed significant but become more severe water stress than leaf water potential root water potential, decreased more in the roots of resistance against soil water potential decreased more than shoot the especially the leaves(14),

The root can be adjusted decisive role for its effects on stress and actually gets created is the first

organ that will be exposed to drought and can regulate their osmotic pressure to perform, he also believes that its root in some water. Because the store and saves water and proximity to sources of water that changes in soil water potential is less than shoot and shoot in the most severe environmental changes are subject to the severe water stress (0.8 MPa) in the root resistance the potential loss of water ended and root water potential was significantly reduced (point 1.8 MPa) the doors yen Point plant became fully wilt mode, re-injecting water and soil water potential in roots and leaves showed some increase. Plants wilt at this point not depending on external conditions were the permanent wilting point, were the result(13).

Most sensitive period of vegetative growth period was in corn, i.e. before the appearance of the double ring following reasons high resistance against drought could rise to self:

A- Set of osmotic pressure in other words, this period was observed with decreasing leaf osmotic potential, relative humidity decreased rapidly in plants result of a severe drought occurred.

B- plants during the vegetative practices, such as pipes to leaf stomata resistance than the other courses was less the result of any stress modulates the incoming water could not be done(4, 11 and 19).

A growing plant root system had not found a perfect result and limit the spread radius of the water absorption was very low, but the osmotic pressure regulating growth stages and appeared completely in terms of root support for water supply increased the shoot physiological behaviors such as percentage leaves to tubes and increased stomata resistance could regulate the intensity of stress was incurred, leaf water potential than leaves at the end leaves showed severe reduction of early relative humidity leaves with different levels of applied water stress decreased leaf lowest percent relative humidity treatments and 75 percent respectively compared to control treatment, water stress decreased approximately 20 percent. Stomata resistance in the supernatant and the back surface of leaves with increased drought stress, which leaves behind the increase in stomata resistance, was higher than the leaf. Stomata resistance during growth in the supernatant and lower leaf surfaces were much less than the periods of growth and the beginning of stomata development in terms of evolution have thus physiology little resistance to water stress did not show, but with age and evolution of plant stomata guard cells, stomata resistance increased(14, 18).

Abstract: In order to effect hormone gibberellins acid on properties such as bean plants Morphophysiology: internodes' length and stem number, plant height, leaf growth dynamics and crop growth rate research as a factorial experiment in randomized complete block design with three replications in crop year 2010 Farm Research HASHEMI located in the city HAMIDIEH province was conducted, first factor hormone gibberellins acid on four levels, respectively, treated (d₀) control (no hormone gibberellins acid) treatments and d₃, d₂, d₁, respectively, 5, 50 and 250 ppm and the second factor included three plant growth periods: (vegetative phase= s₀, Flowering phase = s₁ and pod set phase = s₂) for the hormone gibberellins spray on beans were considered. Dose 50ppm hormone gibberellins acid, more leaf area index (*LAI*) with 1.98 in comparison with other surfaces have been in the treatment group a was used Hormone gibberellins acid applied best courses in the vegetative period before flowering leaf dry weight, 752.2 kg/ha been in a treatment group were. And the flowering period to Pod set treated with 678.3 kg/ha-level statistical treatment Pod set b to aggregation with 666.6 kg/ha c level was statistically. Dose of the hormone gibberellins acid maximum height of internodes 4.07 inches compared to other hormone levels have been in statistical was. Other doses differ quite significantly with this level did not have the lower levels were. The results showed that the hormone gibberellins acid increased crop growth rate to 35 percent in d₃ = 20.15 g/m²/day treatment than control treatment was d₀ = 14.5 g/m²/day. Hormone gibberellins acid effects on bean plant stem internodes' distances showed that on average 2.2 inches were added to the internodes' length. Especially the increase in the lower internodes bean plant stems were most evident in the treated internodes' d₂S₀ height d₀S₀ than the control treatment was significant. [Somaye ghalandari, Tayeb Saki Nejad, Shahram Lack. Effect of GA₃ hormones on growth dynamics of Bean. Journal of American Science 2011;7(6):32-39]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: GA₃, Growth dynamics, Bean

1. Introduction

Like auxin hormone, the GA also to approximate all the physiological processes of growth and reproduction of plants are well controlled. The most obvious effect of increased gibberellins plant growth through the long distance between the nodes makes their stems (4).

This effect is normally associated with temporal pallor normally leaves the host after about 10 days are normally on. a special case of the effect of gibberellins in the plant can be Cocker (Cocker, such as types of corn, beans, peas and ornamental plants) which causes hereditary gibberellins production without sufficient power are observed(6).

Sprinkle gibberellins solution on the shoot elongation and stem caused plants to natural plant height is. Because small amounts of gibberellins (about one thousand micrograms per liter) to do it just a number Biological testing of the most important ways to encourage the growth of gibberellins based on long stems Cocker plant is built. gibberellins can be many two-year plants (without stems), which requires cold for flowering are, without seeing the cold, forced to

produce flowering stems to. how do the stem end so that the gibberellins have one hand into a cell to be intensified and the other hand, each of the cells are too large and thus the stem grows and Plant flowers sits (2).

Hormone gibberellins acid on shoot growth

Hardtke, C. (2003) Expression of gibberellins on rice shoot hormone gibberellins acid had a long shoot growth which caused a substantial impact on internodes distance is an effective host.

El- Dengawy,(2005) with effect levels and timing of application of gibberellins acid on growth and product components with conventional spraying beans hormone gibberellins acid concentrations 2.5, 5 and 7.5 mg gibberellins hormones in times of 7 and 14 and 28 days after planting the beans whole plant had a normal expression of gibberellins hormones increased the shoot length was bean plant.

Long (1965) Physiology of flowering plants in Hanna said that being taller Gibberellins acid causes stem and produce flowers in many flowering plants are long days.

Davies et al. (2002) Gibberellins on Flowering in review Hana reported that gibberellins induction of flowering by long days either in plants to both short-day plant rejections with a significant rise is shoot.

experiment with the application of three concentrations of the hormone gibberellins acid on plant beans, regular doses of 2.5, 5 and 7.5 mg at intervals of 7 and 14 and 28 days after germination beans regular stated that plant height in different times of application, had significantly increased levels of response to hormone gibberellins was linear(6).

Dolan L and Davies, J. (2004) Effect of hormone gibberellins acid on the size and height of shoot meristem capitates spike differentiation stages in the two rice varieties, the concentration of 50 ppm in two stages, early differentiation and late spike to spike differentiation control without gibberellins acid intake was concluded that other varieties of gibberellins in the early stages of differentiation was used to spike the number of side branches and Griffins 65.5 and 48.1 percent rate increased, but the application of gibberellins acid in the secondary or late stage adverse distinction spike numbers, Griffins 36.2 and 43.4 percent rate was reduced. but the other varieties used in the same amount of hormone gibberellins acid in early stage of differentiation than control spike increase in the number of fertile and strong side branches and spikelet spike rate was 92.3 and 72.7 percent, but the application of gibberellins acid late in the second stage of differentiation or a reduction in the number of spike branches and lateral spikelet's per spike were observed.

Effect of gibberellins acid on the size and height of the shoot meristem capitates spike differentiation stages in the two rice varieties, the concentration of 50 ppm gibberellins acid observed that the longitudinal growth of the shoot meristem capital due to cell elongation cell division and developed, in which both varieties of rice due to increase in height of stem cells for stem diameter was increased so the number of side branches that were correlated with stem diameter were also high(11).

Effect of application of the hormone gibberellins acid on shoot said that the Arabidopsis plant hormones have an important role in the development so that the spraying gibberellins on shoot growth and shoot high value also went up gibberellins in roots and primary root growth increased said(4).

in a study examining the effect of auxin and gibberellins acid soybean plants used and the height was missing was the performance down, they concluded that the application of gibberellins concentration 50 mg in the vegetative stage to spray soybean leaves, increased internodes length and stem thickness of the primary shoot and shoot and thus increase total dry matter is increasing (13).

during the three stages before the first leaves produced before the emergence of second leaf and the internodes is 30 days after each was 0.5 cm and the leaves were fully emerged, the hormone gibberellins acid was sprayed on leaves and observed that the number of stem nodes, number of branches and height of branches had increased(7).

2. Material and Method

This test Crop year 2010 on the farm located in the village of Sayed Hossein HASHEMI Hamidieh city was conducted.

Place testing semi arid dry climates and low temperatures are 4 - and the highest degree of temperature 51.8° C, average annual temperature in the station 23.9 ° C has been reported.

The statistical test of the factorial design are equally important in terms of factors examined in a randomized complete block design with three replications was.

D: Different concentrations of the hormone gibberellins acid.

S: Bean plant growth in different periods.

(d0 =No hormones, , d1 = 5ppm and d2 = 50ppm and d3 = 250ppm (and the second factor for three phase bean plant growth hormone gibberellins acid spraying include: (s0 =vegetative phase, s1 = flowering phase and s2 =phase Pod set)

2.1. Analysis of plant growth and seed

To review the growth and dry matter accumulation bean plants were sampled action. Sampled from all plots to 15 days away from each other during the eighth stage was performed. Three lines for the sample was determined after removal of the top 50 cm Down each line as sidelines, three plants randomly taken from each plot and the plastic bag with a label to each plot and samples were transported to the laboratory and measured the following took place on them:

2.2. LAI measurements

Determine LAI weight method was used. In this way, using standard paper (A4), which is a specific area, was used in this way that it leaves the paper had been drawn and shape, then shaped leaves that had been drawn in the oven with a temperature of 70 machine degrees Celsius for 24 hours and dry weight placed them came to be and making a fit according to standard weight paper and dry leaves of all plants sampled amount of area harvested leaves from the field in general and specific indicators leaf stage in the sample were determined.

Fig1. Hormone spray in field

Fig2. Different stages of plant growth in field

2.3. Process of determining dry matter accumulation in different plant organs (leaves, stems, seeds)

Measuring dry matter accumulation process in each of the different organs in each bean plant sampling was done first, after the separation of different plant organs in the laboratory, the device with the oven temperature 75 ° C for 48 hours of was that they were set to dry. SAS computer program components by increasing LAR, CGR, RGR, NAR, LWR, and SLA were calculated.

3. Result

3.1. Leaf Growth Dynamics (LAI)

Applying different doses of the hormone gibberellins acid on leaf area index of plant beans in 1 percent was significant. But applying hormone during different growth in any of the periods of growth of there was not significant. Interactions between hormone gibberellins acid in different doses and periods at 1 percent of growth were significantly different.

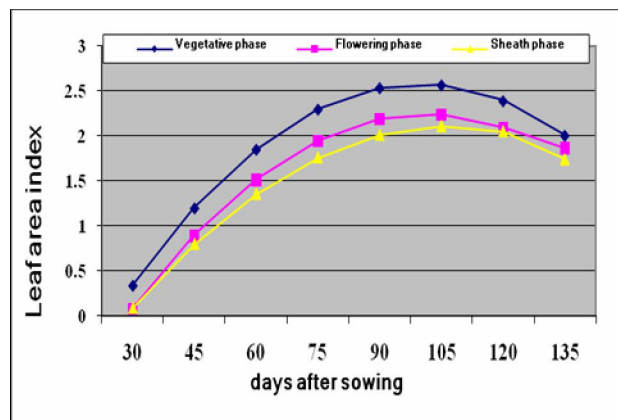

Fig3. LAI changes at different stages of growth

Dose 50ppm hormone gibberellins acid, more leaf area with 1.98 in comparison with other surfaces have been in the treatment group a was used, dosages longer much different from its impact on leaf area did not show in statistics b were.

Period, the highest growth period before flowering leaf area in comparison with other periods of growth and having 1.90 were in a statistical and other courses, flowering period to Pod set respectively 1.59 and 1.51 in the treatment group was b.

Mean comparisons with related table interaction Gibberellins acid and various periods of growth than all treatments and control have increased the concentration of 50 ppm respectively in the period before flowering and vegetative concentration of 5 ppm in the same period of highest LAI their shown in the treatment group a were, and the interaction of

gibberellins and Volume growth for the treatments of 250 ppm and control in the ranks next placed so that control treatment lowest leaf area with 1.47 and 1.36 and 1.43 ranked(Fig3).

Can be concluded that if the hormones in the vegetative period be imposed because of better plant was still young and can be influenced by the environment to be exposed, and the leaves grow more and produce more dry matter to be followed and that the higher dose The performance of the same amount of hormones is not above said high concentrations can cause hormone gibberellins acid on the growth mode is a deterrent.

the list et al stated that providing a larger leaf surface exposed to sunlight led to a fixed building dioxide uptake More carbon is, inversely, plants with lower leaf area index, carbon dioxide are less stabilized and increased leaf area can be, can stabilize carbon dioxide in the plant increased, the hormone acts in the vegetative period This positive result can be achieved (8, 5 & 11).

The effect of different doses of hormones gibberellins acid 50 ppm dose than other doses in the higher level and actually had a higher level of bean leaf in the plant is established, other doses at lower levels and control without hormone lowest LAI had the trend. (Fig4).

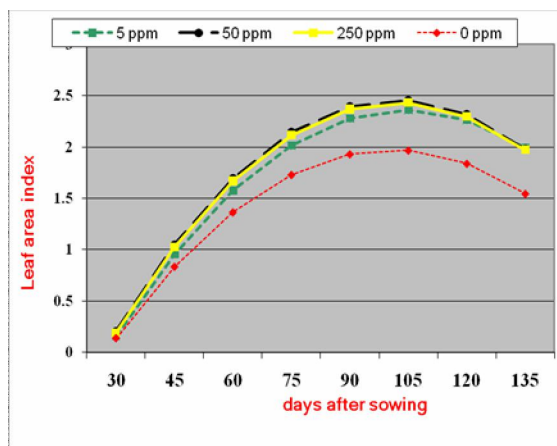

Fig4. Effect GA₃ Hormone on LAI changes

In examining the time course of growth hormone actions, vegetative growth period before flowering had the highest LAI process and during the flowering period Pod set lower level and has been in the last level.

3.2. Leaf dry weight

Leaves the factory plants are making food, whatever leaves more power plant construction will also generate high and significant impact on

performance will rise. Gibberellins acid application according to the role that cell development is the increasing role can is crucial (10).

Applying different doses of gibberellins acid on shoot dry weight in a percentage was significant..

Hormone gibberellins on different periods of growth in a significant percentage were in the interaction of hormone and duration of different developmental levels also was a significant percent.

The dose of hormone gibberellins acid on leaf dry weight concentration of 50 ppm bean leaf dry weight with 813 kg per hectare compared to other hormone levels have been in a treatment group were. A dose of 250 ppm with 750.2 kg per hectare in other doses was statistically b level c were statistically.

Hormone gibberellins acid applied best courses in the vegetative period before flowering leaf dry weight, 750.2 kg/ha been in a treatment group were. And the flowering period to Pod set treated with 678.3 kg ha-level statistical treatment Pod set b to aggregation with 666.6 kg/ha c level was statistically.

In examining the interaction hormone and growth period treatment of the hormone in the phase of eruption had received the highest amount of dry weight were treatment and the hormone gibberellins in the concentration of 50 ppm in the growth period before flowering were received with 958 kg ha In the rest of the group was a statistical interaction between the levels were lower.

Any leaves are younger and more recent actions on the hormone more effective would be the leaf during the vegetative growth hormone has received more time for growth and response to hormones and growth and development will be more.

With the above results that express hormone gibberellins acid in leaf growth and leaf development and thus its final dry weight is involved, was consistent(3).

3.3. Shoot dry weight

Bean plant stems strong and stout, smooth (glabrous) and full leaf height is 180-30 cm (4). Any power that is stronger stems will increase its maintenance. Strength stems should be so well able to keep the pods; the hormone gibberellins in these cases had positive effects on the stem (2).

Different doses of hormones gibberellins acid and time of application actions and interactions in hormone levels were a significant percent.

In between doses of 5 and 50 and 250 ppm difference very noticeably been observed but the dose of 50 ppm with 1724 kg per hectare than other hormones level were concentrations of 5 and 250 ppm respectively in 1600 and 1623 kg b Statistical acres located on the surface were treated with control 1490 kg ha shoot dry weight in Table 4-9 were statistically c.

In various periods of growth that gibberellins acid treatment at the time of eruption before flowering in the treated group had found a weight was 1627 kg ha. And flowering periods of growth and Pod set respectively in 1606 and 1522, respectively, in b and c were statistically.

The interaction of growth hormone gibberellins and vegetative period before flowering and stem dry weight most control treatment having the lowest shoot dry weight was. So that a concentration of 50 ppm gibberellins Hormones during vegetative growth before flowering with 1693 kg ha has the highest shoot dry weight. And the other treatments were next in ranking.

Younger stems much of the hormone acts on it would be more, because growth is still not complete, the most effective dose given was 50 ppm, then we can say: because the dose of 250 ppm is more work than most 50 ppm no deterrence because hormone concentrations are high.

3.4. Morphological characteristics of plant

3.4.1. High plant

Different doses of the hormone gibberellins acid on plant height in a bean is a significant percentage of time the hormone acts on the surface of a bean plant height percentage has a significant interaction of hormone levels during exercise is a significant percentage.

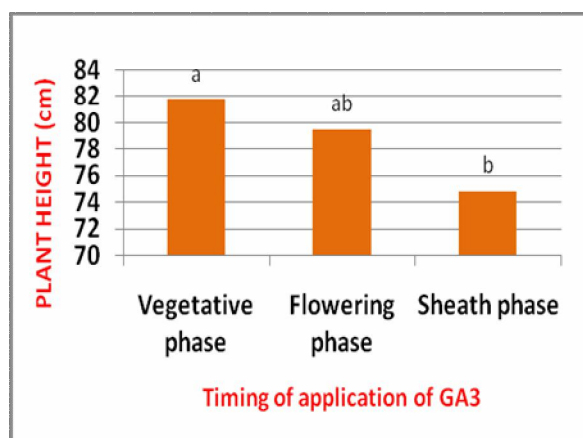

Fig5. High plant at different stages of growth

Dose hormone gibberellins acid 50 ppm maximum 85.56 cm plant height compared to other hormone levels have been in a treatment group and the doses were again placed in the next rank and control the height of the 71.23 cm All lower level d were statistically.

In between periods of growth there was no significant difference but a significant growth period

before flowering greatest height 81.72 cm was located in a statistical exercise and other times were lower in rank.

In examining the interaction term growth hormone and stem height above the vegetative growth period was such that concentrations of 50 ppm cm 46/91 vegetative period before flowering stems have the highest elevation and the elevation control or due to actions Not all hormones were lower (Fig5)

Hormone gibberellins acid hormone that is involved in cell division, the young stems than the high quality of these hormones are also concentrations of 50 ppm to 250 ppm might be more effective deterrent because high concentrations of hormone.

Daykin, Scott, Francis and Causation, 1997), Stewart (1977), Al-Khsswneh, Karam and R.A.Shibli. (2006) believed that which were generally Gibberellins acid impress with cellular processes, including stimulating cell division and cell elongation growth is increasing. Gibberellins role in increasing cell distension through its effect on the osmotic concentration of cell sap is, the somehow stimulate the enzyme activity by causing parser starch hydrolysis of starch can be accumulated by cells that ultimately cause the cells are osmotic potential. Negative intracellular osmotic potential on water exchange within and outside the cell and ultimately affect cells following the water absorption and stretching are suffering from dilated, Gibberellins acid also significantly increased cell wall is opened. This increase may be due to acidification of cell walls and thus absorption of calcium ions into the cytoplasm is, was consistent.

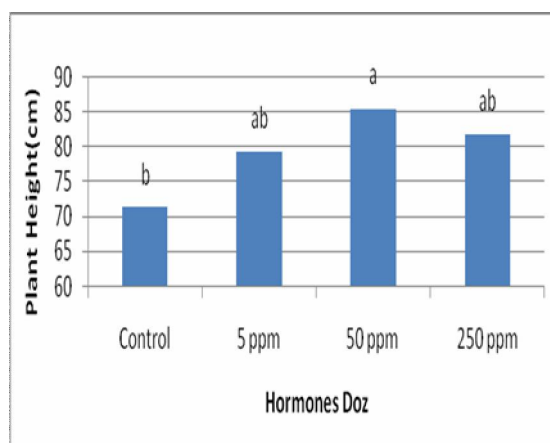

Fig6. Effect GA₃ Hormone on High plant

3.4.2. Number of nodes

Node number of morphological factors is less affected by environmental factors placed. This attribute is located less controversial, but studies done in the way

when you can sub in numbers and performance is somewhat effective

Fig7. Interaction GA3 & different stages of growth On node high plant

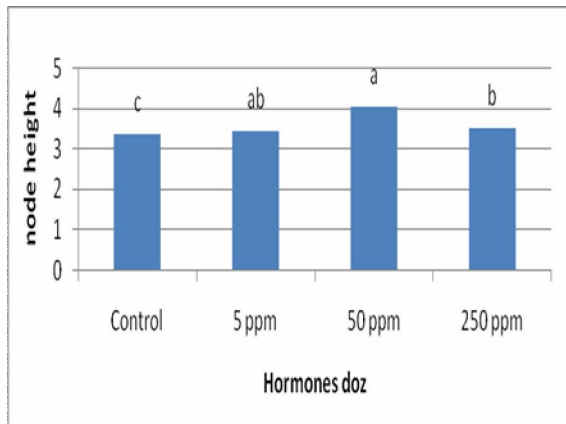

Fig8. Effect GA₃ Hormone on node High plant

Fig9. Node High plant at different stages of growth

Dose hormone gibberellins acid level is a significant percentage. Hormone gibberellins acid applied at different growth periods as a percentage level is significant. Interaction between different doses and periods of growth hormone level is a significant percentage Interaction hormone gibberellins acid on the number of nodes at a percentage level is significant.

Different hormones in different doses did not completely clear, but a dose of 50 ppm with number 25.89 knots were in a statistical group and the control treatment having the least number of nodes and other concentrations were located between the two doses.

Vegetative period before flowering with 25.28 count the number of nodes than most other developmental courses ranked in the treated group was a fact. Other periods of growth were the next in rank.

Interactions of gibberellins acid on growth Vdvrh vegetative growth before flowering period with 50 ppm concentration has the highest number of nodes compared to other treatments and was in a treatment group and other treatments in rank and were statistically lower.

Morphological trait is the number of nodes, hormone dose 50 ppm in the most effective growth Period before flowering has had on the number of nodes, perhaps because of this characteristic of the environment takes less tangible changes have been too. With the above results and Saeed Abdul (1997) stated that GA is effective on the trait was consistent number of nodes.

3.4.3. Internodes length

Legume genotypes during early growth of plants having a high dry mass and grain products tend to have wings. Genotypes can be appropriate and applied growth regulators like gibberellins foreign to these results can be achieved(3).

Dose hormone gibberellins acid in a significant percentage is applied in different periods of growth hormone also was significant at 1% level, and interaction different periods of growth at 1% were significant.

Dose of the hormone gibberellins acid maximum height of internodes 4.07 inches compared to other hormone levels have been in statistical was. Other doses differ quite significantly with this level did not have the lower levels were.

Hormone actions in the period before flowering vegetative internodes length with maximum height of 4.62 inches were followed and the course gave a statistical level, other courses at the next level were b and c.

The interaction of hormones in exercise time and height difference between nodes, but not quite obvious all doses 50 ppm hormones before flowering

vegetative period of the node with the highest (3.78 cm) were.

Fig10. Interaction GA3 & different stages of growth On number High plant

Because of the obvious differences of hormone gibberellins acid on internodes length were observed can be said that this morphological trait is less than the effect of the environment, but such a dose of 50 ppm during the vegetative growth before flowering than other levels and courses Top of the node created is better to say that external plant hormones at the time of eruption to get better.

The hormones in cell division and cell elongation is effective and sub-branches of the nodes there are, whatever nodes have more and more space are perhaps counting the number of nodes that are affecting the performance increase was consistent(11).

4. Discussion

Production, solar energy received by the practice and transforms it into food and other usable materials. Agronomic practices generally, are designed to get some kind of light through the cover to completely change the density of ground vegetation, and spacing of plants and spread rapidly increasing Leaf, drawn up(2, 3).

LAI is a measure of the total surface of the leaves in a unit area regardless of leaf age, position, angle and thickness and other characteristics such as leaf color, fluffy and degree of the tube to be calculated. Increase the speed of LAI is important because it determines the rate of plant photosynthesis capacity expansion is considered the beginning of bean vegetation growth was very slow so that the growth of nearby weeds will not compete was the need for weeding will be done in time if the reproductive period of plant photosynthesis and transport materials for construction materials up to a maximum of their pay, LAI is a good bean yield will also increase (12, 14).

4.1. Process of leaf area changes

LAI important factor in plant production and performance is what the plants ability to absorb carbon dioxide is more efficient in producing dry matter also will be a larger share, at the beginning of the growing trend of increased plant leaf area is small but quiet, near Flowering time the process reached its peak and then everything that the aging of plant leaves near the bottom because we lost production and the consumer will somehow be decreasing trend (12) Height, stem length or in other words one of the main and important criteria for plant quality is expressed. Strength stems should be able to partially weight of flowers, pods and seeds inside the pods to tolerate, given the role that stem remobilization photo assimilate to other organs such as root and requires that the terminal buds, shoot length specified is important, so that it surrounds the ability to shoot up the environment and can have a good competitor for weeds is grown (18, 19).

Test Hardtke, (2003) Effect of gibberellins on the shoot outside the plant height were observed, this increase in shoot length due to the effect of this substance in plant growth is facilitated, so that gibberellins acid stimulates cell division and accelerates a length and cell enlargement it provides.

Abdul (1984) Gibberellins acid, as has the increase in stem length and diameter of plant seedlings has been

* z.ajri@yahoo.com, shatar@putra.upm.edu.my

Abstract: As addiction affects not only on addict person but also on family members, so relationship behaviors is an important part of codependents' life which needs to recover in order to achieve health promotion. This study investigates to find whether the "12-Step Program" empowers families of addicts/alcoholic in term of relationship with others or not. In other words, this study aims to find differences of relationship behaviors by comparing families of addicts/alcoholics who practice the "12-Step Program" and who do not. Theory of empowerment is the key theory to conduct this study. The findings of this study indicate that the "12-step program" is an effective program to enables codependents to improve their relationship with others in comparison with those who do not practice this program (control group). In other words, independent samples t-test reveals that codependents' relationship behaviors are recovered duo to practicing the "12-Step Program" in Al-Anon/Nar-Anon groups in Iran.

[Zahra Ajri , Mohammad Shatar Sabran. **Personal Empowerment among Al-Anon/Nar-Anon Members in Iran.** Journal of American Science 2011;7(6):40-44]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: 12-Step program, Addiction, Al-Anon & Nar-Anon, Codependency, Families of Addict, personal empowerment.

1. INTRODUCTION

Bournes (2008) defined codependency as the tendency to put others needs before own needs. A codependent ignores his/her feelings, enquiries and desires for others' sake. In fact their satisfaction depends on how well other people satisfy with them. Moreover, their self-esteem constructs based on taking care and solving problems for others.

Co-dependency may be obvious in various conditions. But, most simply recognized in families of addict/alcoholic (Beattie, 1989). On the other side, the results of various surveys carried out by the *Islamic Culture Ministry* (2007), showed that addiction is the first social harm in Iran (Iranian Attitude toward Drug Abuse, 2004 & 2008). Although the area of substance abuse and alcoholism was studied globally, but there is not much research about codependency syndrome particularly in Asia.

To discovering more about codependency, the following characteristics were found by Weinhold and Bradshaw (2008), which are related to their relationship with others such as clings to others, other-centered, addicted to people, craves intimacy and closeness.

Moreover Weinhold and Bradshaw (2008), stated some characteristics related to controlling behavior for recognizing Co-dependency. They believe people with codependency troubles are people-pleasers who try to control others' understandings and make a good influence on them. They have a lot of skills in

controlling others. They try to control everything and everywhere, but their efforts will be failed because it is an impossible task.

In this situation, certain tools are needed to empower codependents so that they will be able to find themselves and return to the reality. The empowerment theory states that individuals can control their own lives by empowering or improving their resources (Rowlands, 1997).

Based on this theory, families need to gain the ability to achieve their highest personal and collective aspirations and goals (Robbins, Chatterjee & Canda, 1998). In fact, empowerment is about seeking to increase awareness about the issues surrounding codependents and trying to provide general education for families, which means that codependents need to empower themselves through education and support.

As stated above, troubled relationship is one of the problems among codependents and they need to recover their wrong relationships with others. In other words, empowerment is the process by which people come to have control over their lives. improvement of individual power or strength, the capability of taking action, or developing the ability of communication are the further implication of empowerment phenomenon at the individual level (Schultz, 1980).

Also Weinhold and Bradshaw (2008) in *Breaking free of the Codependency Trap* mentioned that people who is recovered from codependency have close relationship with others without fearing that they

would forget their needs.

Additionally, Patty Simko (2006), in her documents about codependency, mentioned two important behaviors. She believes if codependents worked on accepting others as they are without trying to change them for their needs, they can help their recovery process. When they learn to accept others' faults, failures and inadequacies, they can refrain from giving advice or trying to fix others unless they are asked for help.

In terms of recovery programs, Al-Anon & Nar-Anon are two community resources (founded in 1951) that provide support to anyone affected by a relative or friend's drinking or drug abuse (Fisher & Harrison, 1999). The concept of this program is back to the 12-step program designed by Alcoholics Anonymous (AA) which was founded in 1935 (Lowinson, et al., 2004).

One essential core of Al-Anon/Nar-Anon groups is the sense of friendship with those who have same problem. As Rowlands believed that sharing experience with others who have same problem is one important way to empower a person (ÖSTE, 2003). So that, based on two reasons the most important tool of this recovery program is the fellowship of the group. Firstly, this factor gives the person an opportunity to be with people who are talking about the disease and recovering from it. Secondly, 12-step groups such as Al-Anon/Nar-Anon are the most likely place to surround him/herself with those who will support him/her in his/her efforts, and those who are striving to live by new rules. Such environments will support their efforts to recover (Greenberg, 1994).

Consequently, this study examines the practicing of the 12-step program and finding its result on "relationship with others". Comparing Experimental group and Control group to each other attempted to answer whether there are any significant differences in relationship with other behaviors between two groups of codependents or not.

2. METHODOLOGY

Shiraz City in southwest of Iran was chosen as the research scope because of the high rate of addiction in this city. As this research was designed based on causal comparative design so, two sets of data were chosen from two populations (Gay, Mills and Airasian, 2006).

Four meetings of Al-Anon/Nar-Anon groups in Shiraz city were considered as the first population. The second population was families who conveyed their addicts/alcoholics to the recovery camps. They did not practice 12-step program. As in causal comparative design 30 person for each group is an

accepted number as a sample size (Wallen & Fraenkel, 2001) so 60 families were chosen randomly for two groups.

One important factor in causal comparative design is homogeneity between two groups as experimental and control groups. Based on this factor, groups should be matched to each other on one or more criteria. By this way these important criteria can be controlled by researcher and making sure that only independent variable has effected to group (Wallen & Fraenkel, 2001).

As mentioned in the previous paragraph, Use of Tranquilizers by families, participate in other programs (except of 12-step program) and attending psychotherapy continually were considered as three control variables which were controlled by researcher.

Five-point Likert scale ranging from (1) "strongly agree" to (5) "strongly disagree" was employed to measure each item of questionnaire. As all items are negatively worded so the score is started from 1 to 5.

3. RESULTS AND DISCUSSIONS

The main subject of this study is family of addict. Families who suffered from addiction show some signs of codependency in their relationship which is needed to recover by appropriate program like the 12-step program. Based on the literatures codependents have many problems in their relationship with others.

Fifteen items were analyzed individually in the relationship part. The mean ratings, standard deviations, t-value and p-value were run for both experimental and control group. Based on literature the most important subject which is considered in this part is external focus such as: importance of other judgment, other needs-centered, controlling behavior and lack of self-esteem.

Table 1 shows significant differences in fourteen items between families who practice the 12-step program and families who do not practice this program. In other words, families of addicts who practiced the 12-step program were normal in their relationship with others. On the other hand families who did not practice this program had problems in their relationship with others.

Bibee (2005) believes rescuer in codependency is one of the roles that codependents play. In other words, a rescuer takes responsibility for someone else's problems. At first glance, this may not seem to be a bad thing, but this role is like an arsenal of weapons that defend the codependent contracts and helps to keep these relationships stable.

Table 1: Relationship Items of Two Groups

Statement	Mean	SD	t-value	p-value
I always have an intention to help the people in need				
Ex-group	2.70	1.23	1.94	0.05
Co-group	2.13	1		
I lose my self-esteem confronting capable people				
Ex-group	3.97	0.92	5.68	0.000
Co-group	2.40	1.19		
Others behaviors is not acceptable for me				
Ex-group	4.13	0.73	6.48	0.000
Co-group	2.60	1.07		
I am excessive generous for my family				
Ex-group	3.13	1.33	4.35	0.000
Co-group	1.83	0.95		
My family can make me angry or sad by their behavior				
Ex-group	3.43	1.30	6.83	0.001
Co-group	1.60	0.67		
Saying No is too difficult for me				
Ex-group	4.27	0.78	9.66	0.000
Co-group	2	1.01		
I try to satisfy others				
Ex-group	3.07	1.46	5.39	0.000
Co-group	1.50	0.63		
My family's preference is more important than mine				
Ex-group	3.50	1.22	3.49	0.003
Co-group	2.43	1.13		
I am ready to help anywhere, anytime for anyone				
Ex-group	2.97	1.12	4.06	0.000
Co-group	1.80	1.09		
I often change my behavior for compatibility with others				
Ex-group	3.47	1.40	3.51	0.002
Co-group	2.27	1.20		
My relationship with my family is going down the hill(trouble)				
Ex-group	4.10	0.48	6.64	0.000
Co-group	2.57	1.16		
Other's judgment about my behavior is important to me				
Ex-group	3.53	1.10	5.12	0.000
Co-group	2.13	1		
I try to solve people problems				
Ex-group	3.57	0.93	7.93	0.000
Co-group	1.83	0.74		
I feel responsibility toward others' mistakes				
Ex-group	4.30	0.79	9.76	0.000
Co-group	2	1.01		
I must control everything otherwise we encounter with troubles				
Ex-group	4.10	0.96	8.32	0.000
Co-group	2.03	0.96		

In this study, the researcher examined differences between two groups of families and found out the 12-step program made significant differences in codependents' behavior in terms of responsibility for others' need. On the other hand, families who did not have experience of the 12-step program, play rescuer role in their life. They are excessive generous for their family. It means family members preference are definitely more important than theirs (Ajri & Shatar, 2010). Moreover they are ready to go wherever their help is needed, and feel responsibility towards others' mistakes. Furthermore they try to satisfy others by solving their problem.

To support this finding, Wise and Ferreiro (1995) found common elements through their seeking process on nurses. They found that external focus, caretaking and boundary problems are the main characteristics of nurses as codependents. Another significant finding in this study was control, particularly when nurses dealing with non-compliant patients. This study also found the significant difference in terms of controlling behavior between ex-group and co-group.

Based on the present research's findings, families who did not practice the 12-step program felt that, it is an obligation for them to control everything otherwise they encounter with troubles, and they cannot accept other's behaviors. On the contrary families who practice the 12-step program do not have controlling behavior about people or family. In other words, they recovered their relationship with others. The mean scores of two groups show significant differences between families who practiced the 12-step program and those who did not practice this program.

Moreover, Gehert (1993) stated family of special child tell themselves their personal needs and desires are unimportant next to their child's. Codependents find themselves saying yes when they mean no, doing things they do not want to, and not doing the things they desire. This can extend beyond the immediate family into all codependents' relationships, so that they let everyone take advantage of them. Finally stress, feeling used, depressed, and angry are appeared (Ajri & Shatar, 2010).

In this study, relationship with others was examined to identify differences between families in ex-group and co-group. Researcher found families who did not practice the 12-step program show signs of codependency in their relationship. For example they lost their self-esteem confronting capable man, saying no was too difficult for them, they often changed their behavior for compatibility with others, and other's judgment about their behavior was important to them.

On the other hand, independent samples t-test

revealed families who practiced the 12-step programs differed significantly from another group in their relationship with others. In other word, codependents that practice the 12-step program were improved in relationship with others rather than another group.

The only item that Independent samples t-test showed no significant difference in the mean score was: *I always have an intention to help the people in need*. This item among other items had similar answer among experimental group (mean = 2.70., SD = 1.23) and control group (mean = 2.13., SD=1) with $t(60) = 1.94, p < 0.05$ (refer to Table 1).

4. CONCLUSION

Health promotion occurs in processes of enabling people to grow personal skills, to support and develop helpful situations and communities in order to represent community development. One important part of health promotion approach is self-help group which needs to consider in every community. In other words, health promotion is about empowering people to have more control over their lives, which can be occurs in self-help groups such as Al-Anon/Nar-Anon.

One of the most common themes in the self-help group research is empowerment (Cheung, Mok & Cheung, 2005). Personal empowerment happens after an individual joins the self-help group. Many findings have supported a positive relationship between self-help group participation and empowerment, and its consequences. As members interact with each other to make meaningful changes, empowerment occurs. If group members are empowered, they achieve the ability of collecting the profits of self-help group activities (Cheung, Mok & Cheung, 2005).

The present study, which was conducted in Iran, found significant differences between personal empowerment among participants' and non-participant codependents of the 12-step program.

The result of this study suggests that empowerment can refer to the occurrence of changes of the individual in personal qualities such as relationship with others. Changes in attitudes and skills related to interaction with other people such as the ability to say No to others, not be a controller, not be responsible for the problems of others, not be eager in caring too much for others, which may be classified as interpersonal empowerment (Rowlands, 1997)

As community development seeks to empower individuals and groups of people, by the skills they need to defend on their own behalf, improve their healthy lives, consequently self-help groups like "12-step program" can be one of the most important components to reach these goals.

Moreover sharing the experience with other

members who have same problems in their life in Al-Anon/Nar-Anon groups will empower families to solve their difficulties through practicing 12-step program (Ajri & Shatar, 2010). The present study revealed that personal qualities were changed among codependents in experimental group by practicing 12-step program and it leads to promote their relationship with others despite of control group.

Abstract Due to poor land of Khuzestan and land pollution due to application of chemical fertilizers, use of materials that can no harmful effects on the environment, planting with very low doses, had positive effects on plants have quality performance, it seems necessary. Why research in this area in order to affect hormone levels and time use gibberellins acid (GA3) on the process of change and increasing amounts of protein bean seeds, bean seeds to increase the quality performance (*Vicia FabaL.*) were performed. The research farm located in the city Hamidieh hashemi research during the season and in 2010 was done, figure used in this experiment using BARAKAT variety. Use design was factorial experiments in randomized complete block design with three replications. Factors tested included four concentrations of the hormone gibberellins acid: (no hormones = d_0 , $d_1 = 5$ ppm, $d_2 = 50$ ppm and $d_3 = 250$ ppm) and the second factor the third period, hormone sprayed: (phase of eruption = s_0 , Flowering = s_1 and phase pod set = s_2), respectively. Measuring grain protein levels indicated that the hormone gibberellins acid spray treatment growth period increased grain protein and the greatest amount of protein in the amount of treatments d_2s_0 , d_1s_0 and 29.28 percent, respectively. . [Somaye ghalandari, Tayeb Saki Nejad, Shahram Lack. Effect of different doses of the hormone gibberellins acid on the process of protein changes in bean plants. Journal of American Science 2011;7(6):45-49]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Bean, the hormone gibberellins acid, proteins**1. INTRODUCTION**

The seed storage proteins are N, polymeric amino acids that are bound together by peptide bonds have been necessary for seedling growth are 20 types of proteins are composed of amino acid, all of which exist in nature. Of being more or all amino acids together different protein molecules there are so very large molecules, proteins, complex and high molecular weight and their chemical diversity is limited, if sometimes crude protein as protein is used instead of why crude protein, protein compounds that also encompasses. And this figure is the same method of calculation Kjeldal nitrogen and beat up the conversion ratio, usually 6.25 is obtained. The grief can simply use value crops such as cereals and legumes to supply enough energy is so, can the amount of protein required and sufficient to meet the body, in addition to protein quantity and value, quality and biological value must also be considered.

Important Prvlamynhay Zyyn in cereals including maize, wheat gliadin in the atmosphere is Hvrddyyn. Glvtlynhay some important crops include maize Zkayyn, glutenin in wheat, barley and Avryzyny Hvrddyyn in the rice, some of the major globulin in seeds include legumes legumin, Veisi Lane, Glysy Nin, and Rashyn Vygnyn. in germination, proteins into amino acid hydrolysis and are then transferred to the embryo axis to be there with a new composition and protein taken together constitute Make a mix of amino

acids is balanced. For this reason, buds and seeds with high protein quality are excellent and in large quantities are used in human food, because seeds of cereal protein are substantially in the food industry, as a puree in food manufacturing, such as used Noodles.

Plant hormones that regulators are produced by the plant and within plant normally produces from the impact transferred to the place, where they affect physiological processes. So the hormone regulators are naturally found in plant while in general, regulators can also be natural and synthetic hormones, so all are not. Configuration is based on work that they do their names are different, such as hormones, growth and flowering material (2).

Currently the world's five groups of known plant regulators, many of which have practical applications in agriculture are large and important. These groups are: is auxin, gibberellins, the cytokenin, the ethylene, inhibiting substances (Asfanva, 2008)

2. Material and Method

This test Crop year 2010 on the farm located in the village of Sayed Hossein HASHEMI Hamidieh city was conducted.

Place testing semi arid dry climates and low temperatures are 4 - and the highest degree of temperature 51.8° C, average annual temperature in the station 23.9 ° C has been reported.

The statistical test of the factorial design are equally important in terms of factors examined in a randomized complete block design with three replications was.

D: Different concentrations of the hormone gibberellins acid.

S: Bean plant growth in different periods.

(d0 =No hormones, d1 = 5ppm and d2 = 50ppm and d3 = 250ppm (and the second factor for three phase bean plant growth hormone gibberellins acid spraying include: (s0 =vegetative phase, s1 = flowering phase and s2 =phase Pod set)

To review the growth and dry matter accumulation bean plants were sampled action. Sampled from all plots to 15 days away from each other during the eighth stage was performed. Three lines for the sample was determined after removal of the top 50 cm Down each line as sidelines, three plants randomly taken from each plot and the plastic bag with a label to each plot and samples were transported to the laboratory and measured.

At the end of each growing season, seed treatment to measure 20 grams protein seeds Kjeldal method to estimate the elements were sent to specialized laboratories.

3. Result

Percent Protein

Of bean plants are important sources of protein, more protein in the leaves of beans and seeds are collected and globulins been more than kind and amount of amino acids cysteine, glutamic acid, arginine and ammonia nitrogen that is less, dependent on the nitrogen percentage Protein has a higher protein nitrogen everything will go well above (5).

Gibberellic acid at a dose level of 1 percent is significant, the different developmental courses of any level is not significant, dose interaction gibberellic acid and different periods of growth at 1 percent is significant (3).

Doses of 5 and 50 and 250 ppm compared to the control levels were statistically a higher protein value.

Long period of vegetative growth before flowering with (28.98 percent protein) has the highest percentage of protein and were in a statistical level, the rest period of growth in the levels were statistically lower levels.

The interaction of dose and period of growth hormone on protein and nitrogen developmental growth period before flowering and the dose of 5 and 50 and 250 ppm respectively, with values 29.97 and 29.83, and 30 percent of the highest statistical level, a comparison Others have gained and (Chart 1,2).

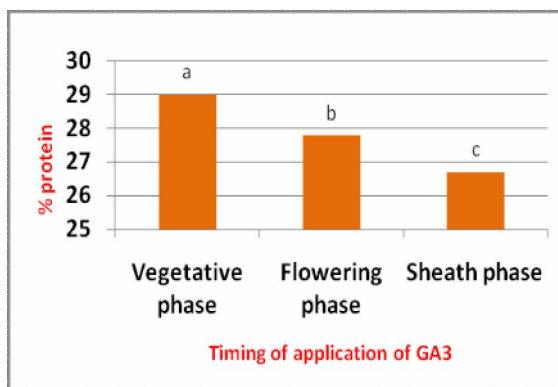

Fig1. Effect timing of application of GA3 on % protein

Perhaps because the hormone synthesis and plays a role in attracting more Assimilate protein, followed by large amounts of protein.

With the above results and by Shft and Shabana Ullah and colleagues reported that the GA is an effective role in protein synthesis and cell enlargement are the hormones produced in the fruit seeds and sprayed it increases the quantity and quality of fruit is (15).

Combinations of growth hormones and regulators through increased construction activity RNA and RNA polymerase proteins, the rate of construction increases was consistent (17).

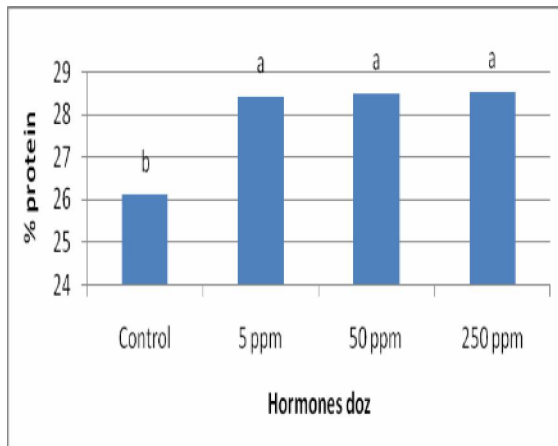

Fig2. Effect hormone doz GA3 on % protein

Percent nitrogen

Structure of protein synthesis and amino acid nitrogen than is the main protein that whatever goes up BFM high nitrogen and high in protein will be gone (small building).

Dose Hormone Gibberellic acid at 1 percent is significant, the hormone acts on the percentage of time means nitrogen is the interaction of different doses and periods of growth hormone level is a significant one in (Table 4-3).

effect of dose on the percentage of nitrogen, all doses of 5 and 50 and 250 ppm respectively, with values of 55 quarters and 56 quarters and 50 quarters at the level of statistical a are located only control treatment is that in statistical b is located.

Fig3. Effect timing of application of GA % nitrogen

Effect of hormone actions in the time period before flowering eruption rate 4.58 percent nitrogen was in statistical and developmental courses set pod up gradation value 4.31 percent were located in c statistics. The interaction of hormone dosage and time of hormone actions vegetative growth before flowering period with a dose of 5 ppm and 50 ppm respectively, with values of 79 quarters and 4.80 percent were in a statistical treatment and control without taking hormone with 4.18 percent statistical level f is the lowest level was statistically.

The nitrogen and protein are dependent; high-protein nitrogen will rise.

Fig4. Effect hormone doz GA3 on % nitrogen

Abstract: The production of surface active compounds or biosurfactants by microorganisms has been a subject of increasing interest in recent years especially due to the potential applications in enhanced oil recovery. A number of studies have indicated that the type of medium and growth conditions can influence the type and yield of biosurfactants. The present work demonstrated that the isolated bacteria, *Pseudomonas* sp from used edible oil was able to utilize the used edible oil as carbon and energy source to produce rhamnolipid at a concentration of 7.6 g/L. The temperature, incubation period, and nitrogen source optima of biosurfactant production was found at 36 °C, 72 hr and sodium nitrate respectively.

[Soniyamby A.R., Praveesh B.V., Vimalin Hena J., Kavithakumari P., Lalitha S and M Palaniswamy. Enhanced Production of Biosurfactant from Isolated *Pseudomonas* Sp Growing On Used Edible Oil. Journal of American Science 2011;7(6):50-53]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: Rhamnolipid. *Pseudomonas* sp. Used edible oil. Biosurfactant

1. Introduction

Surfactants are amphiphilic molecules that tend to lower the interfacial tension. Biosurfactants are microbially produced surface-active compounds. They are amphiphilic molecules with both hydrophilic and hydrophobic regions causing them to aggregate at interfaces between fluids with different polarities such as water and hydrocarbons (Banat, 1995; Fiechter, 1992; Georgiou *et al.*, 1990 and Karanth *et al.*, 1999). Biosurfactants are widely used in the petroleum, pharmaceutical, cosmetic and food industries. Most of these compounds are chemically synthesized and it is only in the past few decades that surface-active molecules of biological origin have been described. At present biosurfactants are readily biodegradable and can be produced from renewable and cheaper substrates, they might be able to replace their chemically synthesized counter parts (Arino *et al.*, 1996).

Various types of biosurfactants are synthesized by a number of microbes particularly during their growth on water-immiscible substrates. A majority of biosurfactants are produced by bacteria. Among them, the *Pseudomonas* species is well known for its capability to produce rhamnolipid biosurfactants with potential surface-active properties when grown on different carbon substrates. Rhamnolipid biosurfactants produced by *Pseudomonas aeruginosa*, in particular offer special advantages because of their potent emulsifying activity and low critical micelle concentration (Cooper *et al.*, 1981).

There are several renewable substrates from various sources, especially from industrial waste have

been intensively studied for microorganism's cultivation and production at an experimental scale. The genus *Pseudomonas* is capable of using different substrate such as glycerol, vegetable oil, mannitol, fructose, glucose, n-paraffin, soap stock, molasses, to produce rhamnolipid type biosurfactants.

Used edible oils and fats are considered as a problematic waste, contributing to the environmental pollution. It is well known that microorganisms are able to grow on vegetable oils or fats and produce new products with potential industrial application such as lipase (Haba *et al.*, 2000) and biodiesel (Alcantara *et al.*, 2000 and Haba *et al.*, 2000) and used olive or sunflower cooking oil as carbon source for biosurfactant production.

The purpose of this work was to study the production of rhamnolipid-type biosurfactants by a strain isolated from used edible oil and produce biosurfactant using used edible oil as energy source, as well as to evaluate different production parameters on biosurfactant production.

2. Materials and Methods

Bacterial isolates:

Pseudomonas sp was isolated from used edible oil. The culture was identified as per IS 13428:1998 Annex D.

Screening for Biosurfactant Activity:

Biosurfactant activity of isolated *Pseudomonas* sp was detected by using oil-displacement method (Youssef *et al.*, 2004 and Praveesh *et al.*, 2010]. Forty milliliters of distilled

water was added to a petri dish followed by the addition of 10 µl of crude oil to the surface of the water, ten µl of sample was added onto the centre of the oil film. The diameters of the clear zone on the surface were measured and compared with control using uninoculated medium.

Biosurfactant Production using different carbon source:

Production of the emulsifier was carried out in 250 mL Erlenmeyer flasks containing 50 mL of the medium composed of (g/l): KH₂PO₄: 0.5, K₂HPO₄: 1, KCl: 0.1, MgSO₄.H₂O: 0.5, FeSO₄.7H₂O: 0.008, CaCl₂: 0.05, Urea: 6 and 0.05 mL of trace elements solution (Br: 0.026, Cu: 0.05, Mn: 0.05 and Zn: 0.07) (Sifour *et al.*, 2004), carbon source (used edible oil, rice water, diesel, petrol and whey) was added at 4% (wt or vol/vol), pH was adjusted to 7.0. The medium was inoculated with 5% of the 18 hours bacterial culture grown on nutrient broth. Incubation was carried out at 37 °C in an incubator shaker at 150 rpm for 48 hours.

Quantification of Biosurfactant:

A modified orcinol method was used to assess the amount of rhamnolipids in the sample (Chandrasekaran *et al.*, 1980). A volume of 200 mL of the acidified culture supernatant was extracted three times with 1 mL of diethyl ether, and then the fractions were pooled, dried and resuspended in 1 mL of 0.05 M sodium bicarbonate. A 200 mL sample was treated with 1.8 mL of a solution of 100 mg of orcinol in 53% H₂SO₄ and boiled for 20 min. After cooling at room temperature for 15 min, the A421 was measured. Rhamnolipid concentrations were calculated from standard curves prepared with L-rhamnose and expressed as rhamnose equivalents (in milligrams per milliliter).

Optimization of culture conditions:

The factors such as temperature, incubation period and nitrogen sources affecting production of biosurfactant were optimized by varying parameters one at a time. The experiments were conducted in 200 mL Erlenmeyer flask containing production medium. After sterilization by autoclaving, the flasks were cooled and inoculated with culture and maintained under various operational conditions separately such as temperature (20, 25, 30, 35 and 40 °C), incubation period (24, 48, 72, 96 and 120 h), and nitrogen source (ammonium sulfate, sodium nitrate and urea each at 0.5%). After incubation the culture filtrate was assayed for biosurfactant productivity.

Determination of the emulsifying activity:

To estimate the emulsifying activity, two equal volumes of supernatant and different hydrocarbon such as kerosene, sunflower oil and petrol (2mL each) were added in a test tube and mixed at high speed for 2 min. The emulsion stability was determined after 24 hr. The emulsification index, E24 (%) was the ratio of the height of the emulsion layer by the total height of the mixture (Iqbal *et al.*, 1995).

Result and Discussion

Isolation and Screening of Biosurfactant Producing *Pseudomonas* sp:

A total of 13 strains of *Pseudomonas* sp were isolated from used edible oil. All isolates were screened for extracellular biosurfactant by oil displacement method. Of these, one strains showed very strong positive reactions indicated by clearing of oil more than 6mm in diameter. The bacterium was identified as *Pseudomonas* sp (Table 1) and used for further study.

Table 1. Identification of *Pseudomonas* sp

Test Performed	Results
Gram staining	Gram Positive
Morphology	Rod
Skim milk agar	Greenish yellow colony with clearing of medium
Oxidase test	Positive
Catalase test	Positive
Hugh-Liefson test	Non fermentative
Gelatin Liquefaction	Positive
Asparagine proline broth	Turbidity, Fluorescence under UV

Biosurfactant Production:

Biosurfactants can be produced with high yield by some microorganisms, especially *Pseudomonas* sp. (Maneerat, 2005). The *Pseudomonas* sp used in this study, produced rhamnolipid biosurfactants of 2.24 g/L when grown with used edible oil. The production of rhamnolipid using used edible oil as carbon source was higher than the other sources such as rice water, diesel, petrol and whey (Fig.1). Few reports have been published on the use of vegetable oil as substrates for rhamnolipid production. From olive oil, a production of 2.7 g/L was produced by Haba *et al.*, (2000).

Effect of Temperature on Biosurfactant Production:

Biosurfactant production was studied for different incubation temperature and the result is presented Fig.

2. In our study the maximum production of 2.78 g/L was found at 36 °C. With a rise in temperature the biosurfactant production was decreased. This was in good agreement with the results obtained earlier for biosurfactant from *Pseudomonas aeruginosa* (Praveesh *et al.*, 2010).

Figure 1

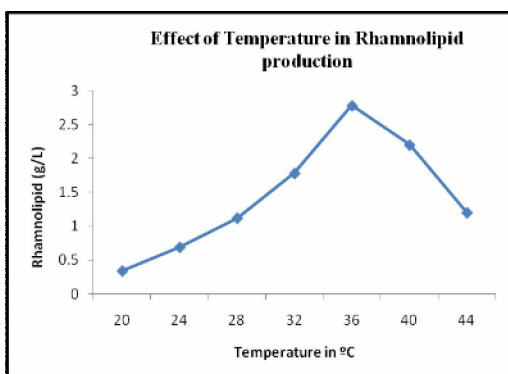

Figure 2

Effect of Incubation period:

The effect of incubation time on biosurfactant production was determined by incubating the culture medium at different time intervals (24 – 168 h) with an interval of 24 h. Rhamnolipid production was found to be maximum (5.86 g/L) at 72 h (Figure 3). The production gradually decreases from 72 to 168 h.

Effect of Nitrogen source:

The nitrogen source can be an important key to aim at increasing the production of rhamnolipids by *Pseudomonas* sp. Different nitrogen sources were tested to determine the best source for biosurfactant production. Figure 4 showed that sodium nitrate (7.6 g/L) is more effective than ammonium sulfate and urea. *Pseudomonas* sp is able to use nitrogen sources such as ammonia or nitrate. However, in order to obtain high concentrations of rhamnolipids it is necessary to have restrained conditions of this macro-

nutrient. Our studies showed that nitrate is more effective in the production of rhamnolipids than ammonia and urea, which is in agreement with other studies reported in the literature (Cooper and Zajic, 1980; Edwards and Hayashi, 1965 and Guerra-Santos *et al.*, 1983).

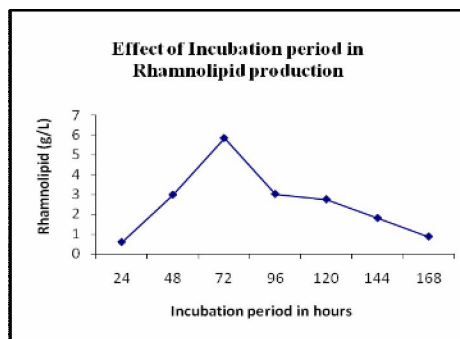

Figure 3

Figure 4

Emulsifying activity:

The highest value of emulsification index (E_{24}) was observed with kerosene (68%) during our study (Fig 5). Sunflower showed lower emulsification index when compared to kerosene, but diesel did not showed much difference.

Figure 5

Conclusion

The strain isolated from used edible oil was identified as *Pseudomonas* sp. It has the capacity to use used edible oil as energy sources to produce rhamnolipids, seems to be an interesting and low cost alternative.

Effect of Nursing Management Protocol on Selected Side Effects of Interferon and Ribavirin among Hepatitis C Patients

Magda M. Mohsen¹, Manal E. Fareed^{*2}, Amal A. El-Sheikh² and Sabry M. Abbas³

Department of Community Health Nursing¹, Adult Health Nursing Department², Faculty of Nursing, Menofia University, Egypt
Hepato gastroenterology endoscopy clinic³, Faculty of Medicine, Menofia University, Egypt
*manalfareed2008@yahoo.com

Abstract: Interferon related side effects need extensive researches especially the management strategies of these side effects are available. This study was carried out to assess the effect of nursing management protocol on selected side effects of Interferon and Ribavirin among hepatitis C patients. A convenience sample of 60 hepatitis C patients of both sexes in liver out patient clinic at Shebin El- Kom teaching hospital was selected for data collection. Tools for data collection included Tool 1: Structured interview questionnaire. It includes 3 parts to assess medical data and knowledge of patients. Tool 2 : Fatigue severity scale to measure fatigue severity among studied sample. Tool 3: Anxiety scale to assess the anxiety level of studied sample. All studied sample had several complains related to Interferon before giving the nursing management. Also there were statistical significance differences in all laboratory findings and body temperature before and after the study by 8 weeks. There were statistical significant improvement of the knowledge after 4 and 8 weeks from beginning of the study. Also, there was significant improvement in anxiety and fatigue level after 8 weeks from beginning of the study. It is concluded that: nursing intervention and knowledge about chronic hepatitis C, its treatment and management of Interferon related side effects seemed to have positive effects on improving patients knowledge about diseases and managing side effects of treatment and self care modalities that reflected by improvement in laboratory findings, vital signs, patients complains, anxiety level and fatigue level. It is recommended that: Promotion & enhancement of the self care modalities to the patient; a strict written instruction with pictures about disease process, prohibited and allowed foods, rest and physical activities and follow up should be continued after termination of the treatment through a rehabilitation program.

Keywords: Nursing management protocol, selected side effects, Interferon and Ribavirin, Hepatitis C

1. Introduction:

Hepatitis C virus (HCV) primarily attack the liver and the chronic hepatitis C infection is now recognized as an important and global health care problem that afflict about 170 million individual world wide⁽¹⁾. Epidemiological data suggested that those with the highest prevalence of HCV are 20-39 years of age. Among those individuals and in the twenty- five years following initial infection, twenty to twenty five percent develop cirrhosis and three to five percent develop fatal complications such as hepatocellular carcinoma which results in an estimated death rate of 8000 to 10000 annually from hepatitis associated chronic liver diseases⁽²⁾.

Liver hepatitis C continues to be a public health problem in Egypt. Its incidence may be increasing and its prevalence is the highest reported worldwide. The overall prevalence of anti HCV was 18.9 %⁽³⁾. While Allen⁽⁴⁾ reported that an estimated 15 to 20 percent of the population has been exposed to hepatitis C compared to less than 5 percent in neighboring Sudan and 2 percent in the United States. In some areas of Egypt the rates are even higher. The

infection rate among Egyptians 10 to 50 years old was 19.4 percent in southern Egypt, 26.5 percent in central Egypt and 28.4 percent in northern Egypt Also in Egypt, patient admission in the National Liver Institute Hospital has been increasing at a very high rate over the past years. In 2002, more than 90,000 patients received treatment in outpatient's clinics and inpatients services that double the number for 1999⁽⁵⁾. But Marwan *et al.*⁽⁶⁾ reported that 10% of Egyptian population has hepatitis B and C viruses

All patients with long term hepatitis C are potential candidates for antiviral therapy. During the last decade, Interferon alfa (INF-a) monotherapy was established as antiviral treatment of choice for treatment of naive patients with chronic hepatitis C for fighting viruses in the body, regulating the reproduction of cells and regulating the immune system⁽⁷⁾. Several small amounts of Interferon is a naturally produced by cells of the immune system of the body. But there have been considerable advances in the treatment of this disease in recent years. Nowadays the most effective and generally available

treatment for HCV is a combination therapy that includes alfa Interferon (INF-a) and Ribavirin⁽⁸⁾.

One of the major concerns with this therapy is its adverse effects. The amount of Interferon that occurs naturally in the body is very small, when it is injected, the amount in the body increases greatly. This is the cause of side effects, even though it is a naturally occurring substance. Some of these side effects may happen in the first or second hours and be over with quickly. Others can last several hours or more. Most of them will get better or disappear over times as therapy continues and body gets used to the therapy⁽⁹⁾. The most expected and common side effects with Interferon alfa and Ribavirin can be categorized to five group which are constitutional symptoms (flu-like symptoms) such as fever, myalgia, headache, chills and fatigue that varies from mild to sever, occurs in up to half of all patients and may start two to three hours after the drug is given ,injection site reaction, hematological side effects including anemia, thrombocytopenia and neutropenia that make patients more vulnerable to infection, bleeding or bruising, neuropsychiatric side effects and thyroid disorders⁽¹⁰⁾. Moreover Bianchi *et al.*⁽¹¹⁾ reported that among the most prominent neuropsychiatric side effects are symptoms of depression and cognitive impairment. These side effects negatively impact the patient quality of life

Lankarani⁽¹²⁾ stated that improving compliance with therapy can be enhanced by some measures such as patient education, close follow up, adequate treatment of side effects and minimizing dose changes. While lack of expertise in the proper management of these side effects as well as lack of educating patient may lead to higher rates of drug discontinuation or dose reduction with resultant lower efficacy of treatment.

Nurses are in a key position to carry out health education since they are the health care providers who have continuous contact with patients and their families and have the best opportunities to assess potential problems or side effects, discuss medical regimen and give teaching about all aspects of care which includes maintaining physical activity, recognizing activity limitations, conserving energy, following dietary modifications and adhering to medication schedule with attending to side effects⁽¹³⁾.

People find it helpful to have their Interferon before going to bed at night, so that; the side effects are less noticeable. Simple measures to prevent or treat these side effects are adequate hydration by drinking plenty of liquids (two to three quarts of fluids per 24 hours), light to moderate regular exercises, alternating schedule of injection days with lighter work loads, giving injection in different

places, conserve energy by getting plenty of rest and maintain nutrition⁽¹⁴⁾. Actinomiphene and Ibuprofen before the time of injection may prevent these symptoms as fever, headache and/or generalized ache. If patient experience these side effects, he/she should discuss them with health care team who can prescribe medications and/ or offer other suggestions that are effective in managing such problems. Also the patients usually lack energy reserves and must learn how to conserve it to decrease the demands on liver. The patients should identifies activities that cause fatigue and bed rest is recommended until the patient regain strength in which activity level is increased gradually as the patient condition improves⁽¹⁴⁾.

Diet is the most important interventions that should be maintained to ensure that the diet will meet the required caloric needs by providing oral care before meals, serving portions of foods and fluids within dietary restrictions of Sodium, offering small frequent meals by offering four to six per day which can prevent gastric distension that increase fatigue, being in high fowler position during meals, arranging medication schedule so that it doesn't interfere with meals and discouraging smoking and intake of caffeine beverage as tea and cola that can increase cardiac load and decrease O2 availability that can increase fatigue⁽¹⁵⁾.

Reducing anxiety is a difficult task. Occasionally, the patients need interventions to deal with anxiety rather than to control it. Techniques such as guided imagery, deep breathing and relaxation technique may help⁽¹⁶⁾. Also National Hepatitis C Program⁽¹⁷⁾ mentioned that making arrangement for maximal job flexibility and limitation of stress at work can be extremely helpful and encourage patients to share their felling with friends and family

Aim of the Study

The aim of this study was to assess the effect of nursing management protocol on selected side effects on Interferon and Ribavirin among hepatitis C patients.

Research question:

What is the effect of nursing management protocol on selected side effects on Interferon and Ribavirin among hepatitis C patients?

2. Material and Methods

Design:

A quasi experimental design was utilized.

Setting:

The study was carried out in liver out patient clinic at Shebin El-Kom teaching hospital.

Subjects:

A convenience sample of 60 hepatitis C patients of both sexes that was available during the time of data collection, in the previously mentioned setting was selected according to the following criteria:

- Had been receiving at least one treatment dose
- During the first three months of treatment.
- Experiencing selected side effects as fever, headache, fatigue, anxiety and anorexia.

Exclusion criteria:

- Presence of these side effects due to other medical causes before starting nursing management protocol.

Tools:

Three tools were used and utilized by the researchers

Tool 1: Structured interviewing questionnaire: developed by the researchers to assess patient's medical data and knowledge. It consisted of:-

Part one: Sociodemographic data such as age, sex, marital status, education and occupation.

Part two: Medical data as laboratory investigations (Hemoglobin level, White blood cell count, Platelets, Alanine aminotransferase and Aspartate aminotransferase), vital signs and patients complain after drug was taken.

Part three: Assessment of patient knowledge about:

- Disease process (definition, causes, signs and symptoms and treatment).
- Drug used (name, action, dose, route of administration and frequency).
- Side effects of the drug taken.
- Measures used to manage these side effects.

Tool 2. Fatigue severity scale:

It was adopted from Krupp⁽¹⁸⁾ It used to measure fatigue severity. It consisted of nine statements, and the researchers read each statement carefully and circle a number from 1-5 that best describes patient degree of agreement with each statement, however 1 indicates strongly disagree (low fatigue level) and 5 indicates strongly agree (high fatigue level). The total score ranges from 9-45 however, the score from 13.5 to 22.5 means mild fatigue, score from 23 to 31.5 means moderate fatigue and score more than 31.5 means severe fatigue. The Arabic version of scale was used.

Tool 3. Anxiety scale:

This scale was developed by Taylor⁽¹⁹⁾ then translated by the researchers to assess the anxiety level. It was composed of 50 statements to which the answer was either (yes) or (no). Every answer by yes was given a score 1 and no was given zero. Sum of

yes was given the total anxiety score. A score of 0-16 were denoting being free from anxiety. A score of 17-20 were denoting mild anxiety. As score from 21-26 was presenting moderate anxiety and score from 27-29 was indicating severe anxiety. Finally, score above 30 was indicating panic

Method

1-Official permission: Before the study began and after explanation of the purposes of the study, a written approval was obtained from the director of out patient clinics to carry out the study.

2-Tools development: The study tool one was developed by the researchers after extensive review of the relevant literature. This tool was tested for content validity by five experts in the field of nursing and liver specialists. Modifications were done accordingly then the tool was designed in its final format and tested for reliability using a test-retest method and a Pearson correlation coefficient formula was used. It was found to be 0.987.

3-Consent: Consent was obtained from patients to participate in the study. The researchers initially introduced themselves to all potential subjects and they were assured that the collected data were absolutely confidential.

4-Pilot study: A pilot study was conducted on 3 patients to test feasibility, clarity and applicability of the tools then necessary modifications were done accordingly.

5-Data collection: Data were collected from October 2008 to the end of April 2009. The researchers initiated data collection by firstly collecting sociodemographic and medical data. Then each participant's knowledge was assessed for disease process, drug used, side effects and measures used to control these side effects. Fatigue and anxiety were assessed for each participant by using tool 2 and 3.

6-Health education:

-After collection of pre study data. The data obtained were meant to aid in formulating nursing management that tailored to suit patient's side effects.

-Each patient was scheduled for a minimum of 3 teaching sessions in three consecutive visits to out patient clinics. Each session lasted forty five minutes for each patient. Patients received verbal instructions supplemented by written materials as an illustrative guide for more clarifications.

- Each patient was given health instructions about disease process as: definition, causes signs and symptoms and treatment; drug used for treating HCV as: name, dose, route of administration and frequency; side effects of Interferon alfa and

Ribavirin and methods to control these side effects. These educations were done individually.

-Patients were asked to repeat the knowledge and skills learned several times until the researchers made sure that it was successfully mastered.

-The other two sessions were done to reinforce the provided knowledge and respond to patients questions.

7-Follow up: Each patient was assessed and monitored three times(pre nursing management protocol, after four weeks and after eight weeks) using all tools to assess the effect of nursing education on these side effects.

Statistical analysis:

Data was collected, tabulated and statistically analyzed using SPSS version 2 statistical program. Comparison between patient's qualitative data before and after the study by 4 and 8 weeks was done using Mc Nemar test at 5% level of significance.

3. Results

Table (1) revealed that more than three fourth of studied sample (76.7%) were male. As regard marital status, the majority (90%) of the studied sample were married. In relation to educational level, about half (46.7%) had basic education. While 70% were workers. The mean age of studied sample was 41.06 ± 9.31 years. More than half (53.3%) discovered the diagnosis from one year or more.

Table (2) showed that there were significance differences of Hemoglobin, leukocyte count and Alanine aminotransferase enzyme level before the study and after 8 weeks. While there were highly significance differences of platelet count and asparate aminotransferase enzymes before the study and after 8 weeks.

Table (3) showed that before the study had begun, 60% of studied sample had fever, tachycardia and tachypnea. While after 8 weeks from the beginning of the study, 66.7% of them had normal temperature and 60% had normal pulse and respiration. Regarding blood pressure, it was noticed that 16.7% of the studied sample had hypotension before the study. While after 8 weeks, hypotensive patients were represented by 36.7% of studied sample. Moreover all of studied sample (100%) had several complains after drug administration. But 53.3% had the same results after 8 weeks. There were highly significance difference of patients complain before the study and after 4 and 8 weeks.

Table (4) showed that there were statistical significance differences between knowledge of studied sample before the study and after 8 weeks regarding definition of viral hepatitis, action and side

effects of medication, management of anorexia and fatigue. While there was a highly statistical significance difference between patient's knowledge before and after 8 weeks related to signs and symptoms of hepatitis C virus, treatment and its dose and route, management of fever and headache.

Table (5) demonstrated that there was an improvement in anxiety level of studied sample after beginning of study than before beginning of the study (70% were panic before the study while after 8 weeks only 13.3% were panic). There was a statistical significance difference between anxiety level before and after the study by 8 weeks.

Figure (1) illustrate that there was continuous improvement of fatigue level along the study period in which 93.4% of studied sample had sever fatigue before the study but after 4 weeks 43.4% had sever fatigue. While after 8 weeks only 20% had sever fatigue. There was a highly statistical significance difference between before and after the study by 4 and 8 weeks regarding fatigue level.

4. Discussion

Because of the world wide prevalence of hepatitis C virus and the associated cirrhosis and mortality, treatment is an important issue which may be carried out by combination therapy of Interferon and Ribavirin. But the adverse effects with this combination therapy are not rare. These effects could be managed effectively which has a great impact on patient compliance during the course of treatment⁽¹²⁾. The current study represented that the mean age of the sample was 41.06 ± 9.31 years. This finding was lower than the results of Heneedy⁽²⁰⁾ who reported that the mean age of her study sample was 49.8 ± 8.3 for study group and 49.3 ± 8.7 years for control group. This may be explained by the lower sample size of the current study which could not be generalized.

As regard to sex, the studied sample showed that, the majority of them were male. This was in line with Alavian *et al.*⁽²¹⁾ who reported that more than three fourth of studied sample were male.

Laboratory investigations:

National Hepatitis C Program⁽¹⁷⁾ mentioned that Interferon can suppress bone marrow production of Red blood cells, White blood cells and platelets that leads to anemia, neutropenia and thrombocytopenia. This was in agreement with the findings of the current study in which the mean Hemoglobin level, Platelet count was decreased than normal level before giving the proposed nursing intervention. But the mean white blood cell level was the lowest normal level (6553 ± 273 cu mm). Also Lankarani⁽¹²⁾ mentioned that anemia and thrombocytopenia were the most significant hematological side effects of combination therapy in

which there is usually a drop of approximately 2-3 g/dl of Hemoglobin level and 10-50% of platelet count. Moreover findings of the present study showed significant improvement of Hemoglobin level, White blood count and Platelet count after application of the proposed nursing intervention. This was in agreement with Heneedy⁽²⁰⁾ who stated that nursing intervention for patients with liver diseases has a number of positive effects on physical responses including laboratory findings. The results of the current study revealed that the mean Asparate Aminotransferase and Alanine Aminotransferase were increased before applying the nursing intervention with a significant improvement after applying the nursing intervention. This was supported by Alavian⁽²¹⁾ who showed that mean Asperate and Alanine Aminotransferase were decreased after patient education and this alteration was significant.

Vital signs and patients complain:

Manns *et al.*⁽⁷⁾ mentioned that most common adverse events reported for Interferon during the clinical studies were flu like symptoms especially fever that varies from mild to sever and occur in more than half of all patients. This was consistent with the findings of the present study which revealed that more than half of all subject had fever.

In addition, the results of the present study showed that less than one fifth of the studied sample had hypotension before giving the proposed nursing intervention protocol. This was in accordance with the study of National Hepatitis C Program⁽¹⁷⁾ which denoted that there are less common side effects of Interferon as hypotension that occurs in 10-29% of

patients receiving this therapy. Also it was observed from the current study that there were continuous improvement of vital signs after giving nursing intervention to patients and this improvement was significant for temperature. This result was supported by Heneedy ⁽²⁰⁾ who found that there was an improvement of respiration, pulse and blood pressure among her study after giving nursing intervention.

Alter *et al.*, ⁽²²⁾ stated that adverse reactions can occur with any drug even over- the counter medications. The most frequent side effects of Interferon are fever, headache, fatigue, nervousness, loss of appetite, loss of thinning hair and injection site erythema and simple measures such as adequate hydration, light to moderate exercises and alternating schedule of injection to days with lighter workload are very effective. This was in line with the finding of the current study which observed that all of studied sample complained of fever, headache, anxiety, anorexia and fatigue before giving the proposed intervention. While after the study by 8 weeks, there was significantly reduction of number of patients who had these side effects.

Patient's knowledge:

Canobbio *et al.* ⁽²³⁾ emphasized that those patients with liver diseases need education, counseling and support to enable them to adjust to their chronic illness and its treatment ⁽³³⁾. Results of the current study showed that there was significant improvement of sample knowledge in approximately every aspects of knowledge given to them than pre intervention. This may be attributed to the theoretical sessions that were provided to cover all aspects of hepatitis C virus (definition, causes, signs and symptoms, treatment, action, dose, route, frequency, side effects and how to deal with it) which eventually increase patients knowledge. These results were consistent with Fareed ⁽²⁴⁾ who showed a statistical significant difference between before and after conduction the nursing management protocol that indicates an improvement of patients total mean score of knowledge after intervention. This result was also in line with Elshikh ⁽²⁵⁾ who found that a significant differences between control and study groups as regard to total knowledge scores after protocol of care. In the present study, patients pre intervention denoted that almost three fourth of them lack any essential knowledge about their medication, action, dose, route, frequency, possible side effects and how to manage it. The educational sessions had given a significant increase in their knowledge about Interferon. This finding was consistent with that obtained by Elshiekh, ⁽²⁵⁾ who found that repetition teaching on patient medication have significantly

increase their knowledge regarding dose, special precautions and possible side effects of drug.

Anxiety level:

Anxiety can be defined as an accompanying emotion of stressful encounters. As the disease state is considered stressors, the Interferon adds another stressor to patients ⁽²⁶⁾. Lankarani ⁽¹²⁾ stated that Interferon based regimen can induce a variety of neuropsychiatric adverse events including depression, anxiety and panic attack. Also National Hepatitis C program ⁽¹⁷⁾ mentioned that sever anxiety is a very common side effects in clinical trial in 30% or more of patients and if patients are aware that medications predispose them to anxiety and learn how to deal with it, they can control anxiety more effectively. These were in consistent with the results of the present study in which before nursing intervention about three fourth of the sample were panic and the rest had sever anxiety but after 8 weeks less than half of the sample had mild anxiety and about one fifth was free from anxiety. While the result was in contrast with result of Hunt *et al.* ⁽²⁷⁾ who reported that their sample exhibited fewer emotional problems as well as lower incidence of anxiety during Interferon therapy. This discrepancy may be attributed to in-completing the questionnaire by all their participants (only about three fourth) so we can not generalize their results.

Fatigue level:

The finding of this study revealed that about all of studied sample had sever fatigue before giving the intervention. But after 8 weeks more than one fourth of the sample had mild fatigue and more than half had moderate level of fatigue and these results were in accordance with Heneedy ⁽²⁰⁾ who found that fatigue was decreased among the study group subjects than control group after giving the nursing intervention.

5. Conclusion:

The present study revealed that enrichment of patients with nursing intervention and knowledge about chronic hepatitis C, its treatment and management of Interferon related side effects seemed to have positive effects on improving patients knowledge about diseases and managing side effects of treatment and self care modalities that reflected by improvement in laboratory findings, vital signs, patients complains, anxiety and fatigue level.

Recommendations:

a). Promotion and enhancement of the self care modalities to the patient; a strict written instruction with pictures about disease process, allowed foods,

rest and physical activities and follow up should be continued after termination of the treatment through a rehabilitation program.

b). Special attention should be given regarding teaching patients family members who have an active role in patient care to help them comply with the prescribed medical and nursing intervention.

c). Replication of the study using a large probability sample from different geographical areas to allow greater generalizability of the results.

Abstract: Any activity that gets your students involved makes the learning experiential. This includes small group discussions, experiments, role playing, skits, building something at their table or desk, writing or drawing something specific – activity of any kind. Activities also keep people energized, especially activities that involve getting up and moving about. Most adult students are in your classroom because they want to be. Some of them are there because they have Continuing Education requirements to keep a certificate current, but most are there because they've chosen to learn something new. This principle is not about why your students are in your classroom, but about why each thing you teach them is an important part of the learning. I'll use my own pickle-making lesson as an example.

Keywords: adult education, adult learning

Introduction:

Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Adult illiteracy severely hinders the life chances of young children, undermines school reform, and limits the opportunities for postsecondary education.

Despite landmark reforms in public schools, too many Kentuckians continue to drop out of school, thereby perpetuating the chronic problem of adult illiteracy. Too many young Kentucky parents are unable to read and lack the basic literacy necessary to provide the necessary stimulating, supportive family environments for young children. It is known that children's literacy levels are strongly linked to the educational level of their parents and that children of parents who are unemployed and have not completed high school are five times more likely to drop out.

As indicated earlier, a strength of adult education in Kentucky is the dedication of the many teachers often serving under difficult conditions, without adequate support, and often with compensation and benefits less than teachers in the public schools. Testimony before the task force characterized the work of adult educators as "missionary" work. Recognizing the seriousness of the adult literacy issue in Kentucky, it should be a major concern that the Commonwealth does not have a comprehensive approach to the professional preparation, development, and support of adult educators. The challenge for Kentucky will be to move from a system that still depends on teachers with limited training in working with adults, to one in which professional competence in working with adults is a basic requirement. Any strategy to make this transition

must involve both professional development and support for the teachers now in the field as well as a new system for a new generation of adult educators.

Principles for the Teacher of Adults Teaching Adult Learners

The teacher of adults has a different job from the one who teaches children. If you're teaching adult students, it's important to understand the five principles of teaching adults. It's important to know how adults learn.

Malcolm Knowles, a pioneer in the study of adult learning, observed that adults learn best when:

1. They understand why something is important to know or do.
2. They have the freedom to learn in their own way.
3. Learning is experiential.
4. The time is right for them to learn.
5. The process is positive and encouraging.

Principle 1: Make Sure Your Adult Students Understand "Why"

Most adult students are in your classroom because they want to be. Some of them are there because they have Continuing Education requirements to keep a

certificate current, but most are there because they've chosen to learn something new.

This principle is not about why your students are in your classroom, but about why each thing you teach them is an important part of the learning. I'll use my own pickle-making lesson as an example.

When I learned to make pickles, my teacher and neighbor, Marilyn, explained:

- It's important to soak the cucumbers in ice water over night. This helps make the pickles crisp.
- If you put a towel under the jars in the canner, they won't bounce against each other and break.
- When sterilizing the jars, it's important to fill each at least halfway with water, AND fill the canner they're sitting in with water. Too little water and the towel mentioned in the previous bullet will catch on fire. You know this kind of information comes from experience.

Principle 2: Respect that Your Students Have Different Learning Styles

There are three general learning styles: visual, auditory, and kinesthetic.

Visual learners rely on pictures. They love graphs, diagrams, and illustrations. "Show me," is their motto. They often sit in the front of the classroom to avoid visual obstructions and to watch you, the teacher. They want to know what the subject looks like. You can best communicate with them by providing handouts, writing on the white board, and using phrases like, "Do you see how this works?"

Auditory learners listen carefully to all sounds associated with the learning. "Tell me," is their motto. They will pay close attention to the sound of your voice and all of its subtle messages, and they will actively participate in discussions. You can best communicate with them by speaking clearly, asking questions, and using phrases like, "How does that sound to you?"

Kinesthetic learners need to physically do something to understand it. Their motto is "Let me do it." They trust their feelings and emotions about what they're learning and how you're teaching it. They want to

actually touch what they're learning. They are the ones who will get up and help you with role playing. You can best communicate with them by involving volunteers, allowing them to practice what they're learning, and using phrases like, "How do you feel about that?"

Pickle Example: I'm generally a kinesthetic learner. Marilyn talked to me about her pickling process, explaining why she uses the ingredients she does, and showed me how she dips a liquid measuring cup into the hot brine and pours it into the jar using a wide-mouthed funnel, but my greatest learning came when I fumbled through the second jar all by myself.

Most people use all three styles while they're learning, and of course, this is logical since we all have five senses, barring any disabilities, but one style almost always is preferred.

The big question is, "How do you, as the teacher, know which student has which learning style?" Without training in neuro-linguistics, it might be difficult, but conducting a short learning style assessment at the beginning of your class would benefit you and the students. This information is as valuable to the student as it is to you.

There are several learning style assessments available online, some better than others. I like the one at Ageless Learner.

Share your thoughts about learning styles.

Principle 3: Allow Your Students to Experience what they're learning

Experience can take many forms. Any activity that gets your students involved makes the learning experiential. This includes small group discussions, experiments, role playing, skits, building something at their table or desk, writing or drawing something specific – activity of any kind. Activities also keep people energized, especially activities that involve getting up and moving about.

The other aspect of this principle is honoring the life experiences your students bring to the classroom. Be sure to tap into that wealth of wisdom whenever it's appropriate. You'll have to be a good timekeeper because people can talk for hours when asked for

personal experiences, but the extra facilitation needed will be well worth the gems your students have to share.

Pickle Example: Once Marilyn had shown me how to prepare one jar, she busied herself in the kitchen doing her own thing, close enough to keep an eye on me and to answer my questions, but allowing me the autonomy to go at my own speed. When I made mistakes, she didn't interfere unless I asked. She gave me the space and the time to correct them on my own.

Principle 4: When the Student Is Ready, the Teacher Appears

“When the student is ready, the teacher appears” is a Buddhist proverb packed with wisdom. No matter how hard a teacher tries, if the student isn't ready to learn, chances are good he or she won't. What does this mean for you as a teacher of adults? Luckily, your students are in your classroom because they want to be. They've already determined that the time is right.

It's your job to listen carefully for teaching moments and take advantage of them. When a student says or does something that triggers a topic on your agenda, be flexible and teach it right then. If that would wreak havoc on your schedule, which is often the case, teach a bit about it rather than saying flat out that they'll have to wait until later in the program. By then, you may have lost their interest.

Pickle Example: My mom canned pickles all during my childhood years, but I had no interest in participating, or even in eating them, sadly. Several years ago, I helped Marilyn can pickles, and even then, I was simply helping and not really learning. When I finally started enjoying pickles and planted my own cucumbers, then I was ready to learn, and Marilyn was right there to teach me.

Principle 5: Encourage Your Adult Students

For most adults, being out of the classroom for even a few years can make going back to school intimidating. If they haven't taken a class in decades, it's understandable that they would have some degree of apprehension about what it will be like and how well they'll do. It can be tough to be a rookie when

you've been an expert in your field for many, many years. Nobody enjoys feeling foolish.

Your job as a teacher of adult students includes being positive and encouraging. Patience helps too. Give your older students time to respond when you ask a question. They may need a few moments to consider their answer. Recognize the contributions they make, even when small. Give them words of encouragement whenever the opportunity arises. Most adults will rise to your expectations if you're clear about them.

A word of caution here. Being positive and encouraging is not the same as being condescending. Always remember that your students are adults. Speaking to them in the tone of voice you might use with a child is offensive, and the damage can be very difficult to overcome. Genuine encouragement from one person to another, regardless of age, is a wonderful point of human interaction.

Pickle example: I'm a worrier. I worried about spilling brine all over Marilyn's stove, about dropping the full jars as I lifted them out of the hot bath, about making a mess of her kitchen. Marilyn assured me that spills were easily cleaned up, especially when vinegar was involved since it's used for cleaning anyway! She encouraged me as I gingerly moved boiling hot jars. Throughout the pickle-making process, Marilyn remained calm, unruffled. She paused by me every once in a while to comment, “Oh, don't they look beautiful!”

Because of Marilyn's understanding of how to teach me, her adult student, the art of making dill pickles, I now have the confidence to make them in my own kitchen, and I can't wait for my next batch of cucumbers to be ready.

This is your challenge as a teacher of adults. Beyond teaching your subject, you have the opportunity to inspire confidence and passion in another human being. That kind of teaching changes lives.

Conclusion:

Beyond the issues relating directly to DAEL (Department of Adult Education and Literacy), the task force heard a number of concerns about the Commonwealth's overall approach to adult literacy.

- Lack of coherent statewide leadership and coordination among multiple complementary initiatives aimed at the same problem.
- Lack of continuity in state leadership. Cited in particular was the difficulty sustaining a high level commitment to the issue long enough to make a difference because of changes in priorities of the state's political leaders. A high level of turnover in the leadership of the Department of Adult Education and Literacy has also contributed to the instability.
- Tendency to think of adult education as a separate categorical program rather than a strategy that cuts across the mission and responsibility of multiple Commonwealth programs and initiatives (e.g., early childhood education, welfare reform, economic development, and corrections).
- Multiple uncoordinated categorical federal initiatives that tend to drive (and fragment) policy for an overall state effort that is largely funded by Kentucky.
- Inadequate coordination of services to meet the needs of individual adults, communities, employers, and regions is hindered by:
 - Vertical financing and regulatory relationships between separate federal and state programs and local providers and administrative units. These vertical relationships can hinder the horizontal coordination of services for individual adult learners, communities, and employers.
 - Turf wars among providers, local politics, and long-standing conflicts among neighboring counties.
 - Inadequate links with and leverage of other public and private initiatives and investments to reach the target population. Major sources of help include employers, postsecondary education, and workforce development.
 - Lack of a state financing policy and strategy for provider performance incentives and collaboration, and tax and other employer incentives for leverage of non-state resources.
 - Lack of programmatic and administrative flexibility to meet the rapidly changing needs of adult learners, employers, regional economies, and communities.

When the issue is examined from a county-by-county perspective, a significant mismatch is found between the availability of services and the target population.

The problem is partially one of resources. Yet an even more serious problem is the lack of local leadership and coordination of available resources—both public and private. A deliberate strategy is needed to focus state priorities on the target population at the lowest literacy levels (Levels I and II) and in the counties with largest percentages of adults at these levels. Unless Kentucky can narrow the disparities within the state, the Commonwealth will be unable to narrow the disparities in per capita income and other critical indicators between Kentucky and its competitor states.

Assessing Lesson Plans for Adults

^{1, 2} Damavand Branch, Islamic Azad University, Damavand, Iran

*Corresponding author: mehran11070@yahoo.com

Abstract: adult who is able to recognize their needs. He is who knows what will. Refers to individual adults in their lives cross and understand their responsibilities and has accepted the role is social. Adult learners are often those that distinguish each other and have many different targets at the same time and will follow a common challenge to fulfill the goals of building self motivation vectors as educational materials to learn and use the forge. Adult illiteracy is like a disease that infects virtually every dimension of Kentucky life. Adult illiteracy saps the energy and capability of Kentucky's people and its economy. Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Though rarer today than in the past, some teachers discount the importance of learning styles. They continue to teach in their one major method without trying to vary instructional methods. This is a mistake that will lead to less learning in the classroom. On the other hand, many students and to a lesser degree some teachers make the mistake of thinking that they cannot learn using methods that are not focused on their learning style. This is also a huge mistake that in the end will result in less learning. If teachers do not help their students find ways to be successful learning information presented in any style, they are not helping them succeed in the future. The fact is that students will be faced with many different styles of teaching during the educational career. Only by finding ways to adapt and learn using other styles, will students end up succeeding. [Mehran Bozorgmanesh and Mojtaba Sadighi. **Assessing Lesson Plans for Adults**. Journal of American Science. 2011;7(6):69-72]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: adult learning, Lesson Plans

Introduction:

Over the years definitions have evolved from provisions in federal law and initiatives of groups advocating particular methodologies or the needs of specific adult populations. The result is that definitions tend to merge statements about the goals to be achieved (e.g., improving the literacy of a particular population) with a particular means (e.g., adult basic education) to achieve the goal.

Therefore, it is helpful to distinguish between at least these dimensions of the issue:

1. "Literacy" refers to the knowledge, skills, and competencies of individuals. The federal Adult Education and Family Literacy Act (Title II of the Workforce Investment Act) defines literacy as "an individual's ability to read, write, speak in English, compute and solve problems, at levels of proficiency necessary to function on the job, in the family of the individual, and in society." Literacy is often defined in terms of specific domains such as "basic academic skills," "workplace skills," "life skills," "parenting skills," or skills

necessary to exercise one's rights and responsibilities for citizenship. Different dimensions of literacy are often categorized by terms that cluster several dimensions of literacy important for different clients. Examples include workplace literacy (combining both basic academic skills and workplace skills), and

family literacy (combining basic academic skills and other skills essential for successful parenting).

2. "Education attainment" usually refers to the numbers of years of schooling completed or the level of credential (e.g., high school diploma or associate degree) an individual has obtained. Despite concerns about the meaning of credentials, there is a strong correlation between educational attainment and literacy.

3. "Literacy initiatives" often are defined in terms of the needs of a particular target group. These may be parents of young children, youth who have dropped out of high school without earning a high school diploma, welfare recipients, persons with limited English-speaking ability, incarcerated adults, or adults in the workforce.

Lesson Plans for Adults:

Lesson plans for adult education don't have to be difficult. Follow these easy steps and see how effective you can be. Every good course design begins with a needs assessment. For our purposes here, we're going to assume you've completed this assessment and you understand what your students need and what your objectives are for the course you're designing. If you don't know your objectives, you're not ready to design your course. With your

objectives in hand, course design can be easy. Like any gathering of people for any reason, it's good to begin at the beginning and address who is there, why they've gathered, what they hope to accomplish, and how they'll accomplish it.

Welcome and Introduction:

Build in 30 to 60 minutes at the opening of your class to conduct introductions and review your objectives and agenda. Your beginning will look something like this:

1. Greet participants as they arrive.
2. Introduce yourself and ask participants to do the same, giving their name and sharing what they expect to learn from the class. This is a good time to include an ice breaker that loosens people up and makes them feel comfortable sharing.
3. Write their expectations on a flip chart or white board.
4. State the objectives of the course, explaining why certain expectations on the list either will or won't be met.
5. Review the agenda.
6. Review housekeeping items: where the restrooms are, when the scheduled breaks are, that people are responsible for themselves and should take a restroom break early if they need one. Remember, you're teaching adults.

Module Design:

Divide your material into 50-minute modules. Each module will contain a warm-up, a short lecture or presentation, an activity, and a debriefing, followed by a break. At the top of each page in your teacher's guide, note the time needed for each section and the corresponding page in the student's workbook.

Warm-Up:

Warm-ups are short exercises (5 minutes or shorter) that get people thinking about the topic you are about to cover. It can be a game or simply a question. Self-assessments make good warm-ups. So do ice breakers.

For example, if you're teaching learning styles, a learning-style assessment would be a perfect warm-up.

Lecture:

Keep your lecture to 20 minutes or less if possible. Present your information in full, but remember that adults generally stop retaining information after about 20 minutes. They will listen with understanding for 90 minutes, but with retention for only 20.

If you're preparing a participant/student workbook, include a copy of the primary learning points of your lecture, and any slides you're planning to use. It's good for students to take notes, but if they have to furiously write *everything*, down, you're going to lose them.

Activity:

Design an activity that gives your students an opportunity to practice what they just learned. Activities that involve breaking into small groups to complete a task or to discuss an issue are good ways to keep adults engaged and moving. It is also a perfect opportunity for them to share the life experience and wisdom they bring to the classroom. Be sure to build in opportunities to take advantage of this wealth of relevant information.

Activities can be personal assessments or reflections that are worked on quietly and independently; they can be games or role playing; or they can be small group discussions. Choose your activity based on the best way to provide the adults in your class with an opportunity to experience what you just taught.

Debriefing:

After an activity, it's important to bring the group back together and have a general discussion about what was learned during the activity. Ask for volunteers to share reactions. Ask for questions. This is your chance to make sure the material was understood. Allow for 5 minutes. It doesn't take long unless you discover that learning hasn't happened.

Take a 10-minute Break:

It's important to get adult students up and moving every hour. This takes a bite out of your available time, but it'll be well worth it because your students will be far more attentive when class is in session,

and you'll have fewer interruptions from people who have to excuse themselves.

Tip: While breaks are important, it's crucial that you manage them well and begin again precisely on time, regardless of stragglers, or chatter will get carried away. Students will learn quickly that class begins when you said it would, and you'll gain the respect of the entire group.

Evaluation:

End your courses with a *short* evaluation to determine whether or not your students found the learning valuable. Emphasis on the short. If your eval is too long, students won't take the time to complete it. Ask a few important questions:

1. Were your expectations of this course met?
2. What would you have liked to learn that you didn't?
3. What was the most helpful thing you learned?
4. Would you recommend this class to a friend?
5. Please share comments about any aspect of the day.

This is just an example. Choose questions that are relevant to your topic. You're looking for answers that will help you improve your course in the future.

Conclusion:

In traditional programs that the principles of psychology and curriculum planning, less attention is the form of content presentation ie codification and providing books, original format and have the dominant form, while for adult content that could have valuable experience in addition to writing, other ways also be provided Affect the selection of pictures and images related to the concepts and content produced by including them.

Learning activities such as activities outside the classroom, dialogue, role playing and ... Another type of content is presented. Duties are placed on the learner, a resource for developing knowledge, skills and insights he considered.

Curriculum content only from the training provided to learners or not, but put together their learning through activities that can inform or does, skills and attitude to achieve. In this case, apart from learning

that the assays taught learners directly to sustainable and effective learning occurs in his.

Another way of providing content that is educational activities outside the learning environment possible for learning more and better enables adult learners. For example, hits, field trip experiences for learners or transfer is provided, develop knowledge, insight and skills they will.

To ensure that science curriculum and educational aspects, according to community needs and audiences, application form is provided or not, the content selection criteria should be considered. These criteria is being include knowledge, effectiveness, flexibility, diversity, relevance and practical learning. Some research findings that can be a learning process for the Guidelines for training operations are applied, is given below:

1- To maximize learning, information must be provided an organized manner. Entries can be simple or complex can be arranged around related concepts are organized. Starting point for organizing content knowledge for adults and adults is linked to past experiences

2- Learning, especially regarding skills development, will be added frequently.

3 - Duties and meaningful content than meaningless subjects are learned more easily and are later forgotten. This issue, especially for older adult learners is true. Challenges of adult learning facilitators by the way that content was significantly associated with the experiences and needs of learners is.

4- Passive than active participation in learning activities, learning increases. Adult educators are allowed to participate actively in India, a stable and meaningful learning to help

5- Environmental factors affect the learning. Tangible things such as noise, crowded places, temperature, light and ... Learning process can be prevented. Other factors such as stress, ridicule, pressure, fatigue and low health can also reduce learning.

Rural people participation in Participatory Rural Appraisal (PRA)¹Mina Abarashi and ²Maryam Nikmanesh^{1,2} Damavand Branch, Islamic Azad University, Damavand, Iran

*Corresponding author: saba11085@yahoo.com

Abstract: There exist different methods of data collection and analysis, each with its own strengths and weaknesses. Through time, more appropriate and refined methods have been developed. In the context of rural development, information regarding the communities, their livelihoods, their beliefs, the physical environment in which they live, and their resource endowments need to be gathered and interpreted in a manner that identifies their priorities with a view of developing better understanding of their status and designing appropriate intervention projects directed at resolving their problems. The different ways of data collection and interpretation can be seen under two perspectives (IUCN, 2001): qualitative versus quantitative, and participatory versus top down. While the quantitative methods generate information that can be captured numerically, the qualitative methods generally do not generate specific numbers. Qualitative methods are concerned with exploring meanings, processes, reasons, and explanations. [Mina Abarashi and Maryam Nikmanesh. **Rural people participation in Participatory Rural Appraisal (PRA)**. Journal of American Science 2011;7(6):73-77]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Participatory Rural Appraisal (PRA), participation

Introduction:

Much of the spread of participatory rural appraisal (PRA) as an emerging family of approaches and methods has been lateral, South-South, through experiential learning and changes in behavior, with different local applications. Rapid spread has made quality assurance a concern, with dangers from “instant fashion”, rushing, formalism and ruts. Promising potentials include farmers’ own farming systems research, alternatives to questionnaire surveys, monitoring, evaluation and lateral spread by local people, empowerment of the poorer and weaker, and policy review. Changes in personal behavior and attitudes, and in organizational cultures, are implied. PRA parallels and resonates with paradigm shifts in the social and natural sciences, business management, and development thinking, supporting decentralization, local diversity, and personal responsibility.

RRA was criticized for being extractive and highly dependent on expert interpretation. It was thus found useful to replace it with PRA which involves a process of learning from, with and by rural people about rural conditions. PRA shares much with its parent, RRA, but is distinguished from it in practice by correcting two common errors: roles of investigation are reversed; and rushing is replaced by relaxation and rapport. At the heart of all these developments was Robert Chambers, although Paulo Friere has also had strong influence especially in similar developments in education circles (Provention Concertium).

PRA are good for:

- Providing basic information in situations where little is known

- Identifying and assessing problems
- Appraising, designing, implementing, monitoring, and evaluation programs and projects
- Getting a better picture of needs and organizations’ ability to meet them
- Developing and transferring appropriate technologies
- Appraising emergencies
- Planning projects that are more relevant, restructuring administrations, assisting in decision-making and policy formation
- Generating hypotheses, ruling out inappropriate ones
- Providing guidelines for survey designs and assessing the applicability of their results to other places.
- Fleshing – out complementing, interpreting, or giving depth and context to information obtained through other methods.

PRA is not very useful for:

Working in situations in which the problem is not usefully addressed at the local or group level, for example, in situations where large-scale structural reorganization is necessary (but even then, local views may help to shape the change).

The objectives of the PRA are:

- to enable rural people to organize their knowledge, share experience among themselves and gather information on resources they have
- to understand the rural environments and social as well as economic dynamism
- to understand the trends in the rural socio economic conditions

- to enable the community identify their problems, causes of these problems and possible solutions

- to enable the community develop a community action plan to address their problems

In order to limit the PRA to the objectives set and to have consistency in conducting the PRA in the different villages, a PRA manual was prepared by the socio economic team. In line with the manual, emphasis was accorded to the following topics:

1) Village History. The first day of the PRA discussion begins with history of the village which enabled participants to easily and comfortably tell about the history of their village.

2) Agriculture and Livestock. Focus group discussions were made on agriculture and livestock rearing practices including the problems encountered and possible solutions.

3) Social service. The provision of social services like education and health including the associated problems were also discussed in focus group discussions.

4) Village institutions. Institutions, both from within the village and outside, as well as formal and informal with which the rural communities interact have been addressed.

5) Trend lines. Trends in food availability, forest, population growth, wealth, rainfall and poverty are addressed in this section.

6) Wealth ranking, problem analysis, and community action plan. Finally, the participants ranked the community on the basis of its wealth, discussed the major problems and formulated action plan. The PRA is to be followed with a more quantitative and structured socioeconomic survey, which will then be followed by specialized researches in specifically selected areas; notably, poverty and coping mechanisms, microfinance, marketing, utilization and management of natural resources, and gender.

At the end of the 1980s, Participatory Rural Appraisal was developed in response to the too mechanistic and extractive implementation of RRAs. In PRAs the target group is encouraged to learn and the role of outsiders is reduced to a facilitator of the learning process. PRA aims to empower local people by encouraging them to share, enhance and analyse their knowledge of life and conditions and to plan, act, monitor and evaluate.

As with RRA it is hard to define what exactly a PRA is (some even prefer not to define it and just refer to "a family of approaches"). PRA shares the basic principles of RRA (quick, multidisciplinary, observations, etc.), yet now it is the local people who are encouraged to analyse their own situation and

plan activities to improve it. The three basic pillars of PRA (and the basic differences from RRA) are:

1. the behaviour and attitude of outsiders, who facilitate rather than dominate;
2. the methods, which are open, group-oriented, visual and comparative;
3. sharing of information, food, experiences, etc. between in- and outsiders.

For the tools used, two issues stand out:

1. 'Handing over the stick': instead of outsiders trying to understand the knowledge of the local people, PRA tries to facilitate local people to develop their capabilities. They collect and analyse the data and propose actions to be undertaken.

2. Visualisation and sharing: local people convey their ideas and knowledge in a visual way. In verbal communication, outsiders dominate the dialogue more easily (via eye contact, cross-checking, etc.) than in communication via visual aids. When a map is drawn by a stick in the soil all can contribute, and local people feel more confident than when outsiders try to draw a map on a piece of paper with a pen - a typical tool of powerful outsiders. Sharing also explicitly involves the food and shelter during the PRA.

The most commonly used tools are:

- participatory mapping: a group of villagers makes a map of the community. The way they do this and what they find important provide good entry points for discussions about crucial aspects of village life;

- village transects: together with a (small) group of villagers the team walks through the village (or another relevant area) and discusses the things observed;

- ranking: people are asked to compare units (e.g. families /trees /crops) and to group them according to their own criteria. For example, via pair-wise comparing the importance of certain trees, people find out which criteria they use to assess the usefulness of these. Ranking is also used to stratify the local population, e.g. via wealth ranking. Both the results of the ranking and the criteria used provide entry

points for further discussions.

- historical recalls: the lifestyle of families are recalled and the main events are used as reference points in the analysis of the present situation;

- calendars: people indicate how things change over time, e.g. in which months they have to borrow money, when their children get malaria, when the rains are normally expected, etc.

Combining information obtained from all the tools provides the villagers with an explicit picture of their daily life. This not only helps them to start a discussion on their main problems and how to tackle

them, it also boosts their self-esteem because they are able to make this analysis themselves.

PRA techniques(Gibson, 1992):

The most common methods are the following:

1- Diagramming, Mapping and Modeling:

- transects
- maps (resource, social, farm)
- venn diagrams
- seasonally analysis
- historical analysis (time lines, trend lines, activity profiles)

2- Ranking and scoring

- pair wise ranking
- matrix ranking
- matrix scoring
- well-being analysis and wealth ranking
- proportional piling
- pie charts (injera charts)

3- Problem analysis

- identification and specification
- causal chaining
- prioritization

PRA has evolved and spread from beginnings in Ethiopia, India, Kenya, Sudan and elsewhere, and in early 1994 is known to be being quite widely practiced in parts of Bangladesh, Botswana, Ethiopia, francophone West Africa, India, Indonesia, Kenya, Nepal, Nigeria, Pakistan, the Philippines, Sri Lanka, Sudan, Uganda, Vietnam, and Zimbabwe, while starts have been made in at least a score of other countries in Latin America, Africa and Asia. Hundreds of nongovernment organizations (NGOs) have adopted PRA and developed applications, as have a number of government departments. The use of PRA methods is being increasingly explored by students and faculty in universities for research, and by training institutes for fieldwork. Spread appears to be accelerating.

five key principles that form the basis of any PRA activity:

1. Participation:

PRA relies heavily on participation by the communities, as the method is designed to enable local people to be involved, not only as sources of information, but as partners with the PRA team in gathering and analyzing the information.

2. Flexibility:

The combination of techniques that is appropriate in a particular development context will be determined by such variables as the size and skill mix of the PRA team, the time and resources available, and the topic and location of the work(Dunn, 1991).

3. Teamwork :

Generally, a PRA is best conducted by a local team (speaking the local languages) with a few outsiders present, a significant representation of women, and a mix of sector specialists and social scientists, according to the topic.

4. Optimal Ignorance :

To be efficient in terms of both time and money, PRA work intends to gather just enough information to make the necessary recommendations and decisions.

5. Systematic :

As PRA-generated data is seldom conducive to statistical analysis (given its largely qualitative nature and relatively small sample size), alternative ways have been developed to ensure the validity and reliability of the findings. These include sampling based on approximate stratification of the community by geographic location or relative wealth, and cross-checking, that is using a number of techniques to investigate views on a single topic (including through a final community meeting to discuss the findings and correct inconsistencies).

Conclusion:

Kamla Bhasin (1999) suggests that development practitioners should constantly ask themselves: “am I increasing the confidence of the poor, their faith in themselves, and their self – reliance, or am I making them instruments of my own plans of action, imposing my own ideas on them and that of my organization and/or institution?” Social Development is a process of gradual change in which people increase their awareness of their own capabilities and common interests, and use this knowledge to analyse their needs; decide on solutions; organize themselves for cooperative efforts; and mobilize their own human, financial and natural resources to improve, establish and maintain their own social services and institutions within the context of their own culture and their own political system. To give effect to this understanding of social development, participation of communities in their own development is important. The participatory approaches, including PRA provides first step/stage in sustainable community development.

As a result of the PRAs, the communities are expected to attain many benefits including:

- Expressing their own ideas and concerns;
- Organizing their knowledge about the past and present;
- Identifying as a community their problems, the causes of these problems and possible solutions;
- Developing a common plan to address these problems;

- Developing the ability to use their own resources more effectively and attract more resources from the outside. The academicians/researchers involved in the PRAs are expected to get the following benefits:

- Developing better understanding of rural environments and social as well as economic dynamism taking place there;
- Appreciating the fact that communities are capable of analyzing their problems and outlining possible solutions to their problems;
- Participating in designing possible solutions to community problems;
- Utilizing the results of the PRA work as a research output for publications and presentations;
- Building their research and problem investigation capabilities;
- Supporting their classroom discussions to students with practical examples from the PRA findings.

The main objectives of the current PRA are:

1. empowerment of rural communities by assisting them to systematically utilize their local knowledge to identify problems and strengths, develop skills of analysis, and design appropriate mechanisms for intervention by themselves and/or by development agents;
 2. advancement of understanding by academicians/researchers of local knowledge and acknowledgement of the capacity of communities to gather data, conduct analysis, and identify as well as prioritize problems and solutions;
 3. utilization of the research questions/problems identified during the PRAs for further investigation;
 4. documenting and presenting the outcomes of the PRAs to development agents (governmental and non-governmental) and other stakeholders so that they could undertake interventions in line with the findings.
- PRA consists of a series of participatory exercises which help community members better assess their history, resources, and overall situation as concerns agriculture, health, marketing, credit, coping mechanisms, education, and other important areas. During the conduct of the PRAs, rural communities in the selected villages will gather information on the resources they already possess; organize their knowledge; share experience among themselves; learn from each other; identify and prioritize local development needs; and develop action plans which respond to these needs.

²Department of Agronomy and Plant Breeding, Shoushtar Branch, Islamic Azad University, Shoushtar, Iran. Email: Zahra_khodarahm@yahoo.com

ABSTRACT: The data for diesel fuel energy consumption on tillage, planting, cultivation, irrigation, harvesting and grain hauling as well as electricity for pumping water from wells obtained by questioners for four western provinces of Iran. The data was analyzed by SPSS software and then compared with the calculation results for the similar activities. Calculations were run for the worst case situation that is the hardest soil type for tillage, lowest forward speed and field efficiency for all. The results showed that the least energy consumption for every one of the practices was higher than the calculated figures; in some cases more than triple. The energy used for irrigation was the dominating. More energy was put into the water wells than for the hardest soil tillage. Statistics showed that the farmers in these provinces used 24.10-38.98 GJha⁻¹ to produce one hectare of irrigated wheat compared to 23.67 GJha⁻¹ calculated for the worst case. International data for semi tropical area in India for the drought years was cited as 15.289 GJha⁻¹ experimental data for energy consumption for every practice was separately analyzed and compared with the calculated figures. Tillage with an average coefficient of 57.38 lha⁻¹ and planting with an average 34.16 lha⁻¹ showed no significant differences between the provinces at 5% probability level. Energy coefficient for the other activities that is cultivation, irrigation, harvesting and grain hauling did show significant differences between some of the provinces. The average energy consumption for these activities was 1.045, 21.268, 1.406 and 2.99 GJha⁻¹ respectively. The worst case calculated values were 0.232, 18.813, 0.680 and 1.748 GJha⁻¹ respectively. The energy coefficient per ton of produced wheat was also obtained.

[Mansoor Behroozi Lar and Zahra Khodarahm Pour. Energy Coefficient for Irrigated Wheat Production Western Provinces in Iran. Journal of American Science 2011;7(6):78-83]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Energy consumption, Irrigated wheat, Energy coefficient, Western provinces, Iran

1. Introduction

The importance of energy consumption in agricultural is not only vital for reducing the production cost; especially with nearing WTO; to have competitive products but it shows the efficiency with which we use the technology. Knowing the energy coefficients makes us able to suggest the ways and means of reducing energy consumption.

Research on energy coefficient for strategic products and especially for wheat has not been accomplished so far in Iran. The Iranian organization of fuel optimization in agriculture is the first to conduct such a research. In a state wide project, experimental data were gathered by questioners from different provinces which were then analyzed statistically in this presentation for four of the provinces namely Hamadan, Kordestan, Kermanshah and East Azerbaijan. The results were compared with calculated values and international literatures. Calculations were run for an assumed worst case situation that is a hard soil, lowest field efficiency and speed for comparison with experimental results. Experimental data were obtained for different field activities namely tillage, planting, cultivation, harvesting and transport. The energy use for pumping water from wells being high

and costly in this semi arid region; was separately determined from the cultivation energy. Cultivation energy was thus divided into three components that are cultivation fuel consumption, irrigation fuel and electricity consumption. The calculations were performed accordingly and compared. The main objective of the research was to find out the mean energy consumption per hectare and per ton of wheat and comparing with the calculation results and international data. Such a comparison was necessary to determine the effectiveness of technology use in Iran.

2. Materials and Methods

Questioners were distributed to 30 farmers in each province but some of the returned answers were not valid. Thus SPSS analysis for unequal observations was used. The number of valid observations for each province is shown in second row of table 2. Calculation equations and methods were as follows:

2.1. Machine Operations

The fuel consumption for tillage as well as for other operations was calculated in two parts (1) energy for machine operation and (2) energy

for prime mover that is tractor. Drawbar power for plowing and converted into equivalent PTO power was calculated from the following equation (Hunt, 1995),

$$P_{PTOm} = w \times b \times v (7 + 0.049 \times v^2) / (0.96 \times 0.77 \times 10 \times 3.6) \quad \text{W}$$

$$= w \times b \times v (7 + 0.049 \times v^2) / 266(1)$$

here: P_{PTOm} = equivalent PTO power for drawbar power, kW

- w = working width of machine, m
- b = working depth, cm
- v = forward speed, km/h

$(7 + 0.049 \times v^2)$ = unit draft for a hard soil, Ncm^{-2}

The mostly used equipment in Iran for tillage (primary and secondary), planting, cultivation, harvesting and grain hauling have the specifications as outlined in table 1. The figures in this table were used for the calculations. The results are shown in the last column of the table 1.

The overwhelming tractors in Iran are MF285 with 47 kW PTO power (Anonymous, 2000). With the factory mounted weights, they weigh 3100 kg. (Nagy C.N. 1999) presented the following equation for fuel consumption of tractors per hour from Nebraska tractor test standards for tractors of 50-100 PTO hp (37.31-74.63 kW),

$$L / h = 4.93 + 0.199 \times 0.75 \times \text{required } P_{db} \quad (2)$$

which was used to calculate the hourly fuel consumption for tractor. Calculated power was divided by 2.60 kWhl^{-1} and divided by farm capacity to obtain the energy consumption in lha^{-1} (Anonymous, 2005 and Deere, 2001).

2.2 .Irrigation Water

About 49% of irrigation water in Iran is extracted from deep and semi deep wells and 51% from surface water sources such as rivers, Qanats and springs (Iran Water and Sewage Department, 2007). Out of all 458069 wells, 77.53% are diesel engine operated and 22.47% are operated by electric motors. Deep well is defined as one with dynamic depth of 75 m and flow of 23.5 Ls^{-1} and semi deep well as one with 20 m deep and flow of 11 Ls^{-1} . Assuming the water was extracted with the above proportional factors, surface irrigation efficiency of 0.35, and using equation (3), the energy coefficient for irrigation water was developed as in equation (4) which must be noticed that it is applicable only for Iran and under the above mentioned assumptions (Anonymous, 2008):

$$P_{\text{well}} = \frac{Q \rho g h}{1000 \times e_p \times e_t \times e_m} \quad (3)$$

$$E_c = 0.162 \text{ lm}^{-3} + 0.067 \text{ kWhm}^{-3} \quad (4)$$

Where: P_{well} = required power for pumping water from well, kW

Q = water flow, Ls^{-1}

ρ = water density, kgm^{-3}

g = 9.81

h = dynamic depth, m

e_p = pump efficiency = 0.8

e_t = transmission efficiency = 0.6 for diesel and 1 for electric motors

e_m = 0.85 for diesel engine and 0.9 for electric motor

E_c = energy coefficient per cubic meter of water drawn from wells.

The wheat net irrigation water need for different provinces were obtained from a NET WAT software (Anonymous, 2006) as shown in the first line of fourth row in table 2. The relevant fuel and electric energy was calculated and shown in the fourth and fifth row in table 2.

2.3. Statistical Analysis

Due to inequality of experimental data, a completely random design with unequal number of observations was used and analyzed by SPSS software.

3. Results

Mean experimental and calculated fuel for all operations and electricity for irrigation as per hectare and per ton are shown in table 2 and depicted by barographs in figure 1. The results for different operations were as follows:

3.1 Tillage

With minimum and maximum of 51.71 lha^{-1} and 61.35 lha^{-1} , no significant differences were observed between the provinces. However the least experimental data was higher than the maximum calculated value.

3.2 Planting

No significant differences were observed at 5% level between the provinces. The least fuel consumption coefficient of 28.82 lha^{-1} was more than twice the maximum calculated energy of 12.9 lha^{-1}

3.3. Irrigation

Net irrigation water need for the wheat (excluding any possible rain fall) for different provinces (Anonymous, 2006) and the relevant calculations are given in row seven in table 2. Significant differences were observed between the provinces with respect to energy use for irrigation. The fuel used in Hamedan and Kordestan provinces was less than the calculated

value while for the Kermanshah and East Azarbaijan was greater.

The lower consumption for the first two provinces may be attributed to their colder weather and more rain. Besides the dynamic head of the wells may be less and the flow rate greater than what was indicated by the Water and Swage Department of Iran and which was assumed in the calculation. No valid data was available on these two characters. However, the rather high yields in these two provinces may indicate that the water

was not a limiting factor. It may also be that more wells were operated electrically rather than by diesel engines. The low yield in Kordestan might have been the result of under irrigation as it is observed that the fuel and electric power consumption in this province is less than all other provinces.

The electric power usage of all the provinces was also greater than the calculated value.

Table1. Machine working specifications and energy coefficient

Machine	Working width (m)	Working depth (cm)	Speed (Kmh ⁻¹)	Field Efficiency %	Field Capacity (hah ⁻¹)	PTO Power Equivalent (kW) ⁻¹	Energy coefficient Lha ⁻¹
Moldboard plow	0.9	20	4	0.74	0.27	24.53	31.8
Tandem disk	3.6	10	8	0.77	1.66	42.40	6.8
Land plane	3.0	-	8	0.77	1.39	42.56	8.1
Total tillage							46.7
Sweep Cultivator	5 row	-					6.1
Broadcaster	10	-					3.1
disking	3.6	6	8	-	-	-	12.0
Seed drill	2.5	3-5					5.1
Grain combine	4.8	-					38.9
Trailer in farm	4 tones	-					32.8
Trailer on road	4 tones	-					13.2

¹power for prime mover included

3.4. Harvesting

No significant differences were observed between the provinces with respect to their harvest energy coefficients and yields except for the Kordestan province. The higher yield the more energy consumption may be expected but interesting enough, the fuel used in Kordestan with the least yield is significantly higher than the other three with higher yields. No reasonable analysis may be drawn in this regard except for inaccuracy of the data. The higher energy used in Hamedan and East Azarbaijan may be attributed to improper combine engine injector pump, tire pressure, and unsuitable forward speed.

3.5. Grain Hauling

Significant differences were observed between three provinces that is Hamedan, Kermanshah and East Azarbaijan while the yield were not significantly different. The only reason that can be assumed is their respective unequal distance from the silo where the wheat was delivered to. The lower fuel consumption for Kordestan was expected due to its lowest yield. The lowest energy consumption for East Azarbaijan despite its rather high yield could be

because of less distance of the farms from the silo.

3.6 Energy Coefficient per Ton

No significant differences were observed between the provinces except for Kordestan which was highly significant. This was expected because of its low yield, and the fact that its energy usage for the cultivation, electricity for irrigation, and harvesting was greater than the other provinces not to mention that its net irrigation water need was also higher.

4. Discussion

4.1. Tillage

The higher energy coefficient for this operation could be due to the following factors:

- Soil is mostly plowed dry because rain falls seldom at the time of plowing and irrigating the field to the its field capacity is not affordable.
- Tractor injection pump might have not been properly adjusted.
- Too much slippage.
- Improper tire pressure for prime movers.
- Improper use of tractor hydraulic system.
- Using foot pedal rather than hand throttle.
- Improper tillage depth adjustment.

Table 2. Calculated and experimental mean energy coefficient for the provinces, Lha⁻¹

* Figures with the same letter were not significant at 5% level.

Figure 1. Barographs for the Fuel and Electricity coefficient for different operations and provinces

4.2. Planting

The possible reason for high energy consumption in planting may be as follows:

- (a) Implementation of seed broadcasters instead of drill planters for which the farmer has to sow $1^{1/2}$ to twice as much grain as is recommended by expertise.
- (b) Improper overlap.
- (c) Extra disking needed with broadcasters to cover the seeds.
- (d) Heavy and hard soil.

4.3. Irrigation

Higher energy consumption may be accounted for the following factors:

- Inaccurate experimental data
- Unmatched prime mover with the flow rate and dynamic head of the wells.
- The recommended efficiency coefficients used in equation 3 might have not been suitable for the provinces.

4.4. Harvesting

A non significant difference for the three provinces that is Hamedan, Kermanshah and East Azerbaijan was expected because the crop yield differences were insignificant and it is harvested by custom operators. Combine contractors start harvesting from the south and move toward north of Iran. Three different routes are taken. One strip in the west bank, second in the central and the third in the east side of the country.

4.5. Grain Hauling

Higher energy coefficient per hectare may be expected for higher yields as it seen for the two provinces of Hamedan and Kermanshah but for East Azerbaijan with the highest yield, the usage is not only lower than these two provinces, but even less than the calculation. The reason as it was mentioned can be due to the less distance of the farms in this province from the silo. Other factors besides greater distance from the silo; such as improper maintenance of the tractors and trailers may be considered for higher consumption in the other provinces.

5. CONCLUSIONS

The energy coefficient per hectare and per ton for all provinces was higher than the related calculated value which might be lowered by rectifying the possible remedies. The mean energy coefficient in producing winter wheat for all the provinces was 31.52 GJha^{-1} and 430.77 lt^{-1} (equivalent to 16.37 GJt^{-1} (Srivatsava et al, 2001)) while for the same climate that is dry and hot places in India (Singh et al, 2002.) it has been 15.29 GJha^{-1} for morocco (Baali and Van Ouwerkerk, 2005.) and 13.96 GJha^{-1} and 19.58 GJha^{-1} for another part of India (Sidhu, et al, 2004). Slotze et al, 2000 extracted data for conventional Wheat production from three references with means equal to 17.33 GJh^{-1} and 3.10 GJt^{-1} .

Although the high figures of domestic energy coefficients may be due to the water supply but the mean machinery coefficient of 244.75 lha^{-1} versus the

128 lha⁻¹ calculated for the worst case indicates that it is not all the water supply to blame for. It can surely be caused by low technology knowledge in using implements.

Another argument may be that high energy usage is due to hard soil and dry plowing; but the energy coefficient for cultivation, harvesting and hauling grain are also higher than the calculated value. These operations do not depend much on soil hardness. It is therefore clear that the technology is not being used to its universal efficiency. Main reason for that could be due to low educational level of the machinery operators and poor maintenance of machinery.

A main source of rather low yield is the combine losses. High combine losses of at least 12.5% (Behroozi Lar et al, 1995) are either because of machine improper adjustment or the delay in harvesting or both. It is reported that in some places in the north east of the country the combine reaches there about 60 days after wheat maturity. One of the problems in the country is harvesting chaff rather than mixing it with soil. This is one of the reasons for hard soil which causes the increase in energy coefficient for soil working machines.

All experimental energy coefficients per hectare and per ton were higher than the related worse case calculation and much higher than the international references.

It was concluded that agricultural technology in Iran can not be beneficially used without teaching the machine operators, and the irrigation method should be changed from surface to pressurized one.

The project was completely supported by Iranian energy optimization in agriculture.

A method for detection and extraction of circular shapes from noisy images using median filter and CHTMasoud Nosrati ^{*1}, Ronak Karimi ², Hamed Nosrati ³, Ali Nosrati ⁴^{1,2} Young Researchers Club, Kermanshah Branch, Islamic Azad University, Kermanshah, Iran.^{3,4} Islamic Azad University, Kermanshah Branch, Kermanshah, Iran.minibigs_m@yahoo.co.uk

Abstract: One of the challenging topics in image processing is extracting the shapes from noisy backgrounds. There are some methods for doing it from different kinds of noisy backgrounds. In this paper, we are going to introduce another method by using 4 steps to extract circular shapes from impulse noisy backgrounds. First step is applying median filter to disappear "salt and pepper" noise. This step causes edge smoothing. So, as the second step, a laplacian sharpening spatial filter should be applied. It highlights fine details and enhances the blurred edges. Using these two steps sequentially causes noise reduction in an impressive way. Third step is using Canny edge detection for segmenting the image. Its algorithm is talked during the paper. Finally, forth step is applying Circular Hough Transform (CHT) for detecting the circles in image. At the end of paper different use cases of this method is investigated.

[Masoud Nosrati, Ronak Karimi, Hamed Nosrati, Ali Nosrati. A method for detection and extraction of circular shapes from noisy images using median filter and CHT. Journal of American Science 2011;7(6):84-88]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Extracting circular shape; median filter; laplacian filter; Canny edge detection; Circular Hough Transform (CHT).

1. Introduction

Extracting shapes from noisy backgrounds was always been a challenging problem in image processing. Recent studies represented some solutions, but no one could give 100 percent guaranteed results.

In this paper, we are going to introduce another method which is a combination of different filters and techniques. Our purpose is to achieve a better result in detecting the circular shapes within an impulse noisy background. Due to this, 4 steps are listed to be applied to image. First step is using median filter for removing impulse points in the image. These points have an absolutely different color from their neighborhood pixels, and they can have bad effects in the result of edge detecting process. So, median filter will be applied to remove them. Other implicit effect of this filter is smoothing the edges. It can make the edge detection harder and the have bad effects on the result. So, another filter that should be applied as the second step, is laplacian sharpen spatial filter. This filter causes the details become more impressive and the edges become clearer. An implicit effect of this filter is noise increasing in image, but we don't worry about it, because the next step will neutralize this effect. Now, it is time to detect the edges. Due to it, some methods were introduced like Sobel and Canny edge detection. Here, we employ Canny edge detection as the third step, because it has a better performance in detecting the thin edges and when the edges are not very sharp and clear. As the edges were detected, it is

time to extract the circular shapes. So, as the fourth step, we will employ Hough transform. In general it can be used for any type shapes. But this special form of this transform is called Circular Hough Transform (CHT).

We are going to investigate all of the mentioned steps in depth during the "Methodology" section. Then, special uses of this method will be talked in "Use cases", and finally "Conclusion" is placed at the end of the paper.

2. Methodology

In this section, we are going to explain the basic concepts of techniques which are used in this paper in details. Also, their application on the proposed image to extract the circular shapes will be investigated.

2.1 Median filter

One of the most efficient solutions for disappearing "salt and pepper" noises is applying median filter. Median filter belongs to the group of order static nonlinear filters. It could be easily used for erasing impulse noise. The process is that it replaces the value of a noise pixel with the median gray levels in the neighborhood of that pixel. It causes the impulse noise in the background be disappeared, but also an extra consequence is blurring the edges. This effect could be neutralizing impressively by applying the laplacian sharpening spatial filter [1].

2.2 Laplacian sharpening spatial filter

The purpose of using laplacian sharpening spatial filter is for highlighting fine details and enhance them which are blurred such as edges. As you know, laplacian is a linear and rotation invariant operator. Laplacian equation can be written for each dimension independently. Partial second-order derivatives in x and y directions could be calculated by (I) and (II).

$$\nabla^2 f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2}$$

$$\frac{\partial^2 f}{\partial x^2} = f(x+1, y) + f(x-1, y) - 2f(x, y) \quad (I)$$

$$\frac{\partial^2 f}{\partial y^2} = f(x, y+1) + f(x, y-1) - 2f(x, y) \quad (II)$$

$$\nabla^2 f = [f(x+1, y) + f(x-1, y) + f(x, y+1) + f(x, y-1)] - 4f(x, y)$$

$$g(x, y) = f(x, y) \pm \nabla^2 f(x, y)$$

A 3x3 laplacian mask which could be obtained is as Figure 1.

-1	-1	-1
-1	9	-1
-1	-1	-1

Figure 1. One pass realization of 3x3 laplacian mask

Result of its application is indicated in Figure 2 [1].

(a)

(b)

Figure 2. (a) Original image, (b) Sharpen image

Laplacian filter by itself causes the increasing noise in the image. But using it in consequence of median filter avoids from occurring this problem. Since the major part of noise is reduced in median filtering process.

2.3 Canny edge detection

Edge detection is an important topic in the research area of image analysis [2]. The purpose of edge detection in general is to significantly reduce the amount of data in an image, while preserving the structural properties to be used for further image processing. Several algorithms exists, and this worksheet focuses on a particular one developed by John F. Canny (JFC) in 1986 [3]. Even though it is quite old, it has become one of the standard edge detection methods and it is still used in research [4] [5].

The aim of JFC was to develop an algorithm that is optimal with regards to the following criteria:

1. **Detection:** The probability of detecting real edge points should be maximized while the probability of falsely detecting non-edge points should be minimized. This corresponds to maximizing the signal-to-noise ratio.
2. **Localization:** The detected edges should be as close as possible to the real edges.
3. **Number of responses:** One real edge should not result in more than one detected edge (one can argue that this is implicitly included in the first requirement).

The algorithm runs in 5 separate steps:

1. **Smoothing:** Blurring of the image to remove noise.
2. **Finding gradients:** The edges should be marked where the gradients of the image has large magnitudes.
3. **Non-maximum suppression:** Only local maxima should be marked as edges.
4. **Double thresholding:** Potential edges are determined by thresholding.
5. **Edge tracking by hysteresis:** Final edges are determined by suppressing all edges that are not connected to a very certain (strong) edge.

Figure 3 shows the result of applying this algorithm on an image [6].

Figure 3. Applying Canny edge detection algorithm to example image

Even though Canny algorithm involves smoothing process, but it doesn't dispel the need for using median filter. Because smoothing step just blur

the image and it causes the little noises to be smoothen. But median filter causes impulse noise to be disappeared.

2.4 Circular Hough Transform (CHT)

A commonly faced problem in computer vision is to determine the location, number or orientation of a particular object in an image. For example, recognizing of roads in an aerial image or detection of circles in the image are two samples of this problem. But it can be solved using Hough transform. Often the objects of interest have other shapes than lines, it could be paraboles, circles or ellipses or any other arbitrary shape. The general Hough transform can be used on any kind of shape, although the complexity of the transformation increase with the number of parameters needed to describe the shape [7].

The CHT has been recognized as robust techniques for curve detection. This method can detect object even polluted by noise. The CHT was sketched by Duda et al. [8]. The CHT is one of the modified versions of the HT. The CHT aims to find circular patterns within an image. The CHT is used to transform a set of feature points in the image space into a set of accumulated votes in a parameter space. Then, for each feature point, votes are accumulated in an accumulator array for all parameter combinations. The array elements that contain the highest number of votes indicate the presence of the shape. A circle pattern is described by (III).

$$(x_p - x_0)^2 + (y_p - y_0)^2 = r^2 \tag{III}$$

Where x_0 and y_0 are the coordinates of the center and r is the radius of the circle. An example of conventional CHT is shown in Figure 4.

Figure 4. The contribution of the edge points to the accumulator space

The black circles indicate a set edge points within the image. Each edge point contributes a circle of radius R to an output accumulator space indicated

by the grey circles. The output accumulator space has a peak where these contributed circles overlap at the center of the original circle. Modification to the CHT has been widely implemented to either increase the detection rate or reduce its computational complexity [9] [10].

The algorithm for Circular Hough Transform can be summarized to following steps [11]:

//HOUGH BEGIN

1. For each edge point

Draw a circle with center in the edge point with radius r and increment all coordinates that the perimeter of the circle passes through in the accumulator.

2. Find one or several maxima in the accumulator

//HOUGH END

3. Map the found parameters (r, a, b) corresponding to the maxima back to the original image.

After applying the median and laplacian filter, Canny edge detection and CHT, circular shapes will be achieved efficiently.

3. Use cases

A question which may be asked is "What are the uses of this method?"

Following items can indicate just a small part of use cases of proposes technique:

- Building extraction: Most of building extraction methods can specify the buildings with polygonal rooftops and they have a weak performance in detecting circular buildings. For example look at the method which was introduced by Masoud S. Nosrati et al. [12].
- Digital filming: While taking film from sport matches like football and volleyball it can be possible to trace the ball by enhancing this technique. It means that a simple camera can take film automatically by using a developed form of this method.
- Biometric security: One way for identification of people is using their iris characteristics. For detecting the iris area this technique can be used. Eyelashes act like impulse noise and the filters which are used in this technique can make the detection process easier and more accurate.

- Astronomy: Proposed method can be used for detecting the planets surrounded by narrow clouds and recognizing the black holes in the special dim images.

Many other use cases can be found in chemistry, physics, biology, computer science and other fields of study. Also, with a little change in this method, other shapes in different noise styles can be extracted.

4. Conclusion:

In this paper, we introduced a method for extracting circular shapes from impulse noisy images. Due to this, 4 steps were nominated which were:

1. Applying median filter for erasing the impulse noise.
2. Applying laplacian sharpening spatial filter for neutralizing the blurring effect of median filter and sharpen the edges in the image.
3. Applying Canny edge detection.
4. Applying Circular Hough Transform for extracting the circular shapes in the image.

At the end of paper, different use cases of this method was investigated.

A short paper on steps of designing an appropriate websiteMasoud Nosrati ^{*1}, Ronak Karimi ², Hamed Nosrati ³, Ali Nosrati ⁴^{1,2} Young Researchers Club, Kermanshah Branch, Islamic Azad University, Kermanshah, Iran.^{3,4} Islamic Azad University, Kermanshah Branch, Kermanshah, Iran.minibigs_m@yahoo.co.uk

Abstract: In the modern world that the lives are going to have an online aspect in addition to traditional life, having suitable websites for different purposes plays a big role in social communications. High quality communication is the product of good interaction, and a good online interaction is the product of a good website.

In this paper, we want to introduce some basic steps that can help to provide a guideline for designing a suitable website. We have tried to cover both technical and psychological aspects of a website. These steps are divided into 3 parts: pre-design, design, and post-design steps. Each one of them is consist of some steps that are described in details through the paper.

[Masoud Nosrati, Ronak Karimi, Hamed Nosrati, Ali Nosrati. A short paper on steps of designing an appropriate website. Journal of American Science 2011;7(6):89-91]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Website design; information systems; modeling website; publishing website.

1. Introduction

Nowadays, World Wide Web (www) plays a definite role in the human societies. Almost all the social relationships are going to have an online aspect in addition to traditional aspects. In this world having a suitable website helps to make high quality relationships and get a social higher level. But a major question witch may be asked is that "What are the steps of designing a suitable website?"

In this paper, we are going to answer this question in technical way. Here we are focus on the performance of the website. And we are not going to over talk on some common aspects such as: beauty, attraction, regularity, complexion, easy working, etc [1].

In the second section, we will get into the steps of designing a good website and each step will be described in details.

2. Steps of design

In general, we categorize the steps of a website design to the following sections. Then, we will investigate them:

Pre-design phase:

- Specifying the goals
- Collecting information about users and their needs
- Organizing the information
- Modeling

Design phase:

- Designing the interface
- Providing the contents
- Testing the website
- Publishing

Post-design phase:

- Supporting and maintenance

2.1 Specifying the goals

Before you start to work, you need to pay attention to an important point that is the goals of the website. Each website has a general purpose and may include some implicit goals, too. Specifying these goals help you to distinguish the way of design.

For example, a big e-shop website may include some goals such as: contributing, delivering, selling, etc. Knowing these goals helps to designer to consider different separated functions for doing each one. It may lead to scheme the website to some micro-sites that work together to obviate these needs. Also, it simplifies the general purpose of website and avoids the designer to face with complex relationships between different parts of website [2].

2.2 Collecting information about users and their needs

As the second step, you have to know that who your audiences are. Having some general information about users' community such as: age, gender, education, taste, needs, etc. can help you to provide more suitable contents.

Another important point is about hardware and user equipments. You have to determine the type of user hardware, in order to adapt the created website to it, and avoid placing some contents that user can't be able to use [3].

2.3 Organizing the information

The purpose of organizing information is to deliver the proper information to corresponding user.

There are some methods to do this. For example we can point out the following ones:

- *Tree structured information:* Using this kind of structure provides access levels for achieving information. It can be used for organic and multilevel user sites.
- *Pure linear structured:* In this type, pages that include information are in a sequential order and placed one after another. They show all of information to all of users in a sequential way.
- *Linear structured with alternatives:* In this type, user can select the path of movements between information by answering YES or NO to asked questions. This type can be used for some special parts of websites or for risk management systems.
- *Complex structured:* Combination of the above structures makes a complex structured information system. Almost all of big sites use this kind of structure.

2.4 Modeling

One of the important parts of website designing is modeling. It means that before you start to work by your computer, draw a model of website on the paper (or by drawing tools on the computer). It helps you to know what material you want to place in the pages and what kinds of information should be displayed. Also, location of each item will be set. This step gives you some ideas about interface of website, because you are not facing with computer limitations in this phase [4] [7].

2.5 Designing the interface

After drawing the model on the paper and making decision about the page style and contents, it is time of beginning to implementation. During the previous steps, you decided what you want to create and specified the characteristics of your website. Now, you have to make it. This step needs to your sufficient technical information and experience.

Remember that use optimized codes as much as possible to decrease the computing complexity. Speed is very important, and fast interfaces are very pleasant to users. Also, showing suitable help messages in appropriate locations of page can motivate users not to close your website in the browser, and return for other times [5].

2.6 Providing the contents

Providing information is the most important part of the website design. It should be tried to organize the information in the best way. Due to this, optimization and categorizing are some useful techniques that can help to provide a suitable content

[6].

Generally, it should be tried to deliver the best content to user in the easiest way. Content should be in a suitable meaningful form so that the meaning can be easily received by the user. It should convey the concepts in the best form [7].

2.7 Testing the website

When you create a website, you have to be aware of its performance. Function of websites in the real world uses should be evaluated before publishing.

As the basic testing, you can check out all the links in the pages. Also, multimedia contents should be covered.

Another important point is the various platforms that users have. One step of testing is to check the website on different web browsers. Website should be designed so that has a similar output on the different platforms and browsers. Always consider the most common browsers like Internet Explorer, Firefox and Opera. Your website should have similar results on all of them.

Other important point is considering the network traffic. It should be tried to use optimized techniques that high traffic of website doesn't defect on the performance [8]. Heavy traffic causes reducing the speed of website and also it may crash.

2.8 Publishing

Previous steps give some guidelines to create a proper website with a suitable interface and good performance. After creating the pages, it is time to publish the website in the internet. An important point which should not be neglected is that you should choose an appropriate host and domain. Your host must support the traffic of your site and it must provide a sufficient bandwidth. Host should be always on and never off. Interruption in servicing is not pleasant to users. Also, the domain that you choose should be related to the name and title of website. It has to be short and easy to remember as much as possible.

2.9 Supporting and maintenance

Supporting is the important post-creating activity that is done by designer. Each website needs to be refreshed from time to time. It is very important to update the content and improve the positive features of website. The purpose is to avoid losing audiences, because users like diversity.

Don't forget that a website is like a plant that grows and goes up everyday, and you have to look after it, in order to have the best fruits [9] [10].

3. Conclusion

In this paper, we talked about basic steps for designing a good website. Due to this, we divided these steps to three parts: pre-design, design, and post-design steps. Then described all of them and told our reasons and advices on each one. The steps including: specifying the goals, collecting information about users and their needs, organizing the information, modeling, designing the interface, providing the contents, testing the website, publishing and supporting and maintenance, were described in details during the second section of the paper.

minibigs_m@yahoo.co.uk

Abstract: In this paper, we intend to introduce a new heuristic algorithm to apply maximum minimization to Boolean functions with normal SOP form. To implement the proposed algorithm, we use the graph data structure and define the adjacencies. Also, we demonstrate some conditions to achieve the maximum minimization. Through this paper, the problem of shared vertices in more than one adjacency is talked, and the solution is presented. Karnaugh map is used to clarify the matter.

[Masoud Nosrati, Ronak Karimi, Hamed Nosrati, Ali Nosrati. An algorithm for minimizing of Boolean functions based on graph data structure. Journal of American Science 2011;7(6):92-96]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Minimization of Boolean functions; Graph data structure; SOP functions; discrete mathematics.

1. Introduction

Minimization of Boolean functions is one of the basic operations in Boolean algebra [1]. This is also useful in digital circuits design [2], and it was been regarded to decrease the price of manufactured circuits by removing extra gates [3,4]. In this paper, we present an algorithm to minimize the Boolean functions extremely. We use the graph data structure to implement this algorithm.

Before it, some methods and algorithms was introduced like "Factoring Boolean functions using graph partitioning" [5] or "A Heuristic Method of Two-Level Logic Synthesis" [6]. These methods are absolutely heuristic, and they don't give the maximum minimized form of Boolean function all the time. The method that we are going to introduce is a simple way to reach the maximum minimized form of Boolean function. Also, it could be used in education, because of its simplicity.

In second part which is entitled as "Graph data structure and agreements", the structure of proposed graph and its objects and methods will be talked. In addition, some agreements are presented which are considered during this paper. In third part that is named "SOP functions and graph", the relationship between SOP functions and graph data structure is objected. Furthermore, the conditions of minimization of function by proposed graph are demonstrated. In "Minimization algorithm", that is forth part of this paper, the algorithm of minimization and its description is presented. Eventually, "conclusion" is places as fifth part.

2. Graph data structure and agreements

First time, graph has been used for solving the classic problem of Königsberg bridges by

Leonhard Euler in 1736. After that, graph came into mathematics world [7].

A graph is constructed of two sets, V (vertices) and E (Edges). For example, look at Figure 1.

Figure 1. A simple example of graph

A path in graph is a set of vertices we should cross to get to a special vertex. If the initial and final vertices are the same, this path is called cycle, and if all the edges in a cycle are met just one time, it is called a simple cycle [8,9,10].

According to these definitions, there is one simple cycle in Figure 1, which is $\{1,2,4,3\}$. Here, we make two agreements and describe the reason in third part of paper.

Agreement1: Each vertex makes a simple cycle by itself.

Agreement2: A couple of adjacent vertices make a simple cycle.
(Adjacent vertices are those which are related by an edge.)

According to these agreements, the simple cycles for Figure 1 are like below:

```
{1}, {2}, {3}, {4}, {5}
{1,2}, {1,3}, {2,4}, {3,4}, {4,5}
{1,2,4,3}
```

Now, we can implement the class of proposed graph data structure [11,12]. This class contains some objects to store V and E , and also some methods to create and remove vertices and edges [13,14]. In addition, there is a method that returns the list of all simple cycles which begins with V_i . Another method is defined to return the number of all adjacent vertices of V_i , too.

Class Graph

```
{
  //Objects
  // Data containers to store Vertices and Edges

  public:
  Graph();
  // To create an empty graph
  bool IsEmpty();
  // If graph has no vertices returns TRUE(1), else
  // returns FALSE(0)
  void AddVertex(Vertex V);
  // Insert a new vertex
  void AddEdge(Vertex U, Vertex V);
  // Insert a new edge between u and v
  void RemoveVertex (Vertex V);
  // Deletes v and all edges incident to it
  void RemoveEdge(Vertex U, Vertex V);
  // Deletes edge (u,v)
  list Cycles(Vertex Vi);
  // Returns the list of all cycles that begins with Vi
  int AdjacentVertices(Vertex Vi);
  // Returns the number of adjacent vertices of Vi
}
```

3. SOP functions and graph

Boolean functions are used for indicating the performance of complex two-level circuits with AND - OR gates. These functions could be shown in normal SOP (Sum Of Products) or POS (Product of Sums) forms [15,16,17]. We aren't going to talk about algebraic concepts or the way of generating SOP or POS forms. Just propose that we have a SOP function which should be minimized.

There are different ways to minimize SOP functions. One is using the algebraic rules, which is hard and confusing for large functions with many variables. Another is using Karnaugh map. It could be used for functions with 2 to 6 variables, by drawing the map of adjacency. In fact, Karnaugh map is an illustrative form of truth table. It puts the adjacent statements near each other and provides the opportunity of selecting appropriate adjacency.

Figure 2 shows the Karnaugh map for 4-variables Boolean functions. In this map, different states of variables are showed by 0 and 1 [18].

0000	0001	0011	0010
0100	0101	0111	0110
1100	1101	1111	1110
1000	1001	1011	1010

Figure 2. Karnaugh map for 4-variables Boolean functions

It is seen that each two adjacent cells has one different bit. In other word, the XOR of two adjacent cells equals 2^r , $r=0,1,2,\dots$

Consider that function (I) should be minimized by this map. By replacing the variables with 0 and 1 (function (II)), its Karnaugh map will be as Figure 3.

$$(I) \\ f(w,x,y,z) = w'x'yz' + w'xy'z + w'xyz' + w'xyz + wx'yz' + wx'yz + wxyz'$$

$$(II) \\ f(w,x,y,z) = 0010 + 0101 + 0110 + 0111 + 1010 + 1011 + 1110$$

Figure 3. Karnaugh map for function (I) with appropriate adjacencies

In Figure 3, appropriate adjacencies are selected, and minimization operation - which is remaining similar bits and removing the others [19] - is done. Essential condition to choose an appropriate adjacency is defined as (*).

(*)

The number of cells in an adjacency should be equal to 2^k , $k=0,1,2,\dots$ and no similar bits equal to k .

Another point which should be regarded is that always the biggest adjacencies that contain more cells should be selected, in order to make the function more minimized, by reducing more different bits [1,18]. Also, it should be paid attention that in functions with complete statements - where all statements are present - minimized function equals to 1.

It is seen that minimized function (I) will be like function (III).

(III)

$$f(w,x,y,z) = yz' + w'xz + wx'y$$

Suppose that f_v is a desire Boolean function. It could be adapted to graph data structure, if for each statement in it, create a vertex and show adjacencies by edges. For example, Figure 4 shows the graph of function (I).

Figure 4. Graph of function (I)

To minimize the function of this graph, first the biggest appropriate adjacencies should be found for each vertex. It has to be done regarding agreements 1 & 2. Now, you can find out the reason of making these agreements. Minimization is operated according to the adjacencies (not vertices), so for each alone vertex, an adjacency should be considered. For two adjacent vertices it has to be done, too. In mathematical definition of simple cycles in no directed graphs, simple cycles with less than 3 vertices are not defined [5,9].

Regarding condition (*), Table 1 shows the biggest simple cycles in graph of Figure 4.

Vertex	Simple cycle (*)	Minimized
0010	0010-0110-1110-1010-(0010)	yz'
0101	0101-0111-(0101)	$w'xz$
0111	0111-0101-(0111) 0111-0110-(0111)	$w'xz$ $w'xy$
0110	0110-1110-1010-0010-(0110)	yz'
1110	1110-1010-0010-0110-(1110)	yz'
1011	1011-1010-(1011)	$wx'y$
1010	1010-0010-0110-1110-(1010)	yz'

Table 1. List of biggest cycles of graph Figure 4 regarding condition (*) for each vertex

For vertices *0010*, *0110*, *1110*, *1010* cycles are the same. Consequently, the minimized forms are similar, too. For vertex *0111* two appropriate adjacency is available. In other word, the biggest cycle is not unique. If both of them be involved in final minimized function, then one extra statement is imposed to it. So, one of them must be chosen as below:

If vertex V has more than one biggest cycle regarding (*), choose the adjacency that its first vertex (next to proposed V) has less adjacent.

In our example, vertex *0111* has two adjacent *0101* and *0110*. First one has 1 adjacent vertex, and second has 3. So, first one has to be chosen and $w'xz$ should appear in final minimized rather than $w'xy$.

The reason is when you choose the path which its first vertex has less adjacent, probability for this vertex to be included in other adjacencies is less, and if it has no other adjacent vertices, it couldn't participate in minimization operation. So, to make sure that it never happens, choose the path with less. But, if the number of adjacent vertices for both of them was equal, then you can choose one randomly. Because, they have similar circumstances and it doesn't differ that which one is selected.

4. Minimization algorithm

To implement the maximum minimization on the introduced graph, the algorithm in below is offered.

// ----- *Minimization algorithm based on graph data structure* -----

```

Create Graph of Boolean function;
If all the vertices and edges are present then return 1;
Else
{
  For each vertex V
  {
    Find biggest cycles with the condition (*);
    If biggest cycle is not unique then
    {
      Find the num of adjacent vertices of first vertex next to V in path;
      If the numbers of adjacent vertices are equal then
      Choose one randomly;
    }
    Else
      Select the path with lest adjacent vertices for its first vertex;
    }
    Minimize (take the similar bits and reduce others);
    Store the minimized forms;
  }
  Reduce the repeated minimized statements;
  Return the minimized function;
}

```

First, it creates a graph according to Boolean function. Then, it checks whether the function is complete, return 1. Else, find the biggest cycles for each vertex, and if it wasn't unique, choose the appropriate one. After that, minimizes the adjacency by taking the similar bits and reduce others. Then, it stores the minimized form. When these steps were done for all the vertices, some statements will be created per vertices (as you see in Table 1). After reducing the repeated ones, final minimized function will be achieved and returned.

5. Conclusion

In this paper, we introduced a new heuristic algorithm to apply maximum minimization to SOP Boolean functions. Therefore, graph data structure as the essential base of this algorithm was defined, and two agreements were made which forked from the difference between mathematical definition of simple cycles and what we need for our object. Then, the method of minimization was talked, which used the concepts of Karnaugh map. Finally, the algorithm of minimization presented.

Embedding stego-text in cover images using linked list concepts and LSB techniqueMasoud Nosrati ^{*1}, Ronak Karimi ², Hamed Nosrati ³, Ali Nosrati ⁴^{1,2} Young Researchers Club, Kermanshah Branch, Islamic Azad University, Kermanshah, Iran.^{3,4} Islamic Azad University, Kermanshah Branch, Kermanshah, Iran.minibigs_m@yahoo.co.uk

Abstract: In this paper, we intend to introduce a steganography algorithm for embedding a message into a RGB 24-bit color image. It will be done by using the concepts of linked list data structure. It will help us to achieve some important advantages. First, we can create a “stego-key” by the address of message blocks. Second, it makes the detection of message harder. Also, there will be other benefits that are mentioned during the paper.

Another point about the presented algorithm is the flexibility. For example, it could be written in recursive way. To prove it, we wrote a recursive function called “Read()” for extracting the message from the cover image. At the end of paper, characteristics of this algorithm will be talked.

For embedding data, LSB (Least Significant Bit) technique is been used.

[Masoud Nosrati, Ronak Karimi, Hamed Nosrati, Ali Nosrati. Embedding stego-text in cover images using linked list concepts and LSB technique. Journal of American Science 2011;7(6):97-100]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Steganography; secure communication; data covering; carrier image; linked list; LSB.

1. Introduction

On line facilities are closely tied with the issues concerning availability, integrity, confidentiality and authentication of information exchanged over communication media, which has lead to the evolution of information hiding techniques for securing communication [1]. To do this, one of the common strategies is using steganography algorithms. The word steganography is derived from the Greek words “stegos” meaning “cover” and “grafia” meaning “writing” defining it as “covered writing” [2]. Steganography is one such pro-security innovation in which secret data is embedded in a cover [3]. In other words, steganography is the process of hiding a secret message within a larger one in such a way that someone cannot know the presence or contents of the hidden message. Although related, Steganography is not to be confused with Encryption, which is the process of making a message unintelligible - Steganography attempts to hide the existence of communication [4]. The notion of data hiding or steganography was first introduced with the example of prisoners' secret message by Simmons in 1983 [5].

In steganography we are faced with two types of components: message and carrier. Message is the secret data which should be hidden; and carrier is the context that hides the message in it. Carrier can be of any types of data such as text, image, audio, etc. Message with embedded hidden information is called “stego-text” [6].

In this paper, we are going to hide a binary message in an image as the carrier material which we call it “cover image”. Message will be embedded

sporadically with a structure like linked list, and random locations of its data blocks. By this, we are going to achieve two important goals:

- a) Make the detection of message harder to gain to stricter security.
- b) Create a security key for extracting message. Since the head of the message has a random location in the cover image, so the initial address of it can be used as a key.

For embedding the message in a 24-bit RGB image, we use the LSB (Least Significant Bit) technique. So, in the second section which is titled “Background” we will talk about basic concepts about RGB color space and the LSB technique fundamentals. In the third section that is named “Linked list structured message embedding”, we will get into the structure of message and the number of pixels needed to store it. Main part of this section is devoted to embedding algorithm. In the fourth section, titled as “Discussion on features” we are going to talk about the characteristics, advantages and uses of this technique. Finally, “Conclusion” is placed in the end of paper.

2. Background

An image can be represented by a collection of color pixels. The individual pixels are represented by their optical characteristics like “brightness”, “chroma” etc. Each of these characteristics can be digitally expressed in terms of 1s and 0s [7]. There are different color spaces that present different forms for storing images. A color space is a method by

which it is possible to specify, create and visualize color [8]. The most common color space among all is RGB (Red, Green, Blue). Each pixel in a 24-bit bitmap image in this space is described by 3 sets of 8 bits (3 bytes), that each set contains the intensity value of individual red, green and blue. Combination of these values forms the characteristics of the pixel. Figure 1 illustrates this matter.

Figure 1. A pixel in RGB color space

Least Significant Bits (LSB) insertion is a simple approach for embedding information in image file. The simplest steganography techniques embed the bits of the message directly into least significant bit plane of the cover image in a deterministic sequence. Modulating the least significant bit does not result in human-perceptible difference because the amplitude of the change is small [9]. To hide a secret message inside an image, a proper cover image is needed. Because this method uses bits of each pixel in the image, it is necessary to use a lossless compression format, otherwise the hidden information will get lost in the transformations of a lossy compression algorithm. When using a 24-bit color image, a bit of each of the red, green and blue color components can be used, so a total of 3 bits can be stored in each pixel. For example, the following grid can be considered as 3 pixels of a 24-bit color image, using 9 bytes of memory:

```
(00100111 11101001 11001000)
(00100111 11001000 11101001)
(11001000 00100111 11101001)
```

When the character A, which binary value equals 10000001, is inserted, the following grid results:

```
(00100111 11101000 11001000)
(00100110 11001000 11101000)
(11001000 00100111 11101001)
```

In this case, only three bits needed to be changed to insert the character successfully. On average, only half of the bits in an image will need to

be modified to hide a secret message using the maximal cover size. The result changes that are made to the least significant bits are too small to be recognized by the human visual system (HVS), so the message is effectively hidden [10].

As you see, the least significant bit of third color is remained without any changes. It can be used for checking the correctness of 8 bits which are embedded in these 3 pixels. In other words, it could be used as “parity bit”.

3. Link list structured message embedding

In this section we are going to embed the message in cover image with a structure like what linked lists place in the memory. As you know, linked list is a data structure like an array, but the most important difference between them is in their placement in RAM. Arrays sit in sequential order of memory places, but linked lists get sporadic addresses, and each item (which is called “node”) stores proposed data and also the address of the next item in the memory [11]. Using this concept, we will embed the separate bytes of message sporadically in cover image, so that, address of the next byte far apart in the image be placed just after embedding each byte. By this, two advantages will be achieved: First, non sequence of message structure makes the detection harder, and it increases the security level. Second, the address of first byte of message could be used as stego-key. As you know, while working with linked lists, always the address of first node is stored in a pointer for accessing the linked list data. Losing this address means losing the data stored in linked list. So, we can take this concept to work in steganography for creating a key for message. Figure 2 shows the structure of message in the cover image.

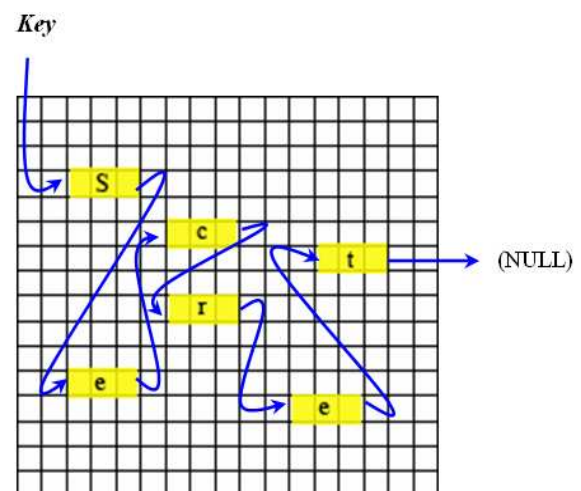

Figure 2. Embedding a linked list structured message in cover image

Another important point we have to consider is about the random location of message bytes. Each image provides a 2 dimension (X, Y) space for putting the message in it. Now, what we need is an algorithm to generate the address of no repeated locations. There are some algorithms for it. For example, you can suppose the image as a simple 1 dimension array, and then do the block scheming. Each block can be a set of pixels for storing a byte of message and also some extra pixels to store the next byte address. The number of pixels in a block depends on the size of image. For an image with $x*y$ pixels, following equation can be used to determine the number of pixels needed for storing the address:

$$(I) \quad p = \left\lceil \frac{k}{3} \right\rceil : x * y \leq 2^k$$

That p is the number of pixels for address. There are $(x*y)$ items that should be addressed. So, we need k bits so that $x*y \leq 2^k$. It can be concluded that the number of pixels will be equal to p in (I).

For example, suppose that there is a $20*30$ pixels image. For addressing:

$$20 * 30 \leq 2^{10}$$

$$p = \left\lceil \frac{10}{3} \right\rceil = 4(\text{pixels})$$

So each block in this image should contain 3 pixels for a byte of message, plus 4 pixels for address of the next byte.

After block scheming, now you can use the random numbers generation algorithms to choose the blocks for storing data in them. We aren't going to describe these algorithms. Just suppose that there is a function which is named "*RandomBlocks()*" and it does the block scheming and random block selection. For more information about generating random numbers see [12].

Here, we present an algorithm for embedding the message in a cover image with linked list structure. It is done by a function which we call it "*write()*".

Class block

```
{
    block(); // Constructor
    void SetData(byte); //Sets the byte for data part of current
block
    void SetLink(block); //Sets the block for link part of current
block
    byte GetData(); // returns the Data part of current block
    block GetLink(); // returns the Link part of current block
    block GetAddress(); // returns the address of current block
}
```

function Write(message)

```
{
    new=RandomBlock();
    new.SetData(First byte of message);
    key=GetAddress();
    previous=new;

    for each byte in message // From second byte
    {
        new=RandomBlock();
        new.SetData(byte);
        previous.SetLink(new.GetAddress());
        previous=new;
    }
    previous.SetLink(NULL);
}
```

For reading the message a recursive algorithm is presented. It is done by *read()* function. While calling this function for the first time, *key* should be sent as a parameter of this function.

byte Read(block)

```
{
    if (block.GetLink==NULL) return block.GetData();
    else return read(block.GetLink);
}
```

4. Discussion on features

In this section, we are going to get into the characteristics of this algorithm. So, the following lines can be pointed out:

- Presented algorithm can be used for any kind of message embedding such as text, images and even the files; because all of them can be reached in bytes form.
- Considering equation (I), maximum bytes of the message that can be embedded in an image with $x*y$ pixels (n_b) is calculated as follow:

$$(II) \quad n_b = \frac{\sum(\text{pixels})}{p+3} = \frac{x * y}{p+3}$$

- It is easily possible to add new blocks of data in the chain of message. Also, removing them could be done easily.
- More than one message can be embedded in a cover image. It means we can have more than one chain of message with different keys. This feature could be very useful when the receiver of message is more than one, and each of them should receive their own message.
- This algorithm can be used as a layer of programming in the process of securing data.

5. Conclusion

In this paper, we talked about basic notions of steganography and also took a look at LSB embedding technique in RGB 24-bit color images. After that, a way for image block scheming was introduced, in order to create a structure like linked lists. Also, some rules were defined to set the size of each block. It was mentioned that the goal of block scheming was creating stego-key and making the detection of message harder. Finally, the algorithm for embedding the message was presented, and its characteristics were talked.

Abstract: User interface is a general connection tool for getting the request of user and give back the responses. A special type of user interface is GUI (Graphical User Interface), which is very important in computer world, and you can't find any application without it. Designing a suitable GUI is definitely an important part of designing any application. Due to this, there are some principles that help to create an appropriate GUI. In this paper, we are going to talk about the necessity of a suitable GUI for an information system. So, the goals of GUI will be investigated. Then we will get into common characteristics of a proper GUI.

[Masoud Nosrati, Ronak Karimi, Rahin Karimi, Hamed Nosrati. Investigating the basic principles for proper GUI design. Journal of American Science 2011;7(6):101-105]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: User interface; Graphical User Interface; GUI; GUI Purpose; information system; information display.

1. Introduction

When the computers came to existence world faced to impressive developments in various fields of science and industry. Consequently, the societies faced with giant revolution in technology. These changes had many effects on the people lives. These advances went to where that computers and information technology got a definite place in everyday life. One of the important outcomes of these advances is information system. Information system is an integrated set of components for collecting, storing, processing, and communicating information. Business firms, other organizations, and individuals in contemporary society rely on information systems to manage their operations, compete in the marketplace, supply services, and augment personal lives [1]. Designing of User Interface is an important part of designing an information system, and it involves the design of computers, applications, mobile communication devices and websites with the focus on the users integration and experience [2] [3]. It includes a wide range of projects from computer systems to cars and commercial planes. All of these projects require some skills and knowledge for the end-user [4] [5]. One of the most challenging matters in this field is the need for principles for designing an appropriate Graphical User Interface (GUI) for information systems and databases full of information. In this paper, we are going to represent some guidelines for designing a user friendly GUI according to technical and psychological bases.

2. Aims of UI design for a special information system

In this section, we will cover some basics which show the goals and consequently the way for

designing a user interface. First, we will talk about types of a user interface and then get into some principles that clarify the general purpose and policies of user interface design.

2.1. Types of user interface

Generally, there are two types of user interfaces which are listed and investigated below [6]:

- Standard User Interface (SUI): In this type, view and user friendliness of user interface is less important and the performance is the main measure. UIs from this type are suitable for applications which are designed for experts.
- Graphical User Interface (GUI): This type is used for the general purpose heterogeneous audience applications. It is based on graphical features and computer vision.
- As the first step of UI design, you have to decide which one to use. SUI is out of the contents of this paper, because we are going to investigate the features of a user friendly UI and it goes to GUI design.

2.2. User community cognition

Recognizing the users is an important step in GUI design, so that Hansen [7] nominates it as the first essence of user engineering.

To design an influential GUI, first the detailed information about user community should be taken, such as gender, age, education, taste, type of needed information, width and depth of information, etc [8] [9]. Different people have different tastes. Analyzing information about users in order to find

some alike taste points causes to achieve guidelines for designing GUI. It is enough clear that main goal of GUI is to have a better interaction with user [10] [11]. So, recognition of what user wants helps to close this goal.

2.3. Information System tasks recognition

After user community cognition, the tasks of information system should be specified. An information system must be known in order to determine the needs, outcomes and facilities that it can provide [12].

Another important point is basic information providing. According to the content information, there should be ways for uninformed users to improve their knowledge about the content. It means that basic information of the content information should be available through GUI for users that have less knowledge; or at least nominate some resources including books, papers, guidelines, etc for them. It has to be tried to help users to spend less time to find information about content. A GUI designer is most known about the essential information which a common user may need, so he/she should consider it during the design.

3. Common characteristics for an appropriate GUI

Nowadays information systems with huge databases are increasing all over the world and each one has an individual GUI. They have their own audiences and applications. But one matter is the same among all of them. That is trying to have better interaction with users to close the user to information which he need. The quality of this interaction is specified by the GUI. A good work that can be considered through GUI design is asking users about their needs. It is often neglected that applications provide a questionnaire to collect the users' ideas. But it can help to make a more user friendly GUI. So, always try to have a feedback facility to get your audience ideas. It helps to discover weak and powerful parts of your work [13]. Furthermore, there are some guidelines that can help to design a proper GUI for applications, which are listed below:

3.1. Information display page

The page that shows the result of queries is probably the most important part of GUI. Shires and Olszak [14] who are pioneers of this field state the following tips for designing a good information display page:

- An ideal page should follow the suitable vision rules such as: balance, regularity, sequence, etc.

- Using space between the sections and paragraphs.
- Putting the different parts of GUI in recommended places. For example, it is better to place the search box in top of page and show the queries in middle.
- Observing punctuation and using suitable fonts.
- Using sequence of pages in place of cramming information in a long volute page.
- Integrating information by putting all information about a special subject in one page.
- Indicating information directly.
- Categorizing the information.
- Labelling the pages and all the items in it.

3.2. Visual components of GUI

Basic visual elements are: dots, lines, shapes, color, texture, and surface which are seen in all views. Regarding the impressive role of visual elements which includes main part of human reception [15], it is recommended that all the subjects that are used to guide user be through images, animations, diagrams and other visual elements. Non-textual materials can help users to comprehend easier, faster and more efficient. Also, it avoids users from boring and eyes fatigue. Less text should be used for help section, because it is time consuming and boring.

Graphical balance of the page is very important. Background, color, font, style, etc. should be selected carefully, so that it be readable, easy to understand and attractive [16].

3.3. Colors

Color scheming is one of the most important parts of GUI design. Different colors can impress emotions in different ways. So, they should be consciously used through design [17]. Shneiderman states that more than 7 colors should not be used in a page [18], but Galitz is for with 4 colors [19].

Another point about color scheme is that users who are suffering from vision problems should not be forgotten. Studies ([20], [21], [22], [23], and [24]) have found that the majority of computer workers experience some eye or vision symptoms [25]. To help these users, colors with high contrast can be used. Observing color conflict, contrast in darkness, contrast in hot or cold colors, supplement conflict, simultaneous conflict, quantity and quality conflict are other solutions [26].

3.4. Symbols

Using the symbols makes the screen more attractive, and users like to see familiar symbols in the page. It helps them to percept the concepts through visual symbols, instead of reading the words. But it should be paid attention that placing unfamiliar or expert symbols for novice users might be confusing. So, these symbols shouldn't be used in wide, and they must be supported by a textual guide as tool tip or any thing else. Rogers believe that establishing a meaningful connection between the symbol and the concept in the unfamiliar user's mind causes some problems [27]. In addition, symbols can cross the language fronts and convey the meaning through visual elements. So, Russo and Boor are concerned about the different meaning of symbols in different cultures [28]. Also, using the symbols may lead to appearing symbolic languages. For example, using triangle in players means "Play", so using the double triangle embodies "Double speed play". For integrating the symbols, ISO suggests some guidelines [29].

3.5. Buttons and options

Users intend to achieve information with only few clicks on buttons and options. It should be tried to avoid design messy pages as it is possible. Crowded pages make users confused and unmotivated to continue. It is better to use key options in page and hide other options under a menu or extra options button. Information should be delivered to user as soon as possible.

Captions of buttons and other option links are very important. They can be self guides to assist the users. Appropriate labels can help user to send what he wants to application and consequently, he can take the best results close to what he want. There should be some buttons to load some pages which contain a brief form of information page. It helps user not to face with a huge mass of information and be able to distinguish the information he really needs [30].

3.6. Application messages

Messages exported from GUI have an impressive role in acceptance feeling of users. Choosing suitable words is very important. Also, error messages that convict user for the mistakes can be confusing and cause nervousness. These messages should be in guidance form to prevent novice users from anxiety. Shneiderman [18] reminds the following features for GUI messages:

- Containing useful tips for users
- Positive tone
- User oriented

- Appropriate wording
- Using no similar messages for different goals
- Considering multilevel users
- Integrity in literary form, words and abbreviations
- Correcting the error by the software as much as possible

3.7. Help

Help is a part of GUI that provides the opportunity of learning through working with application. Branjnik et al. believe that help should be designed strategically and based on conceptual model to include the knowledge in it [31]. Trener categorizes the questions that might be asked by the users as follow:

- What is my mistake?
- Is my act true or false?
- Where am I and then what should I do?
- How do I do?
- How can I get information?
- Why information system faced with problem? [32]

Placing help section in the application pages, is necessary, with the condition that information be comprehensive and sufficient and be able to answer to these questions in a clear way.

3.8. Fast response

Slow response from application leads to dissatisfaction of users. GUI designers should pay much attention to this point that users intend to achieve information in the least time. Even though the novice users have much stamina, but common and professional users can't undergo to lose time.

In some cases that limitation of hardware causes slow speed of actions, GUI designer can create some solutions. The least thing that designer can do is determining the time of each action and inform it through showing appropriate messages. Response time is defines as expectation of user about necessary time for completing an action, which is based on previous experiences of user. Generally, Shneiderman states that following factors effect the user's expectation:

1. Previous experiments
2. Personality differences of users
3. Functional differences [18]

3.9. Interaction of user and information system

The best GUIs are so designed that are able to response different request of their users. It is

recommended that GUI make users to interact with database directly. So, in database applications the tool of this interaction should be provided. One of the best tools which can be used is search box. User can specify what he wants exactly by this tool. Search box should have varied options to give opportunity for searching through all kinds of resources. Also, messages that are exported from search box should be clear and fluent. Generally, every tool that makes the interaction more powerful must be used in GUI design. Remember that users will be motivated only if they feel the interaction [33].

3.10. Target Platforms

Designed GUI is going to run on a target platform. Target platform might be some kinds of portable devices such as mobile cell phones, PDAs, laptops, etc. It is very important to observe some limitations of these devices such as screen size, keypad limitations, etc. Another important point is observing the energy-efficiency factors to avoid using so much battery energy [34].

3.11. Beautiful environments

Human is a beautiful friendly creature and beauty has an undeniable role in his life. Nowadays, computer graphical tools help to create beautiful images. Using this beauty through GUI design helps to the user motivation to return to the application for more other times. Paying attention to following tips is very effective to design a pretty GUI:

- Coherent page layout
- Using suitable colors and fonts
- Embedding related animations (but don't use them so much)
- Using related images and symbols and place them in recommended places
- Margin scheming
- Paying attention to psychological principles [35]

4. Conclusion

In this paper, first the aims of a user interface were talked. Then some considerations were investigated to clarify the way of GUI. They were "Types of UI", "User community cognition" and "Information system tasks recognition". Specifying these subjects helps to achieve general purpose of GUI function for the special applications.

After finding the function of GUI, it was turn to design. There have investigated some common features that can improve the user friendliness of a GUI. They were: Information display page characteristics, visual components of GUI, effect of colors, symbols characteristics, buttons

and options, messages, help of software, effect of fast responding, importance of interaction between user and information system, target platform considerations and beauty.

Abstract: In this paper, we are going to introduce different types of steganography considering the cover data. As the first step, we will talk about text steganography and investigate its details. Then, image steganography and its techniques will be investigated. Some techniques including Least Significant Bits, Masking and filtering and Transformations will be subjected during image steganography. Finally, audio steganography which contains LSB Coding, Phase Coding, Spread Spectrum and Echo Hiding techniques will be described.

[Masoud Nosrati, Ronak Karimi, Hamed Nosrati, Ali Nosrati. Taking a Brief look at steganography: Methods and Approaches. Journal of American Science 2011;7(6):106-109]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Steganography; text steganography; image steganography; audio steganography.

1. Introduction

The word steganography is derived from the Greek words “stegos” meaning “cover” and “grafia” meaning “writing” defining it as “covered writing” [1]. Steganography is one such pro-security innovation in which secret data is embedded in a cover [2]. The notion of data hiding or steganography was first introduced with the example of prisoners' secret message by Simmons in 1983 [3].

Steganography and cryptography are closely related. Cryptography scrambles messages so they cannot be understood. Steganography on the other hand, will hide the message so there is no knowledge of the existence of the message in the first place. In some situations, sending an encrypted message will arouse suspicion while an “invisible” message will not do so. Both sciences can be combined to produce better protection of the message. In this case, when the steganography fails and the message can be detected, it is still of no use as it is encrypted using cryptography techniques. [4]

There exist two types of materials in steganography: message and carrier. Message is the secret data that should be hidden and carrier is the material that takes the message in it [5].

There are many types of steganography methods. In this paper, we are going to take a short look at different steganography methods. Figure 1 in below shows the different categories of file formats that can be used for steganography techniques [6].

Figure 1. Steganography types diagram

In the second section, text steganography will be talked. Then we will get into images steganography principals in the third section. Finally audio steganography will be investigated.

2. Text steganography

Text steganography can be achieved by altering the text formatting, or by altering certain characteristics of textual elements (e.g., characters). The goal in the design of coding methods is to develop alterations that are reliably decodable (even in the presence of noise) yet largely indiscernible to the reader. These criteria, reliable decoding and minimum visible change, are somewhat conflicting; herein lies the challenge in designing document marking techniques. The document format file is a computer file describing the document content and page layout (or formatting), using standard format description languages such as PostScript2, TeX, @off, etc. It is from this format file that the image - what the reader sees - is generated.

The three coding techniques that we propose illustrate different approaches rather than form an exhaustive list of document marking techniques. The techniques can be used either separately or jointly. Each technique enjoys certain advantages or applicability as we discuss below.

2.1. Line-Shift Coding

This is a method of altering a document by vertically shifting the locations of text lines to encode the document uniquely. This encoding may be applied either to the format file or to the bitmap of a page image. The embedded codeword may be extracted from the format file or bitmap. In certain cases this decoding can be accomplished without

need of the original image, since the original is known to have uniform line spacing between adjacent lines within a paragraph.

2.2. Word-Shift Coding

This is a method of altering a document by horizontally shifting the locations of words within text lines to encode the document uniquely. This encoding can be applied to either the format file or to the bitmap of a page image. Decoding may be performed from the format file or bitmap. The method is applicable only to documents with variable spacing between adjacent words. Variable spacing in text documents is commonly used to distribute white space when justifying text. Because of this variable spacing, decoding requires the original image - or more specifically, the spacing between words in the un-encoded document.

2.3. Feature Coding

This is a coding method that is applied either to a format file or to a bitmap image of a document. The image is examined for chosen text features, and those features are altered, or not altered, depending on the codeword. Decoding requires the original image, or more specifically, a specification of the change in pixels at a feature. There are many possible choices of text features; here, we choose to alter upward, vertical endlines - that is the tops of letters, b, d, h, etc. These endlines are altered by extending or shortening their lengths by one (or more) pixels, but otherwise not changing the endline feature [7].

There is another form of text steganography which is defined by Chapman et al. as the text steganography is a method of using written natural language to conceal a secret message [8].

3. Image steganography

Hiding information inside images is a popular technique nowadays. An image with a secret message inside can easily be spread over the World Wide Web or in newsgroups. The use of steganography in newsgroups has been researched by German steganographic expert Niels Provos, who created a scanning cluster which detects the presence of hidden messages inside images that were posted on the net. However, after checking one million images, no hidden messages were found, so the practical use of steganography still seems to be limited.

To hide a message inside an image without changing its visible properties, the cover source can be altered in "noisy" areas with many color variations, so less attention will be drawn to the modifications. The most common methods to make these alterations involve the usage of the least-

significant bit or LSB, masking, filtering and transformations on the cover image. These techniques can be used with varying degrees of success on different types of image files.

3.1. Least Significant Bits

A simple approach for embedding information in cover image is using Least Significant Bits (LSB). The simplest steganography techniques embed the bits of the message directly into least significant bit plane of the cover image in a deterministic sequence. Modulating the least significant bit does not result in human-perceptible difference because the amplitude of the change is small [9]. To hide a secret message inside an image, a proper cover image is needed. Because this method uses bits of each pixel in the image, it is necessary to use a lossless compression format, otherwise the hidden information will get lost in the transformations of a lossy compression algorithm. When using a 24-bit color image, a bit of each of the red, green and blue color components can be used, so a total of 3 bits can be stored in each pixel. For example, the following grid can be considered as 3 pixels of a 24-bit color image, using 9 bytes of memory:

```
(00100111 11101001 11001000)
(00100111 11001000 11101001)
(11001000 00100111 11101001)
```

When the character A, which binary value equals 10000001, is inserted, the following grid results:

```
(00100111 11101000 11001000)
(00100110 11001000 11101000)
(11001000 00100111 11101001)
```

In this case, only three bits needed to be changed to insert the character successfully. On average, only half of the bits in an image will need to be modified to hide a secret message using the maximal cover size. The result changes that are made to the least significant bits are too small to be recognized by the human visual system (HVS), so the message is effectively hidden [4].

As you see, the least significant bit of third color is remained without any changes. It can be used for checking the correctness of 8 bits which are embedded in these 3 pixels. In other words, it could be used as "parity bit".

3.2. Masking and filtering

Masking and filtering techniques, usually restricted to 24 bits or grayscale images, take a different approach to hiding a message. These methods are effectively similar to paper watermarks,

creating markings in an image. This can be achieved for example by modifying the luminance of parts of the image. While masking does change the visible properties of an image, it can be done in such a way that the human eye will not notice the anomalies. Since masking uses visible aspects of the image, it is more robust than LSB modification with respect to compression, cropping and different kinds of image processing. The information is not hidden at the "noise" level but is inside the visible part of the image, which makes it more suitable than LSB modifications in case a lossy compression algorithm like JPEG is being used [4].

3.3. Transformations

A more complex way of hiding a secret inside an image comes with the use and modifications of discrete cosine transformations. Discrete cosine transformations (DCT), are used by the JPEG compression algorithm to transform successive 8 x 8 pixel blocks of the image, into 64 DCT coefficients each. Each DCT coefficient $F(u, v)$ of an 8 x 8 block of image pixels $f(x, y)$ is given by:

$$F(u, v) = \frac{1}{4} C(u) C(v) \left[\sum_{x=0}^7 \sum_{y=0}^7 f(x, y) * \cos \frac{(2x+1)u\pi}{16} \cos \frac{(2y+1)v\pi}{16} \right]$$

$$, C(x) = \begin{cases} \frac{1}{\sqrt{2}} & x=0 \\ 1 & \text{else.} \end{cases}$$

After calculating the coefficients, the following quantizing operation is performed:

$$F^Q(u, v) = \left\lfloor \frac{F(u, v)}{Q(u, v)} \right\rfloor$$

Where $Q(u, v)$ is a 64-element quantization table. A simple pseudo-code algorithm to hide a message inside a JPEG image could look like this [4]:

```

Input: message, cover image
Output: steganographic image containing message
while data left to embed do
  get next DCT coefficient from cover image
  if DCT 6= 0 and DCT 6= 1 then
    get next LSB from message
    replace DCT LSB with message bit
  end if
  insert DCT into steganographic image
end while

```

4. Audio steganography

In audio steganography, secret message is embedded into digitized audio signal which result slight altering of binary sequence of the

corresponding audio file. There are several methods are available for audio steganography. We are going to have a brief introduction on some of them.

LSB Coding

Sampling technique followed by Quantization converts analog audio signal to digital binary sequence. In this technique LSB of binary sequence of each sample of digitized audio file is replaced with binary equivalent of secret message.

Phase Coding

Human Auditory System (HAS) can't recognize the phase change in audio signal as easy it can recognize noise in the signal. The phase coding method exploits this fact. This technique encodes the secret message bits as phase shifts in the phase spectrum of a digital signal, achieving an inaudible encoding in terms of signal-to-noise ratio.

Spread Spectrum

There are two approaches are used in this technique: the direct sequence spread spectrum (DSSS) and frequency hopping spread spectrum (FHSS). Direct-sequence spread spectrum (DSSS) is a modulation technique used in telecommunication. As with other spread spectrum technologies, the transmitted signal takes up more bandwidth than the information signal that is being modulated. Direct-sequence spread-spectrum transmissions multiply the data being transmitted by a "noise" signal. This noise signal is a pseudorandom sequence of 1 and -1 values, at a frequency much higher than that of the original signal, thereby spreading the energy of the original signal into a much wider band.

The resulting signal resembles white noise. However, this noise-like signal can be used to exactly reconstruct the original data at the receiving end, by multiplying it by the same pseudorandom sequence (because $1 \times 1 = 1$, and $-1 \times -1 = 1$). This process, known as "de-spreading", mathematically constitutes a correlation of the transmitted Pseudorandom Noise (PN) sequence with the receiver's assumed sequence. For de-spreading to work correctly, transmit and receive sequences must be synchronized. This requires the receiver to synchronize its sequence with the transmitter's sequence via some sort of timing search process. In contrast, frequency-hopping spread spectrum pseudo-randomly retunes the carrier, instead of adding pseudo-random noise to the data, which results in a uniform frequency distribution whose width is determined by the output range of the pseudo-random number generator [10].

Echo Hiding

In this method the secret message is embedded into cover audio signal as an echo. Three parameters of the echo of the cover signal namely amplitude, decay rate and offset from original signal are varied to represent encoded secret binary

message. They are set below to the threshold of Human Auditory System (HAS) so that echo can't be easily resolved.

Video files are generally consists of images and sounds, so most of the relevant techniques for hiding data into images and audio are also applicable to video media. In the case of Video steganography sender sends the secret message to the recipient using a video sequence as cover media. Optional secret key 'K' can also be used during embedding the secret message to the cover media to produce 'stego-video'. After that the stego-video is communicated over public channel to the receiver. At the receiving end, receiver uses the secret key along with the extracting algorithm to extract the secret message from the stego-object.

The original cover video consists of frames represented by $Ck(m,n)$ where $1 \leq k \leq N$. 'N' is the total number of frame and m,n are the row and column indices of the pixels, respectively. The binary secret message denoted by $Mk(m, n)$ is embedded into the cover video media by modulating it into a signal. $Mk(m, n)$ is defined over the same domain as the host $Ck(m,n)$. The stego-video signal is represented by the equation:

$$Sk(m, n) = Ck(m, n) + ak(m, n) Mk(m, n), k = 1, 2, 3 \dots N$$

Where $ak(m, n)$ is a scaling factor. For simplicity $ak(m, n)$ can be considered to be constant over all the pixels and frames. So the equation becomes [11]:

$$Sk(m, n) = Ck(m, n) + a(m, n) Mk(m, n), k = 1, 2, 3 \dots N$$

5. Conclusion

In this paper, we talked about steganography and its types. First we had a look at text steganography and Line-Shift Coding, Word-Shift Coding and Feature Coding techniques as different methods of it. Then we got into image steganography and introduced LSB, Masking and filtering and Transformations. As the ending part, Audio steganography was talked and LSB Coding, Phase Coding, Spread Spectrum and Echo Hiding were investigated.

Non-steroidal anti-inflammatory phonophoresis versus topical application in improvement of hand grip strength in psoriatic arthritic patients

Amal M. Abd El Baky and Intsar S. Waked

Department of Surgery, Faculty of Physical Therapy, Cairo University, Giza, Egypt
amalabaky@yahoo.com intsarahmed@hotmail.com

Abstract: The purpose of this study was to compare the efficacy of ibuprofen phonophoresis versus topical application of ibuprofen in improvement of hand grip strength in psoriatic arthritic patients. Methods: Forty patients who had asymmetrical psoriatic arthritis in hand participated in this study. Their ages ranged from 30 to 50 years. Patients were classified randomly into two groups of equal numbers; group (1) (control group) received routine physical therapy (hot therapy, stretching and strengthening exercises), in addition to sham ibuprofen phonophoresis, while group (2) (studied group): received routine physical therapy, in addition to ibuprofen phonophoresis. Each patient was evaluated for grip strength, tender and swollen joint count before and after one month of treatment. The results revealed that there was a significant difference between both groups regarding to grip strength, tender and swollen joint count, with the percentage of improvement in group 1 were 56%, 54%, and 55% ,while in group 2 were 82%, 80% and 76% respectively. It is concluded that the results of the current study confirms the effectiveness of phonophoresis as a therapeutic modality enhancing the delivery of ibuprofen so increasing the percentage of improvement of grip strength in the studied group .

[Amal M. Abd El Baky and Intsar S. Waked. Non-steroidal anti-inflammatory phonophoresis versus topical application in improvement of hand grip strength in psoriatic arthritic patients. Journal of American Science 2011; 7(6): 110-114].(ISSN: 1545-1003). <http://www.americanscience.org>.

Key Words: Ultrasound, phonophoresis, ibuprofen, grip strength, psoriatic arthritic.

1. Introduction:

According to the National Psoriasis Foundation, psoriatic arthritis (PsA) is defined as a type of inflammatory arthritis [1]. It is a chronic inflammatory, seronegative, immunologically triggered arthritis of unknown origin, which have a lasting influence on the quality of life of affected individuals [2,3]. Between 10% and 20% of people with psoriasis develop psoriatic arthritis, for the majority of people this is between the ages of 30 and 50, but it can also affect children. Men and women are equally affected [1, 3].

The cause of PsA is currently unknown. A combination of genetic and immune as well as environmental factors are likely involved. The underlying process in PsA is inflammation, which causes tenderness, pain and swelling in the joints and connective tissue with associated stiffness. PsA commonly affects the ends of the fingers and toes. Therefore, the treatments are directed to reduce and control inflammation [4].

Non-steroidal anti-inflammatory drugs (NSAIDs) are drugs with analgesic, antipyretic and anti-inflammatory effects. The term "non-steroidal" is used to distinguish these drugs from steroids, which have a similar eicosanoid-depressing, anti-inflammatory action [5].

Ibuprofen is a NSAID, which relieves pain and swelling .It works by blocking the enzyme that makes

prostaglandins. Decreasing prostaglandins helps to reduce pain, swelling, and fever. It is generally prescribed for arthritis related inflammatory pains [6]. Although NSAIDs are widely used in symptomatic treatment of PsA, they produce potential hazards including gastrointestinal side effects, particularly in the elderly[7]. Physiotherapy may be considered as one of the recommended management option in these patients as phonophoresis with NSAIDs is commonly used to treat inflamed tissues [8].

Phonophoresis is the migration of drug molecules through the skin using ultrasound (US) therapy [9], which is used to enhance percutaneous absorption of drugs. Phonophoresis with anti-inflammatory and local anesthetic agents is used in the management of pain and inflammation in musculoskeletal conditions. This technique is a non-invasive, well tolerated and involves minimal risk of hepatic and renal injury [10].

Restoration of normal hand function in PsA patients is a goal that is necessarily subordinate to sustain life. In daily activity, grasping and transporting object is a frequently encountered task and its dysfunction can severely impact the patient's normal living [11].

Assessment of grip strength with dynamometry was the most common method of reporting motor outcome. Dynamometry is an instrument that is

designed to provide simple, accurate, and reliable method for measuring hand grip strength [12].

Therefore the aim of this study was directed to compare the efficacy of NSAIDs "Ibuprofen" phonophoresis versus topical application of ibuprofen in improvement of hand grip strength in psoriatic arthritic patients.

2. Subjects, Material and Methods

Subjects:

Forty patients from both sex participated in this study, who had asymmetrical psoriatic arthritis in hand referred by physician of dermatology. The study was done in out clinic of physical therapy (Faculty of Physical Therapy –Cairo University). Informed written consent was obtained from all participants. At the time of this study there was no Human Research Ethics Committee had been established in the faculty. The patients were randomly classified into 2 groups of equal number. Group 1 (control group): received routine physical therapy in the form of hot therapy, stretching and strengthening exercises [13], in addition to sham ibuprofen phonophoresis (i.e. topical application). Group 2 (studied group): received routine physical therapy, in addition to ibuprofen phonophoresis. The patient's age ranged from 30 to 50 years. Elapsed time since the beginning of the disease was less than 1 year. All patients received the same medication. Patients were excluded if they had one or more of the following: positive rheumatic factor, circulatory disorders, diabetes, pregnant woman or skin diseases like urticaria

Measurement procedures:

Each patient was evaluated for hand grip strength, tender joint count and swollen joint count before and after one month of treatment. Hand held Jamar dynamometer device 12-0600 was used to measure hand grip strength. The readout of dynamometer dial is represented in pounds and in kilograms. It is graded from zero till two hundred pounds and from zero to ninety kilograms [12]. Grip measurement was performed with the elbow at about 90° according to the American Society of Hand Therapists (ASHT) recommendations [14]. The patients were instructed to assume the sitting position while the affected limb was placed in shoulder adduction and internal rotation, elbow flexion, forearm in mid position and wrist in neutral position. The patients were instructed to squeeze the dynamometer as much as possible. Three consecutive measurements were performed with a 2 minutes inter-measurement interval. The mean strength value of the three trials was calculated and considered as

the hand grip measure [15]. Joint counts for tenderness and swelling were the sum of the number of affected joints [16].

Treatment procedures:

All patients of control and studied group received the same routine physical therapy program in form of hot therapy, stretching and strengthening exercises. Strengthening exercise in form of isometric exercise for hand muscles and fingers, which can help to maintain muscles strength and joints flexibility. Hot therapy in form of warm baths (10 minutes) would be applied before stretching exercise for wrist joint and fingers to relieve joint pain and increase range of motion. Routine physical therapy program would be done daily as a home routine along the treatment time [13]. Sham ibuprofen phonophoresis was applied to control group while studied group received ibuprofen phonophoresis using ultrasonic therapy unit (Nonius, sonopuls 434, S. No. 03-202 type 1463.900 manufactured by Enraf Holland), which was set at frequency of 1MHz, the intensity at 1.5 w/cm², and with continuous mode. A 5cm long strip of cream containing 5% ibuprofen was applied over the affected area. The treatment was given 3 sessions / week, 5 minutes for each session and for one month. [17].

3. Results

The results of this study showed that there were no significant differences between both groups in relation to patients' age and the elapsed time since the beginning of the disease. The results showed that the mean of patients' age were 38.4±5.99 and 38.95±6.18 years for group (1) and group (2), respectively with P value= 0.78, while the mean of the elapsed time were 5.55±3.5 and 5.95±3.3 respectively with P value equal 0.71. The results also presented that there was no significant difference in the patients' sex between both groups with the P= 0.752.

As shown in table 1 the mean value and standard deviation of hand grip strength, tender joint count and swollen joint count for control group at the beginning of the study (pre) were 2.49±0.57 kg, 16.5±1.85, and 14.75±3.63, respectively, while they were 3.9±0.63Kg, 7.65±2.37, and 6.6±1.98, respectively after treatment (post). The results revealed a statistically significant improvement (P<0.05) in hand grip strength and tender as well as swollen joint count joint between pre and post treatment. Fig 1 represented the percentage of improvement of group 1 (control)

Table (1): The statistical analysis of mean differences of grip strength, tender joint and swollen joint count in control group (1) pre &post-treatment

Statistics	Grip strength(Kg)		Tender joint count		Swollen joint count	
	Pre	Post	Pre	Post	Pre	Post
Mean	2.49	3.9	16.5	7.65	14.75	6.6
S.D±	0.57	0.63	1.85	2.37	3.63	1.98
T- value	-9.411		12.69		9.35	
Level of significance	P<0.05		P<0.05		P<0.05	

**Fig (1): The percentage of improvement of grip strength, tender joint count and swollen joint count for group 1 (control)**

Table (2) showed that the mean value and standard deviation of grip strength ,tender joint count and swollen joint count for the studied group at the beginning of the study were 2.75 ± 0.72 Kg, 17.35 ± 1.34 , and 15.7 ± 1.91 , respectively, while they were 5.01 ± 0.99 Kg, 3.4 ± 1.66 , and 3.7 ± 2.38

respectively post treatment. The results revealed a highly statistically significant improvement ($P<0.05$) in hand grip strength and tender as well as swollen joint count joint between pre and post treatment. Fig (2) represented the percentage of improvement for group (2) (studied group).

Table (2): The statistical analysis of mean differences of grip strength , tender joint and swollen joint count in studied group (2)pre &post-treatment.

Statistics	Grip strength(Kg)		Tender joint count		Swollen joint count	
	Pre	Post	Pre	Post	Pre	Post
Mean	2.75	5.01	17.35	3.4	15.7	3.7
S.D±	0.72	0.99	1.34	1.66	1.91	2.38
T- value	-9.44		26.05		19.78	
Level of significance	P	<0.01	P	<0.01	P	<0.01

**Fig (2): The percentage of improvement of grip strength, tender joint count and swollen joint count for group 2 (studied group)**

The mean differences of hand grip strength and tender as well as swollen joint count between both groups before treatment showed statistically non significant difference (t value= -1.244 & $P<0.221$, t value= -1.66 & $P<0.105$, and t value= -1.091 & $P<0.28$, respectively), while after treatment the mean difference showed statistically highly significant

difference (t value= -4.199& $P<0.01$, t value= 6.65& $P<0.01$, and t value= 4.179 & $P<0.01$, respectively).

4. Discussion:

The main findings of this current study showed that there were statistically significant differences between both groups with the percentage

of improvement in group (2) was more than group (1). This confirms the effectiveness of the phonophoresis as a therapeutic modality enhancing the delivery of the drug hence improving patient's grip strength.

Phonophoresis is commonly used in physical therapy practices. The procedure generally utilizes an ultrasound apparatus that generates frequencies of 0.7 to 1.1 MHz and intensities usually range from 0.0 to 3.0 Watts / cm² [9,18]. US is often used in physical therapy because of its deep-heat and pain-relieving effects. When US enters the body, it can affect the cells and tissues through its thermal and nonthermal mechanisms [19].

Phonophoresis has been suggested by early studies to enhance the absorption of analgesics and anti-inflammatory agents [9]. Effectively, medicines contained within or under the ultrasound gel are pushed by the sound waves of the US and driven to a much deeper level than those massaged by hand [17]. Researchers have noted varying results with regard to the therapeutic benefits of phonophoresis (such as pain relief and improved range of motion) [6,20,21]. Meshali et al [6], stated that ibuprofen is poorly absorbed transdermally when applied as a gel even in the presence of high levels of alcohol as a penetration enhancer and they concluded that treatment with US increased ibuprofen absorption by at least three folds, which demonstrates the potential uses of phonophoresis in transdermal drug delivery. Deniz et al [20], showed that both continuous and pulsed US diclofenac gel phonophoresis is more effective for pain and functional status of patients with knee osteoarthritis than topical application of diclofenac gel. In order to enhance the level of skin permeation of Triamcinolone Acetonide (TA), Yang et al [21], investigated various US conditions such as the frequency (1.0, 3.0 MHz), the intensity (1.0, 2.5 W/cm²), and the duty cycle (continuous, pulse) using a 0.5% TA gel. They concluded that the 1MHz frequency showed a relatively higher transport than either 3 MHz or no-ultrasound treatment.

Meshali et al [22], demonstrated that ultrasound application at 1.5 w/cm² continuous mode is optimum for transdermal delivery of the model NSAIDs drugs (ibuprofen, piroxicam and diclofenac sodium) across cellulose and rabbit skin membrane and they stated that the results could be adopted in clinical setting for enhanced management of pain and inflammation by ultrasound.

The phonophoretic effect of US reported that US enabled a greater transport of whole molecules across synthetic or organic semipermeable membranes than was afforded by sham ultrasound [23].

The effect of the US duty cycle on the skin permeation was highest with the continuous mode than with the pulsed mode [21]. There are many explanations for the increased permeability of the membranes. There would be a decrease in the donor solution-membrane interfacial-potential-energy barrier caused by the US treatment. Such a decrease as well as an increase in cavitation might increase the level of drug permeation [24]. A reduction in the boundary layer thickness (close to the membrane), which creates additional resistance to drug transport as a result of mixing the solutions, would also increase the level of drug permeation. The radiation pressure caused by the US wave would exert pressure on the drug molecules as well as on the skin [25]. In addition to the previous, it is known that phonophoresis facilitates the transdermal absorption of a drug as a result of the thermal effects such as an increase in tissue temperature and the mechanical effects such as cavitation and acoustic streaming [26,27]. It is believed that the effect of US might be related to the depth of the vibration as well as the duty cycle. The increased mechanical vibration by the US increases the skin temperature particularly in continuous US mode. This increase in temperature caused by heat liberation using US might increase the level of drug permeability [28].

From the previous it was concluded that, phonophoresis is an effective method to enhance the delivery of ibuprofen and so enhance the improvement of grip strength.

Biodegradation of PAH Compounds in the Rhizosphere of *Tamarix nilotica*: A Salt tolerant wild plant

Eman A. Diab and Reham K.A. Badry

Department of Plant Ecology and Range Management, Environmental Pollution Research Unit, DRC, Cairo, Egypt

Abstract: During a scientific visit to a coastal area at Suez, Egypt, it was observed that *Tamarix nilotica* plant naturally dominated on oil polluted site in this area, indicating that this plant is a tolerant of the combined adverse effects of salinity and petroleum pollutants. This observation stimulated a study to investigate the rhizosphere effect of this plant on the degradation and removal of petroleum aromatic hydrocarbons (PAH) compounds from this coastal saline soil. Accordingly, samples were collected from the rhizosphere and from the non-rhizosphere soil and studied. The results show that the rhizosphere soil of *Tamarix nilotica* was rich in total heterotrophic bacteria and oil-degraders. In the rhizosphere soil oil-degraders were of higher percentage (30.7%) compared to the non-rhizosphere soil (4.6%). Residual total petroleum hydrocarbons (TPH) in the non-rhizosphere soil was 2.25% (w/w), while in the rhizosphere soil the percentage was 0.9% (w/w). This indicate a reduction of 60% of the TPHs. The saturates fraction in the rhizosphere as compared to the non-rhizosphere soil was reduced by 87.5%, while the aromatics were reduced by 60.7%. It is of interest to find that the non-degradable asphaltenes and resins were reduced in the rhizosphere by 1.1% and 2.5% respectively. As a total the amount of PAHs (mgkg⁻¹ soil) were 1073.5 and 541.94 in the non-rhizosphere and rhizosphere soil respectively, i.e. with a loss of 49.5% in the rhizosphere. Chrysene and dibenzo(ah)anthracene as compared to the other PAHs were more frequent in the non-rhizosphere soil. These two compounds were reduced by 55.7% and 24.3% respectively in the rhizosphere. As a total the four-ringed PAHs as compared to other PAH groups were highly reduced (60.3%) in the rhizosphere, this was followed by the three-ringed PAH group (52.5%). The five-ringed and the six-ringed groups were weakly reduced (37.8% and 33.8% respectively). The 8 carcinogenic PAH group were collectively reduced in the rhizosphere by 49.1%. A particular notable distinction of the rhizosphere of *Tamarix nilotica* is the greater efficiency to degrade the carcinogenic PAH compounds especially flouranthene (75.4%), benzo(a)anthracene (63.4%) and pyrene (60.2%). Results of Gas Chromatography (GC) analysis for the detection of the accumulated PAHs in the shoot tissue of *Tamarix nilotica* plant growing in the polluted area as compared to that growing in non-polluted area show that the identified peaks in the tissue of both plants were 15 and 14 peaks respectively. The sum of the 15 PAHs was 528 mgkg⁻¹ dried tissue, whereas the sum of the 14 PAHs was 769 mgkg⁻¹ dried soil. This result indicate an accumulation value of 1.46.

[Eman A. Diab and Reham K.A. Badry. Biodegradation of PAH Compounds in the Rhizosphere of *Tamarix nilotica*: A Salt tolerant wild plant. Journal of American Science 2011;7(6):115-124]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Biodegradation , salt-tolerant plant , *Tamarix nilotica* , PAHs degradation

1. Introduction:

Microorganisms and plants can have complementary roles in phytoremediation of polluted soils. Phytoremediation refers to the use of plants to clean up moderately contaminated soils (Joner *et al.*, 2004). When the pollutants are organic compounds, phytoremediation may comprise rhizodegradation (microbial degradation in the rhizosphere) and phytodegradation i.e. degradation of compounds absorbed by plants (Flathman and Lenza, 1998).

Rhizodegradation of organic pollutants such as PAHs based on the effects of plant root exudates which constitute different growth factors, enzymes, vitamins, amino acids ... etc. (Corgie *et al.*, 2004). The application of plants for remediation of soil contaminated with PAHs is one of the promising environmental and cost effective approach. Rock and Sayre (1998) estimated phytoremediation cleanup

cost of \$162/m² petroleum contaminated soil compare to \$810/m² for excavation and incineration.

To date a great variety of grass species and legumes (Appril and Sims, 1990; Flathman and Lenza, 1998; Pradhman *et al.*, 1998; Banks *et al.*, 1999; Kulakow *et al.*, 2000; Davis *et al.*, 2004 and Eman, 2008) have been applied for phytoremediation, but the predictive power of these phytoremediation studies is compromised by the brief duration and constant environmental conditions often employed (Muller and Shann, 2006).

Trees have received little attention with regard to the dissipation of PAH compounds, although their perennial life-history and extensive root systems suggest they may be suitable for phytoremediation (Muller and Shann, 2006). Trees such as poplar (Jordahl *et al.*, 1997, Newman *et al.*, 1999; Tessar *et al.*, 2000), alder (Caraman *et al.*, 1998), red mulberry

(Olson *et al.*, 2001) and pine seedlings (Liste and Alexander, 2000) have been applied for phytoremediation.

Rare investigations have been carried out on the use of salt tolerant plants for phytoremediation of hydrocarbon-polluted soil.

During a scientific visit to a coastal area at Suez, it was observed that *Tamarix naltica* plant dominated a hydrocarbon-polluted site in this area, indicating that this plant is a tolerant of the combined adverse effects of salinity (2.9% w/w) and petroleum pollutants. As a result of the general lack of knowledge and availability of using *Tamarix naltica* plant for phytoremediation, the above observation stimulated a study to investigate the rhizosphere effects of *Tamarix naltica* plant on the degradation and removal of PAH compounds from this coastal saline soil. Accordingly, soil samples were collected from the polluted rhizosphere soil (soil in direct contact with roots) and also from the polluted non-rhizosphere soil (soil 50 cm away from the effects of roots).

2. Material and Methods

Chemical and Physical Analysis of Soil:

Physical and chemical analysis of the soil were determined according to the methods described in Jackson (1967) Soil pH, total salinity, cationic and anionic compositions and total carbonates were determined. Particle size analysis (dry sieving) of tested soil samples was accomplished according to Jackson (1967).

Collection of rhizosphere and non-rhizosphere soil

A polluted coastal area in which *Tamarix naltica* is dominant was chosen at Suez for the present study. Rhizosphere soil samples (soil in direct contact with roots) and non-rhizosphere soil samples (soil 50 cm away from the roots) were collected from this polluted area .

Counts of total bacteria and fungi

For counting colony forming units (CFU) of bacteria and fungi, the usual dilution plate method was used as described by Al-Gounaim and Diab (1998). Nutrient agar (Oxoid) supplemented with 0.4% soluble starch was used for counting bacteria. For counting fungi malt-yeast extract agar was used. Plates for counting bacteria were incubated at 30°C for a period of 5-7 days. Plates for counting fungi were incubated at 25-26°C for 10-12 days. At the end of the incubation periods, the developed colonies were counted and expressed as CFU/g dried soil.

Counting of hydrocarbon-degrading microorganisms

For counting oil-degraders, the three Most Probable Number (MPN) method was used as described by Chaîneau *et al.* (1996).

The culture medium was dispensed in test tubes, each received 5 ml of the medium. After sterilization, 0.1 ml sterilized oil was added to each tube. One gram of the soil sample was introduced to a test tube containing 10 ml sterilized water, a series of dilution was made. Three tubes of the culture medium were inoculated from each dilution (1 ml for each tube). The inoculated tubes were incubated at 30°C for 21 days. At the end of the incubation period, tubes showing growth were recorded and the MPN values were obtained from the MPN index of the three tubes as found in the Standard Method for the Examination of Water and Waste Water (1989) .

Extraction and determination of the residual oil contents from soil samples and plant shoots

Five grams from each sample of the soil and plant shoot tissue were mixed with 3g anhydrous sodium sulfate to remove moisture and extracted with chloroform by using the shaking method (Chen *et al.*, 1996). The extract was pooled and evaporated. The residual oil was suspended in n-hexane and filtered to remove the non-soluble fraction (asphaltene). The hexane soluble fraction was fractionated by liquid solid chromatography into saturates and aromatics (Chaîneau *et al.*, 1995). The saturated fraction was discarded, and the aromatic fraction in benzene was reduced to one ml. 1µl of this extract was used for GC analysis.

Gas chromatography (GC) analysis of the aromatic fraction for the resolution of PAH compounds.

Although hundreds of PAHs exist in the polluted environment, the US Environmental Protection Agency (EPA) had identified 16 PAH compounds as priority pollutants, which are monitored routinely for regulatory purposes. In the present work identification and quantification of the individual 16 PAHs were determined in the aromatic fraction using Varian 3900 gas chromatography equipped with a CP 9050 liquid samples and configured with FID, using helium (Grade G) as a carrier gas, with a flow rate of 1 ml/min. A CP Sil 19CB column (25 m long x 0.32 mm diameter x 0.2 µm thickness for the stationary phase 1 was used. Temperature programming of initial holding at 40°C (holding 2 minutes) was applied. The total time of analysis was 45 min., injector and detector temperatures were 250°C and 280°C respectively, injection volume was 1 µL or 2 µL for some samples.

The quantification of PAHs was based on the application of reference standard of the 16 PAHs

(100 ppm for each), obtained from Supelco Co. Samples were run in duplicates and the mean values were taken.

3. Results and Discussion

Physical and chemical analysis (Table 1) of the soil of the area in which *Tamarix nilotica* plant is grown is sandy in nature, with pH 8.1 and total salinity of 2.92%. Nitrogen and phosphorus were of low concentrations (Table 1). The results also show that most of the soluble ions concentrations were of higher values in the rhizosphere soil compared to the non-rhizosphere soil.

The results in Table (2) show that one gram of the rhizosphere soil contained (CFU/g) 30.6×10^6 of bacteria, 4.2×10^2 of fungi, and 9.4×10^6 hydrocarbon-degrading bacteria. This is in contrast to the non-rhizosphere soil which contained (CFU/g) 40.2×10^4 of bacteria, 2.4×10^2 fungi and 18.3×10^3 hydrocarbon-degrading bacteria respectively. Oil-degraders in the rhizosphere soil were higher (30.7%) as compared to the non-rhizosphere soil (4.6%).

Residual total petroleum hydrocarbon content of this soil (Table 3) was 2250 mg/100g in non-rhizosphere soil. These results demonstrated that *Tamarix nilotica* plant grown in this habitat is a tolerant to the combined adverse effects of salinity and petroleum hydrocarbon pollutants.

These results indicated the stimulatory effects of the plants roots (especially for HC-degraders), this is confirmed from the values of R/S (Table 2) which ranged from 3 (for the fungi) to 513.7 for HC-degraders. Corgie *et al* (2004) reported that plant roots provide ideal attachment and supply exudates consisting of amino acids, organic acids, sugars, enzymes ... etc. Binet *et al* (2000) reported that microbial communities have been documented to be larger and more active in planted versus unplanted soil, and the rhizosphere is often enriched in organisms capable of hydrocarbon degradation. Rugh *et al* (2005) reported the abundance of PAH-degrading bacteria in contaminated soil planted with different native Michigan plant species.

Table 1: Physical and chemical analysis of the rhizosphere soil (R) and non-rhizosphere soil (S) of *Tamarix nilotica*

Particle Diameter (mm)			Chemical Analysis		
		%			%

Table 2: Mean counts (CFU/g air dried soil) of total heterotrophic bacteria, fungi and oil-degraders in the rhizosphere soil (R) and the non-rhizosphere soil (S) of *Tamarix nilotica* plant.

Microorganisms	CFU / g Soil		R/S Ratio
	S	R	
Total heterotrophic bacteria	40.2x10 ⁴	30.6x10 ⁶	76.5
Total fungi	2.4x10 ²	4.2x10 ²	3.0
Oil-degrader	18.3x10 ³	9.4x10 ⁶	513.7
Percentage oil-degraders	4.6	30.7	

Table 3: Residual oil content and its fractions (mg/100 g soil) in the non-rhizosphere soil (S) and in the rhizosphere soil (R) of *Tamarix nilotica* plant.

Oil and its Fractions	Mg/100 g soil		Reduction (R)
	S	R	
Saturates	800 ± 28.3	100 ± 7.1	87.5
Aromatics	1060 ± 84.5	417 ± 24.0	60.7
Resins	200 ± 14.1	195 ± 7.1	2.5
Asphaltene	190 ± 7.0	188 ± 11.3	1.1
Total	2250	900	60

When the residual hydrocarbons from the rhizosphere soil and non-rhizosphere soil was extracted and fractionated (Table 3), it was found that 2250 mg of TPH/100g soil was extracted from the non-rhizosphere soil, this is in contrast to 900 mg/100g of the rhizosphere soil used was measured, i.e. with a reduction of 60%.

As for the different fractions of the TPH extracted (Table 3) it was found that the rhizosphere soil contained less amounts of these fractions (especially the saturates and aromatics) as compared to the non-rhizosphere soil. Saturates fraction was 800 mg/100g soil in the non-rhizosphere soil while in the rhizosphere soil only 100 mg/100 g soil was recorded, i.e. with a reduction of 87.5%. On the other hand, the aromatic fraction was 1060 mg/100 g of the non-rhizosphere soil, this is in contrast to 417 mg/100 g of the rhizosphere soil, i.e. with a reduction of 60%. It is of important to observe that reduction values of 2.5% and 1.1% of the non-degradable resins and asphaltene respectively were recorded in the rhizosphere of this wild salt-tolerant plant (*Tamarix nilotica*). Al-Abdulla *et al* (2006) extracted 706mg/100g soil of the saturated fraction from the

rhizosphere soil and 1234.2 mg/100g from the non-rhizosphere soil of the wild desert plant *Salsola imbricate*, i.e. with a reduction of 42.8% in the rhizosphere soil. As for the aromatic fraction, the same trend was observed giving reduction value of 45%, which is slightly higher than the reduction value of the saturates (42.8%). The above authors also calculated the reduction values of the saturates and aromatics fractions in the non-rhizosphere soil and in the rhizosphere soil of the wild desert plant *Cyperus conglomerates*. They recorded loss of 37.1% and 40.2% for the saturates and aromatic fractions in the rhizosphere soil. These authors then recommended the use of these wild desert plants for the phytoremediation of the polluted desert soil.

Polycyclic aromatic hydrocarbons (PAHs) of the residual aromatic fraction in the non-rhizosphere soil and rhizosphere soil of this wild salt-tolerant plant were quantified by GC-FID analysis. The results (Table 4, Fig. 2) show the resolution of 15 different individual PAH compounds in the non-rhizosphere soil, and 13 PAHs in the rhizosphere soil. Naphthalene was absent from both non-rhizosphere and rhizosphere soil, while acenaphthylene and acenaphthene were absent from the rhizosphere soil.

Table 4: Residual PAH contents of the rhizosphere soil (R) of *Tamarix nilotica* plant as compared to non-rhizosphere soil (S). Loss (%) of PAHs is also given.

PAH Compounds	No. of Rings	S mg/kg Soil	R mg/kg soil	Loss %
1. Naphthalene	2	-	-	-
2. Acenaphthylene	3	8.1 ± 0.50	-	100
3. Acenaphthene	3	4.7 ± 0.10	-	100
4. Flourene	3	15.3 ± 0.40	5.6 ± 0.43	63.4
5. Phenanthrene	3	100.7 ± 3.10	51.10 ± 2.70	49.3
6. Anthracente	3	22.0 ± 1.60	14.87 ± 1.90	52.5
Total		150.80	71.570	52.50
7. Flouranthene	4	68.3 ± 5.40	16.8 ± 1.28	75.4
8. Pyrene	4	57.3 ± 2.47	22.8 ± 0.92	60.2
9. Benzo(a)anthracene	4	72.6 ± 4.77	26.6 ± 2.83	63.4
10. Chrysene	4	277.6 ± 12.60	122.9 ± 5.97	55.7
Total		475.8	189.1	60.3
11. Benzo(a)flourathene	5	15.33 ± 1.25	7.57 ± 1.04	50.6
12. Benzo(k)flouranthene	5	83.0 ± 2.16	44.77 ± 3.24	46.1
13. Benzo(a)pyrene	5	109.0 ± 7.36	55.70 ± 4.14	49.0
14. Dibenz(a,h)anthracene	5	156.0 ± 4.32	118.13 ± 16.19	24.3
Total		363.33	226.17	37.8
15. Benzo(ghi)perylene	6	13.3 ± 0.85	7.3 ± 1.80	45.1
16. Indeno(1,2,3-c,d)pyrene	6	70.0 ± 1.63	47.8 ± 3.81	31.7
Total		83.3	55.10	33.8
Total		1073.50	541.94	49.5

As a total the amount of PAHs (mg/kg soil) were 1073.5 and 541.94 mg/kg oil in the non-rhizosphere and -rhizosphere soil respectively. Weissenfels *et al* (1999) estimated 1815.1 mg/kg sandy soil collected from former wood impregnation plant. Al-Gounaim *et al* (2006) estimated 2256.8 mg/kg of moderately polluted (2-3% oil w/w) desert non-rhizosphere soil, and 1264.9 mg/kg of the rhizosphere soil of the wild desert plant *Cyperus conglomeratus*, i.e. with a reduction value of 40.0%. On the other hand, the same authors found 1643.9 mg/kg of the non-rhizosphere soil, and 532.6 mg/kg of the rhizosphere soil of the wild desert plant *Salsola imbricate*. This demonstrated 67.6% loss in the rhizosphere of this plant. Davis *et al* (2004) reported that phytoremediation is emerging as potentially cost effective technology; plants have often been shown to reduce the level of PAHs in soil. Rugh *et al* (2005) reported that root-microbe interaction is considered to be the primary process of PAH phytoremediation, since bacterial degradation has been shown to be the most dominant pathway for environmental PAH dissipation. However, the precise mechanism driving PAH rhizostimulation symbiotic largely unsolved.

Most studies on PAH phytoremediation have utilized herbaceous annuals and grasses. When

compared to these plant types, Moeller *et al* (2006) suggested that tree roots are structurally and functionally differed, particularly with regard to their perennial and woody nature and relationships with ectomycorrhizal fungi. Unique root dynamics associated with these trials including exudation and root turnover, could lead to relatively more complex rhizosphere dynamics and important effects on PAHs degradation in the rhizosphere.

Rugh *et al* (2005) found that most of the tested plant species stimulated biodegradation of a broad range of PAH compounds related to the unplanted soil. Spriggs *et al* (2005) found that the rate of dissipation of PAHs was greater for willow followed by poplar, and the unvegetated soil controls. These data support the hypothesis that trees can enhance the degradation of target PAHs in soil. The above authors reported that it is important to note that the degradation rates were measured under greenhouse conditions. Rate of dissipation under field conditions could vary significantly from these results. Hwan *et al* (2008) found that more PAHs were dissipated in the rhizosphere soil than in unplanted soil. This enhanced dissipation of PAHs in planted soil might be derived from increased microbial activity and plant release enzymes.

Fig. 2: Reduction values (%) of PAH compounds in the rhizosphere of *Tamarix nilotica* plant (calculated on the basis of PAH content of the non-rhizosphere soil).

In the present work, it can be observed that (Table 4) Chrysene and dibenzo(ah)anthracene as compared to the other PAHs were more frequent in the non-rhizosphere soil (277.6 and 156.0 mg/kg soil respectively). However, this indicates reduction values of the two PAHs in the rhizosphere soil of 55.7% and 43.4% respectively. Spriggs *et al* (2005) reported that the decrease in concentration of chrysene is noticeably smaller in the presence of poplar and willow vegetation.

As a total the four-rings PAHs as compared to the other PAH groups were more reduced in the rhizosphere soil (60.3%). This was followed by the three-rings PAHs (52.5%). The five-ring and the six-ring PAHs were weakly reduced (37.8% and 33.8% respectively). Spriggs *et al* (2005) reported that the reduction trends of four-ring and five-ring PAHs were noted during 18-monthes study period of phytoremediation, although none were at significant levels when compared to unvegetative controls. Although PAH compounds with increasing number of rings may be microbially degraded, limitation exist which may hinder the bioremediation efficiency.

For simplicity the results in the rhizosphere soil can be summarized in the following point:

PAHs with high reduction values (75.4-100%) were three compounds namely: acenaphthylene (100%), acenaphthene (100%) and flouranthene (75%).

PAHs with reduction values of 50.6-63.4% are six compounds namely: flourene(63.4%),

benzo(a)anthracene (63.4%), pyrene (60.2%), chrysene (55.7%), anthracene (52.5%) and benzo(a)flouranthene (50.6%).

The other PAH compounds had reduction values of 24.3% (for dibenzo(ah)anthracene to 49.0% for benzo(a)pyrene.

Spriggs *et al* (2005) found that acenaphthene, anthracene, flouranthene, naphthalene and phenanthrene decreased significantly in green ash (*Fraxinus pennsylvanica*) and hybrid poplar (*Populus deltoids*) phytoremediation treatment when compared to the unplanted soil controls.

Rentz *et al* (2004) reported that studies of trees including hybrid poplar, red mulberry and willow indicated that root exudates and/or extracts can actually inhibit the phenanthrene degradation. Muller *et al* (2006) found that pyrene mineralization was not affected by planting. They also found that phenanthrene was consistently lost more rapidly than either anthracene or pyrene.

Results of the reduction values of the carcinogenic PAH compounds (Table 5, Fig. 3) show that as a total the eight carcinogenic PAHs resolved were reduced in the rhizosphere soil by 49.1%, and it is important to observe that all of the four-rings PAHs recorded were carcinogenic compounds. This is in contrast to three of the five-rings and one of the six-ring PAHs also are of carcinogenic effects. Knopp *et al* (2000) reported that the four-ringed PAHs chrysene and dibenzo(ah)anthracene, and the six-ringed PAH indeno(1,2,3-c,d) pyrene are

considered by the International Agency for Research Cancer (IARC) as carcinogenic compounds. Other PAH compounds are known to have carcinogenic activity (Irwin, 1997) such as:

*Flouranthene.

*Benzo(a)anthracene.

*Benzo(b)flouranthene.

*Benzo(k)flouranthene.

*Benzo(a)pyrene.

Table 5: Residual carcinogenic PAH compounds in the rhizosphere soil (R) of *Tamarix* plant as compared to those in the non-rhizosphere soil(s)

Carcinogenic PAHs	No. of Rings	S mg/kg Soil	R	
			Mg/kg soil	Loss %
1. Flouranthene	4	68.3 ± 5.40	16.8 ± 1.28	75.4
2. Pyrene	4	57.3 ± 2.47	22.8 ± 0.92	60.2
3. Benzo(a)anthracene	4	72.6 ± 9.77	26.6 ± 2.83	63.4
4. Chrysene	4	277.6 ± 12.60	122.9 ± 5.97	55.7
Total		475.8	189.60	60.2
5. Benzo(k)flouranthene	5	83.0 ± 2.16	44.77 ± 3.24	46.1
6. Benzo(a)pyrene	5	109.3 ± 7.36	55.70 ± 4.14	49.0
7. Dibenzo(ah)anthracene	5	156.0 ± 4.32	118.13 ± 24.30	24.3
Total		348.3	218.60	37.2
8. Indeno (1, 2,3-c,d) pyrene	6	70.0 ± 1.63	47.80 ± 3.8	31.7
Total		894.1	455.5	49.1

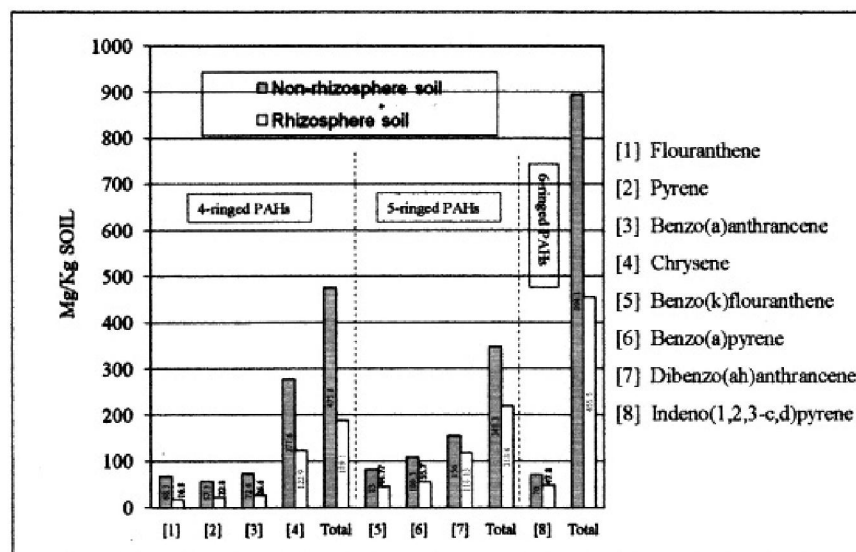

Fig. 3: Carcinogenic PAH compounds (mg/kg soil) in the rhizosphere and non-rhizosphere soils of *Tamarix nilotica*.

PAH compounds usually occur in mixtures in the environment, and they tend to be more carcinogenic. Irwin (1997) reported that co-carcinogenic activity was noted for both flouranthene and pyrene when combined with mixtures of other PAHs in dermal treatment of mice. Collectively, the carcinogenic four-ringed PAHs were highly reduced (60.3%) in the rhizosphere of this plant.

Maximum reduction value in the individual PAHs was 75.4% (for flouranthene) followed by 63.4% (for benzo(a)anthracene) and 60.2% (for pyrene). On the other hand, minimum reduction

values were 24.3% (for dibenzo(ah)anthracene) List and Alexander (2000) reported that accelerated dissipation from pyrene-spiked soil has been shown with pine seedling.

Jordahl *et al* (1997) found that population of benzene, toluene and xylene degrading microbes were five times more abundant in the rhizosphere of poplar trees than in the surrounding soil.

A particular notable distinction of *Tamarix nilotica* rhizosphere is the greater efficiency to degrade the carcinogenic PAH compounds especially flouranthene, benzo(a)anthracene and pyrene.

The present results revealed that the roots of the wild salt-tolerant plant (*Tamarix nilotica*) growing in the polluted seashore sediments were densely associated by oil-degraders and other bacterial groups, which reflected the disappearance of higher amounts of TPH and polycyclic aromatic hydrocarbons (PAHs). Accordingly this plant demonstrated successful phytoremediation of this polluted sediments.

To improve and to accelerate this process in a short period of time, Haung *et al* (2005) developed a multi-process phytoremediation system (MPS) that is composed of : land farming (aeration and exposure to light), contaminant-degrading bacteria, plant growth promoting rhizobacteria and growth of the tolerant plants.

Results of the GC analysis for the detection of the accumulated PAH compounds in the shoot tissues of *Tamarix nilotica* plant growing in the polluted sediments as compared to its growth in the non-polluted area (Fig. 3) show that the total number of peaks resolved for PAH compounds were 201 in the tissues of the plant growing in the unpolluted area, on the other hand , 222 peaks recorded for plants tissues of that growing in the polluted sediments, i.e. with increase of 21 peaks. The identified peaks in the tissues of both plants were 15 and 14 peaks of identified PAH compounds for plant in the unpolluted area and plant in the polluted sediment

respectively. The sum of the 15 PAHs was 528 mg/kg dried tissue whereas the sum of the 14 PAHs was 769 mg/kg dried tissues. These results indicate accumulation value of 1.46 for total PAHs. The results in Fig. (3) show that the more accumulated PAHs was indeno (1,2,3-c,d) pyrene.

It is of important to note that rare (if none) investigations on the accumulation of PAH compounds in the tissues of salt-tolerant plants. Most studies have utilized the annual and herbaceous non-salt tolerant plants. Kipopulou *et al* (1999) found PAH median values of 161 and 42 Mg/g in lettuce and cabbages respectively, grown in the industrial area of Thessaloniki, Greec. Bakker *et al* (2000) reported that the sum of PAHs in samples of leaves of *Plantago major* collected at 50 m from an oil refinery was 8000 µg/g whereas PAH concentration in grass samples of the same site was 2000 µg/g.

Grova *et al* (2000) reported a concentration of 51.8 µg/g for 8 PAHs in rural grass sample. Nadal *et al* (2004) found that in chard samples the highest value (sum of 16 PAHs) was observed in the residential area, followed by the industrial and the unpolluted zones with concentrations of 179.50 and 28 µg/g dry weight respectively. The same authors reported that the concentrations in vegetation under the influence of petrochemical industries were notable higher.

Abstract: The present study was designed to evaluate the effect of low level laser therapy on alveolar bone remodeling and rate of tooth movement secondary to application of orthodontic forces. 42 male Guinea pigs were used in this study. The animals were divided into two groups (each group contains 21 animals), group (1) received soft laser therapy at the treatment site and group (2) as a control group. The orthodontic device was cemented to the lower central incisors to be activated once only. Daily measurements were taken directly from the oral cavity to record the rate of tooth movement of the experimental groups. Seven animals of each group were sacrificed at 3 days, 2 weeks and one month. Radiographic assessment was carried out at these intervals using Radio-Visio-Graphy (RVG), with its personal computer (PC) based version, to monitor the changes in the bone density mesial to each lower central incisor. The lower jaws were histologically treated to obtain mesiodistal sections of the lower incisors with their supporting structures and stained by H & E. Conclusion: Soft laser can enhance the rate of orthodontic tooth movement due to stimulation of bone remodeling.

Key words: Orthodontic treatment, laser therapy

1.Introduction:

Orthodontic treatment is based upon the principle that if prolonged pressure is applied to a tooth, tooth movement will occur as the bone around the tooth remodels. The typical 2 to 3 years treatment period is burdensome for patients, so it is very important to accelerate alveolar bone remodeling during treatment to abbreviate the time required, Kawasaki and Shimizu (2000); Proffit(2007)

A long period of retention is necessary to prevent early relapse. Although the reason for the early relapse is not fully clear, bone regeneration after orthodontic treatment may affect the post treatment relapse. It would be potentially beneficial therefore to accelerate bone formation to prevent relapse and abbreviate the retention period, Saito and Shimizu(1997).

Orthodontic treatment involves the use and control of forces acting on the teeth and associated structures. An optimal orthodontic force intends to induce a maximal cellular response and to establish stability of the tissue. An unfavorable force does not result in a precise biologic response and may initiate adverse tissue reactions, Graber and Vanarsdall (2000).

A considerable number of studies based on human being illustrate the quantitative changes

occurring during orthodontic treatment, but the main evidence for the qualitative histological responses to orthodontic treatment comes from experimental studies on animals , Graber and Vanarsdall (2000).

Lasers can be divided into two groups, the so-called hard lasers, which are used for surgical application as cutting and vaporization of hard and soft tissues (e.g. CO₂, Nd: YAG lasers), Sinha and Gallagher(2003); Esen et al.,(2004). Moreover, the so-called soft lasers, which are used for biostimulation, analgesic effects and promoting wound healing (e.g. He-Ne and Diode laser , Qadri et al.,(2005)

The use of Ga-As diode laser as a soft laser has grown increasingly during the last 10 years. This kind of laser is known to have a high depth of penetration in comparison with other types and thus offers the clinician a penetrative tool of great efficiency, Nissan et al., (2006)..

The effect of low energy laser on the alveolar bone after tooth extraction showed increase in the deposition of bone. Radiological analysis after tooth extraction demonstrates that low intensity laser can activate repair of damaged bone tissue in patients, Nagazawa et al.,(1991). In addition, low power laser irradiation significantly increased the number of viable osteocytes in the irradiated bone by a positive

effect on bone matrix production to produce highly reactive and vital implant bone tissue, Dortbudak et al.,(2002). Moreover, it is effective on the bone healing process in artificially created osseous cavities by affecting calcium transport during new bone formation, Nissan et al.,(2006)..

Sun et al.(2001), reported that the irradiation of low energy laser promotes tooth movement and remodeling of alveolar bone in rabbits. In addition, Miloro et al.,(2007)reported that low level laser therapy (LLLT) accelerates the process of bone regeneration during the consolidation phase after distraction osteogenesis. The adjunctive use of LLLT may allow a shortened period of consolidation and therefore permit earlier device removal, with the avoidance of morbidity associated with prolonged device retention.

Therefore, if laser irradiation can cause the acceleration of bone remodeling, it may also have great potential benefit in abbreviating the orthodontic treatment period .

This study was conducted in an attempt to evaluate the effect of low level laser therapy (LLLT) on alveolar bone remodeling and rate of tooth movement secondary to application of orthodontic force.

2.Material & Methods:

2.1.Materials:

2.1.1.Subjects:

Forty two male Guinea pigs were used in this experiment. They were collected at one week age and were allowed to grow at the same conditions of good ventilation, adequate stable diet, temperature and humidity. The average age of the animals was five weeks and their average body weight was 260 grams \pm 20 grams at the beginning of the experiment.

The animals were grouped randomly, seven in a cage, so that at the time of irradiation, the animals of each group could be selected from different cages to eliminate the effect of cage environmental variants. They were supplied with a daily maintenance diet which was almost stable in both quality and quantity to keep their body growth and functions almost constant throughout the experiment.

The animals were divided into two groups (each group contains 21 animals). One group (group 1) received soft laser irradiation at the treatment sites and the other group (group 2) was non-irradiated as a control group.

The orthodontic appliances were constructed so that each appliance was formed of two main parts two bands & wire in the form of a vertical loop with a

helical. An eyelet was welded on the middle part of the labial aspect of each band. These eyelets were the attachment components of the appliances, El-Dakroury(1998).

2.1.2.Drugs:

Intramuscular injection of a mixture of Xylazine (10 mg/kg b.wt.) and Ketamine (87 mg/kg b.wt.) was used for anesthesia, Kandil(1995).

2.2.Methods:

2.2.1. Experimental design

After anaesthetization, glass ionomer cement was used for cementation of the orthodontic appliance on the lower incisors of the animal (Fig.1). The orthodontic device was activated once only at the beginning of the experiment with no further activation during the treatment period, which lasted for thirty days.

Fig. (1): The orthodontic appliance in place
The first group was received laser irradiation by the Gallium- Arsenide laser system (Ora-laser-ORALIA Dental Products Ltd., Weiherstraße 20, D-78465 Konstanz-Dettingen / Germany).

It is a semi-conductor low level laser therapy(LLLT), with a wavelength 904 nm (Infrared); it was pre-adjusted to deliver a laser beam with an output power of 30 mW, and a frequency of 9999 Hz for 3 minutes daily for two weeks starting from the day of activation of the orthodontic appliance.

The surface area of the probe covers the whole target area of the lower incisors (from the tip of the interdental papilla to the depth of the gingival sulcus, and one millimetre distal to the roots of both lower incisors). The applicator probe was moving in a continuous slow circular motion to assure full exposure of the target surface to the beam.

Seven animals from each group were sacrificed at three days, two weeks and one month intervals from the date of beginning of orthodontic appliance activation. Each animal was anesthetized by intramuscular injection of a mixture of Xylazine (12 mg/kg body weight) and Ketamine (80 mg/kg body

weight). While the animal was under deep anesthesia, a lethal dose of ketamine chlorhydrate was used, Kandil(1995).

2.2.2. Assessment of the Rate of Tooth Movement:

During the experimental period, the amount of tooth movement was measured directly from the oral cavity of the animals using a Vernier caliper. The measurement were taken daily throughout the study period. During the measurement the end of the caliper were in contact with the opposing upper mesial points of the bands around the lower incisors.

2.2.3. Assessment of the Bone Density:

Radiographic assessment was done, after scarification, using Radio Visio Graphy (RVG) (Dür Vistaray system, manufactured by Dür Dental Gm pH and Co. Germany) with its personal computer (PC) base version. The x-ray generator was Orix-65 dental unit (65 kv, 8 mA) (Orix- 65 mobile x-ray machine, with digital x-ray control palm time 100, manufactured by ARDET srl, Italy) with a computer controlled timer, electric digital control device, and centesimal time regulation ranged from 0.01 to 2.99 seconds. In this study the time of exposure was 0.05 second.

The mandible of the animal was put in contact with the sensor and the inferior border of the mandible is parallel to the sensor. The distance between the end of the long cone (16 inch) and the sensor was fixed to 5 cm and the cone was kept perpendicular to the sensor all the time. The read out starts automatically, the image was displayed gradually on the computer screen, when the read out was completed; the newly read image was stored.

2.2.4. Measurement of bone density

The computer program, with an appropriate software (Dür DBS Win image processing software, manufactured by Dür Dental Gm pH and Co. Germany) for image processing and manipulation, was used to evaluate the bone density at the mesial sides of both right and left lower central incisors. Two successive straight lines were drawn 0.5 mm apart and parallel to the mesial surface of each root, then the density were measured at three different and fixed points on each line (at 3,6 and 12mm) then the means were calculated and statistically analyzed, Salah et al.,(2000).

By assigning the value (0) to black and (256 to white, the mean gray value in each region of interest was calculated. Areas of bone loss represented as (darker areas), while areas of bone gain represented as (lighter areas), Yokota et al.,(1994). These data

were used for comparing the bone density between irradiated and non-irradiated groups.

Obtained data were presented as mean±SD and ranges. Results were analyzed using paired Wilcoxon test (Z-test). Statistical analysis was conducted using the SPSS (Version 10, 2002) for Windows statistical package. P value <0.05 was considered statistically significant.

2.2.5. Histopathological Assessment:

The mandible was removed and the soft tissue covering it was removed. Each specimen was fixed in 10% neutral buffered formalin for not more than 48 hours. After fixation, assessment of bone density was done, and then the specimens were decalcified in 20% ethylenediamine-tetra-acetic acid (EDTA) for 6-8 weeks. Natural EDTA decalcifying solution consisted of EDTA (di-sodium salt) 250 g. dissolved in distilled water 1750 cm³. The solution was adjusted to pH 7 by the addition of about 26 g. sodium hydroxide. A volume of 150 times that of the tissue was renewed every 5-7 days during the decalcification process.

The specimens were prepared for haematoxylin and eosin (H&E), histochemical examination to evaluate the process of bone remodeling and the cellular activities in bone and PDL at the cervical one half of the root

3.Results:

3.1.Clinical Findings:

The animals lost some of their body weight during the first two weeks then weight regain started during the third week and continued up to the end of the study period.

Clinically during the first 3 days of the study, the gingiva in all cases was of normal color and texture except for slight gingival inflammation in few animals in both groups. No bleeding tendency or gingival enlargement was noted in any of the study cases. During the period from 4th to 14th days, the gingiva was normal irradiated group. On the other hand, four animals in group V showed slight gingival inflammation. During the period from 15th to the 30th days, the gingiva was normal with no evidence of gingival bleeding, enlargement or inflammation in the irradiated group. While slight gingival inflammation was still detected in three animals in the non-irradiated group.

The rate of tooth movement was measured daily for the studied groups. The highest measurements throughout the study period were recorded in irradiated group than non- irradiated group. Group (1)

reached the maximum distance between the two incisors (10 mm) (as the device became inactive after reaching its maximum opening) on the 24th day, while the group (2) on the 29th day.

The mean distances during the first three days were (3.5 ± 1 mm for group (1), and 3±0.5 mm for group. During the period of 4th – 14th, the mean distances were (5.86 ± 0.84 for group (1) and 4.86 ± 0.83. For the period (15th – 30th days), the mean distance was (9.25 ± 0.84 for group (1) and 7.84±1.2mm for group.

Statistically, there was a non-significant difference (P>0.05) between both groups during the three days period {table 1, Fig.2}. While during both 4-14 days and 15-30 days periods there was a significant difference (P< 0.05) between the irradiated group and the non –irradiated one{Table 2&3, Figs. 3&4}.

Table (1): Statistical analysis of mean distance (mm) estimated at 3 days in both groups.

Fig (4): Mean ± (SD) of estimated distance in the studied groups during the period 15-30 days

3.2. Assessment of bone Density:

The mean bone density was compared between the right and left incisors of both groups. For group (1), it was 100.5 ± 3.21 pixel/mm² and 95.6 ± 6.13 pixel/mm² respectively Fig. (5). for group (2), it was 90.5 ± 2.75 pixel/mm² and 90.4 ± 4.4 pixel/mm² respectively Fig. (6). Statistically, there was a non-significant difference ($P > 0.05$) of the bone density evaluated for either the right or left incisors between the both studied groups {Table 4, Fig. 7}.

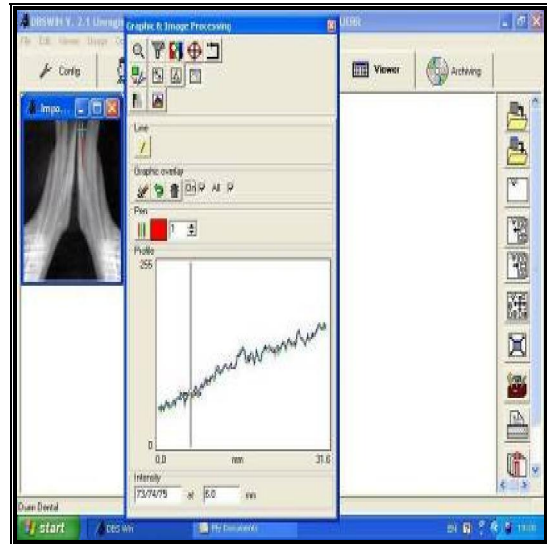

Fig. (6): RVG bone density measurements in group (2)

Table (4): Statistical analysis of the mean bone density (pixel/mm²) between right and left incisors of each group.

	Rt incisor	Lt incisor	Statistical analysis	
	mean±SD (pixel/mm ²)	mean±SD (pixel/mm ²)	Z	p
Group (1)	100.5±3.21	95.6±6.13	0.099	>0.05
Group (2)	90.5±2.75	90.4±4.4	0.007	>0.05

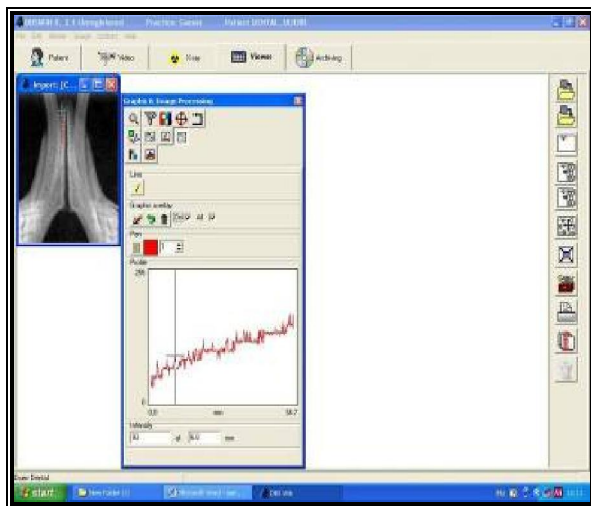

Fig. (5): RVG bone density measurements in group (1)

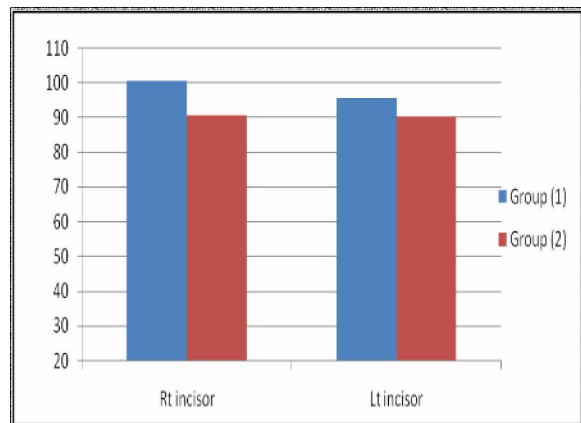

Fig (7): Mean ± (SD) of estimated bone density of both right and left incisors in the studied groups at the end of the study period.

The sum of the measurements of the bone density of both right and left incisors of each animal was used to calculate the mean bone density for each group. In group (1) the bone density was 99.6 ± 3.4 ; range: 95-104 pixel/mm². While, in group (2) it was 90.3 ± 2.72 ; range: 84 – 94 pixel/mm²; (Fig. 49). Statistically, there was a significant difference of bone density between both groups ($P < 0.05$). {Table 5, Fig. 8}.

Table (5): Mean bone density (Pixel/mm²) estimated in both groups

Group (2)	90.3 \pm 2.72		

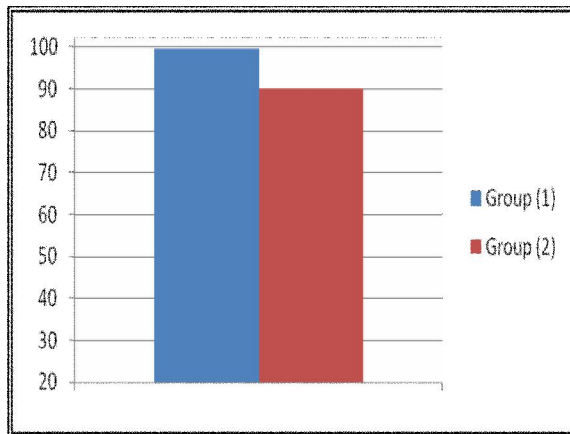

Fig. (8): Mean (\pm SD) of estimated bone density in the studied groups

3.3. Histological evaluation by using H&E stain:

The histological changes after orthodontic movement were mainly based upon changes shown in the non-irradiated group (2). The results were mainly detected in periodontal ligament (PDL) as regard its cellularity, continuity, vascularity and architecture. Alveolar bone changes were also observed as regard its bone cells, bone resorption and new bone formation. As a general, the tipping movement resulted in pressure and tension sites.

3.3.Histological evaluation by using H&E stain:

The histological changes after orthodontic movement were mainly based upon changes shown in the non-irradiated group (2). The results were mainly detected in periodontal ligament (PDL) as regard its

cellularity, continuity, vascularity and architecture. Alveolar bone changes were also observed as regard its bone cells, bone resorption and new bone formation. As a general, the tipping movement resulted in pressure and tension sites.

3.3.1. Three days later:

For pressure sites:

In the non-irradiated group, the PDL showed hyalinization zone of collagen bundles adjacent to both tooth, and bone surfaces, with multiple edematous spaces and vacuolation. Degenerative changes were also observed. Narrow interstitial spaces with compressed blood vessels were prominent and located near the wall of alveolar bone. A few numbers of osteoclasts in their Howship's lacunae was evident. The bone surface was irregular and scalloped with few number of resorption foci. Fig. (9) While the irradiated group showed similar results to the non-irradiated one. The bone surfaces revealed increased number of osteoclasts. Multiple interstitial spaces encircling numerous compressed vessels were demonstrated Fig. (10).

Fig. (9): Photomicrograph of the pressure site in group (2) at 3 days showing few numbers of osteoclasts. Note the multiple edematous spaces (H&E x 100).

Fig. (10): Photomicrograph of the pressure site in group (1) at 3 days showing excessive osteoclasts activity (H&E, x 100).

3.3. 2. For tension Sites:

Non-irradiated group revealed over-stretching of PDL with prominent wavy course. The fibers became dense and elongated with irregular arrangement. Vasodilatation of thin walled vessels was obvious and located at the center of PDL. Normal bone architecture was noted Fig. (11). While *the irradiated group*, showed more pronounced over stretching of PDL than found in group V. In addition, evidence of laid down osteoid tissue was detected in the irradiated groups. Numerous proliferations of mononuclear cells (osteoblasts & fibroblasts) were detected near to root and bone surfaces Fig. (12).

Fig. (11): Photomicrograph of the tension side in group(2) at three days showing widening of the PDL with focal degeneration (H. & E. x 100).

Fig. (12): Photomicrograph of the tension site of group(1) at three days showing over stretching of PDL with prominent degenerative changes (H. & E x 100).

3.3. 3. Two weeks later:

(For pressure sites):

Non-irradiated group, revealed a PDL hyalinization which was similar to the previous

period. Increased osteoclasts number along the bone surface was detected. Areas of degeneration were persistent in the vicinity of resorbed bone Fig. (13). While the irradiated group showed narrowing of the PDL space and evidence of periodontal reorganization especially with group (IV) and to a lesser extent in remaining groups. Increased mononuclear cell proliferation was detected with persistence of degenerative remnants with a higher intensity in addition to increased osteoid tissue formation. With the appearance of few wide reversal lines than that found in non-irradiated group Fig. (14).

Fig. (13): Photomicrograph of the pressure site of the group(2) at two weeks showing increased osteoclast activity. Note the multiple interstitial spaces (H. & E. x 100).

Fig. (14): Photomicrograph of the pressure site of group (1) at two weeks. Note the increased number of osteoclast(H. & E. x 100).

3.3.4. For tension sites:

The non-irradiated group revealed increased osteoid deposition than the previous interval with the appearance of few number of reversal lines. Numerous thin-walled dilated vessels were also prominent Fig. (15). While the irradiated group revealed similar results but with the appearance of numerous deep reversal lines. Vasodilatation was more prominent. The bone surface revealed a highly cellular surface with increased mononuclear cell proliferation opposite to the bone surface. It was also seen adjacent to the root surface in the form of cementoblastic proliferation Fig. (16).

Fig. (15): Photomicrograph of the tension site of group (2) at two weeks showing evidence of osteoid deposition. Note the numerous thin walled vasculatures (H. & E. x 100).

Fig. (16): Photomicrograph of the tension site of group (1) at two weeks showing evidence of PDL re-organization with prominent mononuclear cell proliferation (H. & E. x 100).

3.3.5. One month later:**For pressure sites:**

The non-irradiated group showed a minor evidence of PDL reorganization with persistence of necrotic remnants. Osteoid tissue with numerous wide resting lines was detected. Mononuclear proliferation was highly manifested Fig. (17). Alveolar bone resorption was still active and the newly formed bone was few, with thin and immature trabeculae. While the irradiated groups showed more evidence of PDL reorganization, more new bone formation with thick and mature trabeculae and smooth regular bone surface Fig. (18).

Fig. (17): Photomicrograph of the pressure site of group (2) at one month showing a minor evidence of PDL reorganization. Note the persistence of multiple interstitial spaces and the new laid down osteoid (H. & E. x 100).

Fig. (18): Photomicrograph of the pressure site of group (1) at one month showing few numbers of osteoclasts (H. & E. x 100).

3.3.6. For the Tension Sites:

Non-irradiated group showed fibrous condensation with numerous dilated capillaries. Some areas of PDL were still stretched. Precementum was focally calcified and some uncalcified cementum still persists

Fig. (19). While the irradiated group showed highly detectable reorganization of PDL and to a lesser extent for the remaining groups. Besides increased incidence of new bone tissue with multiple deep reversal lines, the newly formed bone had thick and mature trabeculae. Cementoblasts and precementum were increased. The bone surface showed highly cellular surface and osteoblastic proliferation Fig. (20).

Fig. (19): Photomicrograph of the tension side of group (2) at one month showing evidence of PDL reattachment. Note, multiple dilated capillaries (H. & E. x 100).

Fig. (20): Photomicrograph of the tension side of group (1) at one month showing increased cementoblastic layer, deep reversal lines and PDL reorganization (H. & E. x 100).

4. Discussion:

Orthodontic tooth movement is dependent on the ability of periodontal cells to react to mechanical stimuli. The most prominent features are the remodeling of the periodontal ligament and the resorption and deposition of alveolar bone, Ren et al.,(2005).

The orthodontic force is the promoting factor of alveolar bone remodeling. The force should be as slight as possible to prevent collateral effects such as bone necrosis or root resorption. On the other hand, accelerating the teeth movement is desirable, because

the treatment duration, frequently months or even years, is considered very long, Cruz et al.,(2004).

Literatures show some methods to stimulate bone remodeling such as, drug injections like Prostaglandin, Yamasaki(1983) and osteocalcin. Kobayashiet al.,(1998), electric stimulation, Spadaro(1997) and ultrasound application are other methods, Hadjiargyrou et al., (1998). These methods could be associated with discomfort and pain, Kawasaki and Shimizu(2000) or need sophisticated apparatus and demands applications for a long term to achieve its therapeutic effects, Roberts et al.,(2006).

Recently, low level laser therapy (LLLT), a non-invasive and simple method, was reported to be able to accelerate tooth movement in animals with formation of better quality bone, and augmented production of differentiated osteoclasts, Kawasaki and Shimizu (2000); Youssef et al.,(2008).

Laser energy, when deposited on tissues, causes reactions of a physiological nature. In the organism, the interaction of low level radiation constitutes the energetic incorporation contained in the laser light beam on the radiated tissues. The consequences of these interactions are: 1) primary effects, subdivided into biochemical, bioelectrical and bioenergetics; 2) secondary effects that stimulate the microcirculation and cellular tropism; 3) therapeutic effects, which are analgesic, anti-edematous and healing results, Moreira et al.,(2004); Silveira et al.,(2007).

The amount of the force applied during orthodontic treatment affects the repair capacity; Steigman et al.,(1993). The fixed orthodontic appliance used in this study was designed to produce a distal tipping movement of the incisors by applying the same amount of force with all animals. This is why a moderate force of 90 gm was used in this study to avoid the effect of heavy force on the repair capacity, El-Namarawey(1986).

The rates of tooth movement were high especially during the second (4th-14th days) and third (15th-30th) periods of the study in group (1) compared to group (2). This is in accordance with Cruz et al. (18) who concluded that LLLT does accelerate human teeth movement and could therefore considerably shorten the whole treatment duration. By the end of the study period, all animals in reached the maximum interdental distance. This was due to cessation of the orthodontic force secondary to loss of the springing action of the orthodontic device by reaching the maximum distance between the two ends of the loop arms. This occurred earlier in group (1) followed by group (2). A clinical observation of value is the fewer

occurrences of the gingival inflammation and swelling in the irradiated group compared to the non-irradiated one. This was in accordance with Honmura et al.,(1996) who reported that low power infrared irradiation on affected parts has an anti-inflammatory effect on acute and chronic inflammations.

In the present study, radiographic analysis was carried out for evaluation of bone density using direct digital system that has many advantages, among which, ability of image adjustment and manipulation, possibility of Image storage and the stored images can be used almost instantaneously, Topback et al.,(1999). Bone density at the tension sites was evaluated in this study. Statistically, there was a significant difference of bone density between irradiated and non-irradiated groups.

These results could be explained on lights of the results of Saito and Shimi(1997) who reported that LLLT significantly stimulated the number of bone nodules in a laser dose dependent manner. Also, Nicolau et al.,(2003) concluded that LLLT increased the osteoblasts activity and mineralization apposition rate during healing of bone defects in rats. Moreover, Khadra et al.,(2004) reported that LLLT stimulated the deposition of calcium, phosphorus, and insoluble proteins in rat calvarial bone defects.

The mechanisms by which laser irradiation can stimulate bone formation are not well understood but may be multifactorial and include osteogenic cell proliferation and differentiation, mitochondrial respiration, and ATP synthesis, in addition to promotion of angiogenesis and healing acceleration, Maegawa et al.,(2000); Khadra(2005).

By the end of the study period (30 days), highly detectable reorganization of the PDL, besides increased incidence of new bone tissue with multiple deep reversal lines and mature trabeculae in addition to osteoblastic proliferation were noted. The cementoblasts and precementum were increased. These histological features were more prominent in the irradiated group than the non-irradiated one.

The histological (H&E) results of the present study were in harmony with the clinical results. They explained the higher rate of tooth movement in the irradiated group compared to the non-irradiated one according to the fact that the speed of tooth movement is greatly dependent on the speed of bone remodelling, Kawasaki and Shimizu(2000); Youssef et al.,(2008)

In the current work, there was an agreement between clinical, bone density and histological findings and the statistical analysis of this experimental study.

In conclusion, low-level (Ga-Al-As) diode laser irradiation stimulated tooth movement accompanied with an acceleration of collagen formation and alveolar bone remodeling, as indicated by increases in the number and activity of both osteoclasts and osteoblasts in PDL and mineralized bone formation.

Nucleotide variations of 16S rRNA gene of VacA positive *Helicobacter pylori* strains isolated from human Gastric Biopsies in Saudi Arabia

Milyani MR

¹Department of Biological Sciences, Faculty of Science, King Abdulaziz University, Jeddah, Saudi Arabia

*Corresponding author: rajaamilyani@hotmail.com

ABSTRACT: Three isolates of *Helicobacter pylori* (*H. pylori*) were originally isolated from gastric biopsies taken from patients complaining of gastric disorders in Makkah City, Saudi Arabia. The isolates that previously revealed to be vaculating cytotoxin A positive were identified by 16S rRNA gene as *H. pylori* using a primer pair designed from the similar sequences within consensus regions of GenBank *H. pylori* to amplify the 163 bp fragment. Sequence alignments of 16S rRNA gene were performed and total numbers of 46, 55 and 40 nucleotide positional differences with base-pair substitutions were identified for these isolates compared to GenBank strains of *H. pylori*. Phylogenetic analyses based on 16S rRNA gene sequences showed that the three *H. pylori* strains formed a phylogenetically distinct group, separate from all other species of *H. pylori*. The three isolates were hence coined as *H. pylori* Milyani-1, -2 and -3 at GenBank database under the accession numbers HQ877021, HQ877022 and HQ877023, respectively. The obtained results evidently indicated a large diversity with unique characteristics of the three Saudi Arabian *H. pylori* strains from all the other established strains.

Key words: Accessions HQ877021, HQ877022 and HQ877023, *Helicobacter pylori*, isolates, 16S rRNA gene, variations.

1. INTRODUCTION

Helicobacter pylori is a Gram-negative, microaerophilic, motile bacterium, that has been implicated in the aetiology of most gastritis, duodenal ulcers and is associated with lymphoproliferative disorders as well as gastric carcinoma. Some evidence also suggests that it is a possible factor in the development of cardiovascular disease (Cover and Blaser 1992; Aceti *et al.* 2004).

At the discovery of *H. pylori*, identification was carried out by morphological, biochemical and physiological studies, in addition to histological and serological investigations (Lee and Megraud, 1996). However, by the emergence of the new technology of polymerase chain reaction (PCR), researchers started to detect *H. pylori* using PCR, 16S rRNA gene, ureA and cagA genes (Clayton *et al.*, 1992, Twing *et al.* 2011). The sequence of a fragment of the 16S rRNA gene was determined by Khan *et al.* (2000) for ten strains of *H. pylori* to examine the contribution of point mutation within a conserved gene. There were few differences between the sequences from the

various strains and it was concluded that such differences were not the most important source of diversity. Monstein *et al.* (2001) used real-time DNA sequence analysis of *H. pylori* 16S rRNA gene fragments by pyro-sequencing for rapid molecular identification and

sub-typing of clinical isolates. The latter experiment showed that subtle DNA sequence variation occurs sufficiently often in the 16S rRNA variable V1 and V3 regions of *H. pylori* and the authors concluded that their findings can provide a consistent system for sub-typing. On the other hand, Trieber and Taylor (2002) identified several unique sequence variations in the 16S rRNA genes of *H. pylori* strain 26695, and these have been placed on a secondary structure model of the *H. pylori* 16S rRNA. Moreover, natural transformation with the 16S rRNA genes from *H. pylori* resistant strains conferred tetracycline resistance on susceptible strains. Furthermore, it has now been established that using PCR of 16S rRNA gene is considered as a powerful tool for identification of different types of

micro-organisms. It has also become the primary method for determining prokaryotic phylogeny and is currently the basis for prokaryotic systematic (Monststein *et al.* 2000, Dewhirst *et al.* 2005).

The aim of the present study was to identify three new *H. pylori* isolates obtained from three male patients complaining of gastric disorders at Makkah Almokarama City, Saudi Arabia, based on the variation analysis of 16S rRNA gene sequences.

2. MATERIALS AND METHODS

2.1. Materials:

The present molecular study was performed in Genetics and Cytology Dept., National Research Centre (NRC), Cairo, Egypt.

2.1.1. Clinical specimens:

Three gastric biopsies obtained from three male patients complaining of chronic active gastritis were provided by Gastroenterology-endoscopy Consultant at Al-Noor Specialist Hospital at Makkah Almokarama City, Saudi Arabia.

2.1.2. Specific primers for 16S rRNA gene

Ten NCBI-different accessions (DQ059083, DQ059082, U01332, U01331, U01330, U01329, U01328, AJ310144, AJ310143 and HPU00679) of *H. pylori* 16S rRNA gene were multiple alignments to design a pair of primers; forward 5-GTGTGGGAGAGGTAGGTGGA-3 and reverse 5-GTTTAGGGCGTGGACTACCA-3 with a product size of 163 bp.

2.2. Methods:

2.2.1. Isolation and identification:

The gastric biopsies were cultured and incubated under microaerophilic conditions on Blood and Chocolate agar at 37° C for five days. Culture and Identification was carried out according to Milyani and Barhameen (2004).

2.2.2. DNA extraction and PCR amplification of 16S rRNA gene

DNA extraction was performed using the Wizard® SV kit (Promega, Madison, USA). PCR-amplification reaction was used according to Williams *et al.* (1990) in a final volume of 25 µl containing 10X PCR buffer (10 mM Tris-HCl, 50

mM MgCl₂, 2 mM dNTPs, 10 mM of each forward and reverse primers, 50 ng of template DNA and 5 U of *Taq* polymerase (Promega, USA). Reactions were performed in a thermocycler (Biometra, GmbH, Germany) and PCR was performed as one cycle of 94°C for 3 min (denaturation), 40 cycles of 94°C for 30 sec, 36°C for 1 min and 72°C for 1 min (annealing) and with a final extension of 5 min at 72°C. PCR amplified product was analyzed using 1.2% agarose gel electrophoresis in 1X TBE buffer by staining with 5 µg/µl ethidium bromide and visualized under UV light. The size of the 16S rRNA fragment of 163 bp was estimated based on a 100 bp DNA ladder (Bioron, Germany).

2.2.3. 16S rRNA gene purification, sequencing and analysis

PCR product of 163 bp was purified with the QIA quick PCR Purification Kit (Qiagen GmbH, Germany) according to the manufacturer's instructions. DNA was eluted in 20 µl of sterile water. The 16S rRNA fragment was sequenced on an Applied Biosystems automatic sequencer (ABI PRISM® 1200 DNA Sequencer, Bioron GmbH, Germany).

Sequences were compared with sequences of representatives of the most related *H. pylori* strains deposited in GenBank and sequencing-genome databases by using the BLAST search (<http://www.ncbi.nlm.nih.gov/blast>). Analysis was performed using Geneious Pro 4.5.4 program. A phylogenetic tree was supported from 500 bootstrap replicates and a dendrogram was constructed using multiple alignment of the 16S rRNA from *H. pylori* isolates and strains

3. RESULTS

The colonies obtained from culturing the three gastric biopsies showed typical cellular morphology of *H. pylori* in addition to motility and to their vigorous positivity to urease, oxidase and catalase.

3.1. PCR amplification of 16S rRNA in *Helicobacter pylori* isolates

PCR amplifications of the three *H. pylori* isolates revealed the fragments with expected sizes of 163 bp that represented the 16S rRNA gene (Fig. 1).

Fig. 1. PCR amplified products of 16S rRNA gene of the three *H. pylori* isolates using designed primer with 163 bp. M= DNA ladder with 100 bp

3.2. Sequence analysis of PCR-amplified 16S rRNA of the *H. pylori* isolates

A 163 bp nucleotide sequence of the partial 16S rRNA gene from the three *H. pylori* isolates were aligned and compared in the GenBank using the BLAST search. A total of 121 to 129 16S ribosomal RNA gene partial sequences from different accessions of *H. pylori* included different strains, 9 isolates and one clone were identified **Table (1)**. Blast alignment revealed several accessions of *H. pylori* scored 99% maximum identity for Milyani-1 and 98% maximum identity for Milyani-2 and Milyani-3, except strain DA (AY366422) with 96%.

Sequence alignments of the 16S rRNA gene of the *H. pylori* isolates (HQ877021, HQ877021 and HQ877021, respectively) compared with *H. pylori* GenBank strains and isolates revealed positional differences in nucleotide sequences and base-pair substitutions between the three isolates and the numerous isolates and strains (**Fig. 2**).

The accession HQ877021 with a fragment size 163 bp (isolate Milyani-1) showed a total number of 46 nucleotide positional differences with base-pair substitutions, whereas the highest number (6) of positional differences was cytosine (C) found that changed to Guanine (G), followed by (G) to Adenine (A) in 5 positional differences and five from Thymine (T) to (A) in all other GenBank isolates and strains as shown in **Table 2**. A single base change or

a mixed base (more than one nucleotide determined at a single position) is considered as a new 16S type. Four other nucleotide positional differences were obtained from A' G, C' A and G' T. Moreover, three of four nucleotide positional differences were obtained from (...) with no nucleotide base to G, T, A and one from (...) to C. One positional difference at nucleotide number 819 was detected from C to (...).

The accession HQ877022 with a fragment size 163 bp (isolate Milyani-2) showed a total number of 55 nucleotide positional differences with base-pair substitutions, whereas the highest number (7) of positional differences was adenine (A) found in HQ877023 that changed to thymine (T) in all other GenBank isolates and strains as shown in **Table (2)**. Six nucleotide positional differences were obtained from C' A, C' G and G' A and one with five positional differences from A' G. Moreover, three of four nucleotide positional differences were obtained from () with no nucleotide base to G, T, A and one from () to C. One positional difference at nucleotide number 819 was detected from A to ().

The accession HQ877023 with a fragment size 163 bp (isolate Milyani-3) showed a total number of 40 nucleotide positional differences

with base-pair substitutions, whereas the highest number (4) of positional differences was adenine (A) found in HQ877023 that changed to thymine (T) in all other Gene Bank isolates and strains as shown in Table (2). Three nucleotide positional differences were obtained from A(C and C(T and four with two positional differences from A(G, C(G, G(A and T(A. Moreover, 7, 6, 5 and 3 nucleotide positional differences were obtained from () with no nucleotide base and changed to G, T, A and C, respectively. One positional difference at nucleotide number 819 was detected from A to ().

Consequently, the overall total number of nucleotide positions of the three isolates was 141 and the highest changes in nucleotide positions were 14 from C' G, followed by 13 from A' T and G' A. However, the lowest changes were two from T' C and three from T' G with no change was obtained from G' C (**Table 2**).

Table 1. Blast search of 16S rRNA gene sequence identity between the three *H. pylori* isolates (Milyani-1, -2 and -3) and GenBank sequences.

Fig. 2. Sequence alignment of 163 bp of 16S rRNA gene in three *H. pylori* isolates (Milyani-1, -2 and -3) compared with other isolates and strains existed in NCBI GenBank. Conserved nucleotides between the studied isolates and other sequences are boxed in black. Putative conserved between the different isolates with no identity with isolates are boxed in grey. The yellow box referred to the identity of all accessions except the studied isolates. Dashes correspond to gaps introduced to optimize the alignments.

Table 2. Positional differences and base pair substitutions in nucleotide sequences between the three *H. pylori* isolates (Milyani-1, -2 and -3) and numerous isolates and strains based on 16S rRNA gene similarity.

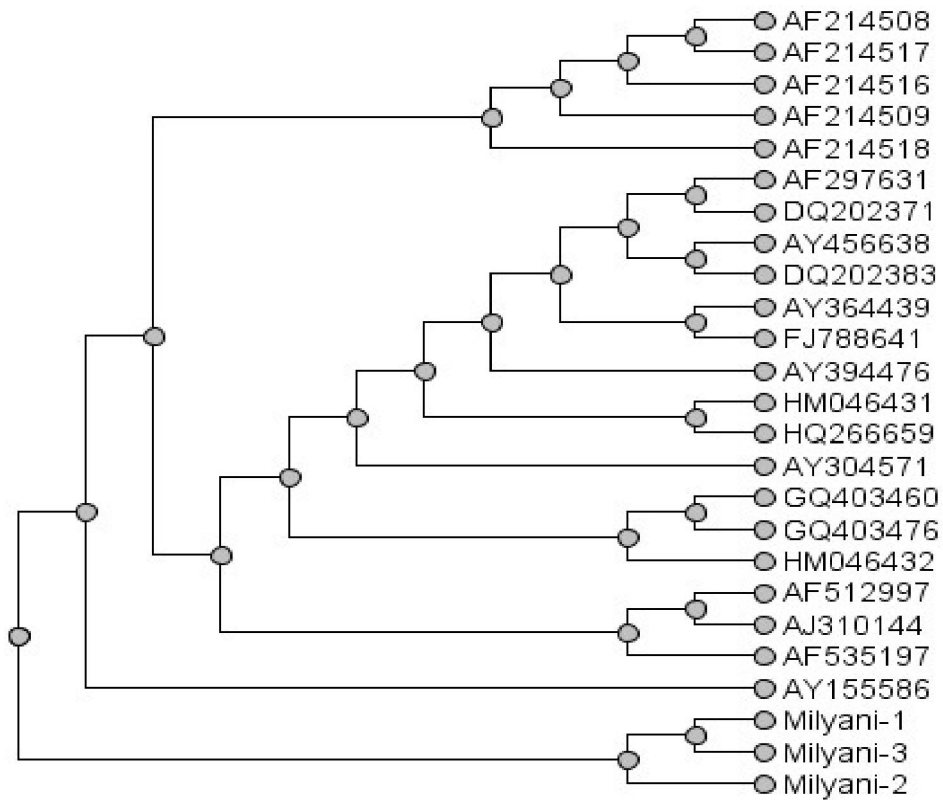

Fig. 3. Phylogenetic relationships between the three *H. pylori* isolates (Milyani-1, -2 and -3) other GenBank related strains, based on 16S ribosomal RNA gene.

The phylogenetic tree represented the relationship between the three *H. pylori* strains (Milyani-1, Milyani-2 and Milyani-3) with their accession numbers (HQ877021, HQ877022 and HQ877023, respectively) and all described *H. pylori* related strains obtained from Gene Bank based on the 16S ribosomal RNA gene are shown in **Fig. 3**. The dendrogram divided all Gene Bank strains into two clusters; one contained the three *H. pylori* strains and the second cluster comprised all GenBank strains. The three strains were divided into two sub-clusters, whereas Milyani-1 and Milyani-3 were linked together and separate from Milyani-2. In general, each of the three local strains formed a phylogenetically distinct cluster, separate from all other species.

4. Discussion

The traditional identification of bacteria in the clinical setting is based on phenotypic characteristics and biochemical tests which is generally not as accurate as identification based on molecular methods. Comparison of the bacterial 16S rRNA gene sequence has emerged as a preferred genetic technique since 16S rRNA gene sequence analysis can identify poorly described, rarely isolated and unculturable bacteria (**Clarridge 2004; Smuts and Lastovica, 2011**). In the present study, the three strains of *H. pylori*; Milyani-1, -2 and -3 isolated from gastric biopsies of patients in Makkah City, Saudi Arabia revealed variations in 16S rRNA sequence in positional differences with base-pair substitutions compared to Gene Bank *H. pylori* strains. On the other hand, each of the three strains displayed a unique phylogenetic cluster and evidently demonstrated a large diversity from all the other isolates and strains established around the world. This is in accordance with **Taylor et al. (1992)** who demonstrated that the genome patterns of *H. pylori* are so diverse that almost no two strains from different patients appear related. In addition, **Trieber and Taylor (2002)** identified several unique sequence variations in the 16S rRNA genes of *H. pylori* strain 26695. However, the obtained variations among the three strains under study and the enormous genomic diversity among other *H. pylori* strains is so far not understood. Nevertheless, it might be related to restriction and modification which could change restriction sites, point mutations in certain genes and different positions of genes on *H. pylori*

maps within the approximate 1.7-kb genome (**Taylor 1996**). Furthermore, allelic diversity is so high that almost every unrelated isolate of *H. pylori* has a unique sequence when a fragment of several hundred base pairs is sequenced from housekeeping or virulence genes (**Falush et al. 2003**). Others also believe that this allelic diversity is the result of the combination of a high (mutator-type) mutation rate, a high frequency of recombination between strains during mixed colonization and the ability of *H. pylori* to integrate unusually small pieces of exogenous DNA into its chromosome (**Kraft et al. 2006**). Consequently, the 16S rRNA of the three *H. pylori* strains are very polymorphic and confirm the conclusion that the three *H. pylori* are unique strains and each of them displayed a unique phylogenetic cluster and evidently indicated a large diversity from all the other isolates and from the established strains in different geographical parts of the world. Moreover, it is well known now, that 16S rRNA PCR test gives 100% specificity and sensitivity (**Moyaert et al. 2008**), thus sequencing and the phylogenetic analysis of the 16S rRNA are often utilized to identify new isolates (**Smuts and Lastovica 2011**).

It should be noticed that at the present study, the 163 bp fragment of 16S rRNA gene of the three *H. pylori* strains were delivered to Gene Bank/NCBI database according to the expected size of the designed primer pair and to their appearance on the agarose gel electrophoresis (Fig. 1). However, the size of the three fragments were finally reduced by the Gene Bank and submitted as 111 bp. This reduction in fragment size normally occurs when extraction of the fragments is from genomic DNA and not from sub-cloning experiment.

Finally, a future challenge is to translate information from 16S rRNA gene sequencing into convenient biochemical testing schemes, making the accuracy of the genotypic identification available to the smaller and routine clinical microbiology laboratories (**Clarridge 2004**). Above all, the obvious variations seen in the new three *H. pylori* strains may indicate differences in virulence factors, biochemical characteristics, antibiotic different patterns and the outcome of the clinical picture. In addition, these variations could be used in the future as new markers for virulence factors, diagnostic, therapeutic purposes for *H. pylori* different diseases and for further studies that would give answers to many question marks about the source, real route of

transmission, recurrence of *H. pylori* infection and the role of coccoid forms of *H. pylori* in pathogenesis.

Aknowledgment:

Thanks for prof. Dr. Osama Ezzat El Sayed Genetics and Cytology Department NRC for his help

Disk-Rim flywheel of minimum weight

Bedier B. EL-Naggar and Ismail A. Kholeif

Department of Engineering Mathematics and Physics, Faculty of Engineering, Cairo University
Giza, Egypt

bbnaggar@hotmail.com

Abstract: In this article the disk-rim flywheel is suggested for light weight. The mass of the flywheel is minimized subject to constraints of required moment of inertia and admissible stresses. The theory of the rotating disks of uniform thickness and density is applied to each the disk and the rim independently with suitable matching condition at the junction. Suitable boundary conditions on the centrifugal stresses are applied and the dimensional ratios are obtained for minimum weight. It is proved that the required design is very close to the disk with uniform thickness.

[Bedier B. EL-Naggar and Ismail A. Kholeif. **Disk-Rim flywheel of minimum weight.** Journal of American Science 2011;7(6):146-149]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Disk-Rim; flywheel; minimum angular speeds; moment of inertia; radial and tangential stresses.

Introduction

Fluctuating power and/or load machines are equipped with a flywheel to store kinetic energy upon rotation. Strokes of large power increase the wheel rotation whereas this increased speed is reduced in strokes of low energy. If the energy fluctuation each cycle is ΔE , ω_{\max} and ω_{\min} are the maximum and minimum angular speeds; then
$$\Delta E = \frac{1}{2} I (\omega_{\max}^2 - \omega_{\min}^2)$$
. Here I is the mass moment of inertia of the flywheel about the axis of rotation. If the difference $\omega_{\max}^2 - \omega_{\min}^2$ is required not to exceed a given value in a certain application, the value of I is then fixed. Flywheels are then designed to ensure this value. Upon deciding the material of the flywheel the dimensions are determined accordingly. Usually the materials used are cast iron and steels.

The value of the maximum speed ω_{\max} is of primary importance in the design of the flywheels because higher speeds result in higher centrifugal stresses which should not exceed the admissible values of the flywheel material. This will be discussed later in detail. As modern designs require light weight, the design parameters are chosen according to ensure minimum weights with inertia and stresses are prescribed as constraints. As the moment of inertia of a mass element about a given axis is proportional to the square of the distance between the element and the axis, smaller mass at a large distance is more preferable than larger mass at small distances from the point of view of minimum weight. However in bodies of revolution larger distances imply larger circumference and areas. The two factors must be investigated properly the rim-

disk wheel is suggested to ensure this. Figure (1) shows a schematic of disk-rim flywheel considered.

We should indicate that the flywheel is fitted with a hub around the axis of rotation for mounting the shaft. This hub serves as a reinforcement of the disc and dropping it in the calculation will be an approximation in the safe side.

Figure 1

The mass M of the flywheel is given by

$$\frac{Mg}{\pi\gamma} = R_i^2 t \left[1 + y(x^2 - 1) \right] \quad (1)$$

Here;

- g acceleration of gravity
 γ specific weight of flywheel material.
 R_i disk radius
 t disk thickness

$$x = \frac{R_0}{R_i}; \quad R_0 \text{ outer radius of rim}$$

$$y = \frac{b}{t}, \quad b \text{ width of rim}$$

Also, the moment of inertia I is given by

$$\frac{2I}{\pi\gamma} = R_i^4 t \left[1 + y(x^4 - 1) \right] \quad (2)$$

Different aspects of flywheel design are investigated by several authors along with other rotating disk machine elements. You et. al.[1] made numerical analysis of elastic plastic rotating disks with arbitrary variable thickness and density; the governing equation is derived from the basic equations of rotating disks and solved using the Runge-Kutta Algorithm. Also, Sterner et. al.[2] developed a unified numerical approach for the analysis of rotating disks including turbine rotors. The problem of stresses in linearly hardening rotating solid disks of variable thickness is discussed by Orcan and Eraslan[3], analytically flywheels with friction used for optimal control of damping are studied by EL-Gohary [4]. The problem of robust stabilization and robust output feedback stabilization of the angular velocity of a rigid body are tackled by Astofi A. [5,6], the problem of rotating anisotropic disk of uniform strength is investigated by Jain et al.[7]. Callioglu [8] made an analysis of the stresses in an orthotropic rotating disk under thermal loading. The problem of limit angular velocities of variable thickness rotating disks is solved by Eraslan et al. [9].

Formulation and Solution:

Consider the disk-rim flywheel whose cross-section is shown in figure (1). The flywheel is rotating around its axis of symmetry at an angular speed ω , the radial and tangential stresses σ_r and σ_θ respectively are given by [10]:

$$\sigma_r = \frac{A}{2} - \frac{3+\nu}{8} \frac{\gamma \omega^2}{g} r^2 + \frac{B}{r^2} \quad (3)$$

$$\text{And } \sigma_\theta = \frac{A}{2} - \frac{1+3\nu}{8} \frac{\gamma \omega^2}{g} r^2 + \frac{B}{r^2} \quad (4)$$

here ν is the Poisson's ratio of the material A and B are arbitrary constants to be determined from the boundary conditions imposed on both the disk and the rim.

Stresses in the disk:

The disk of Radius R_i and thickness t includes the centre line $r=0$. For bounded values of stresses the constant B must be chosen zero and the resulting stresses in the disk are reduced to:

$$\sigma_r|_{disk} = \frac{A}{2} - \frac{3+\nu}{8} \frac{\gamma \omega^2}{g} r^2 \quad (5)$$

$$\text{And } \sigma_\theta|_{disk} = \frac{A}{2} - \frac{1+3\nu}{8} \frac{\gamma \omega^2}{g} r^2 \quad (6)$$

the maximum value of this stresses occur at the centre line and are equal to the yet undetermined arbitrary constants $\frac{A}{2}$ to be determined from the

boundary condition at $r=R_i$ where the disk and the rim join together. This condition is imposed by the centrifugal force on the rim transmitted to the edge of the disk as radial stresses $\sigma_r|_{R_i}$. The total centrifugal force on the rim is given by $M_{rim} \omega^2 \bar{R}_{rim}$ where M_{rim} is the mass of the rim and \bar{R}_{rim} is the mean radius of the rim. We

$$\text{have } M_{rim} = \frac{\gamma}{g} \pi b (R_0^2 - R_i^2) \quad \text{and}$$

$$\bar{R}_{rim} = \frac{1}{2} (R_i + R_0).$$

The area over which this force is uniformly distributed is the contact area between the disk and the rim $2\pi R_i t$. The resulting radial stress on the disk edge σ_r radial $|_{R_i}$ is given by:

$$\frac{1}{4} \frac{\gamma \omega^2}{g} R_i^2 y (x^2 - 1) (x + 1), \quad x \text{ and } y$$

are defined before, substituting this value in equation (5) for $r=R_i$ gives

$$\frac{A}{2} = \sigma_{r \text{ diskmax}} = \sigma_{\theta \text{ diskmax}} = \frac{\gamma \omega^2}{g} R_i^2 \left[\frac{3+\nu}{8} + \frac{1}{4} y (x^2 - 1)(x+1) \right] \quad (7)$$

this value should be equal to the admissible stress of the material σ for safe design. Accordingly, the second constraint on design is given by:

$$\frac{\sigma g}{\gamma \omega^2} = R_i^2 \left[\frac{3+\nu}{8} + \frac{1}{4} y (x^2 - 1)(x+1) \right] \quad (8)$$

the first constraint is that the moment of inertia is given by equation (2).

Stresses in the rim

In the rim, the centre line $r=0$ is not included and the arbitrary constant B can not be dropped. Accordingly, the stress distribution on the rim is given by equations (3) and (4). A relation between the values of the constants A and B in the rim can be obtained by applying the condition $\sigma_{r \text{ rim}}|_{R_0} = 0$ since the edge R_0 of the rim is free from external radial stresses. In terms of the constant A - not yet determined the expressions of the stresses in the rim are:

$$\sigma_r = \frac{A}{2} \left(1 - \frac{R_0^2}{r^2} \right) + \frac{3+\nu}{8} \frac{\gamma \omega^2}{g} \left(\frac{R_0^4}{r^2} - r^2 \right) \quad (9)$$

$$\sigma_{\theta} = \frac{A}{2} \left(1 - \frac{R_0^2}{r^2} \right) + \frac{\gamma \omega^2}{g} \left(\frac{3+\nu}{8} \frac{R_0^4}{r^2} - \frac{1+3\nu}{8} r^2 \right) \quad (10)$$

The value of the constant $\frac{A}{2}$ is determined from the value of centrifugal force on the rim divided by the area of the rim at the edge giving

$$\sigma_{r \text{ rim}}|_{R_i} = \frac{\gamma \omega^2}{4g} R_i^2 (x^2 - 1)(x+1) \quad (11)$$

Equations (9) and (11) give:

$$\frac{A}{2} = \frac{\gamma \omega^2}{g} R_i^2 \left[\frac{3+\nu}{8} (x^2 + 1) - \frac{1}{4} (x+1) \right] \quad (12)$$

Using equation (12) in equations (9) & (10) give:

$$\sigma_{r \text{ rim}} = \frac{\gamma \omega^2}{g} R_i^2 \left[\frac{3+\nu}{8} (x^2 + 1) - \frac{1}{4} (x+1) \right] \left[1 - \frac{R_0^2}{r^2} \right] + \frac{\gamma \omega^2}{g} \frac{3+\nu}{8} \left(\frac{R_0^4}{r^2} - r^2 \right) \quad (13)$$

$$\sigma_{\theta \text{ rim}} = \frac{\gamma \omega^2}{g} R_i^2 \left[\frac{1}{4} (x+1) \left(1 - x^2 \frac{R_0^2}{r^2} \right) + \frac{3+\nu}{8} (x^2 + 1) \left(x^2 \frac{R_0^2}{r^2} - 1 \right) - \frac{1+3\nu}{8} \frac{r^2}{R_i^2} \right] \quad (14)$$

Investigation of equation (14) for maximum shows that the maximum occurs for

$$\left(\frac{r}{R_i} \right)^4 = \frac{2(x+1) - (3+\nu)(x^2 - 1)}{1+3\nu} x^2$$

for $x \geq 1$ this gives negative r and therefore rejected. The accepted value for maximum $\sigma_{\theta \text{ rim}}$ occurs at $r = R_i$ and this gives the third constraint on the minimization of the flywheel mass as:

$$\frac{\sigma g}{\gamma \omega^2} = R_i^2 \left[\frac{1}{4} (1-x^2)(x+1) + \frac{3+\nu}{8} (x^4 - 1) - \frac{1+3\nu}{8} \right] \quad (15)$$

Equations (8) and (15) give

$$y = \frac{\frac{3+\nu}{8} (x^4 - 2) - \frac{1}{4} (x^2 - 1)(x+1) - \frac{1+3\nu}{8}}{(x^2 - 1)(x+1)} \quad (16)$$

$$\text{and } R_i^2 = \frac{\sigma g}{\gamma \omega^2} \frac{1}{\frac{3+\nu}{8} + \frac{1}{4} (x^2 - 1)(x+1)y} \quad (17)$$

where y is given in terms of x in equation (16). Having determined R_i^4 and y as functions of x , the x dependence of t is given by :

$$t = \frac{2 I \gamma g \omega^4}{\pi \sigma^2} \frac{\left[\frac{3+\nu}{8}(x^4-1) - \frac{1}{4}(x^2-1)(x+1) - \frac{1+3\nu}{8} \right]^2}{1 + \frac{x^2+1}{x+1} \left[\frac{3+\nu}{8}(x^4-2) - \frac{1}{4}(x^2-1)(x+1) - \frac{1+3\nu}{8} \right]} \quad (18)$$

Inserting values of R_i^2 , t and y as a function of x in equation (1), we require to minimize the function:

$$\frac{\left[\frac{3+\nu}{8}(x^4-1) - \frac{1}{4}(x^2-1)(x+1) - \frac{1+3\nu}{8} \right] \times \left(1 + \frac{1}{x+1} \left[\frac{3+\nu}{8}(x^4-2) - \frac{1}{4}(x^2-1)(x+1) - \frac{1+3\nu}{8} \right] \right)}{1 + \frac{x^2+1}{x+1} \left[\frac{3+\nu}{8}(x^4-2) - \frac{1}{4}(x^2-1)(x+1) - \frac{1+3\nu}{8} \right]} \quad (19)$$

The minimum for $\nu=0.3$ is found to be very close to $x=4$ where

$$y = 1.144, \quad R_i = 0.11 \sqrt{\frac{\sigma g}{\gamma \omega^2}},$$

$$t = (24.3) \left(\frac{2}{\pi} \right) \frac{I \gamma \omega^4}{g \sigma^2}, \quad M = 5.16 \left(\frac{2}{\pi} \right) \frac{I \gamma \omega^2}{g \sigma^2},$$

$$R_0 = 0.44 \sqrt{\frac{\sigma g}{\gamma \omega^2}} \quad \text{and} \quad b = (27.8) \left(\frac{2}{\pi} \right) \frac{I \gamma \omega^4}{g \sigma^2}$$

Conclusion:

The result of this analysis is remarkable; the width of the rim is approximately equal to the thickness of the disk. Besides most of the side area of the flywheel is spanned by the width of the rim the flywheel tends to be close to the uniform disk of constant thickness. This is for minimum weight. It became obvious that wide rims are used in rim flywheels when the disk is replaced by a set of long arms joining it to the hub.

Genetic variability and path coefficient analysis in sweet basil for oil yield and its components under organic agriculture conditions

Ibrahim, M.M.^{1*}, K.A. Aboud¹ and R.M. Hussein²

^{1&2} Genetics and Cytology Department National Research Centre, El-Behouth St., Dokki; P. Box; 12622; Cairo; Egypt.

² Present address: Department of Biological Science, Faculty of Science, King AbdulAziz University, Jeddah, KSA. *mohamed_mostafa480@yahoo.com

Abstract: Data for variability, heritability, genetic advance and path coefficient analysis for oil yield and related characters were conducted on 15 genotypes of sweet basil at two seasons in complete randomized block design. The results revealed that analysis of variance showed highly significant differences among genotypes in studied characters. Ranges of herb dry yield (HDY) (68.40 – 86.30 gm.), oil content (2.30-2.90 ml.) and oil yield (1.22-2.24 ml.) were obtained. Overall, the highest values of genotypic coefficients of variation (G.C.V %), genetic advance (GA%), and broad sense heritability (h^2b) were obtained for stem dry weight (SDW), linear growth (LG), herb dry weight (HDW) and leaf dry weight (LDW). Path coefficient analysis for oil yield exhibited variation from season to other and slight variation was found among cuts. The highest direct effects on oil yield were observed for herb dry yield followed by stem dry weight and essential oil content; hence, the study reflected the importance of herb dry yield and essential oil content as selection criteria for improvement of oil yield in sweet basil.

Keywords: Genetic variability; Path coefficient; Sweet basil; Organic agriculture

1. Introduction

The genus *Ocimum* L. (*Lamiaceae*), collectively called basil comprises 30-160 annual and perennial herbs and shrubs native to tropical and subtropical regions of Asia, Africa and Center & South America, Paton 1996.

Sweet basil, *Ocimum basilicum* L., is well known for its numerous economical, medicinal and aromatic values (Simon *et al.*, 1990) and (Morales and Simon, 1996). Medicinally, it is useful in a variety of human and animal diseases treatment such malaria, colic, vomiting, common cold, cough and skin diseases, (Bhattacharier, 1998). The importance of basil is increasing and has promising future in Egypt, especially, when cultivated in new reclaimed soil under organic agriculture conditions (Abd-El Raouf 2001, and Aboud *et al.*, 2006). Genetic improvement in aromatic plants for quantitative characters is helpful for determination of yield components to improve oil yield through selection of genotypes from population Kazmferezak, *et al.*, 2001 and Seidkr-Ozykowska *et al.*, 2001.

Genetic parameters estimating (PCV, GCV, h^2b and GA) are important to determined genetic variability among selected genotypes of different species of basil, De Masi *et al.*, 2005 and Nurzynska-Wierdak 2007.

Oil yield is a quantitative trait and highly influenced by many genetic factors and environmental fluctuation. In a plant breeding program, direct selection for yield as such can be misleading. Path coefficients provide a better understanding of association of different characters with yield. (Singh, 1990; Singh *et al.*, 1998 and Yadav, 2007).

The objectives of this study are to determine the variation and genetic interrelationships among herb yield components of basil using genetic parameters and path coefficient analysis.

2. Materials and Methods

The present study was carried out during two successive growth seasons of 2009 and 2010 at the farm of South Tahrir Agric. Company, El-Bohira governorate. Fifteen sweet basil genotypes seeds (variety Grand Verde) selected and sown in bed on 25 March in both seasons.

35 days later from planting, seedlings were transplanted into field in 1 May 2009 and 2010. All plants were fertilized at rate of 35m³/ fed by organic manure without any chemical nutrient addition. The plants were harvested 2 times (Cuts) during July and September in both seasons. Data recorded on of the 15 genotypes from each replicate in both cuts for seven growth herb characters included: Linear

growth (LG), Number of primary branches (NPB), Leaves dry weight (LDW), stem dry weight (SDW), Herb dry weight (HDW), Essential oil content % (EOC) and Essential oil yield (EOY).

A complete randomized block design with three replications was used in the experiment, the general statistical procedures was practiced according to Steel and Torrie, (1980). Analysis of variance (ANOVA) and broad sense heritability (h^2b) were generally assigned for the data of each season according to Robinson *et al* (1951). The phenotypic coefficient of variation (PCV %) were computed according to Burton and Dorane (1953). The expected genetic advance from selection (ΔGA %) was computed according to Johanson *et al*, (1955). Path coefficient analysis was performed as illustrated by Singh and Chaudhary (1979), to partition correlation between the characters studied into direct and indirect effects.

Essential oil content in air dried herb was extracted and determined on basis of volume / weight X 100. (Guenther (1972) Oil yield was calculated from multiplication of leaves dry weight gm. /plant X essential oil % content.

3. Results

Genetic variations

The variations displayed by the seven characters studied in sweet basil at two successive seasons in the two cuts among fifteen genotypes are shown in table (1). Genotypes differed significantly in all studied characters. The highest coefficients of variation ranged from 15-20 % and shown by stem dry weight SDW, oil yield EOY, and oil content EOC at the two seasons, (Tables 2 and 3). Data presented in Tables 3 and 4 indicated the narrow range in essential oil yield EOY (2.30-2.90) in both seasons, cuts and also in NPB (13.80-17.602), LDW (35.14-41.17) and stem dry weight SDW (20.80-27.13) respectively. While in case of linear growth LG, wide ranges were observed in both seasons and cuts. The phenotypic coefficient of variation PCV, genotypic coefficient of variation GCV estimates, broad-sense heritability (h^2b) and genetic advance GA are also shown in tables (2) and (3). The PCV was generally higher than the GCV for all the characters, but in many cases, the values of PCV and GCV differed only slightly. PCV and GCV ranged from (5.638-21.347) and (5.092-17.578) in both seasons and cuts. The heritability estimates ranges from 81.66% to 97.50% for LDW and SDW at first season in both cuts respectively. While in the second season it was ranged from 86.37 to 97.14% for HDW and EOC. High heritability estimates were also shown for other characters in both seasons and cuts. The expected genetic advance, expressed on a percentage of the

mean, varied from (4.159) in the 2nd cut to (10.313) in the 1st cut for SDW and LG respectively in the second season. Genetic advance was the highest in LG (11.99) and lowest value in NPB (1.35) at the first season.

Path coefficient analysis

The direct and indirect effects of the seven herb growth characters and oil yield are presented in Tables (4) and (5) at two seasons over two cuts. The direct effect of (LG) Linear growth was negative and moderate (-0.3122) in the 2nd season at the first cut but it was low for linear growth was (-0.1015) at the first season on the first cut. Low positive value was observed in the 2nd cut (0.0247) at the first season. The lowest values for linear growth showed in case of indirect effects were of (LG) via LDW at both seasons. High and moderate indirect effects were observed for (LG) via HDW (0.51531, 0.3772) and (0.2505; 0.3168) at first and second cuts of both seasons.

Comparing the results of path coefficient analysis for (NPB), the direct effect was negative in all cuts with small values except in case of first cut at second season (0.0303) it was positive.

High indirect effect was observed in (NPB) via EOC (0.6567) at second cut in the first season, but in other cuts in both seasons, moderate values (0.3824), (0.3086) and (0.244) were observed in this characters via EOC at first, first and second cuts respectively in both seasons. The lowest values of (NBP) via LDW (0.0003) at second season in second cut indirectly. The remaining indirect effects for this trait were ranged from low to very low values in both seasons Leaf dry weight (LDW) revealed that high indirect effect (0.5962) on oil yield via EOC at the second cut on the first season. The direct effect of (LDW) (-0.0748), (-0.1121) at first season were negative with low values in case of first and second cuts except in first cut at second season, positive affect was recorded (0.1381). The lowest values of (LDW) (0.0006) (0.0088) were estimated through LG and NPB in both cuts and seasons.

The direct effect of (SDW) ranged from very low positive (0.0051), (0.0310) to low negative values (-0.0348, -0.0412) at second and first cuts for both seasons. High to moderate indirect effects were detected through HDW (0.6503), (0.4246) and (0.4331) , (0.3486) at first and second cuts in both seasons, for (SDW) the indirect effect via EOC was moderate positive value in the first season (0.1801), (0.2011) at first and second cuts respectively. On the other hand negative low values were observed at second season in both cuts, via LDW (-0.0245) (-0.0341) indirectly. The (HDW) had the highest positive direct effect on oil yield on both seasons and

cults (0.6925) vs. (0.5806) and (0.5001) vs. ((0.4363) first cut and second cut on both seasons respectively. moderate values via EOC at the first and second seasons on both cults except in case of indirect effect of this trait (HDW) through the same character which was very low value (0.0.0008).

Essential oil content (EOC) showed the highest direct effects on oil yield in the both seasons. The values of direct effects were (0.9033) followed

The indirect effects of (HDW) were positive by (0.8404), (0.7793) and (0.5507) in second and first cuts in both seasons respectively. The indirect effects of (EOC) were ranged from low positive values to very low negative through each of HDW and LDW, Tables 4 and 5.

4. Discussions

The breeding strategies are mainly oriented toward yield and oil yield in aromatic crops. The success of the breeding program depends on the variability of initial material, Fick and Miller, (1997). In order to apply on optimum breeding strategy for targeted quantities characters, genetic analysis of these traits, need to perform. (Has 1999, and Nistor *et al.*, 2005).

Analysis of variance showed that genotypes of basil differed significantly among themselves for all studied characters in both seasons. The presence of wide variations among genotypes indicated that these traits were governed by additive genes with low environmental effects. Similar results were obtained by Aboud, 2006.

The results of ranges of studied characters showed narrow ranges in essential oil content, oil yield, No. of primary branches and leaf dry weight but in case of linear growth (LG) wide range between means of genotypes are observed in generations and cuts. The wide range of this trait could be due to the large sample size of population, therefore, the higher proportion of phenotypic variance observed on this trait Miller *et al* (1957). From (P.C.V) and (G.C.V) estimates, for studied characters, suggested that,

(PCV) was generally higher than (GCV) for all characters except in some traits, (PCV) and (GCV) differed slightly. The highest values of (P.C.V) and (PCV) were obtained for stem dry weight, oil content, oil yield and linear growth (LG) in both seasons. Genotypic coefficient of variation (GCV) indicates the genetic variability with heritability estimates would give best indication for the amount of gain due to selection Johanson *et al* (1955). Heritability estimates were high for most studied characters. Highest broad sense heritability values for stem dry weight (SDW) and herb dry weight (HDW) indicated that selection for these characters under organic agriculture conditions may be effective in breeding programs. Similar results are accordance with results of Singh, (1990), and Ibrahim, (2006).

The expected genetic advance (GA) ranged from 4.159 to 10.313 in stem dry weight (SDW) and linear growth (LG) respectively in both seasons. Genetic advance (GA) and broad sense heritability (h^2_b) estimates (Table 2 and 3) showed higher values by (LG), (SDW), (HDW) and oil content (EOC) that due to additive gene effect, therefore selection for these traits could predict the performance of the progenies. Blank *et al* (2004). Beside coefficient of variability and heritability, it is important to know the

relationships between the yield component and oil yield by the path coefficient analysis Dewey and Lu (1959).

Path coefficient analysis of herb growth characters with oil yield in two cuts and two seasons was partitioned into direct and indirect effects (Tables 2, 3). The results revealed that herb dry weight (HDW) had maximum direct effect on oil yield followed by oil content and leaf dry weight. These results are in agreement with Baslma (2008), and Mijic *et al.*, (2009). The direct effect of linear growth (LG), No. of primary branches (NPB), leaf dry weight (LDW) and stem dry weight (SDW), on oil yield had negative effects and ranged from moderate to low values in both seasons which suggested that the selection for these traits indirectly may be less effective on oil yield. The indirect effects through studied characters with oil yield were fluctuated from negative or positive and ranged from moderate, low and very low in both seasons.

5. Conclusion

In conclusion, the results obtained in this study revealed that (PCV), (GCV), (h^2b) and (GA %) had the highest values in case of (HDW), (SDW), (LDW) and (LG), respectively. The lowest values of these items were observed in (EOC), (EOY) and (NPB). The highest values of direct effects of path coefficient are shown in herb dry weight (HDW) and oil content (EOC). The indirect effects of oil yield through linear growth (LG) and stem dry weight (SDW) via (HDW) were high positive effect. Similar results were observed in (NPB) via (EOC) and (LDW) via (HDW). The strong direct effects on oil yield for above characters indicated that these traits can be used as selection criteria for increasing oil yield. The influence of other studied characters covered by the indirect effects on oil yield.

Antihepatotoxic Effects Of *Ficus Vogelii* Ethanol Leaf Extract On The Liver Function Indices Of CCl₄ – Induced Hepatotoxicity In Rats.

EGBUNA, P. A. C.; JOSHUA, Parker Elijah and CHIGBO, Maureen Ujunwa

Department of Biochemistry, University of Nigeria, Nsukka, Enugu, Nigeria

ABSTRACT: This study was conducted to evaluate the anti-hepatotoxic effect of intraperitoneal administration of ethanol extract of *Ficus vogeli* (600mg/kg) in CCl₄-induced hepatotoxicity in male albino rats. Phytochemically, the leaf extract contains tannin, alkaloid, flavonoid, carbohydrates, protein, saponin, steroids, terpenoids, fats and oil. The administration of the *Ficus vogelii* extract was at one phase of the experiment according to the body weight of the test animals. The ethanol extracts of *Ficus vogelii* significantly reduced ($p < 0.05$) the level of activity of the hepatic enzyme markers in the serum (Alanine amino transferase (ALT), Aspartate amino transferase (AST), alkaline phosphate (ALP) and total bilirubin) which occurred due to induced oxidative stress. Relative to the control group, treatment with CCl₄ significantly raised the levels of ALT, ASP, AST and total bilirubin in the serum. The animals that received *Ficus vogelii* showed not only reduced hepatocellular degeneration but also of hepatocellular regeneration when compared to the liver of those exposed to CCl₄ alone. Thus the histopathological studies also supported the anti-hepatotoxic action of the ethanol extract of *Ficus vogelii*. The results of this study clearly indicate that *Ficus vogelii* ethanol extract has a potent anti-hepatotoxicity action against carbon tetrachloride induced liver damage in rats.

Keywords: *Ficus vogeli*; Hepatotoxicity; Carbon tetrachloride; Liver Function Tests

INTRODUCTION

Liver plays a vital role in regulating various physiological processes such as secretion, storage and metabolism. It detoxifies toxic substances and drugs absorbed in the body from the intestine which expose it to harmful substances that lead to the damage of the liver. Liver disease remains one of the major health problems and is quite challenging to the health care professionals including the pharmaceutical industry and drug regulatory agencies.

In addition, hepatic viral infections (hepatitis, A, B, C and D e.t.c) and the microbial infections of *Entamoeba histolytica* aids in hepatocellular damage. Globally, plant based drugs like *Silybium marimum*, *Picorrhiza kurna*, *Phyllanthus embalica* and *Phyllanthus amarus* are experimentally proven and successfully used in the clinical treatment of liver disorder (Thyagarajan *et al.*, 2002) These herbal drugs are rich in antioxidants which aid to cure liver diseases and they are widely prescribed in this modern age. It is therefore very important to provide scientific prove to justify the various medicinal uses of herbs.

The body cells and tissues identify almost all drugs or substances as non-self (i.e. xenobiotics) thereby subjecting them to various chemical processes (i.e. metabolism) to make them suitable for elimination. Almost all the tissue in the body has the ability to metabolize chemicals but the smooth endoplasmic

reticulum in liver is the principal metabolic agent for both endogenous and exogenous substances. This exposes it to drug induced injury.

Many factors aid in the induction of hepatotoxicity. They include the following; age, nutritional status, gender, duration and dosage of drugs, ethnicity and race. Certain chemicals and drugs that induce liver damage are Carbon tetrachloride, Chloropromazine, Carbamazepine, Oral Contraceptive pills and tetracycline.

CCl₄ was formerly used as fire extinguisher and as a precursor for refrigerants but its applicability declined due to its severe adverse effect. It is among the most potent hepatotoxins. Under high temperature, it forms poisonous phosgene. It is synthesized from methane as shown in Fig. 1 below.

Ficus belong to the family of Moraceae. It is a genus of about 800 species and collectively known as Figs. It was indicated that *Ficus* is a relatively ancient species being about 60million years old. The fruits of most *Ficus* are edible while some are used as food resources for wild-life. Most culture uses *Ficus* as an object of worship while some use it for medicinal purposes.

The study aims at investigating into the effect of ethanol extract of *Ficus vogelii* on the liver of rats intoxicated with CCl₄.

Fig. 1: Biotransformation of carbon tetrachloride

(From Harris and Anders, 1981; Anders and Jakobson, 1985; McGregor and Lang, 1996)

MATERIALS AND METHODS

Animals. Twenty (20) albino rats and nine mice were obtained from the Animal House of Faculty of Veterinary Medicine, University of Nigeria, Nsukka, Nigeria.

Plant Materials. The leaves of *Ficus vogelii* were used for this study. They were collected in the forest within Nsukka environ by a botanist at Botany Department, University of Nigeria, Nsukka on the 5th of May, 2008.

The freshly collected leaves of *Ficus vogelii* were chopped into pieces and dried for two weeks at room temperature. The dried leaves were weighed and 50g was defatted using petroleum ether (60 – 80°C) in a chamber.

Preparation of Plant Extract. The defatted leaves were macerated for two days using 1,200ml of 70% ethanol as the solvent. The filtrate obtained was concentrated using a rotary evaporator to remove the

ethanol content and kept in an oven at 40°C to remove the water content of the extract to obtain a semi-solid extract and dark brown viscous residue. The extract was subjected to phytochemical analysis for the presence of alkaloids, saponins, reducing sugars, oils, resins, fat, emulsion, and steroids using the method described by Harborne (1973).

Concentration of Extract. The extract was concentrated using the rotary evaporate to remove the ethanolic content of the extract and also the laboratory bench oven at 40°C to remove any trace ethanol and water content of the extract. A watch glass was weighed and 2ml of the extract was poured into it and weighed again. The extract with the watch glass was reweighed until a constant weight is achieved.

Determination of Yield of Plant. A quantity of the air dried chopped *Ficus vogelii* leave was packed into the soxhlet extractor. The weight of the evaporated extract was calculated using the formula:

$$\frac{\text{Weight (g) of Evaporated Extract}}{\text{Weight (g) of Packed Ficus vogelii}} \times 100$$

Preparation of Working Materials

- Normal saline:** 0.9g of NaCl was dissolved in 100ml of distilled water.
- Five percent ethanol in normal saline** was prepared and used as the vehicle in dissolving the extract. The 5% ethanol was gotten by measuring 5ml of 96% ethanol into a 250ml beaker and 95ml of distilled water was added to give a 100ml solution.
- Stock Solution:** A quantity, 0.4g of extract of *Ficus vogelii* was dissolved in 5ml of normal saline to give 400mg in 5ml of solution (80mg/ml). 1ml of the stock solution was added to another test tube and 4ml of normal saline was added to make it 5ml solution containing 80mg/5ml which is 16mg/ml.
- CCl₄ Model for Evaluation of anti-hepatotoxic activity:** The CCl₄ model described by Rojikind (Rojikind 1973) was used for scheduling the dose regimen. 1.5ml/kg i.p. of CCl₄ diluted in olive oil (1:3) was employed for inducing liver toxicity.

Experimental Design

Twelve albino rats were used for this study with three rats each in groups of four.

Group One: The rat weighing (173.8g 162.0g & 171.4g) was used for this group. This group was administered intraperitoneally at the dose of 1.5ml/kg b.

w. of the carbon tetrachloride before the extract at the dose of 600mg/kg b. w.

Group Two: The rats weighing (159.7g, 155.6g & 159.0g) were used for this group. This group was administered intraperitoneally at the dose of 1.5ml/kg b.w. with the toxicant (carbon tetrachloride).

Group Three: The rat weighing (153.0g, 155.6g & 157.1g) was used for this group. This group were administered intraperitoneally at the dose of 5ml/kg b.w. of the vehicle (olive oil) together with water and fed.

Group Four: The rats weighing (145.6g 147.7g & 147.0g) was used for this group. This group were given the normal fed and water *li bidum*.

Determination of Serum Glutamate Pyruvate Transaminase (SGPT) or Alanine Amino Transaminase (ALT).

The colorimetric method for *in-vitro* determination of SGPT/ALT in serum was done using a Quimica Clinica Applicada test kit (Reitman, et al; 1957). Here, 0.5ml of Reagent A was put in a test tube and incubated for 5minutes at 37°C. 0.1ml of serum sample was added to the incubated sample and incubated again for 30minutes at 37°C. The standards were prepared as follows:

- Tube 1—0.1ml deionized water + 0.5ml Reagent A
- Tube II—0.1ml deionized water + 0.45ml Reagent A + 0.05ml of standard.
- Tube III—0.1ml deionized water + 0.40ml Reagent A + 0.10ml of standard
- Tube IV—0.1ml deionized water + 0.35ml Reagent A + 0.15ml of standard
- Tube V--0.1ml deionized water + 0.30ml Reagent A + 0.20ml of standard

Next, 0.5ml of colour developer (Reagent B) was added to sample tubes and the standards, allowed to stand for 20minutes at room temperature. 0.5ml of NaOH working solution (diluted Reagent C) was added and allowed to stand for 15minutes at room temperature. The transmittance of the samples and the standard were read at 505nm against deionized water blank. The mixture is stable for up to an hour. The SGPT/ALT activity/values of the samples were gotten by interpolating the transmittance obtained for the samples in the calibration curve made from the standards. The results were express in SI units (International units per liters (IU/L)).

Determination of Serum Glutamic Oxaloacetic Transaminase (SGOT) or Aspartate Amino Transferase (AST).

The colorimetric method for *in-vitro* determination of SGOT/AST in serum was done using a Quimica Clinica Applicada test kit (Reitman, et al;

1957). Here, 0.5ml of Reagent A was put in a test tube and incubated for 5minutes at 37°C. 0.1ml of serum sample was added to the incubated sample and incubated again for 60minutes at 37°C. The standards were prepared as follows:

- Tube I—0.1ml deionized water + 0.5ml Reagent A
- Tube II—0.1ml deionized water + 0.45ml Reagent A + 0.05ml of standard.
- Tube III—0.1ml deionized water + 0.40ml Reagent A + 0.10ml of standard
- Tube IV—0.1ml deionized water + 0.35ml Reagent A + 0.15ml of standard
- Tube V--0.1ml deionized water + 0.30ml Reagent A + 0.20ml of standard

Next, 0.5ml of colour developer (Reagent B) was added to sample tubes and the standards, allowed to stand for 20minutes at room temperature. 0.5ml of NaOH working solution (diluted Reagent C) was added and allowed to stand for 15minutes at room temperature. The transmittance of the samples and the standard were read at 505nm against deionized water blank. The mixture is stable for up to an hour. The SGOT/AST activity/values of the samples were gotten by interpolating the transmittance obtained for the samples in the calibration curve made from the standards. The results were express in SI units (International units per liters (IU/L)).

Determination of Serum Alkaline Phosphatase

The phenolphthalein monophosphate method for the *in vitro* determination of alkaline phosphatase in serum using Quimica Clinca Applicada test kit. Here, the colour developer was prepared by adding one vial of colour developer salt to 250ml of de-ionized water. 1.0ml of deionised water was added to a clean test tube and a drop of chromogenic substrate was added also, mixed and incubated at 37°C for 5minutes. 0.1ml of serum sample was added to the test tube, mixed and incubated at 37°C for 20minutes. 5ml of colour developer was added. The absorbance was read against a water blank at wavelength 550nm. For the standard, 1ml of water was added to a test tube and a drop of the chromogenic substrate, mixed and incubated at 37°C for 20minutes before the addition of 5ml of colour developer and the absorbance was read at 550nm. The result was express in SI unit (IU/L)

Determination of Serum Bilirubin

The *in vitro* determination of total bilirubin in serum was done using Quimica Clinica Applicada bilirubin test kit (Doumas *et al.*, 1973). In this case, 0.2ml of sulphuric acid solution (Reagent A) was poured into a test tube and a drop of sodium nitrite (Reagent D) and 1ml of caffeine solution (Reagent B) were added with 0.05ml of serum sample. The contents

were mixed and allowed to stand for 10minutes at room temperature. Lastly, 1ml of tartarate solution (Reagent C) was added, mixed and allowed to stand for 5minutes at room temperature. The absorbance was read at 578nm against the blank content. The result was expressed in SI unit (mg/dl).

Statistical Analysis

The values were expressed as mean \pm SEM (Standard Error Measure). The statistical analysis was carried out by one way analysis of variance (ANOVA). The Pearson value ($p < 0.05$) were considered significant. Biochemical parameter results are presented in the Tables and Figures respectively. The descriptive statistics for total bilirubin, liver enzymes and lipid profile were analyzed using SPSS.

RESULTS

Effect on the Serum Glutamate pyruvate Transferase (SGPT) or Alanine aminotransaminase (ALT)

Significant difference ($P < 0.05$) exists in comparing group II with groups I, III, IV, and V. Non-significant difference ($P > 0.05$) exists in comparing groups I with groups III, IV, and V. This graph showed a significant increase in group II when compared with other groups.

Fig. 1: The effect of *Ficus vogelii* on Alanine aminotransferase (ALT) or SGPT.

Effect on the Serum Glutamate Oxalo-acetate Transferase (SGOT) or Asparate aminotranferase (AST):

Fig. 2 shows that significant difference ($P < 0.05$) exists in comparing group II with groups I, III, IV, and V. Non-significant difference ($P > 0.05$) exists in comparing groups I with groups III, IV, and V. The graph (Fig. 2) shows a significant increase ($P < 0.05$) in group II when compared with other groups.

Effect on the Serum Alkaline Phosphatase (ALP):

Significant difference ($P < 0.05$) exists as shown in Fig. 3 in comparing group II with groups I, III, IV, and V. Non-significant difference ($P > 0.05$)

exists in comparing group I with groups III, IV, and V. Fig. 3 below shows a significant increase ($P < 0.05$) in group II when compared with other groups.

Fig.2 Effect of *Ficus vogelii* on Aspartate aminotransferase (AST) or SGOT

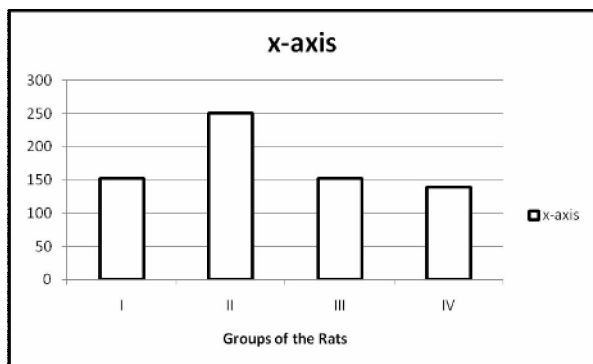

Fig. 3 Effect of *Ficus vogelii* on Alkaline Phosphatase (ALP)

Effect on the serum Total Bilirubin:

In Fig. 4, significant difference ($P < 0.05$) exists in comparing group II (the toxicant) with group I (the toxicant + 600mg/kg b. w. of Ext.), group III (5ml/kg b. w. of olive oil), group IV (600mg/kg b. w. of Ext. + the toxicant) and group V (control) and vice versa. Non-significant difference ($P > 0.05$) exists in comparing group I with group III, group IV, and group V; group III with group I, group IV and group V; group IV with group I, group III, and group V and the group V with group I, group III and group IV.

IV	Control	78.9267±16.9	139.4100±59.3	27.4400±21.5	0.5767±0.2

DISCUSSION

By nature, the liver possesses regenerative capacity and this should be considered in the experimental design by including a toxic control. The elevation in the serum marker analysis namely AST, ALT and ALP is one of the causes of hepatotoxicity of CCl_4 (Kaplowitz *et al.*, 1986). The liver function test studies demonstrate that CCl_4 (compared to normal) induces degeneration in hepatocytes. Following the spectrophotometric reading, increase in the liver enzyme induced by CCl_4 was remarkably reduced by the administration of the extract obtained from *Ficus vogelii* which is in good agreement with the histopathological result. This may be attributed to the recovery of the liver damage induced by CCl_4 .

The hepatotoxicity effect of CCl_4 is largely due to its active metabolite "Trichloromethyl radical (Srivastava *et al.*, 1990), which binds to the macromolecule and induce peroxidative degradation of membrane lipids of endoplasmic reticulum rich in polyunsaturated fatty acids (Sengottuvelu *et al.*, 2007). The tichloromethyl radical also causes functional and morphological changes in the cell membrane. The hepatic cells are involved in a variety of metabolic activities. They consist of higher concentration of AST and ALT in the cytoplasm and AST in particular exist in mitochondria (Kumar *et al.*, 2007). Due to the damage caused to hepatic cells, the leakage of the membrane will lead to increase in levels of hepatospecific enzyme in serum. The elevated serum

enzyme levels like AST and ALT are indicative of cellular leakage and functional integrity of cell membrane in liver. The antihepatotoxicity of a drug can be evaluated by its capacity to cure the injuries or to restore the normal hepatic physiology by regeneration mechanisms, which have been induced by a hepatotoxin. This study has, therefore, shown that ethanol extract of *F. vogelii* contain an antioxidant effect that leads to its hepatocurative effect.

The results of this study indicate that the ethanol extract of *F. vogelii* could protect liver against CCl₄ induced hepatotoxicity. The component of the plant that is responsible for this effect was not investigated though the phytochemical analysis indicate the presence of alkaloids, flavonoids, carbohydrates, protein, saponins, tannins, Fats and oil, steroids and terpenoids. Most of this anti-oxidant is known to have anti-inflammatory property while most of them aid in the regeneration of a damaged liver (Kumar *et al.*, 2007). In order to elucidate the mechanism by which *Ficus vogelii* extract component exhibit the anti-hepatotoxicity effect which was demonstrated in this study, further studies with the isolated components will follow to indicate the component of the leaf that has the antihepatotoxic activity.

Power Purchasing Agreements in Modern Power System

Mohammad Sadegh Javadi ¹, Amin Javadinasab ¹

¹Department of Electrical and Electronic Engineering, Shoushtar Branch, Islamic Azad University, Shoushtar, Iran
msjavadi@gmail.com

Abstract: Power Purchasing Agreements (PPAs) are the recent contracts between Generation Companies (GENCOs) and Independent System Operator (ISO). After restructuring in power system, lack of motivations for Independent Power Producers (IPPs) to partnership in power generation and long term maintaining energy have affect the long horizon expansion planning. In this area, long term contracts can help the market entities to hedging their risks in satisfying the future demands and ensuring the return of their investment cost. From an IPP point of view, clarifying the rate of return of investment has an important role in his financial decision making. In competitive power market, each GENCO would offer in the market and some of them could exercise market power in power market. One of the proposed ways to controlling the market power is PPA. In this paper the PPA and some proposed PPAs are introduced and clarifying the weak and strong point of the PPAs are presented.

[Mohammad Sadegh Javadi, Amin Javadinasab. Power Purchasing Agreements in Modern Power System, Journal of American Science 2011;7(6):164-169]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Power Purchase Agreements, Independent System Operator, Independent Power Producer, Renewable Energy.

1. Introduction

Power Purchase Agreements are contracts between two parties, one who generates electricity for the purpose of sale (the seller) and one who is looking to purchase electricity (the buyer). There are various forms of Power Purchase Agreements; these are differentiated by the source of energy harnessed (solar, wind, etc.). Financing for the project is delineated in the contract, which also specifies relevant dates of the project coming into effect, when the project will begin commercial operation, and a termination date for which the contract may be renewed or abandoned. All sales of electricity are metered to provide both seller and buyer with the most accurate information about the amount of electricity generated and bought. Rates for electricity are agreed upon in the contract between both parties to provide an economic incentive to being a Power Purchase Agreement (wikipedia, 2011).

A Power Purchase Agreement is a legal contract between an electricity generator (provider) and a power purchaser (buyer). Contractual terms may last anywhere between 15 and 20 years, (Javadi et., al, 2011) and during this time the power purchaser buys energy, and sometimes also capacity and/or ancillary services, from the electricity generator. Such agreements play a key role in the financing of independently owned (i.e. not owned by a utility) electricity generating assets. The seller under the PPA is typically an Independent Power Producer (IPP). Energy sales by regulated utilities are typically highly regulated by local or state government, so that no PPA is required or appropriate. Commercial PPA providers can enable

businesses, schools, governments, and utilities to benefit from predictable, renewable energy (Gunther, 2007).

Under a PPA, the seller is often the developer and owner of the technology that generates electricity. The seller may also be someone who buys electricity from another supplier for resale. Under these circumstances, another PPA may be established but will usually contain similar contractual agreements as already proclaimed in the original PPA, with the exception of some pricing mechanisms that would be redefined (Eriksson and Holmes, 2010).

Under a PPA, the buyer is often a utility company that purchases the electricity generated from the seller. In some circumstances, a company may be trying to meet renewable-energy portfolio standards and would be considered a retail purchaser. Under this condition, the retail purchaser may resell the electricity to another entity under a new PPA. Typically, a PPA is established between the primary seller and a utility company who is regulated to buy the electricity (Eriksson and Holmes, 2010).

2. Renewable Power Purchasing Agreements

There are regulatory concerns associated with the implementation of renewable technologies and the agreement on contracts for producing and purchasing power. The Federal Energy Regulatory Commission (FERC) determines which facilities are considered to be exempt wholesale generators or qualifying facilities and are applicable for PPAs under the Energy Policy Act of 2005 (FERC, 2005).

There are different types of PPAs according to the type of renewable technology utilized in the

electricity generation process. The two most prolific PPAs utilized today are solar PPAs and wind PPAs [solar and wind PPA]. Other PPAs will be made commercially available once the technology utilized is established.

In the United States, the Solar Power Purchase Agreement (SPPA) depends heavily on the existence of the solar investment tax credit, which was extended for eight years under the Emergency Economic Stabilization Act of 2008. The SPPA relies on financing partners with a "tax appetite," profits that are subject to taxation, who can benefit from the federal tax credit. Typically, the investor and the solar services provider create a special purpose entity that owns the solar equipment. The solar services provider finances, designs, installs, monitors, and maintains the project (EPA, 2011). As a result, solar installations are easier for customers to afford because they do not have to pay upfront costs for equipment and installation. Instead, customers pay only for the electricity the system generates (EPA, 2011). With the passage of the American Recovery and Reinvestment Act of 2009 the solar investment tax credit can be combined with tax exempt financing, significantly reducing the capital required to develop a solar project.

Wind Power Purchase Agreements (WPPAs) are not found quite as prolifically as their solar counterparts, but they do exist (Eriksson and Holmes, 2010).

Wasatch Wind in Wyoming entered into a twenty year WPPA with PacifiCorp in July 2010; Wasatch Wind will produce wind power in its newly developed Pioneer Wind Park, and PacifiCorp will purchase it (DOE/EE, 2011).

Current law restricts most of the Federal government of the United States from entering into a contract longer than ten years. PPA contracts, particularly for larger systems, need at least a 20 year term (Bolinger, 2009). In 2009, the United States Senate Committee on Energy and Natural Resources passed S. 1462, which among other things would have allowed federal agencies to enter into power purchase agreements for renewable energy for up to 30 years. However, the United States Department of Defense has a separate authority to enter into energy contracts for as long as 30 years. Using this authority, the United States Navy recently signed a renewable energy project for Marine Corps Air Station Miramar. All agencies of the US Government are exploring methods to achieve the renewable energy requirements set forth by law (James, 2008). Nellis Air Force Base demonstrates the long term consequences of such an agreement. Completed in 2007, the Nellis Solar Power Plant generates 30 million kilowatt-hours of electricity per year—

equivalent to a quarter of the total power used at the 12,000-person base. This arrangement allows Nellis to annually avoid 22,000 tons of carbon dioxide emissions while at the same time save the Air Force over \$1 million dollars in electricity costs a year.

Other PPAs will become commercially available once the technology has been established and the market exists for such contractual agreements to be effective. Geothermal PPAs are being explored; their difference from wind and solar PPAs is that the actual gathering of energy would require much more active monitoring and servicing (Stoel, 2010)

The PPA is often regarded as the central document in the development of independent electricity generating assets (power plants), and is a key to obtaining project financing for the project. Under the PPA model, the PPA provider would secure funding for the project, maintain and monitor the energy production, and sell the electricity to the host at a contractual price for the term of the contract. The term of a PPA generally lasts between 5 and 25 years. In some renewable energy contracts, the host has the option to purchase the generating equipment from the PPA provider at the end of the term, may renew the contract with different terms, or can request that the equipment be removed. One of the key benefits of the PPA is that by clearly defining the output of the generating assets (such as a solar electric system) and the credit of its associated revenue streams, a PPA can be used by the PPA provider to raise non-recourse financing from a bank (Javadi and Javadinasab, 2011) or other financing counterparty. Figure 1 shows the financial and power flows among the consumer, system owner, and the utility. (Boylston, 2008)

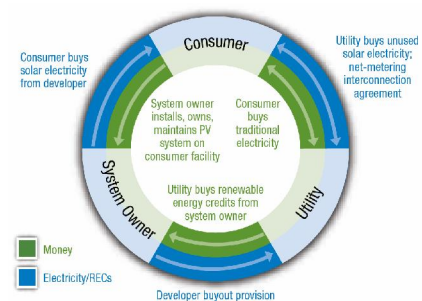

Fig. 1 Contracts and Cash Flow in Third-Party Ownership/PPA Model (Source: NREL)

Because a Power Purchase Agreement or Energy Service Agreement is at the "heart" and underlying foundation of recent projects, it can help the business with the selection and oversight of PPA's and ESA's. The projects range in size from as small as 1-2 MW to well over 100 MW. It means that the project development process may include;

- Engineering (including engineering & economic feasibility studies, project
- Design, air quality and site permitting requirements, etc.)
- Procurement
- Construction and Project Management
- Project Commissioning
- Project Funding/Financing
- Power Purchase Agreements
- Long-Term Service Agreements

In conjunction with strategic partners, the committee is able to receive bonding for projects exceeding \$100 million in value. In such cases the committee is able to secure funding for power projects that exceed 100 MW.

Fig. 2 Renewable Power Purchases by Federal Agencies (DOE/FEMP)

A Power Purchase Agreement is also "behind" almost every power plant. A PPA is a contract involving the generation and sales of electricity – which is normally developed between the owner of a power plant generating the electricity, and the buyer of the electricity. PPA's can be quite lengthy agreements that may exceed 100 pages in length and take several months to even years to finalize.

The basic information contained in a Power Purchase Agreement includes the following items:

Definitions

- Purchase and Sale of Contracted Capacity and Energy (such as steam, hot water and/or chilled water in the case of co-generation and tri-generation plants)
- Operation of the Power Plant
- Financing of the Power Plant
- Guarantees of Performance
- Penalties
- Payments
- Force Majeure
- Default and Early Termination

- Miscellaneous

PPAs allow Federal agencies to fund on-site renewable energy projects with no up-front capital costs incurred.

With a PPA, a developer installs a renewable energy system on agency property under an agreement that the agency will purchase the power generated by the system. The agency pays for the system through these power payments over the life of the contract. After installation, the developer owns, operates, and maintains the system for the life of the contract (Logan, 2009).

Power purchase agreements feature a variety of benefits and considerations for Federal agencies, including:

Benefits:

- No up-front capital costs
- Ability to monetize tax incentives
- Typically a known, long-term energy price
- No operations and maintenance responsibilities
- Minimal risk to the agency

Considerations:

- Federal sector experience with PPAs is still growing
- Contract term limitations
- Inherent transaction costs
- Challenges with site access contracts and concerns

3. Power Purchasing Agreements Policies

Federal Energy Management Programs (FEMP) FEMP developed an introductory guide to PPAs for Federal on-site renewable projects. FEMP outlines the power purchase agreement process in its Alternative Finance Options (AFO). An on-demand recording of the training is available. Dates and times of upcoming training sessions are posted to the FEMP events calendar. An updated version of the PPA portion of this presentation is available, featuring typical PPA processes, benefits, challenges, and several case studies. Several PPA sample documents are available. Available resources include sample requests for proposal, contracts, land use agreements, case studies, and more (Logan et al., 2009).

3.1 High-Level Project Plan for Solar PV with PPA Financing

Implementing power purchase agreements involves many facets of an organization: decision maker, energy manager, facilities manager,

contracting officer, attorney, budget official, real estate manager, environmental and safety experts, and potentially others (Shah 2009). While it is understood that some employees may hold several of these roles, it is important that all skill sets are engaged early in the process. Execution of a PPA requires the following project coordination efforts, although some may be concurrent.

Step 1. Identify Potential Locations

Identify approximate area available for PV installation including any potential shading. The areas may be either on rooftops or on the ground. A general guideline for solar installations is 5–10 watts (W) per square foot of usable rooftop or other space. In the planning stages, it is useful to create a list that contains site plans and to use Google Earth software to capture photos of the proposed sites (Pechman 2008). In addition, it is helpful to identify current electricity costs. Estimating System Size (this page) discusses the online tools used to evaluate system performance for U.S. buildings.

Step 2. Issue a Request for Proposal (RFP) to Competitively Select a Developer

If the aggregated sites are 500 kW or more in electricity demand, then the request for proposal (RFP) process will likely be the best way to proceed. If the aggregate demand is significantly less, then it may not receive sufficient response rates from developers or it may receive responses with expensive electricity pricing. For smaller sites, government entities should either:

- 1- seek to aggregate multiple sites into a single RFP

or

- 2- Contact developers directly to receive bids without a formal RFP process (if legally permissible within the jurisdiction).

Links to sample RFP documents (and other useful documents) can be found at the end of this fact sheet. The materials generated in Step 1 should be included in the RFP along with any language or requirements for the contract. In addition, the logistical information that bidders may require creating their proposals (described later) should be included. It is also worthwhile to create a process for site visits. Renewable industry associations can help identify Web sites that accept RFPs. Each bidder will respond with an initial proposal including a term sheet specifying estimated output, pricing terms, ownership of environmental attributes (i.e., RECs) and any perceived engineering issues.

Step 3. Contract Development

After a winning bid is selected, the contracts must be negotiated. This is a time-sensitive process. In addition to the PPA between the government agency and the system owner, there will be a lease or easement specifying terms for access to the property (both for construction and maintenance). REC sales may be included in the PPA or as an annex to it (see Page 6 for details on RECs).

Step 4. Permitting and Rebate Processing

The system owner (developer) will usually be responsible for filing permits and rebates in a timely manner. However, the government agency should note filing deadlines for state-level incentives because there may be limited windows or auction processes.

Step 5. Project Design, Procurement, Construction, and Commissioning

The developer will complete a detailed design based on the term sheet and more precise measurements; it will then procure, install, and commission the solar PV equipment. The commissioning step certifies interconnection with the utility and permits system startup. Once again, this needs to be done within the timing determined by the state incentives. Failure to meet the deadlines may result in forfeiture of benefits, which will likely change the electricity price to the government agency in the contract. The PPA should firmly establish realistic developer responsibilities along with a process for determining monetary damages for failure to perform (Logan et al., 2009).

4. Investment Setting in Utility and Market Environments

In traditional utility environments there are two types of projects, utility construction and independent construction. Utility construction refers to a project in which the power plant is owned and operated by the utility. Before construction, projects must be approved by the state utility commission. The approval process includes a provision for the utility to finance the debt and equity of the project through customer rates.

Independent construction refers to projects in which a new power plant is owned and operated by an independent power producer (IPP). Before construction a power purchasing agreement (PPA) is signed between the producer and the utility; the PPA is subject to the approval of the state utility commission. There are many possible structures for the PPA, but the essence is that the utility provides a guaranteed payment to the producer in exchange for agreed-upon power production and capacity.

Along with approval for the PPA, the state utility commission provides a mechanism for cost recovery to the utility through customer rates. The common feature of both of these mechanisms is cost recovery through regulated rates. Furthermore, the recovery mechanism is set in place over the lifetime of the project. Banks find this feature very attractive and readily provide financing for such projects.

In nontraditional markets, neither retailers nor power producers are able to demonstrate regulated cost recovery to banks. Banks are less willing to finance projects that don't have cost recovery mechanisms than projects that are backed by a cost recovery mechanism. In a nontraditional market, the only agent that can provide regulatory assurances is the ISO. This presents a bit of a quagmire for federal and local authorities wishing to develop free markets. To ensure financing for new construction, regulatory agencies must provide the ISO with the authority to enter PPAs so that cost recovery can be ensured. Absent such authorization, financing for new construction may be difficult to arrange and the state cannot ensure reliability of supply. Of course, providing such authorization restores a regulated environment, with the ISO assuming the role of the traditional utility. There is tension between the desire to develop free markets and the desire to regulate reliability. Organizing long term planning activities is difficult in this environment. (Mazer, 2007)

4.1. Power Purchase Agreements in Long-Term Horizon

The investment and development communities have learned a hard lesson from losses on projects built between 2000 and 2003. Currently in the United States, IPPs and their financial backers seek to construct projects with revenue guarantees by contracting with a suitable counterparty. The most common counterparty is a utility.

Another potential counterparty may be the ISO. These are the only two counterparties who can pass the risk of long-term contracts through the regulatory arena and ensure cost recovery by a regulated rate mechanism. There are several possibilities for structuring contracts. In this section, we present commonly negotiated contract types and categorize the contract terms. Then we provide a series of issues that the counterparties must agree upon before finalizing contracts. Afterwards we discuss the pricing and valuation of contracts.

There are various ways to structure payments. For fixed-quantity contracts only, the owner may charge the counterparty a fixed payment stream of dollars per MWh.

Since the dispatch quantity is fully established within the contract terms, the full payment is also established at the time of the contract's signing. Typically, payments are made on a monthly basis. Most contracts have both fixed and variable components to the payment. The fixed component is referred to as the capacity payment, and the variable component is referred to as the energy payment. Whereas the capacity payment described in the preceding sections is a hypothetical value, in this situation it is an actual contractual payment. Often the contracts are structured so that the energy payment covers the costs of energy production, (fuel, maintenance, and operations), while the capacity payment covers the cost of construction.

5. Conclusion

In this paper the Power Purchasing Agreements presented. The importance of these contracts in restructured power system is illustrated. Below are several ways to structure the energy payment:

- Indexed to power price. The energy payment may be set at the settlement price of a designated market. This requires the availability of a price that is published in a forum acceptable to both the owner and the counterparty. An ISO index is an example. Another example is a daily price that is published in an industry-wide accepted publication.
- Indexed to gas price. The energy payment may be indexed to the settlement price of a designated gas market. Once again, an acceptable published price must be available. There is a contractual heat rate that converts the \$/MMBTU charge of the gas index into a \$/MWh charge for the energy. The owner often sets the contractual heat rate at a level that allows the owner to recover all variable energy costs and is accordingly often higher than the actual operating heat rate of the plant.
- Indexed to coal. Another possibility is for the variable component to be indexed to a different fuel such as coal with a contractual heat rate.
- Determined by guaranteed operational costs. The energy payment may be made in the form of a variable heat rate in accordance with agreed-upon operating characteristics applied to an indexed fuel price. This provides the fuel payment. In addition to the fuel payment there are additional variable operations and maintenance charges along with start-up charges.

- Lessee provides fuel and pays guaranteed operational costs. Under this arrangement the lessee independently arranges for fuel shipments to the plant and pays all of the fuel costs of the dispatch. However, the owner provides a guaranteed efficiency in the form of a variable heat rate. If the actual fuel burn exceeds the contractually guaranteed fuel burn as determined by the contractual heat rate, the owner must reimburse the lessee for the additional fuel cost. Variable operations and maintenance costs along with start-up costs are charged to the lessee at a set cost.
- Lessee provides fuel and pays actual fuel costs along with set Variable Operation and Maintenance (VOM) and start-up costs. Under this arrangement, the lessee independently arranges for fuel shipments to the plant and pays all of the fuel costs. Additionally, the owner charges variable operations and maintenance costs along with start-up costs.

aelbakry@yahoo.com , afifyhisham@hotmail.com and LaLaLaLaLa2011@yahoo.com

Abstract: The aim of this research is to evaluate differences in growth and chemical composition of *in vitro* grown seedlings (10, 20 and 30 days old) of *Rumex vesicarius* L. (Polygonaceae) on either solidified MS medium or agar. Percentage of germination increased with time from 2 days till 16 days in case of seedlings grown on MS medium, and 10 days in case of seedlings grown on agar. Variations in seedlings length at 10, 20 and 30 days were non significant. Seedlings grown on agar were longer than seedlings grown on MS medium. Shoot: root ratio (%) decreased with time from 10 to 30 days, shoot: root ratio of seedlings grown on agar was less than these of seedlings grown on MS medium. Variation in shoot: root ratio of seedlings grown on either solidified MS medium or agar was highly significant. Fresh and dry weights of these seedlings increased with time in 10, 20 and 30 days old seedlings. Variations were highly significant in both fresh and dry weights. Fresh and dry weights of seedlings grown on MS medium were higher than seedlings grown on agar. Phytochemical screening of 10, 20 and 30 days old seedlings showed variations in the presence and / or amount of some biologically active constituents under investigation such as: flavonoids, saponins, alkaloids and tannins, chlorides and Sulphates, these variations indicated that, the formation of these active constituents is positively or negatively related to time. Regarding total phenolics, of seedlings grown on MS medium, 20 days old seedlings had the maximum concentration (3.833 ± 0.334 mg GAE_s/g F.W.), followed by 10 days old seedlings (1.910 ± 0.334 mg GAE_s/g F.W.), while 30 days old seedlings were found to contain the least amount of phenolics (1.167 ± 0.334 mg GAE_s/g F.W.). Variations in the amount of total phenolics within different seedlings were non significant. Seedlings grown on agar contained low amount of phenolics till 30 days old, compared with seedlings grown on MS medium. Total flavonoids were determined also, highly significant variations were found between 10, 20 and 30 days old seedlings grown on either MS medium or agar. The maximum amount of total flavonoids was found to be in 10 days old seedlings grown on agar (106.350 ± 3.849 µg/g F.W.); flavonoidal contents were negatively related to time. In wild young plantlets of *Rumex vesicarius* L. at vegetative stage, total phenolics were found to be lower than *in vitro* grown seedlings. Plantlets roots were found to be the richest organ (1.695 ± 0.178 mg GAE_s/g F.W.), however roots contains about less than half amounts found in *in vitro* grown seedlings on MS medium at 20 days old (3.833 ± 0.334 mg GAE_s/g F.W.). Wild young plantlets were rich in flavonoids. There were highly significant variations between plantlets parts. Leaves were found to contain the highest amount of flavonoids (2835.000 ± 305.757 µg/g F.W.).

F.W. : Fresh Weight.

1. Introduction

Rumex vesicarius L. is a wild edible plant used as a sorrel and collected in spring time and eaten fresh (Batanouny, K.H., 1999), or cooked (Al-Quran, 2009). It was considered as a dietary complementary plant, since this plant is a rich source of β carotenes (Bélanger *et al.*, 2010).

Rumex vesicarius L. has many important medicinal uses, the plant is stimulant, tonic, and acts as aphrodisiac agent (Gopal *et al.*, 2008).

The medicinal importance of this plant is a reflection to its chemical composition since the plant contains many bioactive substances such as flavonoids (vitexin, isovitexin, orientin and isorientin). The plant also is

rich in anthraquinones particularly in roots (emodin and chrysophanol). The plant also contains carotenoids, vitamins (especially vitamin C), proteins, lipids and organic acids. This plant is a good source of minerals such as; K, Na, Ca, Mg, Fe, Mn and Cu (Saleh, 1993; Al-Rumaih *et al.*, 2002; Alfawaz, 2006; Filho *et al.*, 2008).

The previously mentioned bioactive phytochemicals (such as polyphenols, flavonoids, carotenoids, tocopherols and ascorbic acid) have a role as antioxidant and detoxifying agents. The intake of dietary antioxidant phytochemicals like carotenoids, phenolic compounds and flavonoids leads to protection against non-communicable diseases i.e. cancer, cardiovascular diseases and cataract. Phenolics and flavonoids were very important biologically active constituents, since they considered to be anticancer, antioxidant and antimicrobial agents etc., (Rao, 2003; Alberto *et al.*, 2006; Matkowski, 2008; Abd Ghafar *et al.*, 2010 ; Imran *et al.*, 2011).

The main aim of this study is to evaluate differences in seedlings growth parameters as manifested by seedling length, shoot : root ratio, fresh and dry weights and chemical composition (particularly, total phenolics and total anthraquinones) of *in vitro* grown seedlings of *Rumex vesicarius* L. (Polygonaceae) at different stages of growth (10, 20 and 30 days) on either solidified MS medium or agar. Wild young plantlets were also studied for their chemical composition.

2. Materials and Methods

Plant material:

Seeds of *Rumex vesicarius* L. were obtained from plant samples collected during August 2010 at the ripening fruiting stage. Wild young plantlets at the vegetative stage of growth (February 2011) were collected from 60 km, Quatamia- Ain Sokhna desert road, Egypt. Plant specimens were botanically identified and authenticated by comparing with herbarium specimens, and the identified plant specimen was deposited in the herbarium of Botany and Microbiology Department, Faculty of Science, Helwan University, Helwan, Egypt (Number:1057). All experimental studies were carried out in Prof. Dr. / Hisham Afifi Lab., Plant Physiology Unit, Botany Department and Central Services Lab., National Research Centre, Giza, Egypt.

In vitro germination of seeds:

Seeds were surface sterilized by immersion in 70 % ethanol for 30-60 seconds, then soaked in 20% of commercial Clorox for 15-20 minutes, then washed 3 times with sterile double distilled water. Sterilized seeds were aseptically transferred to either 1% (w/v) agar in double distilled water or hormone free MS medium (Murashige and Skoog, 1962) supplemented with 1% agar, then incubated at 25± 2°C in light (16

hours). Percentage of germination was determined every 2 days till 30 days. Seedlings of 10, 20 and 30 days old were collected and growth parameters estimated (seedling lengths "cm", fresh and dry weights "mg". Replicates = 300 seeds for determination of germination percentage and 30 seedlings for determination of growth parameters except shoot: root ratio (3 seedlings).

Chemical examination of *in vitro* grown seedlings and early vegetative wild plantlets:

1- Preliminary phytochemical screening:

Preliminary phytochemical screening of *in vitro* grown seedlings at different stages of growth (10, 20 and 30 days old) on either solidified MS medium or agar and early vegetative wild plantlets was carried out as follows: Flavonoids (Mabry *et al.*, 1970); Anthraquinones (Farnsworth *et al.*, 1969); Tannins (Trease and Evans, 1978); Alkaloids (Shellard, 1957); Saponins (Hungund and Pathak, 1971); Carbohydrates and / or Glycosides (Stank *et al.*, 1963); Irodoids (Weiffering, 1966); Coumarins (Feigl, 1960); Chlorides and Sulphates (Islam *et al.*, 1993); Sterols and / or Triterpenes (Claus, 1967 and Schmidt, 1964) and Cardiac glycosides (Balbaa *et al.*, 1981).

2- Determination of total phenolics and total flavonoids:

a- Assay for total phenolics:

Total phenolics were estimated according to Gursoy *et al.*, (2009), involving Folin-Ciocalteu reagent and Gallic acid as standard. 1 ml of each extract of either *in vitro* grown seedlings at different stages of growth (10, 20 and 30 days) on either solidified MS medium or agar and early vegetative wild plantlets contained 150 mg F.W.. Each sample was done in triplicate. Concentrations of phenolic compounds were calculated according to the following equation that was obtained from the standard Gallic acid graph.

$$\text{Absorbance} = 0.0167 \text{ Gallic acid } (\mu\text{g}) + 0.017 \text{ (R}^2\text{: 0.99)}$$

b- Assay for total flavonoids:

Total flavonoids were determined using the method of Gursoy *et al.*, (2009). 1 ml of each extract of either *in vitro* grown seedlings at different stages of growth (10, 20 and 30 days) on either solidified MS medium or agar and early vegetative wild plantlets contained 150 mg F.W.. Each sample was done in triplicate. Concentrations of flavonoid contents were calculated according to the following equation that was obtained from the standard Quercetin graph:

$$\text{Absorbance} = 0.0228 \text{ Quercetin } (\mu\text{g}) - 0.0045 \text{ (R}^2\text{: 0.9979)}$$

Statistical analysis:

Statistical analysis was done using Fisher analysis of variance methodology. A least significant difference test was applied at 5% and 1% probability level to determine differences among treatment means (Steel and Torrie, 1984). The MSTAT computerized package

program was subjected to the regular statistical analysis of variance (Nissen *et al.*, 1985).

3. Results and Discussion:

***In vitro* germination of seeds of *Rumex vesicarius* L.:**

Percentage of *in vitro* germination of *Rumex vesicarius* L. seeds (Figure:1.a) increased gradually with time from 2 days (72.333%), till 16 days (86.833%), then no change occurred in % of

germination till 30 days in case of seeds germinated on solidified MS medium.

Regarding seeds germinated on agar, percentage of *in vitro* germination of seeds (Figure:1.b) increased gradually with time from 2 days (20.755%), till 10 days (85.535%), then no change occurred in % of germination till 30 days.

a) MS medium

b) Agar alone

Figure (1): *In vitro* germination of seeds of *Rumex vesicarius* L. on either solidified MS medium or agar during 30 days.

***In vitro* grown seedlings growth:**

Data in Table : 1 showed seedling length, shoot: root ratio and fresh and dry weights at 10, 20 and 30 days old seedling grown on either solidified MS medium or agar.

Length of seedlings grown on agar (7.080 ± 0.587 , 10.130 ± 0.587 and 11.180 ± 0.587 cm at 10, 20 and 30

days old respectively) was higher than that of seedlings grown on MS medium (3.960 ± 0.587 , 5.890 ± 0.587 and 6.130 ± 0.587 cm at 10, 20 and 30 days old respectively), this may be because seedlings tried to get more nutrients from this poor media (agar) by increasing roots length as absorbing organs, variation in length between seedlings grown on MS medium and

agar may be due to other factors such as gelling strengths of MS medium and agar and porosity of MS medium and agar particles etc.,. There were non significant differences in seedlings length grown either on solidified MS medium or agar.

Shoot: root ratio decreased with time from 10 to 30 days. Shoot: root ratio of seedlings grown on agar (50.000 ± 11.742 , 36.500 ± 11.742 and 33.333 ± 11.742 at 10, 20 and 30 days old respectively) was less than that of seedlings grown on MS medium (66.667 ± 11.742 , 61.111 ± 11.742 and 50.000 ± 11.742 at 10, 20 and 30 days old respectively). Variation in shoot: root

ratio of seedlings grown on either solidified MS medium or agar was highly significant.

Fresh and dry weights increased with time in 10, 20 and 30 days old seedlings. Both fresh and dry weights of seedling were more in case of seedling grown on solidified MS medium (They reached 382.200 ± 18.970 and 66.700 ± 2.882 mg respectively) than those grown on agar (118.000 ± 18.970 and 23.600 ± 2.882 mg respectively). Variations were highly significant in case of fresh and dry weights of seedlings grown on either solidified MS medium or agar.

Table (1): Seedling length, shoot: root ratio (%), fresh and dry weights of *in vitro* grown seedlings of *Rumex vesicarius* L. (Polygonaceae) at different stages of growth (10, 20 and 30 days) on either solidified MS medium or agar.

<i>In vitro</i> grown seedlings	Seedling length (cm)	Shoot: root ratio (%)	Fresh weight (mg)	Dry weight (mg)
a) MS medium				
10 days	3.960 ± 0.587	66.667 ± 11.742	245.000 ± 18.970	38.800 ± 2.882
20 days	5.890 ± 0.587	61.111 ± 11.742	331.200 ± 18.970	49.500 ± 2.882
30 days	6.130 ± 0.587	50.000 ± 11.742	382.200 ± 18.970	66.700 ± 2.882
b) Agar				
10 days	7.080 ± 0.587	50.000 ± 11.742	106.000 ± 18.970	21.200 ± 2.882
20 days	10.130 ± 0.587	36.500 ± 11.742	115.500 ± 18.970	23.100 ± 2.882
30 days	11.180 ± 0.587	33.333 ± 11.742	118.000 ± 18.970	23.600 ± 2.882
L.S.D. (0.05)	1.627	36.184	53.660	8.152
L.S.D. (0.01)	2.138	50.730	71.360	10.842

Preliminary phytochemical screening of *in vitro* grown seedlings and early vegetative wild plantlets:

Phytochemical screening of 10, 20 and 30 days old seedlings (Table: 2 a) showed variations in the presence and / or amount of some biologically active constituents under investigation, in this regard, seedlings grown on MS medium were found to contain Sulphates in amounts increased with time, chlorides increased then decreased with age, flavonoids, alkaloids and tannins decreased with age then increased again. Saponins were formed between 10 and 20 days then increased with time, coumarins, sterols, carbohydrates and / or glycosides amounts did not change with time.

Seedlings grown on agar were found to contain all substances under investigation in lower amounts than those grown on MS medium except flavonoids and carbohydrates and / or glycosides. Seedlings grown on both MS medium and agar were devoid of cardiac glycosides, irodoids, anthraquinones and sublimable substances, since they were not formed till 30 days.

These variations indicated that the formation of biologically active constituents is

positively or negatively related to seedlings age and composition of growing nutrient media.

It was found also that, all plant parts of early vegetative wild plantlets of *Rumex vesicarius* L. (Table: 2 b) were rich in majority of active constituents under investigation, plantlets organs varied in the amount of these biologically active substances.

However, these plantlets were rich source of these active constituents; it is considered a limited source for two reasons:

1- Duration of vegetative stage of this plant is about one month then amounts of active constituents decreased when the plant turned to other developmental stages

2- Over collection of these young plantlets changed the ecological status of the plant gradually to being rare, taking in consideration that these plantlets are found normally in little numbers in the desert.

These results agreed with Mostafa *et al.*, 2011, since they found that, all plant parts of *Rumex vesicarius* L. at flowering and fruiting stages were rich in flavonoids, anthraquinones, alkaloids, tannins, sterols and / or triterpenoids, carbohydrates and/or glycosides, chlorides and sulphates and sublimable substances . There were variations in the presence and /

or amount of some biologically active constituents under investigation within different plant parts.

Table (2a): Preliminary phytochemical screening of *in vitro* grown seedlings of *Rumex vesicarius* L. (Polygonaceae) at different stages of growth (10, 20 and 30 days) on either solidified MS medium or agar.

	10 days old seedlings		20 days old seedlings		30 days old seedlings	
	MS medium	Agar	MS medium	Agar	MS medium	Agar
1-Carbohydrates and / or Glycosides	+	++	+	++	+	+
2- Saponins	-	-	+	+	++	+
3- Tannins	++	+	+	+	++	+
4- Sterols and / or Triterpenoids	+	+	+	+	+	+
5- Alkaloids	++	-	+	-	++	-
6- Cardiac glycosides	-	-	-	-	-	-
7- Flavonoids	++	++	+	++	+	++
8- Anthraquinones	-	-	-	-	-	-
9- Coumarins	+	+	+	+	+	+
10- Irodoids	-	-	-	-	-	-

Total phenolics and total flavonoids of *in vitro* grown seedlings and early vegetative wild plantlets:

Phenolics and flavonoids are important biologically active constituents, since they are

considered to be anticancer, antioxidant and antimicrobial agents etc., (Alberto *et al.*, 2006; Abd Ghafar *et al.*, 2010 ; Imran *et al.*, 2011).

Results of total phenolics (Table: 3a) revealed that, in case of seedlings grown on MS medium, the maximum amount of total phenolics was found to be in 20 days old seedlings (3.833 ± 0.334 mg GAEs/g F.W.), followed by 10 days old seedlings (1.910 ± 0.334 mg GAEs/g F.W.), while 30 days old seedlings were found to contain the least amount of phenolics (1.167 ± 0.334 mg GAEs/g F.W.).

This means that, there were nearly a duplication in the amount of total phenolics occurred in seedlings from 10 to 20 days, then a decline in the amount of total phenolics occurred again.

Regarding seedlings grown on agar it was found that, they contain low amounts of phenolic contents till 30 days old seedlings.

Variation in the amount of total phenolics within different seedlings grown on either MS medium or agar was non significant.

These results agreed with Mostafa *et al.*, (2011), since they found that, all plant parts were rich in phenolics, particularly fruits (15.633 mg GAE_s/g F.W.), while whole plant was found to contain 10.417 ± 0.320 mg GAE_s/g F.W..

Results of total flavonoids in seedlings growing on MS medium (Table: 3a) showed that, the maximum amount of total flavonoids was found to be in 10 days old seedlings (42.930 ± 3.849 µg/g F.W.), followed by 30 days old seedlings (37.868 ± 3.849 µg/g F.W.), while 20 days old seedlings were found to contain the least amount of flavonoids (34.993 ± 3.849 µg/g F.W.).

This may be explained physiologically on the basis that flavonoids is one of stress signs, so when seedlings at the first stage of formation and growth were under stress, so total flavonoids increased, and this followed by a decrease in total flavonoids of 20 days old seedlings, this may be due to that the stress may be reduced with further growth of seedlings, this decrease in total flavonoids is followed by increase in 30 days old seedlings, because plantlets may undergone further stress under growth and formation of leaves, other organs and more differentiation was occurred, so total flavonoids increased again as a sign of this stress, another reason for this increase may be also depletion of nutrient contents in the MS medium.

Regarding seedlings grown on agar, it was found that, flavonoidal content decreased with increasing seedling ages from 10 to 30 days, flavonoidal content of these seedlings was double of those found in seedlings grown on MS medium.

There were highly significant variations between 10, 20 and 30 days old seedlings grown on either MS medium or agar.

Total flavonoids content was higher than that in whole plant parts of wild samples, since Mostafa *et al.*, (2011) found that, whole plant parts collected from

desert during flowering stage contain 11.223 ± 1.850 µg/g F.W. only, at all cases seedling growing on either solidified MS medium or agar produced flavonoids (4-10 folds respectively) more than whole plant in the flowering stage.

Results of this research agreed with results of Astrid Kännaste, 2008, who found that age is an effective factor on the formation of phenolic volatile compounds (such as terpenoids; -pinene, camphene, -pinene, myrcene, -phellandrene, terpinolene and limonene etc...) in newly planted conifer seedlings in deforestation areas, thus small ("mini") seedlings, planted at the age of 7-10 weeks, are gnawed less by pine weevils than the larger, conventionally planted seedlings. So, it has been proposed that planting young conifer seedlings in clear-cut areas may reduce the damage caused by pine weevils.

Concerning total phenolics, early vegetative wild plantlets of *Rumex vesicarius* L.(Table : 3b) were found to contain lower amounts than *in vitro* grown seedlings. Plantlets roots were found to be the richest organ in plantlets in this regard (1.695 ± 0.178 mg GAE_s/g F.W.), however roots contains about less than half amounts found in *in vitro* grown seedlings on MS medium at 20 days old (3.833 ± 0.334 mg GAE_s/g F.W.). There were non significant variations between plantlets parts in this regard.

It was found that, early vegetative wild plantlets of *Rumex vesicarius* L.(Table : 3b) were rich in flavonoids. There were highly significant variations between plantlets parts. In this regard, leaves were found to contain the highest amount of flavonoids (2835.00 ± 305.757 µg/g F.W.), followed by whole plant parts (1986.000 ± 305.757 µg/g F.W.).

To conclude, chemical composition of seedlings varied according to seedlings age and composition of growing nutrient media. Seedlings grown on MS medium at 20 days old were a rich source of phenolics (3.833 ± 0.334 mg GAE_s/g F.W.), these seedlings contained more than double the amount of phenolics found in roots (as the richest organ in the plantlet) of early vegetative wild plantlets of *Rumex vesicarius* L. (1.695 ± 0.178 mg GAE_s/g F.W.). Seedlings grown on agar at 10 days old and leaves (as the richest organ in the plantlet) of early vegetative wild plantlets of *Rumex vesicarius* L. were rich source of flavonoids (106.350 ± 3.849 µg/g F.W. and 2835.000 ± 305.757 respectively).

Finally, seedlings grown on MS medium at 20 days old (Photo: 1) were a rich source of phenolics, while seedlings grown on agar at 10 days old and leaves of early vegetative wild plantlets of *Rumex vesicarius* L. were a rich source of flavonoids (Photos: 2 and 3).

Table (3a): Total phenolics, total flavonoids of *in vitro* grown seedlings of *Rumex vesicarius* L. (Polygonaceae) at different stages of growth (10, 20 and 30 days) on either solidified MS medium or agar.

<i>In vitro</i> grown seedlings	Total phenolics (mg GAE _s /g F.W.)		Total flavonoids (µg/g F.W.)

The importance of indigenous knowledge in agricultural development

Esmail Ghorbani¹ and Fatemeh Bakhtiar²

^{1,2} Darab Branch, Islamic Azad University, Darab, Iran

*Corresponding author: abbasrezazadeh80@yahoo

Abstract: Different definitions were presented about indigenous knowledge by experts that each of them present their idea about this knowledge from their viewpoint. Each of them emphasis on a special aspect of indigenous knowledge according to their viewpoint. Oxford vocabulary define the word indigenous knowledge such this" it is created naturally in a region which is related to the people of that region. Indigenous knowledge is a knowledge that has been grown in a long time and has transferred from one generation to other generation in hereditary form . Williams and Molina have defined indigenous knowledge such this: indigenous knowledge is the learning methods, understanding and attitude to the world which is the result of experience and solving problems according to test and error by the people who are active and have used their available resources on its suitable time. Chambers with emphasizing on people's role in development process, believed that the phrase rural people's knowledge is more sensible than the other phrase such ethnic ecology, ethnographic knowledge, ethnic classification. He also believed that indigenous knowledge is a knowledge that is created naturally and is emanated from geographical circle.

Keywords: Indigenous knowledge, rural women

Introduction:

Agriculture part is bearing the most damage in this rapid industrialization process. Absolving old and compatible ways in agriculture part and replacing and using of implant, harvest patterns without any proportions with environment has caused decrease of production efficiency, soil erosion and hard destruction of environment during a long time. Finally, at the end of the 20th century decades, some solutions were suggested to solve these inconsistencies and problems. So the importance of native knowledge and effort in compilation of that with modern knowledge were considered and it was tried to make general and stable view in relation with environment and the way of living through this way (popzan, 2002).

On the other hand, the colonist countries attention to industrial productions and agriculture policies has caused to promote industrial and single product agriculture which will influence the native farmer's knowledge about different productions and will make it inconspicuous. Also, colonized plans and imported extension programs have intensified the alienation of native knowledge (Nowroozi and Alagha, 2000). In the middle of 1980 decade, there was a new view" giving priority to farmer" that increased the attention to native knowledge. This view that emphasized on "listen people and learn of them" emphasized on people's active communion on developing and searching process. Before using of this way, understanding rural society's culture was in another way and it was thought that rural people have failed

in economic, politic, innovation and its transfer, creation of knowledge and using of that in rural societies. Before representation of this attitude "giving priority to farmer", it was thought that development need in other people management who are not living on that village. But in this way, we look rural people as the one who are able to solve their problems with relying on their knowledge and experience (Eshraghi, 2000).

Indigenous agriculture is base on farmer's cooperation with nature. Sustainable agriculture that inspired by indigenous systems would rectify most of deficiencies of modern agriculture. Indigenous agriculture systems is production of centuries of cultural and subsistence revolution. These systems are collections of farmer's experiences that haven't enjoy sources except inputs, capital and indigenous knowledge. And consequently they accessed to such sustainable agriculture that just is dependent on using restricted local resources and existing humane and animal power. At indigenous agriculture, culture diversity and frequency would minimize possibility of loss crops in spite of simple technology. These systems despite of limitation of sources enjoy merits of sponsors traditions and intelligent methods of using animals, fields, and compatible crop species. Thus ecological agriculture scholars consider these systems as unique samples to determine sustainability standards in agricultures activities (Penny, 2001).

This knowledge would rise at different fields such as language, botanical and zoology and also skills and manual and agriculture professions that all are

product of human efforts in his environment. This information contain best, useful and consistent collocation of exploiting methods and living in special environment which be transmitted through verbal and empirical way from one generation to another (Smita, 2003).

unlike development that is dependent on using maximum of natural sources in order to current generation's access to maximum economic growth and income , sustainable development insists on supplying current generation's needs without jeopardizing next generation's facilities for supplying their needs. Policy making is impossible and unacceptable with no program that leads to starvation, poverty, social inequality and environment pollution at cities and villages and finally to ecologic devastation. In contrast, kind of development is acceptable that leads to continues improvement of life quality for all global society and next generations. Accessing to this goal is possible just through protecting natural sources and sustainable use of these sources.

Accessing to indigenous knowledge would enforce primary foundation of sustainable development. On the on hand, indigenous knowledge is production of empirical learning process and at the other hand is test and error of few thousand years of one society in relation to its environment. It is obvious that this knowledge represents human's interaction with nature and displays features of climate and specifications of vegetarian and animal nature of one region and more important , it displays their interactions with human(Kolawopole, 2001).

By possessing this valuable information it is possible to predict its component relations , and it is possible to use of its latent power intelligently so that both balance be preserved and also human's needs be supplied.

At the other hand furthermore valuable latent information in indigenous knowledge, villager's epistemology would enforce relation between experts and local men. This issue is possible through deep analyzing of indigenous knowledge and familiarizing with local people's attitudes and epistemology and through that raft between men and experts would be restored. Everything is inter-related at village and intelligent rural people by considering accessible things in nature or easily is obtainable, would supply their needs (Box, 1999).

Broaching indigenous knowledge issue in order to presenting new approaches was reinforces in current decade which insists on human-oriented developing and sustaining. In this attitude, development process, environmental, social and cultural considerations, was considered important in addition to economic interests. Principle of sustainable development can be

summarized so that development should be consistent with desired society from aspects of sustainable environment, fair social aspect, and from economic efficiency and cultural viewpoint. Considering people's indigenous knowledge was emphasized directly or indirectly as one of the development needs, at most of forty principles of sustainable development charter. Considering indigenous knowledge means accepting variation principle and describes that all people share and participate at variation and culture richness and they create common human's heritage. Sustainable development would not be able to be success without identifying people's indigenous knowledge, role and its position and also without protecting knowledge and indigenous people's rights, because indigenous knowledge has most consistency with principle of sustainable development (Karami and Moradi, 2003). Necessity of attention to indigenous knowledge was appeared more due to failure of common development samples, especially at rural development, and being attracted to it to help formal knowledge was identified very critical. At the context of cooperative approach as new approach that is base on paradigms which forms concepts of development, focus on new revolution is emergence of new proficiency that is called indigenous knowledge. Cooperative approach is seeking to systematic use of indigenous knowledge at related researches to technologic actions.

According to different definitions of indigenous knowledge, it is possible to count it as part of unique culture of each ecosystem or country and that is knowledge and findings which obtained through experience in order to be consistent with certain ecosystem conditions, and changed as part of social and productive culture of that society over time. This acknowledges, represent compatibility methods with nature and establishing reasonable relationship between human and his environment. And has complete harmony with principle of sustainable development, form this viewpoint (Burger, 1997).

Characters of indigenous knowledge :

The characters of indigenous knowledge like the definition of this knowledge are presented by experts in different ways which we will explain about them as follow:

1- it is based on experience:

Indigenous knowledge is the result of people's experience during many centuries.

2- it was tested during centuries by working on it.

3- it is compatible with indigenous environment and culture:

Indigenous knowledge was created through native societies and it was formed according to their needs

and during time the things which were not compatible with indigenous environment were omitted, so what was remained was compatible with the environment and culture of that society (Amiri Ardekani and 2003).

4- it is dynamic and is changing:

Simultaneously with changing indigenous culture, the indigenous knowledge was changing too.

5- the knowledge of rural people was not technical:

This knowledge was consisted of rural people's wishes, values and preferences.

6- the rural people's knowledge is not statistic:

This knowledge was formed according to people's culture, social and economic history. The history which was written by these rural people shows that their manner and activities were efficient in changing of their conditions.

7- rural people's knowledge is not enough.

Maybe the rural people are knowledgeable but they like to know more and more. Because they want to be powerful in their discussions with political, economical and social forces who made these people poverty before give them technology (Zare and Yaghoubi, 2003).

8- rural people's knowledge has root on their political economy and is more important in political field.

The advantages that rural people can get from indigenous knowledge are the knowledge that is created and released locally and is on their authority and also depends on main factors in regional politic economy (land distribution, marketing relations, and vertical links and ...). So improvement of their livelihoods depends on interferences which were made to pervade on these main factors.

9- most of the rural people are public-oriented

Mostly, they have a little information about many things which is in contrast with academic educations. Specialist people in universities have deep knowledge in little fields (of course some of these native people are specialist too) (Razavi, 1999).

10- indigenous knowledge systems are holist:

Local people consider the other people's problems as their problems and try to solve these problems in a whole frame with using their knowledge.

11- indigenous knowledge systems combine the culture and religious believes.

Religious believes as a part of indigenous knowledge are not separated from technical knowledge and these believes effect on people' do and don't

12- indigenous knowledge systems prefer the less risk to most profit

Escaping of risk is important for native people, for example a native person usually keeps some goats for

possible cases such as disease of his children and he and he didn't expect any incomes of these cases.

Conclusion:

effort and national commitment and multi-dimensional support is very critical for recording, valuing, extending and exchanging this rich source and also preparing mechanism and practical strategy for synthesizing this knowledge with new knowledge and agricultural development programs.

Agricultural extension was identified as one powerful IT focused area, due to role variation at knowledge system and agriculture information at one hand and at the other hand due to its dependence on various exchanges among farmers, that can has great affect on rural society and developing agriculture. So that work and productions of farmers would increase by farmer's access and use of Internet and subsistence farmers at all over the world are at developing by gaining needed knowledge and information that during time would becoming as commercial producers. Transmitting from system-cycle source of agriculture to technology-cycle system of agriculture placed more responsibility on agricultural extension because agriculture extension system is as vital technology transfer crossing to farmers at one hand and as crossing for referring feedbacks, needs and agriculture issues, researchers and policy makers of market.

What that is obvious is that extending and researching agriculture can help to sustainability through close relation to farmers , attending to their experiences , gaining their information and logical understanding of agriculture activities , attending to their vital needs for doing "demand-base" researches and extension education efforts for developing agriculture , at process of improving agriculture development.

Finally native knowledge as a constant structure, with many years experience could attain a deep understanding and insight of the environment and ecologic exchanges. This knowledge is conveyed to next generation and the next conveyed it to their children. Native knowledge is on the verge of destruction like a curative prescription that has hidden a constant glamour on it. By dying each native person, the great treasury of knowledge will lay underground and these knowledge sources are destroying very speedily.

On the research which was done by Bozarjomhari (2004) with this title "analyzing native knowledge position on rural sustainable development". It was specified that although there are many differences between native and modern knowledge but they are not in contrast with each other, because they are each other's supplement and we can't be success when we

use them separately. According to new parameters in rural development, for solving rural problems, at the first we should use of native solutions and if it was not efficient, we can use and test external solutions.

Research findings which was done by Emadi and Amiri (2004) with this title " compilation of native and modern knowledge is necessary for reaching agriculture sustainable development" signify that The believe of educated people to native people and their knowledge " precondition for making them close" is called combination and compilation. Making evolution in modern system for attention to tentative knowledge is the main necessity for this compilation. Another necessity for this evolution is the researcher's attention to experimental accumulated wisdom and historical exploit by using qualitative and communion methods. Also applying compilation methods and making evolution among government, educational centers, farmers and peasant is the necessity and pre condition for combination of modern and native knowledge.

Research findings that was done by Karimi with this title " native knowledge in development process" signify that native knowledge was a essential element and important source for realization of sustainable development, poverty reduction, making local people capable and motivate them to participate in activities for agriculture and rural development, developing and product suitable technology, rural society's self-reliance and self sufficiency. For this reason all side's try, partnership and protection for record and registration, compatibility, distribution and promotion , exchange of this resources and also suitable and scientific guidelines for compilation of this knowledge with new knowledge and rural and agricultural development plans are needed.

Decentralization in agricultural extension: implications and priorities

Abbas Emami¹ and Esmaeil Ghorbani²

^{1,2} Darab Branch, Islamic Azad University, Darab, Iran

*Corresponding author: hossein11070@yahoo

Abstract: Over the past two decades many countries have undertaken to decentralize government functions and transfer authority and responsibilities from central to intermediate and local governments, and often to communities and the private sector. Decentralization is potentially important to agricultural knowledge and information systems, but decentralization is not an end in itself, and successful decentralization strategies must address three challenges—establishing a national framework for decentralization, developing subsector approaches, and enhancing capacities of various participants for coproduction of decentralized goods and services. Agricultural extension services are under increasing pressure to become more effective, more responsive to clients, and less costly to government. Decentralization is an increasingly common aspect of extension reforms. Field extension advisory services are well suited to decentralized approaches, but a comprehensive extension system requires a range of extension support services and programs, some of which (strategy formulation, training, monitoring and evaluation, specialized technical support) are often best carried out at the central level. The prime challenges in the traditional public extension systems enlisted as outdated, top-down, paternalistic, inflexible, subject to bureaucratic inefficiencies that results less ability to cope with the dynamic demands of modern day agriculture (World Bank, 2002; Obaa et al., 2005). In some countries the change is occurring with its natural pace but in many developing countries these have been accelerated by structural adjustment reforms.

[Abbas Emami and Esmaeil Ghorbani. **Decentralization in agricultural extension: implications and priorities.** Journal of American Science 2011;7(6):185-189]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Decentralization, Agricultural extension

Introduction:

Agricultural extension increasingly has become defined as one or other of (apparently) differentiated activities of technology transfer or rural development. In many situations, the transfer of technology, heretofore considered the purview of public sector systems, has been reconceived. Such changes suggest a refocussing of paradigms for the delivery of public sector extension. In developed industrialized countries, which often provide models for extension service delivery elsewhere, the declining relative importance of agriculture for economic growth, the increasing education and affluence of smaller populations of rural producers, and the increasing use of externally purchased inputs have changed the nature of publicly funded extension services and led to a questioning of the means of delivery of extension services by governments. Agricultural extension is a non-formal type of education that provides advisory services by the use of educational approach in acquiring knowledge and skills to deal with the growing needs of global world. Diverse agricultural extension funding and delivery arrangements have been undertaken since the mid-1980s by governments worldwide in the name of "privatization." When agricultural extension is discussed, privatization is used in the broadest sense – of introducing or increasing private sector participation, which does

not necessarily imply a transfer of designated state-owned assets to the private sector.

Like other developing country Pakistan is also an agrarian country, whose economy is highly dependent on agriculture having 23% share to GDP (Government of Pakistan, 2005). But still the performance of agriculture sector at the farm level remains significantly below the potential and limited due to the weak institutional formwork in disseminating agricultural technology to the farmers (Farooq, 2005). Research scientists evolving new methods and technologies to meet the challenges of new era and the farming community also has a potential and courage to adopt but the third component i.e. agricultural extension, which serves as a technology transfer vehicle and play a significant role in increasing the productivity, farm incomes and ensure food security has been very much weak since independence (Luqman et al., 2004; Farooq, 2005). The extension services in the country have not been able to achieve their goals effectively, because of a number of bottlenecks. These include weak research-extension linkages, lack of adequate resources for on-farm demonstrations, poor mobility, inadequate research and training in extension methodology and lack of an effective system of continuing education for extension personnel at various levels (Sandhu, 1993). Among major field crops wheat, rice, cotton and sugarcane accounts for 90.4% of the value added

in major crops and 37.1% of the value added in overall agriculture (Government of Pakistan, 2005). The low production of these crops depends upon a number of factors including ineffective and isolated agricultural extension system.

Decentralization as transfer of authority and responsibility for government functions from central government to intermediate and local governments, and often to communities and the private sector has become widespread over the 1980s and 1990s. Countries with diverse systems and traditions of government have pursued decentralization initiatives for many reasons, including especially the failure of government to meet expectations under centralized approaches to economic management and service approaches to organizing public administration. Though not yet widely applied to agricultural research and extension, decentralization strategies are potentially important to these agricultural knowledge and information systems. Decentralization is frequently viewed from one of two different perspectives (Johnson, 2000).

1. The democratic view emphasizes the aspect of empowering local people to control and direct their own public programs; and

2. The administrative view emphasizes the efficiency gains resulting from improved administration and effectiveness of public programs due to local control. Decentralization is generally expected to: encourage local financing and ownership of programs, result in more efficient and equitable allocation of government resources, provide incentives for production and service delivery, ensure lower-cost service delivery, build local capacity, and respond more effectively to local needs. (Khan, 2002).

For rural programs, decentralization offers hope for correcting the urban bias that results from the geographic dispersion of rural people, the difficulties for them to organize to promote their interests, and the discrimination against agriculture inherent in many country policy frameworks. Decentralization of agricultural extension and research seeks to increase user participation in technology programs and make programs more accountable to users. (Eicher, 2001). Enthusiasm for decentralization needs to be tempered with some caution. In small countries, decentralization may be unnecessary and in very large countries decentralization to the state or provincial level may still leave programs distant from user influence. Definitive evidence of the impact of decentralization is limited and not everyone benefits from any reform. Furthermore, decentralization does little to improve intraregional disparities, may bring oppressive elites into power, and can lead to greater inequalities in allocation of government resources.

Thus, decentralization has the potential to increase access to and cost of services, but specific targeting mechanisms and strong central oversight are needed to avoid inequities in service access and quality. (Farooq, 2005).

Decentralization:

Extension services differ from research in two important ways that affect their potential for decentralization. First, extension advisory services (field extension services) come in direct contact with clients and provide services that have a high private-goods content. These characteristics make field extension services a much better candidate for decentralization than research, which typically has a longer-term payoff. Local producers are more willing to commit resources to pay for effective extension services from which they realize immediate direct benefits. Still, there remains a need for other extension services to address “externalities”—environmental problems, food quality or safety concerns, or social equity issues (that is, special needs of small farmers)—that are in the public interest, but are not a priority for individual producers or decentralized institutions. This requires continued central support for extension. A second difference between research and extension is the scope and scale of programs. (Williamson, 2002).

Research institutions are generally smaller and more concentrated. Extension programs typically operate across the country, provide information on a wide range of technologies from various sources, and draw on traditional knowledge and farmer innovation to improve producer organization, management, production, and marketing functions. The broad demands on extension require strategies that incorporate a variety of approaches to providing services.

Despite the apparent suitability of extension service provision to be decentralized, they are often highly centralized. A World Bank study of 19 countries found that in the early 1990s 13 countries or regions showed almost no evidence of decentralization of extension services. Colombia, Jiangxi (China), the Philippines, and Nusa-Tenggara-Timor (Indonesia) were relatively highly decentralized, and Poland and Tunisia showed some decentralization. The study found that:

- When extension is decentralized there is a fairly good balance in fiscal, administrative, and political decentralization;
- Political decentralization (the role of elected officials) lags other elements of decentralization; and
- NGO involvement is moderate and farmer participation is significant in extension.

Underlying these conclusions was the fact that institutional development and civil society provide important support to decentralizing extension services. (FAO, 2001).

Deconcentration is intrinsic to extension services that are provided in dispersed fields and communities throughout a country. Cropping systems, markets, agroecological zones, and ethnic and cultural characteristics of farmers can vary widely within a country, and moving administration closer to field services can substantially improve program management through better understanding of local conditions. Administrative decentralization goes further by making extension programs directly responsible to local authorities. The challenge in any successful decentralization reform is that of maintaining overall program quality and coherence. Decentralized extension programs are limited if the decentralized administration lacks awareness of new technologies, sources of assistance, and extension methodologies. Although decentralized administrations can effectively integrate local institutions, organizations, and technologies into an extension system, major benefits from formal extension often come from integrating external knowledge into the local system. Lack of coordination between local administrations can be a problem. If many localities promote a single commodity, the result might be overproduction and low prices. Similarly, separate localities might finance the same feasibility studies, training programs, or extension materials. Implementing an integrated watershed or regional development plan might prove impossible if programs in each administrative region are completely independent. Other potential problems include the lack of career opportunities for extension staff in decentralized programs, and difficulties with monitoring and evaluation when local administrative units lack ability to compare targets, results, and achievements with other areas. (Khan, 2002).

Extension program quality depends fundamentally on good linkages with other programs—specialized training for extension agents and farmers, technical backstopping by subject matter specialists and information services, other extension services (mass media, fairs), and other development programs (credit programs, market development programs, input supply).

Some of these linkages can be maintained at the local level, but many require higher level coordination to ensure efficiency and quality support.

Government inability to sustain financial support for large extension systems has been a motivation for the many reforms that attempt to reduce public sector funding, introduce private financing, or eliminate

government programs that compete with the private sector. Typically, these strategies tend to decentralize extension financing. Although an objective of many decentralization reforms has been to reduce government expenditures, local governments generally have limited resources and limited ability to raise funds. Central governments therefore must usually continue financing for extension services through intergovernmental financial transfers (IGFTs), and must also finance the considerable costs of reform and local capacity development. This increases total financing requirements for extension, at least over the short term. Over the longer term, decentralizing extension services might reduce government financing requirements by: (1) increasing efficiencies through better oversight and greater flexibility in funding decisions and (2) increasing cofinancing by being more responsive, and demonstrating greater benefits, to users. Cofinancing grants (IGFTs) to local governments or farmer groups are an important element of fiscal decentralization, but they present two significant problems: (Chapman & Tripp, 2003).

- Many local organizations lack capacity to plan, manage, and evaluate extension programs and lack the contacts and financial management capacity to procure needed services; and
- Resource-rich farmers are better able to cofinance services and capture program benefits, even if program objectives are to assist weaker elements of rural society. Still, many new initiatives are using subgrants of various types for local subprojects, and future program design can draw on this experience. Decentralization programs must address these two problems. Training and orientation, program promotion, and support services are critical to enable target clients and local organizations to take over extension responsibilities under new decentralized systems. Later, as programs are implemented, a strong monitoring and evaluation system is needed to provide management with information necessary to understand who is benefiting from the program and what real impact it is having (Farooq, 2005).

Conclusion:

Decentralize extension services where possible, with emphasis on giving users control over program planning, implementation, and evaluation.

- Provide for adequate centralized support systems for decentralized extension services, especially support for training, subject matter specialists, and production of extension materials.
- Adapt strategies to local institutional environments to accommodate country legal frameworks, political traditions, administrative structures, and social and agroecological conditions. Extension strategies can

emphasize decentralization when there is already a strong political decentralization in the country, but should proceed cautiously when decentralization is not yet well established.

- Determine on a case-by-case basis whether decentralized services should be managed by local governments, community/producer organizations, or local governments in conjunction with producer/community organizations.

- Provide clear division of responsibilities between the different levels of government and other program participants.

- Develop procedures for policy formulation and priority setting in mixed systems to reconcile central government financing and policy objectives (poverty alleviation, food security, and environmental conservation) with local peoples' priorities that emerge from the decentralized program governance.

- Provide for needed fiscal transfers from central government to decentralized implementing agencies to finance decentralized extension services, recognizing that over the short term decentralization rarely reduces requirements for central government financing.

- Structure fiscal transfers to give users maximum influence over programs and to promote institutional pluralism in service provision. This empowers users and develops capacities in a range of public and private providers, such that the most competent institutions are able to provide the services.

- Provide for extensive planning, promotion of the rationale and principles behind reforms, and training in new operational procedures before launching decentralization reforms.

- Provide for needed investments in development of local capacity (local governments, executing agencies, community or producer groups), as such implementation capacity is critical to success of decentralization reforms.

- Establish effective systems to monitor and evaluate decentralized programs, and ensure that the data are available at all appropriate levels. Central monitoring should be sensitive to equity issues and the possibility of local elites capture of programs, thus excluding services to the poor or women.

Using of E-learning in agricultural education

Esmaeil Ghorbani

Darab Branch, Islamic Azad University, Darab, Iran
E-mail: leila11070@yahoo

Abstract: Distance education places students and their instructors in separate locations using some form of technology to communicate and interact. The student may be located in the classroom, home, office or learning center. The instructor may be located in a media classroom, studio, office or home. The student may receive information via satellite, microwave, or fiber optic cable, television (broadcast, cable or Instructional Television Fixed Services (ITFS), video cassette or disk, telephone - audio conferencing bridge or direct phone line, audio cassette, printed materials - text, study guide, or handout, computer - modem or floppy disk, and compressed video. Recent rapid development of technology has resulted in systems that are powerful, flexible, and increasingly affordable. The base of available information technology resources is increasing with dramatic speed. Much has been learned about connecting various forms of technology into systems, so that the ability to link systems is growing. Most distance learning systems are hybrids, combining several technologies, such as satellite, ITFS, microwave, cable, fiber optic, and computer connections. Interactivity is accomplished via telephone (one-way video and two-way audio), two-way video or graphics interactivity, two-way computer hookups, two-way audio. Interactivity may be delayed but interaction provided by teacher telephone office hours when students can call or through time with on-site facilitators. Classes with large numbers of students have a limited amount of interactivity. Much of the activity on computer networks is on a delayed basis as well. Possibilities for audio and visual interaction are increasingly wide.

Keywords: E-learning, distance education

Introduction:

With a view to clarifying this issue can be paid in the best way to create a platform for developing data standards and access to a knowledge based society, what really can be. To achieve a clear and practical answer in this area before all the existing definitions and indicators mentioned placed.

When the standardization and the requirements for training by the third millennium will be talking, unconscious form, design and construction to provide context and use tools and indicators to teaching the principles of community-based knowledge to the mind is centered. . No doubt these requirements and identify the correct tools and proper utilization of their functions according to accelerate the development expected in the knowledge-based information society will be effective. Such concerns and problems that any country in its development plans in motion to the information becoming a knowledge based society means a society would be faced with the centrality of knowledge, Dealing with existing tools and how these tools are used.

Led the way when dealing with those massive training programs available to speak to the technological tools that we expect to occur that planners and decision makers that planners and decision makers of large structures, especially

university education according to the image Access to the development of community information are available on these tools are selected and used.

Massive wave of data produced in today's world it nicknamed the "information age" has all day and through various means of communication in the world will move on its size are added. Other hand, as we're not the world witnessed the development of the role of information communication devices transporting feedback fast and absorb the information around the world, we forget

Educational methods in distance learning:

Today, under the new system replaced the traditional systems of learning and learning week (ie tutoring methods, lectures) are:

- **Multimedia courses:**

These courses and widely used elements of image, communication, graphics and simulated components, animation and communication elements for guidance and tips, and talk back on course and curriculum issues are held.

- **Enhanced communication mechanisms:**

The mechanism of any texts simultaneously, and asynchronous audio-visual communications to protect you. This case allows students to practice on topics learned will give.

- Written test:

thus, question and test via a distributed communication network, are corrected and returned. These exams through video conferencing support and runs.

-Virtual Seminar:

thereby different groups of students in different geographical environments linked together makes.

- Collaborative virtual laboratories:

the laboratory of the Group's activities are supported. Workshops such as software engineering.

-Smart academic factors:

academic factors that inform intelligent, support and guidance students pay.

Key factors in the process of distance education:

the process of remote training, the following factors contribute:

- Students:

Regardless of educational content, role and main element in the learning process students are responsible.

- Coaches and Teachers:

Success depends on a lot of educational activities the ability, skills and knowledge are the coaches and professors.

- Facilitators of communication:

Facilitator bases, as the bridge between students and mentors are. Must base expectations of teachers and educational needs of students and service coordination and communication to create.

- Support staff:

One of the important pillars of any development of distance education programs, by development group finds. Operational support staff such as student registration, copy and distribute their resources, order textbooks, security and copyright, and are responsible for the report.

- Management:

The group decision makers, builders and judges are considered to be educational and should be considered among the factors above, establish the correct relationship formation.

**Advantages of E-Learning: Benefits of E-Learning
What are the e-Learning advantages and what are the disadvantages?**

This is an important question to consider before making a final decision whether to enroll online learning or not.

It is known that Online Education with its e-learning software tools offers a new experience but does it work for everyone?

This experience may not be for everyone, professionally and personally, however it does have its strong point, advantages, and unique feature worth knowing.

This article reviews and discusses the best features it provides -

E-Learning Benefits – E-Learning Advantages:**1. Accessibility**

Online classes are very attractive to some people because of their unprecedented accessibility: virtual classes in any online institution can be accessed from anywhere on the planet. The internet also allows much greater time flexibility, though it does not mean an absolute absence of submission and exam dates. For many, online education means – being able to study an advanced degree during breaks at work or at night from home.

2. Geographic diversity – Ease of accessibility

Many universities are renowned for their diversity. But online institutions create unprecedented possibilities in this area. The e-learning technology they use enables accessing classes online – It is possible for any person on the planet to study in any online course (and online school/university) without the need to travel and reside abroad. For this reason diversity can be far greater than in any traditional university.

3. Classroom Size and Manageability

Traditional education cannot afford to have very large classes, especially in advanced degrees. Then e-learning means and tools answer this need – Online education allows a greater number of students to be accepted to their desired courses since managing students online is easier.

4. Self-Paced Studies

The internet allows an unprecedented degree of freedom in pacing and spacing one's studies. This is a great appeal to those who like a lot of freedom and have learning rhythms which do not align with traditional campus life.

5. Learning tools and means

e-Learning offers different learning experience – It is a new technology based on standard means and tools such as – videos, e-books, online interactive means and activities. One may even select instructional material and work their own way/level to their degree.

6. Asynchronous Communication

Another advantage of e-learning methods is the use of asynchronous communication. Asynchronous communication is a communication through such online technology as email and online message boards.

Communicating online is easier for those who cannot express themselves face to face. It also allows time to

think before responding, which you do not really have in a classroom discussion.

7. Biased Interactions

There tends to be less bias online, because the setting is less direct and intimate. For many, this is another great plus.

Conclusion:

In the earlier days of distance learning, it was most common to see distance learning used for rural students who were at a distance from an educational institution. The student might watch a telecourse on a television stations, read texts, mail in assignments and then travel to the local college to take an exam. This model is still in use, but as the technology has become more sophisticated and the cost of distance learning dropped as equipment prices dropped, the use of distance education has increased.

High front-end costs prevented an early widespread adoption of electronically mediated learning. Distance learning has been aggressively adopted in many areas because it can meet specific educational needs. As the concept of accountability became accepted and laws required certain courses in high school in order for students to be admitted to state colleges, telecommunications was examined as a way to provide student access to the required courses. Many rural school districts could not afford the special teachers to conduct required courses. Distance education met this need by providing courses in schools where teachers were not available or were too costly to provide for a few students. It also fulfilled a need for teacher training and staff development in locations where experts and resources were difficult to obtain. These systems link learner communities with each other and bring a wide array of experts and information to the classroom.

The key to success in distance learning is the teacher. If the teacher is good, the technology can become almost transparent. No technology can overcome poor teaching which is actually exacerbated in distance education applications. When skilled teachers are involved, enthusiasm, expertise, and creative use of the media can enrich students beyond the four walls of their classroom.

Teachers need training in the system's technical aspects and in the educational applications of the technology. Areas for assistance include the amount of time needed to prepare and teach courses, how to establish and maintain effective communication with students, strategies for adding visual components to audio courses, ways to increase interaction between students and faculty, planning and management of organizational details, and strategies for group cohesion and student motivation.

The interchange of ideas requires different communication methods than in conventional

classrooms: information technologies are predominantly visual media, rather than the textual and auditory environment of the conventional classroom, the affective content of mediated messages is muted compared to face-to-face interaction, and complex cognitive content can be conveyed more readily in electronic form because multiple representations of material (e.g., animations, text, verbal descriptions, and visual images) can be presented to give learners many ways of understanding the fundamental concept.

babaei1973@gmail.com

Abstract: This meta-analysis aims to assess the influence of social capital on the Human Development Index, Human Poverty Index, and Gender-related Development Index in Iran. The results reveal a positive and significant relationship between social capital and the human development index (HDI). The effect of social capital on the Human Poverty Index (HPI) was negative and significant. However, no significant relationship was found between social capital and the Gender-related Development Index (GDI).

[Hamidreza Babaei, Amir Hossein Zomorrodian, Sarjit S. Gill, Nobaya Ahmad, Leila Falahati. Social Capital and Human Development: A Meta-Analysis in Iran. Journal of American Science 2011;7(6):194-197]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Social Capital, Human Development Index, Human Poverty Index, Gender-related Development Index, Iran

1. Introduction

Poverty, education, and a healthy long life are among the most important issues facing human society, and social and economic development is the main solution that nations of the world have chosen to address such problems. New research has shown that social capital affects the process of development as well as the above-mentioned problems.

In recent decades, sociologists and economists have acknowledged that physical capital is not the only available and necessary kind of capital. Evidence indicates that human capital, natural capital, cultural capital and social capital also have an important role in human social life. Although social capital is recognized as a core concept of development, scholars have not given adequate attention to this concept in developing countries.

Moreover, previous research has shown that social capital is consistently and positively associated with many indicators of human development (Castiglione, Van Deth, & Wolleb, 2008; Häuberer, 2010; Norris, 2001, 2002). Social capital is fundamental to the concept of human development. Social capital involves economic development by facilitating transactions among individuals, households, and groups in developing countries (Bourdieu, 1983; Coleman, 1988; Fukuyama, 2001, 2002; Putnam, 1995; Woolcock, 1998; Woolcock & Narayan, 2000). Narayan and Pritchett (1997), and Grootaert (1999) have shown econometrically that the ownership of social capital has strong effects on improving household welfare and family economic status. Lisakka and Alanen (2006) and Nieminen (2008) identified the strong relationship between education and social capital. Alanen's research

(2006) findings revealed that an increase in trust and participation, which are two major elements of social capital, is associated with an increase in the level of education. Caplan and Choy (1992) established that people who participate in educational matters create and foster a social network, and, as a result, build social capital. In addition, many scholars have found a positive and statistically significant relationship between indicators of social capital and public health and life expectancy (Baum, 1999; Helliwell, 2006; Kawachi, Kennedy, Lochner, & Prothrow-Stith, 1997; Marmot, Wilkinson, & Ovid Technologies, 1999; Pearce & Davey Smith, 2003). Furthermore, according to Sabatini (2007), bonding and bridging social capital impede human development whereas linking social capital promotes human development.

Therefore, it can be concluded that social capital has a proven relationship with income, education and life expectancy. These three dimensions are used by UNDP to create indicators such as HDI, HPI and GDI for the assessment of human development in different countries.

2. HDI, HPI and GDI

HDI measures a country's average achievements in three basic aspects of human development: a long and healthy life, Knowledge (as measured by the adult literacy rate) and a decent standard of living (as measured by GDP per capita). The breakthrough for the HDI was the creation of a single statistic to serve as a frame of reference for both social and economic development (UNDP, 2010).

The Human Poverty Index (HPI) is an indication of the standard of living in a country, also

presented by the UNDP. The HPI uses indicators of the most basic dimensions of deprivation: a short life, lack of basic education and lack of access to public and private resources (UNDP, 2010).

The Gender-related Development Index measures achievement in the same basic capabilities as the HDI does, but takes note of inequality in achievement between women and men. It aims to show the inequalities between men and women in the following areas: long and healthy life, knowledge, and a decent standard of living (UNDP, 2010).

3. Social Capital

Social capital is 'the sum of the resources, actual or virtual, that accrue to an individual or group by virtue of possessing a durable network of more or less institutionalized relationships of mutual acquaintance and recognition' (Bourdieu, 1986). Social capital refers to connections among individuals, social networks and the norms of reciprocity and trustworthiness that arise from them. In that sense, social capital is closely related to what some have called civic virtue. Public and political participation, informal relationships, level of trust, public awareness, and rate of crime are the main indicators for the assessment of social capital (Putnam, 2000; Saadat, 2008).

4. Research Hypotheses

Based on the aforementioned, the hypotheses of the research are presented as follows:

H 1: There is a relationship between social capital and the Human Development Index in Iran.

H 2: There is a relationship between social capital and the Human Poverty Index in Iran.

H 3: There is a relationship between social capital and the Gender-related Development Index in Iran.

5. Methodology

This meta-analysis examines the effects of social capital on the three essential indicators, HDI, HPI and GDI, as presented by UNDP. We included four nationwide researches conducted in Iran: (a) level and distribution of social capital in Iran's provinces (Saadat, 2008), (b) ranking of Iran's provinces according to indicators of human development (Azar & Gholamrezayee, 2007), (c) reviewing status of Iran's provinces according to Human Development Index (Bakhtiari, Dehghani, & Majid, 2008), and (d) human development in Iran (Sadgi, Abdolahi Haghei, & abdolahzadeh, 2008). These researches provided detailed and accurate information concerning human development and social capital. We have provided a chart explaining the situation regarding the social capital and human

development indicators in each province of Iran. Then we employed SPSS software and tested the Pearson r Correlation Coefficient between variables to identify significant relationships.

6. Results

Table 1 shows that the highest rate of social capital (26.8948) was found in Golestan province, and the lowest rate of social capital was in Sistan province (12.4130). Sistan also has the lowest rate of Human Development Index (0.5820) and the highest rate of Human Poverty Index (0.3320). Tehran, in addition to the highest rate of Human Development Index (0.7780) and Gender-related Development Index (0.62), has the lowest rate of Human Poverty Index (0.0810). Zanzan Province, however, has the lowest rate of GDI (0.13).

Table 1: Distribution rate of social capital, HDI, HPI, and GDI in Provinces in Iran

Province	SC	HDI	HPI	GDI
Azarbaiejan Shargi	18.9643	.687	.206	.54
Azarbaiejan Gharbi	24.8260	.643	.220	.50

Esfahan	24.5156	.733	.128	.57
Ilam	14.8266	.708	.164	.54
Bushehr	20.6883	.720	.155	.44
Tehran	22.9292	.778	.081	.62
Charmahal Bakhtiari	23.7916	.681	.180	.50
Khorasan	25.5156	.684	.162	.54
Khuzestan	18.2747	.761	.143	.48
Zanzan	21.7227	.658	.197	.13
Semnan	13.1026	.740	.130	.50
Sistan-va-Balochestan	12.4130	.582	.332	.30
Fars	27.9292	.708	.137	.52
Qazvin	19.3091	.731	.142	.50
Qom	24.1364	.711	.141	.52
Kordestan	20.6883	.614	.242	.31
Kerman	21.7227	.713	.154	.54
Kermanshah	21.0331	.659	.186	.47
Kohgiluyeh Boyer Ahmad	13.0338	.676	.203	.45
Golestan	26.8948	.676	.162	.55
Gilan	24.4812	.709	.149	.60
Lorestan	18.2747	.676	.172	.46
Mazandaran	16.2058	.717	.143	.55
Markazi	23.1019	.734	.156	.48
Hormozgan	17.2403	.715	.200	.45
Hamadan	23.4468	.673	.172	.49
Yazd	26.8604	.740	.133	.56
Minimum	12.4130	.582	.081	.13
Maximum	27.9292	.778	.332	.62

Table 2 explains the distribution of social capital, HDI, HPI and GDI in three main categories. According to these results, 42.9 percent of provinces have high social capital, 32.1 percent are average and 25 percent have low social capital. Comparing the HDI makes it clear that 39.9 percent of provinces are

in the high rate of the index, 46.4 in the middle and 14.3 are in the low rate of the HDI index. Only 3.6 percent of provinces can be categorized as high rank when we assess HPI. More than half, 51.7 percent, of the provinces are in the low level of HPI and 39.3 are average. Finally, the results concerning GDI indicate that 78.6 percent of provinces are in the high GDI category. Table 2 also shows that 17.9 percent of provinces are average and only 3.6 percent are in the low category of the GDI indicator.

Table 2: Category Distribution rate of social capital, HDI, HPI, and GDI in Provinces in Iran

	SC		HDI		HPI		GDI	
	Fi	Pi	Fi	Pi	Fi	Pi	Fi	Pi
Low	7	25	4	14.3	16	57.1	1	3.6
Average	9	32.1	13	46.4	11	39.3	5	17.9
High	12	42.9	11	39.3	1	3.6	22	78.6

When we examined H1, as depicted in Table 3, we found a weak linear relationship between the social capital and Human Development Index ($r = .296$, $p \leq 0.05$). The positive correlation coefficient of 0.296 indicates that as the score of social capital increases, the rating for human development improves. Since the average score is 0.05 and $p \leq 0.05$, H1 is supported.

Table 3: Mean, Standard Deviation and Pearson Correlation between social capital, HDI, HPI, and GDI

	Descriptive Statistics		Correlation	
	Mean	Std.Deviation	Pearson Correlation	Sig. (1-tailed)
HDI	.69521	.04386	.296*	.038
HPI	.17189	.04679	-.619**	.000
GDI	.4868	.09918	.277	.077
SC	20.7535	4.46607		

Furthermore, Table 3 illustrates a strong relationship between social capital and the Human Poverty Index ($r = -.619$, $p \leq .01$). The negative correlation coefficient indicates that as social capital increases, the Human Poverty Index decreases sharply, and vice-versa. Since the average score is 0.01 and $p \leq 0.05$, the relationship is significant and H2 is supported.

Finally, based on the data presented in Table 3, there is no meaningful linear relationship between the social capital and Gender-related Development Index ($r = .277$, $p = .077$). Since the average score is 0.077 and $p > 0.05$, H3 is not supported.

7. Conclusion and Discussion

The results of this meta-analysis support the findings of other research concerning the positive and significant relationship between social capital and human development (Christoforou, 2010; Levitte, 2003; Deepa Narayan, 2002; Sabatini, 2007; Woolcock, 2002; Woolcock & Narayan, 2000), and the negative and significant relationship between social capital and human poverty (Bourdieu, 1983; Coleman, 1988; Fukuyama, 2001, 2002; Putnam, 1995; Sabatini, 2007; Woolcock, 1998; Woolcock & Narayan, 2000).

Furthermore, according to the Legatum Prosperity Index (2010), social capital in Iran is very weak (Iran ranked 106 among 110 countries), which could be the reason for the weakness of the relationship between social capital and the Human Development Index and the reason for the Failure of H3. Tajbakhsh (2005), Saadat (2008), and Alaghband (2006) indicated that the decline of social capital in recent years is the main obstacle for the human development process in Iran.

Another important fact uncovered by the result of this research is the severe inequality among the different provinces in Iran. Table 1 shows that Tehran, which is the capital of Iran, has the greatest proportion of human development and social capital and least poverty. However, a border province like Sistan faces a lack of proper human development, is challenged by poverty, and has very low social capital. It seems important for the Iranian government to stop focusing on Tehran and various other central provinces and consider the more distant and poorer areas of the country.

The Influence of Life Skills with respect to Self-Help Approach on Relapse Prevention in Iranian Adolescents Opiate Addicts

Samira Golestan^{1*}, Hajar Namayandeh¹, Ali Anjomshoa¹

¹Islamic Azad University, Kerman Branch, Iran,
Email Address: Samira.Golestan@yahoo.com H/P: 00989133436185

Abstract: This study explores the importance of three elements of life skills, i.e. problem solving, critical thinking and ability to abstinence, on drug use and its effects on the prevention of relapse among male adolescent opiate users in Kerman, Iran. Life skills are one of the important factors that affect the recovery of addicts and presuppose relapse among adolescents. The lack of life skills is an operative factor to relapse among adolescents. The development of life skill was recognized as a factor that could help the adolescents in their efforts to avoid relapse. Iran is in the process of developing options concerning drug abuse treatment for opiate and other drug dependent patients while nearly 60% of its population is under the age of 25 (Farjad, 2000). Scholars emphasize the critical role of life skills to prevent relapse in adolescents and highlight the lack of life skill as a factor leading to relapse among adolescents (Barr & Parrett, 2001; Gorski, 2001; Gouws, Kruger, & Burger, 2000; Mc Whirter, 2004; Van Niekerk & Prins, 2001). Focusing on this issue, this research explores a new examination area and finally reinforces the result of the previous relevant studies in its own contribution. In this research 226 adolescents between the ages of 13 to 20 in ten rehabilitation centers were selected to answer the self-administered questionnaire. Benefiting from Pearson Correlation analyses, the findings represent a significant moderate negative relationship between life skills and relapse ($r = -0.453$, $p < 0.01$), i.e. the lack of life skills significantly raises the risk of relapse among adolescents. The study proposes some suggestions in order to prevent relapse after treatment in adolescents.

Keywords: Life skills, Opiate Addiction, Adolescents, Recovery Process, Relapse Prevention

1. Introduction

Nowadays, addiction as the most vicious phenomenon of the present century threatens life, economy and families and societies (Youth at the United Nations, 2006). In fact, drug addiction is a big social and personal problem which influences not only the mind and body of the addict but also the health of a society concerning social, economical, political and cultural issues (Farjad, 2000).

These days adolescent drug use is a problem all over the world (Mental Health Touches, 2006). The percentage of addiction among adolescents is increasing recently, that is drug using mostly starts during the second decade of one's life.

Iran is also no exception. Substances used among adolescents is widespread in Iranian communities, schools and families (Azizi, 2004). According to Azizi (2004), drug use among Iranian adolescents is increasing, and is related to a multitude of problems. In Iran, male adolescents are more at risk of drug use than female adolescents because females are more powerfully monitored by their parents (Ghahramanloo, 2000; Mohamadi, 2006). However, when this monitoring is weak, the probability that they will

become involved with deviant peers, and also their involvement with drugs rises (Ziaaddini, 2005).

Previous studies have shown that among male adolescent pupils aged 12 to 20, 51.5% had tried alcohol and 33.7% had tried opiate drug (Chen, Dormitzer, & Gutierrez, 2004; Wendy & Lenn, 2007). Male adolescents may be disturbed to a greater degree than female adolescents from their surrounding environment, resulting in adjustment problems such as use of drugs (Nagpal, 2009).

As drug abuse in adolescent is increasing, the demand for treatment of drug addicted adolescents is also increasing. In spite of the attempts during the recovery processes, almost 2/3 of opiate addicts return to drug in just less than one year (Kaplan, 1997). According to statistics 78 percent of adolescents relapsed after they stopped using drugs after six months (Gorski, 2001).

Drug addiction is a persistent relapsing disorder (O'Brien & McLellan, 1996; Yahyavi & Ronald, 2009). Due to the variety of consumed including alcohol, nicotine (tobacco), heroin and opium, relapse -as a complicated phenomenon- has become a common widespread issue (Hunt, Bamett, & Branch, 1971; Marlatt & Gordon, 1985). Such high relapse percentages among opiate addicts have also been

reported in Iran (Mohamadi, 2006; Momtazi, 2010; Saeed, 2000). Research has proved successful results of many different treatments; however, high relapse rates are still typical across all classes of drug abuse (Hunt et al., 1971; Marlatt & Gordon, 1985). Usually the recovery processes are not inclusive enough and confine themselves to mere physical attendance for the purpose of detoxification, neglecting the important factors such as life skills, social, cultural, economic, environmental and family factors. Since after detoxification the addicts return to their family and society, we cannot expect a perfect quit without considering these factors carefully (Ghorbanhosseini, 1990).

Life skill is one of the important factors that effects on addicts in recovery and presupposes relapse among adolescents. The lack of life skills is an effective factor to relapse among adolescents. Life skills have been defined by World Health Organization (1994) as “abilities for adaptive and positive behavior that enable individuals to deal effectively with the demands and challenges of everyday life”.

The literature emphasized on the importance of life skills as an important source in supporting addicted adolescents during recovery. Dodgen & Shea (2000) by regarding social learning theory suggested that life skills will maintain relapse prevention and a sober life. According to Westhuizen (2007) those addicts who do not have life skills to start a new life during their recovery, will return to drug again after treatment.

In a study on adolescents relapse prevention, Gorski (2001) argued that the focus only on the addiction without any attend to development of life skills can lead to relapse, and life skills cause the strength of addicted adolescents in recovery. Van Niekerk & Prins (2001) are holding the opinion that the development of life skills leads to empowerment on individuals and community levels. Furthermore, the literature recognized the following life skills as important factors to prevention relapse: stress management, problem-solving skills, decision-making skills, critical thinking, assertiveness training, communications skills, self-care, abilities to abstinence (Barr & Parrett, 2001; Fisher & Harrison, 2005; Gouws *et al.*, 2000; Velasquez *et al.*, 2001).

In Westhuizen's study (2007) time management and critical thinking are recognized as a life skill that has a very important role in relapse prevention of adolescents during recovery. According to him, an addict who is not equipped with life skills to start a new life when they are in recovery will return to using drugs after treatment. Based on social learning theory, Dodgen & Shea (2000) stated that life skills, inclusively: anger management, refusal skills, problem-solving and

relaxation will assist an addicted person to prevent a relapse and to conform to a sober life. Mc Whirter *et al.* (2004) warned that adolescents in recovery are located at risk before acquiring the necessary life skills.

The need for further research in this field and a more profound understanding of the drug abuse adolescents who have relapsed after treatment still exists. Thus, this study highlights the significance of the three elements of life skills, namely problem solving, critical thinking and ability to abstinence in preventing relapse among male adolescents in Kerman.

1. Methodology

This study is quantitative correlational and intends to investigate and find out the pattern of relationships between variables. For this, the data was collected from 226 opiate addicted male adolescents in Kerman, aged 13 to 20, who had referred to rehabilitation centers, and had at least once relapse. In order to select the respondents the random number generator software available at <http://www.random.org> was employed.

The method of data collection was self-administered questionnaires. It took about 20 minutes to complete each questionnaire. Demographic information was collected using a questionnaire of demographic data. Table 1 had showed the frequencies and percentages on respondents' background characteristics such as age, education level, and occupation status.

The second part included questions about key study variables (life skills).

The Myers and Brown scale contains 28 items: the first 12-items rated on seven point scale ranging from (1= Definitely would not do and think to 7= Definitely would do and think) and measured the ability of problem solving. After that there were 7-items to measure critical thinking and rated on seven point scales ranging from (1= Definitely would not do and think to 7= Definitely would do and think). Next, abstinence was focused on with 9 items rated on seven point Likert scale ranging from (1= Definitely would not do and think to 7= Definitely would do and think). The reliability of the scale in the previous research by Myers & Brown (1996) shows a correlation of 0.78. Reliability assessment of the life skill scale in the present study yielded an alpha coefficient of 0.81.

For data analysis, the two statistical procedures of descriptive and inferential statistics were used. The inferential statistics utilized in this study were Pearson Correlation Analyses. The Pearson Product-moment Correlation Coefficient was used to determine the magnitude or strength and direction of relationships between the independent variables (life skills: problem solving, critical thinking and ability to abstinence) and the dependent variable (relapse).

Table 1. Frequencies and Percentages of Respondents' Demographic Background

Characteristics	Number (n=226)	Percentage (%)
Age (n=226)		
13-14 years	20	8.8
15-16	39	17.3
17-18	83	36.8
19- 20 (Mean=17.5)	84	37.2
Level of Education		
Elementary	28	12.4
Secondary school	79	35
Associated degree	82	36.3
Bachelor	37	16.4
Occupation Status		
Unemployed	138	61.1
Employed	88	38.9
Parental Marital Status		
Live together	133	58.8
Divorced	51	22.6
Widow	18	8
Widower	24	10.6
Relapse		
Once	77	34.1
Twice	68	30.1
Third	29	12.8
More than three times	52	23
Income (Dollars)		
< 75000	164	72.7
> 75000	62	27.3

2. Results and Discussion

As table 1 indicates, the age of the adolescents ranged from 13 to 20 years old. Their mean age was 17.5. The Majority of the respondents (37.2%) belonged to the age group of 19 to 20. In term of education, the largest part of the samples in this study had an associated degree that comprised 36.3% of the whole subjects. Also regarding occupation, 61.1% of the adolescents were unemployed and 38.9% employed. Table 1 also illustrates that the largest part of the samples in this study (58.8%) were adolescents whose parents live together. 72.7% of the respondents' monthly income or spending money was between (0-75,000 Dollars). Based on the classification of income in Iran, this means that most of the respondents were in the low-income group.

Pearson correlations between life skills and relapse shows that relapse is correlated with life skills (problem solving, critical thinking and ability to abstinence). Taking the data analysis into account, it is specified that Pearson Correlations between life skills and relapse of respondents is -0.453 in rank order and with p-value is 0.000 in rank order which is less than = 0.01 significance value. Table 2 confirms a significant negative correlation between life skills (problem solving, critical thinking and ability to

abstinence) and relapse ($r = -0.453, p < 0.01$). A negative relationship in the correlation indicates a decrease in the independent variables in spite of an increase in the independent variables. In other words, whenever a person is not well-trained with life skills, he would most probably find himself in relapse situation again.

Table 2. Pearson Correlation Tests between Life Skills and Relapse

		Relapse	Life skills
Relapse	Pearson Correlation	1	-0.453*
	Sig. (2-tailed)		0.000
	N	226	226
Life Skills	Pearson Correlation	-0.453*	1
	Sig. (2-tailed)	0.000	
	N	226	226

*Correlation is significant at the 0.01 level.

In this study life skills were identified as efficient factors of relapse in addicted adolescents. Based on the results of the present research in Kerman, the adolescents are not equipped with life skills and need

to be trained while being treatment. In addition, life skills training in schools and the status of family education have not been mentioned as part of the relapse prevention in Kerman which in turn caused 90% of addicts to have relapse after detoxification. In Iran the recovery processes are not usually completed and are basically restricted to the physical dimensions of detoxification; i.e. life skill training is ignored. The development of life skills was recognized as a factor that could help the adolescents in their efforts to avoid relapse.

Iran is in the process of developing and growing drug abuse treatment options for opiate and other drug dependent patients. Self-help approach is one of the essential approaches in community development. This approach is based on the belief that people can, will and should work together to solve community problems (Littrell & Hobbs, 1989). Self-help approach is becoming more significant as a planning style to solve the community problems and self-help is a community building approach and also it is a style of planning, decision making, and problem solving (Christenson & Robinson, 1980; Littrell & Hobbs, 1989).

Self-help approach a serious emphasize on education about the problem and its sources (vague! No verb). Self-help can exist as an institute, place or an interest group (Littrell & Hobbs, 1989). The person is vulnerable but can improve huge strength in self-help groups (Kindernothilfe, 2002). Berger & Neuhaus (1977) proposed empowerment as a way of improving individuals by means of mediating social institutions.

Self-help has become an integral part of treatment for emotional issues, behavior problems, drug use, relapse and also dealing with stressful situations. Many people find that self-help and support groups are an invaluable resource for empowerment and recovery (Focus adolescent service, 2008). Self-help support groups bring together people with common experiences. Participants share experiences, provide understanding and support and help each other find new ways to cope with problems (Younus, 2005). Most drug addiction treatment programs encourage patients to participate in a self-help group during and after formal treatment and also encourage parents who have adolescents with behavior problems like relapse to attend a parenting group for support and guidance (Kindernothilfe, 2002). Self-help groups play a necessary role for the family members to know the addiction. Self-help groups are effective in supporting the family, and addressing the feelings related to the addiction and the involvement of families in aftercare efforts as necessary to prevent relapses (Goodwin, 2000; Van Der Westhuizen, 2007). A support group can also supply emotional support, practical coping skills and strategies, and empower

individual towards personal growth, positive changes, and healing (Focus adolescent service, 2008). Brandt and Delpont (2005) indicated that the self-help groups provide addicted adolescents with role models to help them in forming new beliefs regarding drug abuse and also Focus Adolescent Services (2006) declare that self-help groups learn them to function in the community and to assist them to form healthy relationships. The strength of using the self-help approach in this study lies in its potential to focus on the influence and interaction of self-help group on relapse prevention in male adolescent. Self-help groups can be engaged powerfully in the context of aftercare services supplied in the route of relapse prevention. Self-help approach was included here to explain relapse prevention through self-help group after treatment.

3. Conclusion and Implication

This study explored the influence of life skills on relapse prevention in male adolescents opiate users who relapsed after treatment. The findings were supported by relevant literature and were also consistent with the literature of previous research. The general conclusion was that there are several factors that may lead to relapse. Lack of life skills, i.e. problem solving, critical thinking and ability to abstinence, is significantly related to relapse in addicted adolescents. Based on the results, the researcher suggests, the following methods to decrease relapse in Kerman.

The adolescents need self-help group in order to support them to avoid relapse. The opiate addicted adolescents should be assisted in dealing with high-risk situations. Also they should develop assertiveness to deal with peer pressure and learn how to get in to the right friendship. In addition, self-help groups play an essential role for the family members to understand the addiction. They should be empowered in the recovery process and get more involved in the treatment. Parents should be capable to support their adolescents and receive information on high-risk situations.

Abstract: Background: There are evidences that low level laser therapy (LLLT) stimulates wound healing. Objective: The study aimed at investigating the exact vascular mechanisms through which infrared (IR) laser acts to promote wound healing. Participants: Thirty normal female volunteers were selected from the female section, Faculty of Applied Medical Sciences, King Abdul-Aziz University. They were randomly divided into three equal study groups (G1, G2, and G3). Methods: Five ml. of whole blood were collected in a plane tube from all volunteers for the analysis of lipid profile including cholesterol (Chol); triglyceride (TGL); low density lipoprotein (LDL) and high density lipoprotein (HDL). Other five ml of blood were collected for the performance of glycated hemoglobin (HbA1c), hemoglobin (Hgb) and red blood cells (RBCs) count before and immediately after receiving continuous IR laser (810 nm, 100 mW). The irradiation doses were 12 J/cm² for 120 sec, 6 J/cm² for 60 sec and 1.4 J/cm² for 14 sec in groups one, two, and three respectively. Results: There was a significant increase in Chol, TGL, HbA1c%, Hgb concentration and RBCs count after irradiation. On the other hand, there was no significant difference in LDL or HDL concentration in the three groups. Conclusion: Infrared laser was effective in increasing the levels of different blood components that are important for wound healing processes with the best results obtained from laser dosage of 12 J/cm².

Keywords: Vascular alterations, Wound healing, Infrared laser.

1. Introduction:

Large number of neurological disorders may be complicated with the development of ulcers and bed sores such as spinal cord injuries and diabetic polyneuropathy due to autonomic and/or sensory disturbance. Those ulcers need different kinds of treatment including medical, physical therapy, and nursing care. Recently, there has been an increase in the clinical application of LLLT in various therapeutic fields. One of the most important functional aspects of laser therapy is photobiostimulatory effects on various biological systems especially microcirculation [1]. Varicose ulcers and bedsores are appropriate indications for laser therapy combination with conventional therapies [2]. It was found that LLLT was effective in open wounds, which showed better regeneration and faster restoration of structural and functional integrity [3]. In one survey, LLL was ranked as more effective in promoting wound healing than other electrophysiological agents such as particular types of electrical stimulation and ultrasound [4].

Hopkins et al. [5] investigated the effects of LLL on wound healing. They applied laser (8 J/cm², 700 Hz) on an induced abrasion on the anterior surface of the forearm in twenty-two healthy subjects. Follow-up photograph testing revealed smaller wounds in the laser group than in the sham one. They also found that

other abrasion in the forearm of the study group was contracted more than that of the control group without direct laser application denoting that LLL produced an indirect systemic healing effect on surrounding tissues.

Other study also confirmed the positive efficacy of LLL in enhancing wound healing. Schubert [6] evaluated the effects of IR and red pulsed monochromatic light, with varied pulsations and wavelengths, on the healing of pressure ulcers in a prospective, randomized, controlled study. He concluded that pulsed monochromatic light increased healing rate and shortened healing time.

The use of radiations of all kinds to accelerate wound healing has a long history but radiations in the red part of the visible spectrum have been particularly employed and found to be effective. Despite of those promising effects, little is known about the exact mechanisms through which LLLT promotes healing.

Aim of the study:

The aim of the research was to investigate the possible vascular mechanisms through which IR laser accelerates wound healing. In addition, the study aimed to examine the effects of three different IR laser dosages on different blood components.

2. Materials and Methods

Enrollment of Subjects

Prior to inclusion, a complete medical history was taken. Intended enrollment comprised of 30 healthy female subjects who were selected from faculty of applied medical sciences at King Abdul-Aziz University, their age ranged from 18–24 years (mean=22 ± 0.1). For the initial evaluation, each subject was examined medically by a physician at King Abdul-Aziz University out patient clinics. Subjects were excluded in cases of psychological history or stresses, pregnancy, use of drugs, like corticosteroids, during menstruation period, bleeding or vascular disorders and liver or renal disease. Subjects were randomly divided into three equal groups (G1, G2 and G3). Procedures used in this study were approved by the Ethics Committee of the faculty of applied medical sciences at King Abdul-Aziz University, Saudi Arabia. Written informed consent was obtained from subjects prior to the start of the study.

Analytical Methods

Blood Sampling and Laboratory Methods

Blood samples (10 ml) were collected, before and immediately after laser irradiation, from antecubital veins with a 20G butterfly without use of tourniquet; hemolysed and lipemic samples were excluded. Samples were centrifuged at 3500 rpm for 5 minutes, to separate the plasma. All samples stored after centrifugation at -70°C until time of processing. These samples were collected in two different vacutainer tubes. One tube was used for measuring lipid profile (Total Chol, TGL, LDL and HDL). The second tube contains EDTAK₂ and EDTAK₃ for measuring complete blood count and glycated hemoglobin (HbA1c).

Blood Count

Blood count was measured in Beckman Coulter AC-T (Beckman Coulter, Fullerton, CA, USA) at king Abdul-Aziz University Hospital. Blood count provided red blood cells count (RBC) and Hemoglobin (Hgb) concentration.

Glycated hemoglobin (HbA1c)

Quantitative determination of HbA1c% was measured by using COBAS INTEGRA 400 system, Roche, German. The total Hgb concentration was measured calorimetrically. Glycated hemoglobin was determined immuno-turbidimetrically. The ratio of both concentrations yields the final HbA1c%.

Biochemical analysis

Biochemical parameters included serum for total Chol, TGL, LDL, and HDL. All were measured at the same time when the medical pre-check up was

performed. All of the biochemical assessments were performed using a fully automated analyzer using the principle of Electro-chemiluminescence's immunoassay (Modular Analytics E170, Roche, German) at king Abdul-Aziz University Hospital.

Laser

Sys*Stim, ME-540, USA was used, with Aluminium-Galium Arsenide (AlGaAs) diode and wavelength of 810 nm. The beam delivery system is hand held probe, continuous/ pulsed, the output power is 100 mW, and the dose ranges from 0.01 to 99.99 Joules.

Laser Application

Each Subject was asked to sit on a chair with back support and a table of suitable height was beside her to support the forearm in supination position. The area of application was determined, two cm proximal to the palmer crease of the wrist joint in the midline. The area was cleaned well with alcohol swab. The three groups were exposed to IR laser as follow: G1 received 12 J/cm² for 120 seconds [7], G2 received 6 J/cm² for 60 seconds [8], and G3 received 1.44 J/cm² for 14 seconds [9]. For safety measure, both the subject and the researcher wore goggles for eye protection.

Statistical Analysis

Data was presented as the mean and standard deviation. Paired t-test was used to analyze the data within each group and one way Anova test was used to analyze the data between the three groups. The p-value was <0.05.

3. Results

Lipid Profile Cholesterol

The results revealed no significant difference regarding chol. mean values between groups, neither pre nor post irradiation (5.2±0.9, 4.7±0.9 and 4.7±0.75 mg/dL, respectively) ($p= 0.888$ and 0.331 , respectively). On the contrary, there was a significant increase in chol. mean values after laser application compared to that before in the three groups ($p_1 = 0.0001$, $p_2 = 0.017$ and $p_3 = 0.001$) (Table: 1).

Table (1): Comparison of groups 1, 2 and 3 regarding cholesterol mean values before and after laser irradiation.

Cholesterol (mg/dL)	G 1 (Mean ± SD)	G 2 (Mean ± SD)	G 3 (Mean ± SD)	<i>p</i>
Pre	4.3 ± 0.8	4.5 ± 0.9	4.4 ± 0.76	0.888
Post	5.2 ± 0.9	4.7 ± 0.9	4.7 ± 0.75	0.331
<i>p</i>	0.0001	0.017	0.001	

Triglyceride

There was a significant difference in TGL mean values between the three groups after irradiation compared to that before ($p=0.115$ and 0.0001 , respectively). Also, the results revealed a significant difference after laser application compared to that before in the first two groups ($p_1=0.001$, $p_2=0.048$) and non significant difference in the third one ($p_3=0.875$) (Table: 2).

Table (2): Comparison of groups 1, 2 and 3 regarding concentration of TGL mean values before and after laser irradiation.

TGL (mg/dL)	G 1 (Mean±SD)	G 2 (Mean±SD)	G 3 (Mean±SD)	<i>p</i>
Pre	0.87 ± 0.3	0.74 ± 0.27	1.01 ± 0.3	0.115
Post	1.3 ± 0.5	0.91 ± 0.4	0.98 ± 0.5	0.0001
<i>P</i>	0.001	0.048	0.875	

High density lipoprotein

The results revealed no significant difference regarding HDL mean values between groups before and after irradiation ($p=0.834$ and 0.558 , respectively). Also, the results showed no significant difference after laser irradiation compared to that before in the three groups ($p_1=0.269$, $p_2=0.119$ and $p_3=0.666$) (Table: 3).

Table (3): Comparison of groups 1, 2 and 3 regarding concentration of HDL mean values before and after laser irradiation.

HDL (mmol/L)	G 1 (Mean±SD)	G 2 (Mean±SD)	G 3 (Mean±SD)	<i>p</i>
Pre	1.8 ± 0.2	1.8 ± 0.4	1.7 ± 0.5	0.834
Post	1.92 ± 0.5	1.97 ± 0.3	1.8 ± 0.6	0.558
<i>p</i>	0.269	0.199	0.666	

Low density lipoprotein

Also, There is no significant difference regarding LDL mean values between groups before and after irradiation ($p=0.907$ and 0.754 , respectively). The results revealed no significant difference after laser application compared to that before in the three groups ($p_1=0.116$, $p_2=0.143$, $p_3=0.914$ respectively) (Table: 4).

Table (4): Comparison of groups 1, 2 and 3 regarding concentration of LDL mean values before and after laser irradiation.

LDL (mmol/L)	G 1 (Mean ±SD)	G 2 (Mean±SD)	G 3 (Mean±SD)	<i>P</i>
Pre	2.7 ± 1.1	2.9 ± 0.7	2.7 ± 0.9	0.907
Post	2.96 ± 0.7	2.7 ± 0.8	2.7 ± 1.1	0.754
<i>p</i>	0.116	0.143	0.914	

Red Blood Cells

There was no significant difference regarding RBCs mean values between groups before and after

irradiation ($p=0.454$ and 0.153 , respectively). But there was a significant increase after laser application compared to that before in the first two groups ($p_1=0.0001$, $p_2=0.001$) and non significant difference in the third one ($p_3=0.126$) (Fig: 1).

Fig (1): Mean values of RBCs count in the study groups before and after laser irradiation.

Hemoglobin

There was a significant difference regarding the Hgb concentration mean values among the three groups after laser irradiation compared to that before ($p=0.737$ and 0.038 , respectively). Also, there was a significant increase after laser application compared to that before within G2 and G3 ($p_2=0.0001$ and $p_3=0.0001$) while non-significant difference was found in G1 ($p_1=0.07$) (Fig 2).

Fig (2): Mean values of Hgb concentration in the study groups before and after laser irradiation.

Glycated Hemoglobin

Significant difference in HbA1c% mean values was shown in the three groups after irradiation compared to that before irradiation ($p=0.234$ and 0.004 , respectively). Also, high significant increase was revealed after laser application compared to that before

in the three groups ($p_1=0.001$, $p_2=0.0001$ and $p_3=.0001$) (Fig: 3).

Fig (3): Mean values of HbA1c% in the study groups before and after laser irradiation.

4. Discussion

The current study aimed at investigating the vascular changes that may occur in different blood components in response to IR laser in normal subjects. It was also concerned with comparing the changes that result from exposure to three different laser doses.

The results revealed variable findings in the different measured blood components in the three groups. Some essential components for healing process showed significant increase after laser irradiation, especially in the first two groups, while others did not.

In accordance with the findings of the present work, Adltya *et al.* [10] studied the efficacy of low energy photon therapy (LEPT) in the treatment of venous leg ulcers in nine patients with 12 venous ulcers. Treatment was given three times a week for ten weeks using two different sources. One source provided a wavelength of 660 nm (red), while the second source delivered a wavelength of 880 nm (infrared). They concluded that LEPT of both sources was an effective modality for the treatment of venous leg ulcers.

Moreover, the findings of the current research are supported by those of kujawa *et al.* [7]. Their study aimed at investigating the effect of laser radiation on the structure of protein and lipid components of RBCs membranes and its functional properties. Human RBCs were irradiated with LLLT at different radiant exposures ($3.75 - 25 \text{ J/cm}^2$) and laser powers of 10 mW. An increase of the ATPase activity was found with maximal effect at $12-15 \text{ J/cm}^2$ of light dose. On the contrary, the same research procedures were carried out with laser power of 400 mW and inhibition of ATPases activities occurred.

In addition, the positive findings of the current work came in accordance with those of Verdote *et al.* [11]. They studied the LLLT effect for the treatment of open wounds in psycho-geriatric patients. In total, 84 psychiatric patients with 188 open wounds were referred for the treatment of open wounds of varying severity and etiology. Traditional wound care management was used in addition to laser therapy. About 84% of these wounds completely healed.

On the other hand, Lucas *et al.* [12] found no evidence that justifies using LLLT as an adjuvant to the decubitus ulcer treatment. Their negative findings may be attributed to laser parameters they applied. Parameters were infrared laser, 904 nm; total peak power was $12 \times 70 \text{ W}$ in an 830 Hz pulse frequency mode of 150 nsec pulses with an average beam power of $12 \times 8 \text{ mW}$ and a radiant exposure of 1 J/cm^2 , which required an exposure time of 125 sec.

The positive outcomes of the present research suggest that, in case of open wound, healing occurs due to photochemical changes in blood components as a result of IR laser irradiation. Photochemical reactions included increase in hemoglobin, RBCs and lipid levels in blood leading to an increase in blood flow and membrane stability. Hence, there will be increase in the ATP activity, oxygen and nutrition delivery to body tissues that enhances healing process. Such changes were also reported by Siposan and Lukacs [13] who found significant differences between control and irradiated blood samples for RBCs; Hgb; and viscosity. In addition, they found increase in plasma proteins including albumin; alpha one globulin and gamma globulin and fibrinogen.

Other study was carried out by Schindl *et al.* [14] who selected thirty patients with diabetic ulcers or gangrenes. They received either a single LLL irradiation with an energy density of 30 J/cm^2 or a sham irradiation over both forefoot regions. Skin blood circulation, as indicated by temperature recordings over the forefoot region, was detected by IR thermograph. Data from this first clinical trial demonstrated an increase in skin microcirculation due to athermic laser irradiation in patients with diabetic microangiopathy.

Furthermore, LLLT improves blood microcirculation by soothing blood vessels, which is biologically beneficial. It has been found that LLLT increases the delivery of oxygen and nutrients in the blood cell to the body's soft tissue areas [15]. Photons are picked up by the cell membrane and result in improved membrane stability and increased activity of the ATP dependent Na/K pump. Moreover, light therapy increases blood flow much better, resulting in improved systemic blood circulation thus increasing RBCs which stimulate the release of ATP [16].

Additionally, Wounds require adequate oxygen delivery to heal [17] and hemoglobin, in the blood, is

what transports oxygen from the lungs to the rest of the body tissues where it releases the oxygen for cell use. Also, Hemoglobin in the RBCs carries some of the waste product carbon dioxide back from the tissues to the pulmonary capillaries of the lungs [18]. Therefore, the significant increase in hemoglobin level and RBCs, whose cytoplasm is rich in hemoglobin, shown in the current study may be other possible mechanisms that contribute to healing process. In accordance, Vladimirov *et al.* [19] found that nitrosyl complexes of heme proteins, such as hemoglobin and cytochrome c, are the primary chromophores of laser radiation. Upon irradiation, they can easily dissociate to produce free nitric oxide which may be responsible for blood vessel relaxation and activation of mitochondrial respiration. Glycated hemoglobin has a nutritional role as well; it is a form of hemoglobin used primarily to identify the average plasma glucose concentration over prolonged periods of time.

The findings also showed significant increase in TGL, which is a type of lipid that circulates in the blood stream, in the first two groups. Certain vitamins such as vitamin A, D, E, and K are fat-soluble and depend totally on the presence of TGL for absorption. Therefore, TGL helps in ensuring adequate nutrition that is highly useful for wound healing [11].

Other mechanism of accelerating healing was also suggested by P^ontinen [15] which is the removal of accumulated toxins by LLLT through improving lymph circulation. The buildup of toxins in a health body could block the normal blood circulation and impair cellular energy. When IR waves are applied, water molecules that encapsulate the toxins get heat up, and start to vibrate. This vibration reduces the ion bonds of the atoms that are holding together the molecules of water. As the breakdown of the water molecules occurs, encapsulated gases and other toxic materials are released and the body gets rejuvenated.

The findings also revealed significant increase in blood cholesterol level upon irradiation in the three study groups. So, IR laser should be used cautiously with patients who are at risk of hypercholesterolemia. Finally, further studies are recommended with wounds or pressure ulcers monitoring both the immediate and long term effects of IR laser on different blood components and its correlation with the rate of wound closure.

5. Conclusion:

Infrared laser was effective in increasing the levels of different blood components that are important for wound healing processes with the best results obtained from laser dosage of 12 J/cm².

Contraceptive use dynamics and effect of counseling on use- continuation of contraception in Assiut Governorate, Upper Egypt

Etemad A.A. El- shereef¹, Gamal H. S.², Abo Bakr A. M.², and Ahmed M.A.²

Public health & community Medicine Department¹ and Obstetrics & Gynecology Department². Faculty of Medicine, Assiut University. etemadshereef@yahoo.com

Abstract: Background: Egypt's family planning programs have followed a similarly unsteady course. Debated by Egyptian social scientists since the 1930s, Egypt's high population growth became widely viewed as an acute problem in the 1960s, when the government acknowledged the serious economic and social problems associated with it. **Objectives:** analyzing the factors associated with contraceptive methods discontinuation among women aged 15- 49 years in study area and contraceptive use dynamics. We also examined the effect of counseling on percent of continuation. **Study design:** A cross sectional survey was carried out among the eligible women. **Study setting:** The study areas included Assiut Governorate family planning units in different places providing contraceptive methods. **Study population:** One thousand and ten women in reproductive age from 15-49 who used contraceptive methods once or more, has one child or more were included. **Study tools:** An interview questionnaire were constructed including data about used contraceptive methods, discontinuation and its causes, failure and its fate. We asked about ten steps of counseling. Data entry –after revising and editing -was done via Excel software while data analysis was carried out via SPSS program version 11. **Results:** the most commonly used modern method was IUD (43.0%). The results revealed that (69.7%) of methods had been stopped within 2 years of starting for various reasons. The percent of discontinuation decreased significantly with increasing age. Discontinuation was the lowest when there were four or more living children and increased significantly by decreasing number of living children. It decreased significantly with increasing the number of sons. As regards infant deaths, discontinuation was insignificant among those who did not experience infant deaths, and presence of one and two deaths respectively. University graduated women showed least discontinuation level. As regards causes of discontinuations, side effects and health concerns was the most common reason of discontinuation. Most of method failure as expressed by pregnancy ended in live births. The results indicated that a higher score on counseling was significantly associated with continuation. **Conclusion:** Counseling should emphasize the possibility of side effects, stressing the fact that most will be transient, and the need to identify a backup method. Follow-up visits should be scheduled for 1 to 2 months after a prescription is written.

1. Introduction

Strengthening of reproductive health and family planning services in developing countries is repeatedly highlighted as a priority for reducing maternal mortality and improving maternal and child health. Effective implementation of appropriate services requires an understanding of the factors affecting reproductive outcomes among women at risk and their patterns of behavior⁽¹⁾.

Improvement in the quality of contraceptive use is an important goal of Egypt's family planning program. Information on the level of current use of contraception is important for understanding the key determinants of fertility and for measuring the success of the national family planning program⁽²⁾.

Contraceptive use in Egypt doubled from 24% in 1980 to 48% in 1995. The change was rapid in 1980, but virtually no change occurred in the use rate

during 1991-1995. The shift toward more effective methods which was evident in the 1980 continued during the first half of 1990. Although at slower pace in Assiut, 12.7% of married women use family planning method in 1988, 28.2% in 1992, 32.9% in 2000⁽³⁾.

In spite of unmet need for family planning remains a useful tool for identifying and targeting women at high risk of unintended pregnancy and used as a standard measure for evaluating programs effectiveness in meeting of reproductive needs of the individuals, it's validity and accuracy in identifying women most at risk of unintended pregnancy have been questioned⁽⁴⁾.

Counseling is an important element of providing good quality family planning services. For counseling to be effective, however, policy markers need to support clients ability and right to make decisions

about their reproductive health as well as allocate funding for counseling materials, services, and provider training/supervision⁽⁵⁾.

High rates of discontinuations are recognized as a major problem facing family planning programs and there is need to search for associated factors. Discontinuation is an indicator of method acceptability. Changing methods denotes dissatisfaction with specific method. Stopping all contraceptive use while at risk of an unintended pregnancy marks a more general dissatisfaction. The present research aimed at analyzing the factors associated with contraceptive methods discontinuation among women aged 15- 49 years in study area and contraceptive use dynamics. We also examined the effect of counseling on percent of continuation.

2. Subjects and Methods:

Definitions:

We adopt these definitions in our study:

Contraceptive method discontinuation: is the stoppage of use of method within two years of starting its use for any reason.

Contraceptive method switching : is the use of another method within the period of twelve months following discontinuations of the method.

Contraceptive method failure: is defined as a pregnancy occurring while contraception being practiced by using a contraceptive method .

Study design:

A cross sectional survey was carried out among the eligible women.

Study setting:

The study areas included Assiut Governorate family planning units in different places providing contraceptive methods which included:

1. Contraceptive units of Ministry of Health and Population (MOHP): Ministry of Health has 237 family planning units in Assiut Governorate, of them 12 mobile units, 7 urban health units, 12 units in general and central hospitals, 7 health office units, 12 units in urban health centers, 187 rural health units. Simple random sample of primary health care units, hospital units and mobile units were included in the study.
2. Assiut University Hospital Contraceptive Clinic (AUHs).
3. Clinical Service Improvement Project (CSI) in Assiut Governorate.
4. Sample of private clinics (PCs).

Study population:

By Epi Info 2000, at a confidence level = 95%, a power of 90%, a contraceptive prevalence rate

(CPR) = 38%⁽⁷⁾. In addition, the Egypt DHS sampling policy recommends that a minimum of 450 completed interviews with eligible women be obtained to provide reliable estimates for estimation of contraceptive prevalence rate and other health indicators⁽⁷⁾.

One thousand and ten women in reproductive age from 15-49 who used contraceptive methods once or more, has one child or more were included in the study of them; 710 women were selected from MOHP units, 100 from Assiut University Center (AUH) 100 from CSI centers and 100 from private clinics were included in the present study.

Study tools:

An interview questionnaire were constructed including data about socio-background characteristics of studied women. Other data included reasons of discontinuation, initiatives of switching and failure.

Ten counseling steps were tested in the form of either done or not done. We give one if done and zero if not done through asking the clients the following questions of counseling: Counseling and examination done in privacy, Telling about type and person who do physical examination, Complete flexibility to accept or refuse the service, Telling about useful function of family planning, Telling about all methods available in and outside the unit, Telling in a descriptive manner about each method and how to be used, Telling about effectiveness of each method, Discussion about rumors of different methods, Telling about side effects and complications of chosen method.

Data collection:

Data collection was done through personal interview with eligible women.

Data analysis and study hypothesis :

Data analysis phase was carried out via Statistical Package of Social Science (SPSS) version 11. A plan for data analysis was established based upon the objectives of the study and the conceptual framework.

Data analysis began by obtaining frequency distribution and descriptive statistics for most variables. Several cross tabulations were also included. Chi-square was the test of statistical significance of the observed association in some cross tabulations of the bivariate analysis. A significance level of 95% with a P value < 0.05 was considered.

Ethical issue:

Each client informed about the aim of the study and the client consented either orally or by written consent and she had a full chance to stop giving information about her method.

3. Results:

The total number of clients included in the present study was 1010 distributed as follow: 710 (70.3%) clients were taken from MOHP outlets. One hundred clients (9.9%) were selected from each sector, AUHS, CSI, and private clinics. The total number of methods used during reproductive age

group was 1728 distributed as follow: MOHP (59.3%), AUHS (13.8%) , CSI (17.7%) and private clinics (9.3). Most of clients used only one method (43.6%) or two methods (43.2%). Only 13.3% used three or more methods (Table 1).

Table (1): Percent distribution of ever users of modern contraceptive methods according to source of supply, Assiut Governorate, 2006.

	Sectors								Total	
	MOHP		AUHS		CSI		PCs		No.	%
	No.	%	No.	%	No.	%	No.	%		
-Total number of clients per sector	710	70.3	100	9.9	100	9.9	100	9.9	1010	100.0
-Total number of methods per sector	1024	59.3	238	13.8	305	17.7	161	9.3	1728	100.0
Number of methods:										
One method only	288	40.6	58	58.0	57	57.0	37	37.0	440	43.6
2 methods	309	43.5	23	23.0	41	41.0	63	63.0	436	43.2
3 methods and more	113	15.9	19	19.0	2	2.0	0	0.0	134	13.3

Table (2) shows Percent distribution of modern contraceptive methods according to source of supply. On the total level, the most commonly used modern method was IUD (43.0%) followed by injectables (28.4%), then OCPs (16.1%), followed by Norplant (7.6%) and barrier methods (5.0%).

The second method of choice was injectable methods in all sectors except AUHS in which OCPs was the second method. Norplant method was not recorded in CSI and private clinics but it represented 13.9% and 9.6% of methods used in AUHS and MOHP. Barrier methods was the least in use constituting 6.1%, 4.6%, 3.7% and 1.7% in MOHP, CSI, private clinics and AUHS respectively.

Table (3) shows the percent of discontinuation of modern contraceptive methods according to background characteristics. As regards age, the percent of discontinuation decreased significantly with increasing age ($P= 0.000$). It was 83.2% among those aged < 20 years, 70.5% in 20-34 years and 54.0% in 35-49 years.

As regards the **number of living children**, discontinuation was the lowest when there were four or more living children and increased significantly by decreasing number of living children ($P= 0.000$). It increased from 59.3% among women who had four children to 87.8 % among women who had only one child.

According to **number of sons**, discontinuation decreased significantly from 84.9% among those who did not have sons to 63.3% among those who have three or more sons ($P= 0.000$).

As regards **infant deaths**, discontinuation was (70.1%), (62.3%) and (64.7%) among those who did not experience infant deaths, and presence of one and two deaths respectively. This difference was statistically insignificant ($p= 0.313$).

As regards **education**, 67.8% were illiterate and 80.3% were primary graduated. Preparatory, secondary and university education represented (71.3%, 97.0%, and 41.9 of women respectively). The difference was statistically significant ($p= 0.000$).

Table (4) shows the percent distribution of contraceptive method discontinuation according to sector and method in use. The results revealed that (69.7%) of methods had been stopped within 2 years of starting for various reasons. It was found that, 95.4% of CSI methods, 68.9% of private clinics methods, 68.4% of AUHS and 62.5% of MOHP methods had been stopped within 2 years of starting use.

On comparing percentage of discontinuation according to different types of methods, it was 76.6%, 75.5%, 67.3%, 61.6% and 36.6% in OCPs, IUDs, Injectables, Barriers and Norplants methods respectively.

As regards causes of discontinuations (Table 5), side effects and health concerns (50.4%) was the most common reason of discontinuation. The desire to become pregnant was also frequently mentioned for discontinuing use (25.2%). An unintended pregnancy (method failure) as a reason for discontinuation was mentioned by (5.6%). Personal reasons as husband disapproved the method, wanted

more effective method, inconvenient to use, cost access availability, marital dissolution, infrequent sex, husband away, or menopausal were mentioned by (18.8%).

Table (5) also shows causes of discontinuation in different methods. Health side effects as a cause of

discontinuation was the highest among injectables (55.5%) followed by IUDs users (54.2%), Norplant (50.0%) and then OCPs (43.2%). Method failure was the main cause of discontinuation in barrier methods (73.6%).

Regarding events within 12 months after use; (44.3%) of them switched to another method, (42.8%) got pregnant and (1.1%) returned to the same method, (11.8%) of discontinuation ended their use of any method (Fig.1).

Table (6) shows event within 12 months of discontinuation according to contraceptive method; it was as follow:

For **OCPs**; 47.9% switched to another method, 42.3% got pregnant, 7% did not use any methods and 2.8% returned to the same method.

For **IUDs**; 45.9% switched to another method, 43.5% got pregnant, 11.9% did not use any methods and 0.7% returned to the same method.

For **Norplant**; 33.3% switched to another method, 43.7% got pregnant, 16.7% did not use any methods and 6.3% returned to the same method.

For **barrier** methods; 9.4% switched to another method, 83.1% got pregnant, 7.5% did not use any methods and no woman returned to the same method.

Out of 1010 women, 68 (6.7%) stopped using contraceptive method due to method failure. Failure represented (3.9%) of all studied methods (1728) and (5.6%) of all reported discontinuation (1205).

Out of 1010 women, 68 (6.7%) stopped using the contraceptive method due to method failure. Failure

represented (3.9%) of all studied methods (1728) and (5.6%) of all reported discontinuation (1205). **Failure** was the main cause of discontinuation among barrier methods users (73.6%) followed by OCPs (7.5%) and then IUDs (2.3%). There was no failure cases reported among norplant and injectables method. (Table 5).

Most of method failure as expressed by pregnancy ended in live births (72.1%) and only (27.9%) ended in abortion. Events occurring within 12 months of end of pregnancy of failure : In general : Switching to another method (64.7%) constituted the highest percentage followed by no events occurred (20.6%) followed by another pregnancy (10.3%). Returning to the same method represented only 4.4% of failure cases. (Table 7) .

Table (8) shows effect of counseling on continuation of contraceptive methods. On the basis of 10 questions of counseling steps; the results of the quantitative assessment indicated that a higher score on counseling was associated with continuation. Mean score was 4.61 ± 4.11 among women who continue use of contraceptive methods as compared to 3.01 ± 3.86 Among those who discontinue ($p=0.0001$).

4. Discussion

Egypt's family planning programs have followed a similarly unsteady course. Debated by Egyptian social scientists since the 1930s, Egypt's high population growth became widely viewed as an acute problem in the 1960s, when the government acknowledged the serious economic and social problems associated with it. The government soon established the National Family Planning Program as one response to the economic problems⁽⁶⁾.

In the present study, clients used one or two contraceptive methods in 43.6% and 43.2% respectively and only 13.3% used three or more methods (Table 1). As in agreement with our results, El-Zanaty and Way⁽⁷⁾ showed that half of ever user women have had experience with only one method while (33%) have used two methods and (19%) have tried three methods or more.

The most commonly used method was the IUD (43.0%) followed by injectables (28.4%), OCPs (16.1%), Norplant (7.6%) and Barriers (5.0%) and this was true for all sectors (Table 2). The second method of choice was injectable contraceptive methods in all sectors except AUHS in which OCPs was the second method. Norplant was not recorded in CSI and private clinics but it represented 13.9% and 9.6% of methods used in AUHS and MOHP. Barrier methods was the least in use constituting 6.1%, 4.6%, 3.7% and 1.7% in MOHP, CSI, private clinics and AUHS respectively.

Regarding sectors supplying methods in the present study, it is similar to previously mentioned by El-Zanaty and Way⁽⁸⁾ as IUDs and injectables are the common method supplied by MOHP and AUHS (Governmental units). Norplant were not available in non governmental units (CSI, private clinics). Therefore our population are in great need for implant to be supplied to all sectors especially in private, semi-private and public units. Training of the service providers to insert and remove norplant is also needed.

The recent El-Zanaty and Way⁽⁷⁾ survey showed that 59% of currently married women in Egypt are using contraception. The IUD, pill, and injectables

are the most widely used methods. There is dramatic shift from pill to IUD use that occurred during the past two decades. In 1980, almost 70 percent of current users relied on the pill, more than four times the percentage of users who relied on the IUD. By 2005, more than 60 percent of current users relied on the IUD compared to 17% who preferred the pill. The relatively rapid expansion of the use of injectables is also evident. Twelve percent of current users relied on injectables in 2005, compared to five percent in 1995 and only one percent in 1992 (El-Zanaty and Way)⁽⁷⁾.

In contrast to western societies the popularity of IUD among women of reproductive age in Europe varies from 5% in Great Britain to 19% in France and 21% in Finland⁽⁹⁾. In The United States of America, IUD use is very low as some think that this method is abortifacient and it increases the risk of pelvic inflammatory diseases and ectopic pregnancy⁽¹⁰⁾.

The higher rate of IUD use in our population has been attributed to its images as a safe, effective, inexpensive and long acting method which is independent of coitus. Injectables and norplant develop more accessibility after providing the clients more information about their rumors and emphasis on their advantages, but still need more efforts of counseling about their side effects especially amenorrhea. Injectables have several advantages, they are simple to administer, require minimum patient compliance with an administration schedule and reduce use error. In addition, they are independent of coitus, do not interfere with lactation and are highly effective⁽⁷⁾.

Back ground characteristics of clients:

Current contraception use is the net difference between acceptance and discontinuation. It is in fact a dynamic process, involving the decision to adopt contraception, the selection of the method and over time the decision to continue or discontinue contraception use. The nature of behaviour relating to contraception is complex as it is affected by a large set of factors and shows

considerable variation throughout the childbearing period ⁽¹¹⁾.

Contraception practice is mainly governed by women's reproductive status as the combined impact of age and number of surviving children ^(12, 13, 14). Surveys conducted in Egypt ⁽²⁾, Pakistan ⁽¹⁵⁾ and Bangladesh ⁽¹⁶⁾ revealed that women over the age of 30 years consistently maintain higher continuation rates. These findings are consistent with that of the current research. Generally, women opt for contraception either to end childbearing or to maintain adequate spacing ⁽¹⁷⁾. It is then expected to observe an ever use of modern contraceptives, longer duration of use and lower probability of discontinuation among older women who have more than four living children as they tend to use contraception to end childbearing. In contrast, younger women who have less number of living children may have a tendency to use contraception for child spacing as they are still in the phase of family formation.

Previous studies have indicated the higher likelihood of discontinuation of contraception among women of low parity ⁽¹⁶⁾ and those who had not achieved their desired family size at the start of use ⁽¹⁸⁾. Asari suggested that family size preference is apparently more important than preference about sex of children in determining contraception use ⁽¹⁹⁾. The current survey revealed that the representation of sons among surviving children was significantly associated with longer duration of contraception use and lower probability of discontinuation. It is true that Egyptian women express a higher preference for sons. This finding is in agreement with previous reports which documented the influential role of sons in the initial acceptance and maintenance of contraception use ⁽¹⁶⁾⁽²⁰⁾.

On the other hand, Rahman et al., observed that parental preference is not monotonically son-biased but is rather for a balanced composition of sons and daughters ⁽²¹⁾. It is not unlikely that women who have both boys and girls are also those who have a larger number of surviving children. Actually, the effect of sex composition of surviving children was eliminated when the number of surviving children was considered ⁽²¹⁾.

Chowdhury, Fauveau and Aziz & Rahman ⁽²²⁾ pointed out the negative effect of infant mortality on the initial acceptance and continuation of contraception use. In the present study, women who experienced the loss of a child were relatively short with high probability of discontinuation; this was not, however, statistically significant owing to the very few events reported.

The results show that the risk of discontinuing contraception methods will decrease by increasing

the woman's education level. In the present research university graduated women showed the least percent of discontinuation. Similar results have been shown in a study by Kijuan and Yue in 1994 ⁽²³⁾. Couples who had had 9 or more years of formal education each were more likely to report ever use of modern contraceptives. Several studies have documented the role of education in this respect ^{(24) (12)(17)(25)}. Education is likely to influence contraception use through its effect on women's preference for small family size, desire to be gainfully employed and the attainment of higher socioeconomic status.

In contrast to our results, Mahdy ⁽²⁾ found that contraceptive methods use were not significantly related to the level of education.

Discontinuation:

Table (4) shows the percent distribution of contraceptive method discontinuation according to source of supply and method in use. It was found that (69.7%) of methods had been stopped within 2 years of starting for various reasons. According to El-Zanaty and Way⁽⁷⁾ one third of users 33% in Egypt stop using methods within 12 months of starting use. In our study out of 1728 method only 523 (30.3%) continued up to 2 years. Mahdy⁽²⁾ found that (57.8%) of women continued using contraceptive method up to 2 years.

On comparing percentage of discontinuation according to different types of methods, it was 76.6%, 75.5%, 67.3%, 61.6% and 36.6% in OCPs, IUDs, Injectables, Barriers and Norplants methods respectively.

It was found that, CSI showed the highest percent as compared to other sectors (95.4%). On the other hand, 68.9% of private clinics methods, 68.4% of AUHS and 62.5% of MOHP methods had been stopped within 2 years of starting use (Table 4). Quality of the service may have slight impact on percentage of the discontinuation (Blanc)⁽²⁶⁾. A higher rate of method discontinuation among contraceptive users may indicate good quality service and availability of multiple choices methods rather than discontinuation itself (Kost) ⁽²⁷⁾.

Adequate counseling especially on side effect is significantly related to decision to continue contraception. The rate of discontinuation among women who reported that they had not been adequately counseled about side effects in high. In Ghana 51% of these who felt that they had not been properly counseled discontinue use compared with 14% who reported retrospectively on the information at the initial adoption of their contraception status (Cotton) ⁽²⁹⁾.

Side effects and Complications :

As regards **causes of discontinuations** side effects and health concerns was the most common reason of discontinuation (50.4%) (Table 5).

As in agreement with our results, Mahdy⁽²⁾ found that health concerns were the leading cause of discontinuation. He reported that the most common complaints were nausea, headache, weight gain, leg pain and breast fullness among OCPs users. Injectable users reported side effect as amenorrhea or bleeding problems. The majority of women had norplant implants removed because of health concern including amenorrhea followed by bleeding problems. Among IUD users women requested removal of device, because side effects, the greatest proportion of them do so because of bleeding problems or pelvic infection.

The same results were reported by Blanc⁽²⁶⁾ They stated that, one of the drawbacks of IUD was the increase in menstrual bleeding leading to discontinuation of method. As regards Injectables the commonest side effects was amenorrhea, followed by severe bleeding. For norplant severe bleeding was the commonest complaint. Change of libido was mentioned in women only using barriers.

In the present study, the desire to become pregnant was also frequently mentioned for discontinuing use (25.2%). Desire to be become pregnant was also frequently mentioned reason for discontinuing use (>25%)⁽³⁰⁾.

For other woman an unintended pregnancy (method failure) as a reason for discontinuation was mentioned by (5.6%) of methods. Ali and Cleland⁽³¹⁾ reported that discontinuation across six countries after one year due to desire for another child was relatively 5-10% except in Thailand 14%, but was higher after two years (11-24%).

Personal reasons as husband disapproved the method, wanted more effective method, inconvenient to use, cost access availability, marital dissolution, infrequent sex, husband away, or menopausal were mentioned by (18.8%)

Regarding events within 12 months after use; (44.3%) of them switched to another method, (42.8%) got pregnant and (1.1%) returned to the same method, (11.8%) of discontinuation ended their use of any method (Fig.1).

Failure and its fate :

Out of 1010 women, 68 (6.7%) stopped using the contraceptive method due to method failure. Failure represented (3.9%) of all studied methods (1728) and (5.6%) of all reported discontinuation (1205). **Failure** was the main cause of discontinuation among barrier methods users (73.6%) followed by OCPs (7.5%) and then IUDs (2.3%).

There was no failure cases reported among norplant and injectables method (Table 5).

According to El-Zanaty and Way⁽⁷⁾ 3% of users stop using due to method failure (they became pregnant while using the method). Method failure occurred most often with withdrawal, periodic abstinence, and other traditional methods^{(26),(31)}. This higher percentage of failure in barrier method (condom) may be related to low effectiveness either breakdown or in appropriate use.

Pill failure varied widely across countries but occurred much less frequently than withdrawal, periodic abstinence, and traditional methods. As in agreement with the present results, failure with IUDs and injectables was low across countries⁽³¹⁾.

In this research most of **failure** ended in live births (72.1%) and only (27.9%) ended in spontaneous abortion. Events occurring within 12 months of end of pregnancy of failure included: Switching to another method (64.7%) constituted the highest percentage followed by no events occurred (20.6%), got pregnant (10.3%) or return to the same method in 4.4% of cases (Table 7).

As in agreement with our research, Kost⁽²⁷⁾ reported that, after the end of pregnancy resulting from failure (82%) of women will become pregnant again. The probability of switching to another method after failure is high (24%). In contrast to the present results, kost⁽²⁷⁾ found that the probability of returning to the same method is twice great (48%). These means that these women consider that failure to be their own fault rather than of the method. Also Blanc⁽²⁶⁾ reported that Women who had experienced contraceptive failure and resumed using contraception after giving birth were most likely return to the same method. This was not the case in this study as returning to the same method represented only 4.4 of failure.

Clients' counseling:

Table (8) shows effect of counseling on continuation of contraceptive methods. On the basis of 10 questions of counseling steps; the results of the quantitative assessment indicated that a significant higher score on counseling was associated with continuation. Mean score was 4.61 ± 4.11 among women who continue use of contraceptive methods as compared to 3.01 ± 3.86 Among those who discontinue ($p=0.0001$).

Cotton⁽²⁹⁾ reported that adequate counseling especially on side effects is significantly related to decision to continue contraception. The rate of discontinuation among women who reported that they had not been adequately counseled about side effects is high. In Ghana 51% of these who felt that they had not been properly counseled discontinue use

compared with 14% who reported retrospectively on the information at the initial adoption of their contraception status.

Steel et al.,⁽³²⁾ reported that discontinuation are more likely with non-governmental sources of contraception as opposed to governmental sources (Clinic and hospitals) perhaps because of better and more counseling.

Recommendations:

for family planning programs were: 1) the focus should be on essential information and discussions that help the client make an adequate choice and properly use the method chosen; 2) the available time should be a factor in the number of issues discussed; 3) the client's ability to understand and retain information should be a factor in determining the amount of information; and 4) service providers must be aware of differing needs and levels of knowledge of clients 5) Counseling should emphasize the possibility of side effects, stressing the fact that most will be transient, and the need to identify a backup method. Follow-up visits should be scheduled for 1 to 2 months after a prescription is written.

Rediscovering Red Blood Cells: Revealing Their Antigens Store**Mahmoud Rafea¹, Serhiy Souchelnytskyi¹, Saleh El-Ayouby²**¹Karolinska Biomics Centre, Department of Oncology-Pathology, Karolinska Institutet, Stockholm, Sweden²Veterinary Serum and Vaccine Research Institute, Cairo, Egyptmahmoudrafea@gmail.comserhiy.souchelnytskyi@ki.sesaleh.elayouby@gmail.com

Abstract: This paper describes a newly observed phenomenon related to red blood cells (RBCs). We found that plasma from a healthy individual immune-reacted with hemolysates from the same person and from other individuals. This strongly suggested presence of antigens in RBCs and corresponding antibodies in plasma. Those RBCs' antigens are different from RBCs proteome. Those antigens can be separated using plasma / serum of blood from which RBCs were taken. It is found that those antigens consist of HLA antigens, tissue specific antigens, and foreign antigens. The foreign antigens can be fetus antigens in pregnant females, microorganisms' antigens, food, insects or other antigens from environment. The collection of those transported antigens represents a dynamic store. Consequently, RBCs may play role in tolerance through transporting those antigens to central organs of the immune system. The experiments, which have been done, reveal some of the antigens of the store, and show how this phenomenon can be exploited, for instance, in diagnosis of human tuberculosis (TB). In effect, this work opens a new avenue of research and hopes.

1. Introduction:

We found that plasma from a healthy individual immune-reacted with hemolysates from the same person and from other individuals. This strongly suggested presence of antigens in RBCs and corresponding antibodies in plasma. Figure 1(a) shows Ouchterlony immuno-precipitation test of normal serum against self and other normal hemolysate. We confirmed this finding by using Western Blot technique, and showed that serum from one individual recognized antigens in hemolysate from two normal persons, Figure 1(b). Further confirmation was obtained by using two-dimensional gel electrophoresis (2-DE) of co-immunoprecipitated hemolysate antigens using self-serum, Figure 1(c). Antigenicity of the separated proteins was confirmed by immune-blotting proteins separated by 2-DE with the same self-serum. This excluded co-precipitation of non-antigens, as they would not be detected in immune-blotting. Notice that the number of the immunoprecipitated antigens is numerous and many spots were enriched by immune-precipitation because those antigens were not detected in 2DE gel of hemolysate, Figure 1(d). It should be remarked that this phenomenon is not reported before.

This observed phenomenon can be exploited in many directions. The proposed direction is to exploit

functional proteomics approach with the following three crucial aspects of the experimental design (Thompson, *et al.*, 2008):

- 1) The strategy used for the selection, purification and preparation of the antigens to be analyzed by mass spectrometry
- 2) The type of mass spectrometer used and the type of data to be obtained from it
- 3) The method used for the interpretation of the mass spectrometry data and the search engine used for the identification of the proteins in the different types of sequence data banks available

Consequently, using a subset of antibodies which are specific against a subset of antigens of a particular disease will enable the use of those antibodies and those antigens in beneficial applications. This approach has been used, in this article, to identify *Mycobacterium tuberculosis* bacilli protein antigens (MTPAs) in TB-patient hemolysate.

In the next section, the motivation and the aspects of experimental design are described. Experiments for identifying MTPAs in TB-patient hemolysate are detailed in section 3. Section 4 contains discussion arguments. The last section is the conclusion and future work.

Figure 1: Detection of antigens in Red Blood Cells. (a) Ouchterlony test showing serum of normal against hemolysate of self and others (b) Western Blot using two normal hemolysate propped with serum of one of them (c) Silver stain of 2D electrophoresis of immune-precipitated hemolysate antigens (d) Silver stain of 2D electrophoresis of hemolysate.

2. Motivation and aspects of experimental design

Before trying to detect hemolysate antigens using self antibodies¹, there were some observations which lead to the induction of a number of hypotheses. Using background knowledge, some simple experiments were performed to prove or disprove those hypotheses. The observations start with a question related to Hemolytic Disease of Fetus and Newborn (HDFN). HDFN occurs sometimes due to ABO blood group incompatibility (Cariani, *et al.*, 1995). The incidence of HDFN does not exceed 5% (Cariani, *et al.*, 1995). In pregnant women with blood group 'O', ABO antibodies are mainly IgG in nature (Daniels & Bromilow, 2006). IgG antibodies usually pass the placenta barrier (Leach, *et al.*, 1996). In most pregnancies (> 95%), delivered infants are normal which means that there is an efficient mechanism that can handle this incompatibility. The question is: "How do circulating antibodies against blood group ABO in pregnant women who have blood group "O" not harm the fetus whose blood group is not "O"?"

It is claimed that the low prevalence of clinically significant ABO HDFN is due to the expression of ABO by fetal cells and tissues other than RBCs, i.e., ABO is a histo-blood group system (Mollison, *et al.*, 1997) and (Tawfik, 2005). In addition, it is also stated that A and B red cell antigens are not fully developed in the fetus (Hadley & Soothill, 2002) and (Tawfik, 2005). In fact, this

¹¹ Self antibodies are antibodies of blood from which RBCs are taken. This term is used because autoantibodies are just a fraction of self antibodies.

may explain the mechanism of why HDFN does not occur in 95% of pregnancies but it does not explain the mechanism of why it occurs in the 5%. Furthermore, neutralizing the effect of ABO antibodies on the fetus side is acceptable as a part of a mechanism, but not accepted as the full mechanism due to: a) the tiny size of a fetus in relation to the volume of blood of his mother, and b) the possible destructive effects of the consequences of antigen-antibody immune complex reactions. This neutralization effect should occur in the placenta by catering for the needed antigen similar to HLA antibodies (Koch & Platt, 2003). The placenta is designed for such reactions. This raises the question: "How are ABO antigens delivered to the placenta without being trapped by the ABO circulating antibodies and lymphocytes?"

For ABO antigens to be transported, a possible way is by RBCs because RBCs are specialized for transport. RBCs pinocytotic activity has been demonstrated very early (Orci & Perrelet, 1973). Consequently, the occurrence of HDFN is due to the depletion of the RBCs antigen store. The sources of those antigen(s) may be the fetus, the environment, and/or the male spouse. A simple experiment that shows that hemolysate contains ABO antigens different from the person's ABO group antigens is described in Figure 2. It was observed that whenever there is ABO incompatibility and male spouse is not 'O', male spouse RBCs agglutination by female spouse plasma, was inhibited by female spouse hemolysate and was not inhibited by male spouse hemolysate.

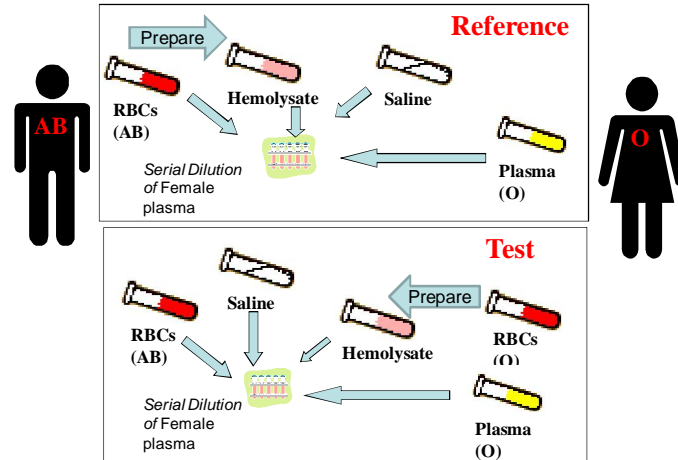

Figure 2: Detection of ABO antigens in RBCs' hemolysate. The experiment is performed, for each couple, by making two serial dilution of female plasma. In the first serial dilution (Reference), a drop of male spouse hemolysate is added to all tubes followed by a drop of his intact RBCs. In the second serial dilution (Test), a drop of female spouse hemolysate is added followed by a drop of male spouse intact RBCs.

If RBCs are capable of ABO antigen transport to the placenta, they may be also capable of transporting male spouse genetic antigens (e.g., HLA antigen) to thymus and bone marrow to induce tolerance to those antigens. RBCs may deliver also self antigens (e.g., HLA and Tissue Specific Antigens (TSAs)) to those central organs of the immune system to maintain self tolerance. Especially, this transport mechanism is important because the probability for any antigen to reach the thymus without being trapped by the immune system is zero. Consequently, the mechanism by which a pregnant woman is able to tolerate her fetus and placenta is the

same mechanism a body tolerates his self antigens. The simple experiment that demonstrates the existence of self and spouse HLA antigens is, also, based on competitive inhibition and was performed using commercial HLA Typing Trays for the identification and definition of HLA Class I Antigens using the microlymphocytotoxicity assay (Hopkins, 1990). It was observed that female and male spouse hemolysate inhibited the typing reaction while a third person hemolysate did not. This indicates the existence of male HLA antigens in his hemolysate and in his female spouse hemolysate, Figure 3.

Figure 3: Detection of HLA antigens in RBCs' hemolysate. First, a couple is HLA typed and a suitable control person that does match the couple is selected. Three Terasaki plates are used for each couple. In each plate a different hemolysate (diluted 1/16) is used while male lymphocytes are used in the three plates.

If RBCs hide tolerated antigens (tolerogens) but antibodies still exist for those tolerogens because there is no absolute tolerance (Burek, 1998), then by implication some antigens, which induce immune

response, may exist in RBCs, i.e., there is no absolute immune response, too. Consequently, if this is true, then blood circulating antibodies in any individual will react with his RBCs' hemolysate antigens. When

it was found that this hypothesis is true, searching for specific bacterial antigens is needed to confirm the hypothesis. As TB is a priority disease, trying to find *Mycobacterium tuberculosis* bacilli protein antigens (MTPAs) in TB-patient hemolysate was conducted through 2D electrophoresis, and then identifying gel spots with mass spectrometry. Fortunately, we discovered four MTPAs. This motivated us to do the experiments of the next section to identify more MTPAs in hemolysate of TB patients.

Identifying MTPAs in TB patients hemolysate

The goal is to find the set of antigens, in TB patients' hemolysate, which is related to *Mycobacterium tuberculosis* bacilli. This set of antigens can be used in preparation of: 1) a kit for TB diagnosis, and vaccine. The approach taken follows the following steps Figure 4:

1. The study resources are:
 - [A] Patients
 - [B] *Mycobacterium tuberculosis* (H37Rv)
2. For each patient:
 - Collect blood sample on anticoagulant (step 1)
 - Separate RBCs and wash many times with saline (step 2)
3. Hemolysate [C] is prepared by rupturing RBCs with low isotonic solution which is the binding buffer in affinity chromatography
4. Prepare hyper immune serum for *M. tuberculosis* (step 3)
5. Purify antibodies using Protein A Sepharose beads (step 4)
6. The purified antibodies are then used to separate antigens from hemolysate (step 5)
7. The disease related antigens are identified using in gel trypsin digestion and MALDI TOF mass spectrometry (step 6)

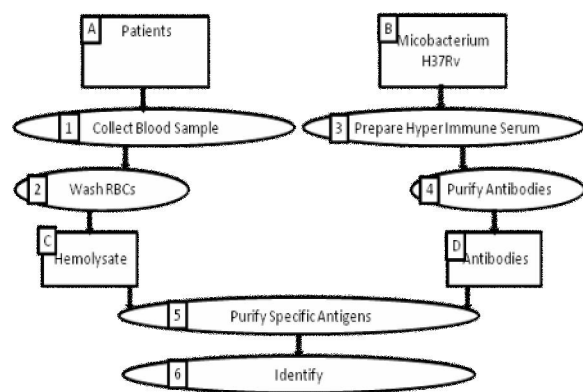

Figure 4: Flowchart depicting the resources and steps for identification of hemolysate antigens related to *Mycobacterium tuberculosis* (H37Rv)

2.1. *Mycobacterium tuberculosis* (H37Rv) Antigens Extraction

H37Rv strain was obtained from Veterinary Serum and Vaccine Research Institute (VSVRI), Tuberculosis Department. The protocol applied is a modified version of (Wood, *et al.*, 1988). *Mycobacterium* were grown on modified Middlebrook 7H11 medium (Gallagher & Horwill, 1977). The bacterial suspension was adjusted, approximately, to 10^9 bacterail ml^{-1} , and killed in 80°C waterbath for 2h followed by sonication for 10 min. The suspension was centrifuged at 4000g for 15 min. The supernatant was filtered sequentially through $0.45\ \mu\text{m}$ and $0.22\ \mu\text{m}$ cellulose acetate filters. The total protein content was estimated by measuring UV absorbance at 280 nm. This supernatant is referred to as extracted antigens.

2.2. Preparation of hyper immune serum

Female rabbits weighting 1.5- 2.0 kg were injected subcutaneously on 3 occasions at 2 week intervals with 0.5 ml suspension of the extracted antigens (100 μg of protein) in oily adjuvant (Jansen & Knoetze, 1979) and 150 μg of H7 Flagellin derived from *E. coli* O157:H7 (McNeilly, *et al.*, 2008) while Flagellin preparation was done according to (El Ayouby, *et al.*, 2008). Blood was collected 2 weeks after the last injection. Serum was separated immediately after clot retraction and stored as 2 ml aliquots at -70°C .

2.3. MTPSs separation using affinity column

The reagents used are Binding Buffer (BB): 0.02 M sodium phosphate, pH 7.0, Elution Buffer (EB): 0.1 M citric acid, pH 3.0, Neutralization Buffer (NB): 1 M Tris-HCl, pH 9.0, and Desalting buffer (DB): 8M urea. A syringe (5 ml) is packed with a small wad of cotton wool in the bottom which is thick enough to prevent the passage of solid support but not too thick that a large amount of air is trapped. The syringe was filled three-fourths full of EB and a small amount was drained. To remove any air bubbles from the cotton wool, a glass rod was used to tamp it. The solid support was prepared from 1 ml Protein A Sepharose 4 Fast Flow slurry by washing it 3 times with EB. The slurry is then slowly added after draining some of EB from the syringe.

The rabbit serum and hemolysate are centrifuged at 10 000 g for 10 minutes to remove cells and debris. Both serum and hemolysate are diluted 1: 5 in binding buffer (BB) to adjust pH conditions and ionic strength. The diluted serum and hemolysate are used, in electrophoresis, as a reference to compare with the affinity column output. Figure 5 shows Western Blot of column elution fraction and the SDS-PAGE of all outputs of affinity

column. The labels shown in the figure are explained in the following column separation steps:

1. Equilibrate the column with 5 column volumes of binding buffer (BB).
2. Apply serum, and collect the output in a tube and labeled "Serum Sample (SS)".
3. Wash with 5 column volumes of BB to remove impurities and unbound material. Collect output in a tube labeled "Serum Wash (SW)".
4. Apply hemolysate, and collect the output in a tube and labeled "Hemolysate Sample (HS)".
5. Wash with 5 column volumes of BB to remove impurities and unbound material. Collect output in a tube labeled "Hemolysate Wash (HW)".
6. Elute with 5 column volumes of EB. Since elution conditions are quite harsh, collect

fractions of 1 ml into NB (100 μ l per fraction). Label tube fractions: E1, E2, E3, E4, E5.

7. Immediately re-equilibrate with 10 column volumes of BB.
8. The total protein content was estimated by measuring UV absorbance at 280 nm. Fractions were desalted with DB using a desalting column.

In Figure 5(b), notice the heavily stained 50 KDa bands which represent the concentrated antigens from the hemolysate. Meanwhile, Western Blot, **Figure 5(a)**, shows other larger and smaller proteins that appear hazy in the SDS-PAGE. Western Blot is done to compare human patient antibodies against MTPAs with those prepared in rabbits.

Figure 5: Verification of affinity column output. a) Western Blot of column elution fraction E4, E3, E2, and E1 which are transferred from SDS-PAGE to nitrocellulose membrane and then probed by human TB patient plasma. b) Coomassie Blue stain of affinity column output compared to serum (S) and hemolysate (H)

2.4. Antigen Identification

The affinity column separated hemolysate antigens from two patients were used in 2D-electrophoresis, Figure 6. Notice that the number of spots has decreased and become better manageable when compared with Figure 1(c). Spots were cut and

proteins were extracted and digested according to the trypsin digestion protocol mentioned in (Shevchenko, *et al.*, 2002). We could identify 11 proteins belonging to H37Rv from 60 spots. Other proteins were related to bacterial commensals, e.g., bacterioids.

Figure 6: 2D-Electrophoresis of patients hemolysate antigens separated by affinity column chromatography containing Protein A Sepharose beads and the ligand is Ig of rabbit hyper immune serum against *M. tuberculosis*. Eleven proteins at pI: 4.8 and KDa: 219.14, 219.16, 219.27, 218.27, 54.23, 54.52, 54.62, 54.63, 54.65, 54.68, and 54.75. The rest are proteins related to bacterial commensals, mainly bacterioids.

3. Discussion

The study of RBC antigens was directed to cell membrane proteins, only. The differences in human RBCs are due to the presence or absence of certain protein molecules or antigens. The antigens are located on the surface of the red blood cells. Individuals have different types and combinations of these molecules. The blood group that one belongs to depends on what he has inherited from her/his parents. The antibodies against those molecules are in the blood plasma and depend on the type of antigens on the RBC membrane. There are more than 20 genetically determined blood group systems known today, but the ABO and Rh systems are the most important ones used for blood transfusions. Nobel Laureate Karl Landsteiner was involved in the discovery of both the ABO (Daniels & Bromilow, 2006) and Rh (Mollison, *et al.*, 1997) blood groups.

The only identifiable function of RBCs is the delivery of oxygen to tissues and return back of carbon dioxide to the lungs. Hemoglobin is the key player in this function. All the previous work in RBCs proteomics has not identified another function. Also, RBCs proteomics has not mentioned HLA, TSAs, or foreign proteins. The reasons are obvious. Firstly, it is not expected to find such proteins and consequently the method used for the interpretation of the mass spectrometry data, and the search engines used for the identification do not consider the right types of sequence data banks available. Secondly, the amount of most of the antigens which belong to the RBCs antigens' store is little. This makes those antigens invisible and hence easily missed. This is clear when one compares the 2DE gel of hemolysate immunoprecipitated antigens of Figure 1(c) and hemolysate of Figure 1 (d).

Although this phenomenon can be related to immune tolerance by logical induction, the concrete evidence and mechanism need further research. Mainly, the logical induction is based on the finding all kind of antigens in hemolysate, especially HLA antigens which are related to fetus. This existence of all kinds of antigens, definitely, plays some immunological role which may be immune tolerance.

Whatever the reason of this existence of antigens in hemolysate this existence can help in designing diagnostic kits for different types of diseases. Further, it will help in discovering, not only, new immunological disorders which are, now, categorized under idiopathic disease, but also, identifying the obscure cause of many immunological disorders, including cancer. The identification of the cause of a disorder will help in its treatment and prevention.

4. Conclusion

In this article, the work described is just a pilot study that throws some light on a new phenomenon related to RBCs. This phenomenon is the existence of antigens store consisting of self and non-self antigens. Most probably this antigens' store has some role in immune tolerance.

The initial experiment, which shows the existence of ABO antigens in hemolysate of pregnant females, explains the mechanism of how HDFN occurs. Meanwhile, the experiment which shows that HLA antigens exist in their hemolysates proposes a new hypothesis which is the mechanism by which a pregnant woman is able to tolerate her fetus and placenta is the same mechanism a body tolerates his self antigens.

The experiments which use hemolysate against self-serum: Ouchterlony immune-precipitation test, Western Blot, and 2DE of co-immunoprecipitated antigens demonstrated that RBCs have an antigens' store. Mass spectrometry of spots obtained from 2DE gel demonstrated the finding of all kind of antigens, self and non-self, in hemolysate. This indicates that blood circulating antibodies in any individual will react with his RBCs' hemolysate antigens. In effect, there is no absolute immune response, too.

This directed our attention to use hyper immune serum against Mycobacterium antigens. This will help to get rid of other proteins and do better separation; and hence better identification. Consequently, we could identify 11 proteins from 60 gel spots belonging to H37Rv strain. The rest of spots are proteins related to bacterial commensals. Consequently, purification of specific antibodies from hyper immune serum is recommended to get further better separation.

Acknowledgments

We would like to thank Dr. Essam Nasr and Professor Dr, Mervat El Anary. Dr. Nasr has provided the H37Rv strain and helped in the preparation of the antigen extract. Professor El Ansary has provided lab facilities and reagents for HLA typing and has examined the typing trays.

The effect of vitamin E on post-thawed buffalo bull sperm parametersRahim Beheshti¹, Aiden Asadi², Naser Maheri-Sis¹Department of Veterinary medicine, Shabestar Branch, Islamic Azad University, Shabestar, East Azarbaijan, Iran.²Department of Animal science, Shabestar Branch, Islamic Azad University, Shabestar, East Azarbaijan, Iran.Rahimbeheshti@gmail.com

Abstract: The sperm cells protection against oxidative reactions during cryopreservation process done by antioxidant and amino acids agents. The purpose of this study was evaluation of the effects of vitamin E on Azerbaijan Buffalo bull's sperm cells after thawing. Therefore for definition the percentage of motility, acrosomal membrane integrity, and live ratio of sperm cells, ejaculations from five mature buffalo bulls after preparation in tris-yolk base medium was added with five levels of vitamin E (0.1, 0.5, 1 or 1.5 mM) separately and frozen process was performed. One month latter, five piote selected randomly and after thawing in 37 °C water bath in twenty seconds, sperm cells motility evaluated with 37 °C warm plate microscope. On the other hand, the one step eosin-nigrosin staining for evaluation of live ratio percentage and formal citrate for acrosomal membrane integrity was performed, then slides evaluated with 1000x light microscope and 200 sperm per slide was counted. The result showed significant difference between blank and vitamin E groups and sperm motility was higher in vitamin E (P<0.05). On the other hand sperm motility in vitamin E 1.5 mM was higher than other vitamin E groups (P<0.05). Between vitamin E groups, the percentage of live-ratio was higher in vitamin E 1.5 mM and lower in vitamin E 0.1 mM (P<0.05) and the lowest was in control group (P<0.05).

[Rahim Beheshti, Aiden Asadi, Naser Maheri-Sis. The effect of vitamin E on post-thawed buffalo bull sperm parameters. Journal of American Science 2011; 7(6):227-231]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: Buffalo bull, vitamin E, semen.

1. Introduction:

Buffalo population of the world was estimated to be more than 140 million (Sansone *et al.* 2000). Artificial insemination (AI) is one of the important reproductive biotechnologies, which causes the widespread propagation of semen, limiting the spread of sexually transmitted diseases, and chiefly facilitating genetic improvement programmes in livestock (Andrabi *et al.* 2008; Numan Bucak *et al.* 2009). Nevertheless, cryopreservation generates sub-lethal injury to the sperm due to chemical, osmotic, thermal, and mechanical stresses, which may result in loss of viability, motility, damage of deoxyribonucleic acid (DNA), destruction of acrosomal and plasma membrane (Numan Bucak *et al.* 2007; Rasul *et al.* 2001). Furthermore change of biochemical factors have been recognized during cryopreservation, including depletion of amino acids and lipoproteins, release of glutamic-oxaloacetic transaminase (GOT), decrease in phosphatase activity, decrease in loosely bound cholesterol protein, inactivation of acrosin enzyme and hyaluronidase, prostaglandins diminution, increase in sodium, decrease in potassium content, reduction of ATP and ADP synthesis and decrease in acrosomal proteolytic activity (Barbas *et al.* 2009). The extenders is an important factor in cryopreservation process. These mediums must have adequate pH and buffering capacity, appropriate osmolality and should

protect spermatozoa from cryogenic lesion. The Tris extenders are an important mediums that often used for semen freezing of bulls, rams, bucks and buffaloes (Barbas *et al.* 2009; Rasul *et al.* 2001).

In fact sperm plasma membrane is a primary target for freezing or cold shock injury (Numan Bucak *et al.* 2009).

Reactive oxygen are responsible to sperm dysfunction due the lipid peroxidation of membranes (Arabi *et al.* 2001). Agrawal *et al.* (2005) demonstrated that antioxidants are the major defensive mechanism against oxidative stress. It has been now documented that vitamin E is the major antioxidant agent of sperm cells which is a potent scavenger of free radicals and is able to protect plasma membrane from damages mediated by ROS and LPO (Yousef *et al.* 2003; Gurel *et al.* 2005; Sinclair, 2000). It has been established that presence of vitamin E is necessary for normal function of male reproductive system and traditionally, vitamin E is called as anti-sterility (Momeni *et al.* 2009).

Bansal *et al.* (2010) and Ball *et al.* (2001) reported that E is a main chain-breaking antioxidant in membranes because it may directly quench the free radicals such as superoxide anion ($\bullet\text{O}_2^-$), hydrogen peroxide (H_2O_2) and hydroxyl radical ($\text{OH}\bullet$).

The present study aimed at finding out the efficacy of E, a biological antioxidant, in reversing

the free radical-mediated oxidative damage on sperm motility, acrosome integrity and viability.

2. Material and methods

2.1. Chemicals

The anti-oxidant used in this study such as E, and other chemicals were obtained from Sigma–Aldrich.

2.2. Animals, Semen collecting and processing

The four mature buffalo-bulls (3–4 years of age, and 600–650 kg of body weight) maintained at the northwest buffalo Research Institute, Ministry of Agriculture, Urmia, Iran, under uniform feeding, housing and lighting conditions were used as a semen donor. A total number of 20 ejaculates were collected from buffalo-bulls with the aid of an artificial vagina at weekly intervals for 5 weeks. Immediately after collection, the ejaculates were transferred to the laboratory, and evaluated for sperm motility and sperm concentration.

The sperm concentration of each ejaculate was determined by means of a spectrophotometer. Only ejaculates containing sperm with >80% progressive motility and a concentration higher than 1.5×10^9 sperm/ml were pooled, in order to eliminate the bull effect. The base extender was Tris-based extender (Tris 2.66 g/100 ml, citric acid 1.47 g/100 ml, fructose 0.63 g/100 ml, egg yolk 20% (v/v), glycerol 7% (v/v), pH 6.8) was used as the basis extender. Each mixed ejaculate was split into 11 equal aliquots and diluted at 37 °C to concentration of 6×10^6 sperm/mL with the base extender containing E (0.1, 0.5, 1 or 1.5 mM), and no anti-oxidants (control), respectively.

Diluted semen samples were aspirated into 0.5 ml French straws, sealed with polyvinyl alcohol powder and cooled horizontally from 37 to 4 °C, and maintained at 4 °C for 4 hrs. The straws were frozen in vapor 4cm above liquid nitrogen for 10 minutes and plunged into liquid nitrogen. After being stored for one month, 5 frozen straws from each group were thawed individually at 37 °C for 20 s in a water bath for microscopic evaluation.

2.3. Semen evaluation

• Sperm viability

A 50 µL drop of frozen–thawed semen was placed on a pre-warmed slide and mixed with 50 µL drop of the supravital stain [1% (w/v) eosin B, 5% (w/v) nigrosin in 3% tri-sodium citrate dehydrate solution] to prepare a thin smear [20]. After air-drying, the smear was evaluated by microscope with 400× magnification. Two hundred spermatozoa were counted for unstained heads of spermatozoa (live)

and/or stained/partial stained heads of spermatozoa (dead) (Ijaz *et al.* 2009).

• Post-thawed sperm motility

Percentage motility was assessed using a phase-contrast microscope (×40). A 5 µL drop of thawed semen placed directly on a pre-warmed slide and covered with a cover slip. Sperm motility estimations were performed in three different microscopic fields for each semen sample by the same researcher. The mean of three observations was considered as a single data point.

• Normal Acrosomes:

A 500-µL portion of each semen sample was fixed in 50 µL of a 1% solution of formal citrate containing 2.9% (w/v) trisodium citrate dihydrate (Merck) and 1% (v/v) commercial formaldehyde. Two hundred spermatozoa were counted with a phase contrast microscope (1000×) for their normal apical ridge.

• Statistical analysis

The study was replicated three times. Results are expressed as the mean ± standard error of the mean (SEM). Analysis of variance (ANOVA) was used to assess differences among treatments on motion characteristics, plasma membrane integrity and normal acrosome morphology. When the F ratio was significant ($P < .05$), Tukey's post hoc test was used to compare treatment means (Version 12.0; SPSS, Chicago, IL).

3. Results

• Sperm parameters (percentages of motility, viability, acrosome Normality):

The effects of antioxidants on the sperm characteristics of frozen buffalo semen were evaluated in the five independent experiments. The post-thaw sperm motility improved significantly ($P < 0.05$) in the groups as compared to their respective values.

As set out in Table 1, the inclusion of vitamin E led to a higher motility, compared to the control group ($P < 0.05$). The motility of sperm cells post thaw increased significantly when adding of 0.1, 0.5, 1 or 1.5 Mm, E (56.98 ± 0.05 , 61.08 ± 0.07 , 63.16 ± 0.17 and 65.03 ± 0.09 respectively) to the extender as compared to the control group (45.86 ± 0.18).

No significant differences were observed in acrosome damage, following the supplementation of the freezing extender with antioxidants, following the freeze–thawing process.

Table 1. Effect of different concentrations of vitamin E on buffalo-bull semen Motility after freezing-thawing

Treatments	Motility (%Mean \pm SE)
E 0.1 mM	56.98 \pm 0.05 ^d
E 0.5 mM	61.08 \pm 0.07 ^c
E 1 mM	63.16 \pm 0.17 ^b
E 1.5 mM	65.03 \pm 0.09 ^a
Control	45.86 \pm 0.18 ^e

Values are (mean \pm standard error of mean). Different letters within a column indicates significant differences (P<0.05).

Table 2. Effect of different concentrations of vitamin E on buffalo-bull semen acrosomal normality after freezing-thawing

Treatments	acrosomal normality (%Mean \pm SE)
E 0.1 mM	68.38 \pm 0.14
E 0.5 mM	68.03 \pm 0.12
E 1 mM	67.91 \pm 0.11
E 1.5 mM	68.26 \pm 0.14
Control	68.38 \pm 0.11

Table 3. Effect of different concentrations of vitamin E on buffalo-bull semen viability after freezing-thawing

Treatments	Live sperm (%Mean \pm SE)
E 0.1 mM	66.86 \pm 0.06 ^d
E 0.5 mM	71.03 \pm 0.28 ^c
E 1 mM	73.03 \pm 0.10 ^b
E 1.5 mM	74.7 \pm 0.14 ^a
Control	55.51 \pm 0.16 ^e

Values are (mean \pm standard error of mean). Different letters within a column indicates significant differences (P<0.05).

The viability of sperm cells post thaw increased significantly when adding of 0.1, 0.5, 1 or 1.5 mM, vitamin E (66.86 \pm 0.06, 71.03 \pm 0.28, 73.03 \pm 0.10 and 74.7 \pm 0.14 respectively) to the extender as compared to the control group (P<0.05) and the highest viability of sperms were seen at 1.5 mM vitamin E treatment. Also, there are significant differences between the E treatments (P<0.05).

4. Discussions

Buffalo sperm is susceptible to cold stress than other species such as bull, rabbit and human (Andrabi et al., 2008; Fise et al., 1989). Of course, different reactions to temperature tensions is result

from differences in membrane lipid composition as buffalo sperm has high levels of saturated and unsaturated fatty acids and has lowest ratio of cholesterol/phospholipids compared with other species (Evans et al, 1987).

Antioxidant capability in sperm cells is limited because of deficiency cytoplasmic components having antioxidant effects to expunction of reactive oxygens. Thus, mammal's sperm haven't enough ability to encountering with peroxidation during the freezing and thawing processes (Alvarez et al, 2005; Bilodeau et al, 2000 and Lapointe et al, 2003). Reactive oxygen is known to play a major role in sperm membrane damage and directly damage sperm DNA that cause reduces of the sperm's motility, acrosomal membrane integrity and sperm metabolic alterations. In recent years, adding antioxidants to semen extenders for improvement of sperm quality were studied.

Addition of antioxidants such as vitamin E and vitamin C to the semen freezing diluent, may prevents or diminishes cryodamage to spermatozoa metabolism and antioxidant capacities (Anghel et al, 2009; Andrabi et al, 2008; Beheshti et al, 2011).

Beconi et al (1991) demonstrated that vitamin E prevents lipid peroxidation of frozen bovine semen. It has been demonstrated that this improved sperm quality and fertility in human sperm.

In some studies have been documented low levels of vitamin E would allow for production of physiological level of ROS that are necessary for capacitation, acrosome reaction and *in vitro* fertilization (DalEt al, 1998). Addition of vitamin E had a beneficial effect on sperm motility in liquid ram semen (Upreti et al, 1997), fresh human semen (Donnelly et al, 1999) and to little effect in equine chilled semen (Ball et al, 2001). In the present study, the inclusion of different levels of vitamin E to extender before freezing causes significant improvement in sperm quality parameters such as motility and viability of sperms than control group (P<0.05).

This study shows that all doses of vitamin E improve the buffalo sperm quality parameters such as motility and viability of sperms than control group (P<0.05). These findings were similar to results obtained with Ijaz et al (2009), Kheradmand et al (2006), Bansal and Bilaspuri (2009).

Supplementation the incubation medium with all doses of vitamin E improved the percent sperm motility compared to control group (P<0.05). It is suggested that addition of E may be useful in preventing the rapid loss of motility that occurs during semen freezing.

However, we haven't seen significant differences in normal acrosome percent between treatment and control groups. This finding was in contrast with results of Bansal (2010) that may be due to the differences in semen extender and animal species.

Abstract: Supporting students' autonomy has many outstanding benefits. It promotes self motivation and satisfaction for students in various learning settings. The aim of this study was to identify the nursing students' perception of their clinical instructors autonomy support. A convenient sample was taken from Faculty of Nursing, Alexandria University at Maternity and Psychiatric Nursing Departments. Sample of this study consisted of 250 undergraduate students attended and studied Maternity and Psychiatric Nursing courses. Data were collected in the second semester of academic year 2009/2010. Two tools were used to collect the necessary data. One questionnaire sheet to obtain demographic data including gender, age, and academic achievement. Second questionnaire sheet was Learning Climate Questionnaire, to assess the perceived autonomy support among students at different learning settings. Results of this study showed that the majority of Maternity and Psychiatric nursing students perceived either low or moderate levels of autonomy support and no statistically significant difference was found. Significant differences were only found between students' perception of clinical instructors autonomy support and gender differences among both groups. Teaching programs will be recommended to train clinical instructors in both specialties to display more autonomy-supportive behaviors.

[Fatma Hussein Ramadan and Rasha Mohamed Essa. B Perceived autonomy support among Maternity and Psychiatric nursing students. Journal of American Science 2011;7(6):232-240]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: autonomy support, self-determination theory, gender differences, maternity and psychiatric nursing students.

1. Introduction:

Motivation is a key element in nursing education. Highly motivated students are more enthusiastic, interested, involved, and persistent in their learning.⁽¹⁾ One source of intrinsic motivation is student autonomy. Autonomy is one of the basic psychological needs in which humans are intrinsically motivated toward learning, growth and intellectual challenge. This innate motivation requires nutrients from interpersonal environment in order to remain operative and creative.⁽²⁾ Among the necessary nutrients are support and encouragement for the individual to be self-initiating and volitional. Autonomy is encouraged when students are allowed to make decisions as to what, when, and how they learn.^(3,4)

According to a large body of empirical research in social psychology, individual autonomy is defined as "independence from others, feeling free and volitional in one's actions".⁽⁵⁾ Spear and Kulbok (2004) had performed a conceptual analysis of autonomy including the examination of selected research studies published between 1985 and 2001 within the fields of education, psychology, and nursing. Their findings demonstrated that the autonomy concept has been used to describe maturation, self-governance, individuation, and self-actualization.⁽⁶⁾ In learning situation, autonomy is

defined as "the students' ability to take charge of their learning, to develop a personal learning plan, to find resources for study and to evaluate themselves".⁽⁷⁾

Autonomy is a priority human need that improves the quality of human development in the light of different theoretical perspectives in psychology, ranging from psychoanalytic thinking in the conceptualization of personality to evolutionary psychology.⁽⁸⁾ It fosters human development in two ways. *First*, human development promotes autonomy because it expands human potentials and people's opportunities to participate in social life. *Second*, it supports human development because the more autonomous people are in better position to expand the potentials they most value and experience the responsibility for their own behaviors. Accordingly, they can enact significant social change in coordination with others to pursue common goals for improving their present and future well-being.⁽⁹⁾

Autonomy in nursing profession refers to nurse's freedom to act on what she/he knows in the best interests of the patient, to make independent clinical decisions in the nursing sphere of practice and interdependent decisions in those spheres where nursing overlaps with other disciplines. It often exceeds standard practice and includes being held accountable in a constructive and positive manner.⁽¹⁰⁾

Nurses in all nursing specialties have to act on their own in different situations. Some of these specialties can at times be much more physically, mentally, and emotionally demanding, such as maternity and psychiatric nursing specialties. Nurses in maternity nursing provide physical and psychological care to women during pregnancy, childbirth, and to women and their babies following birth. Similarly, nurses in psychiatric nursing provide emotional care for patients experiencing acute mental illness, administer and monitor psychopharmacologic agents, and provide crisis intervention. Furthermore, nurses in both specialties respond to the psycho-educational needs of the patient and their family members. All of these caring behaviors in maternity and psychiatric nursing professions require high level of autonomy and flexibility to independently make clinical decisions within the nurses' scope of practice.⁽¹¹⁾

Accordingly, the intended learning outcomes of maternity and psychiatric nursing education endorse many autonomous activities that have been evaluated by clinical instructors in various clinical settings for both specialties. Maternity activities include: the biopsychosociocultural assessment of pregnant, parturient, and puerperal women. Also provision of appropriate nursing interventions throughout the above mentioned 3 stages of the maternity cycle. In addition the provision of the immediate care of the newborn. In psychiatric nursing education, students assess patients' psychological needs, utilize therapeutic communication, build trustful relationships with psychotic patients, produce emotional care plans and apply de-escalation techniques to help patients manage their emotions and behavior. Hence, the development of the autonomous profession, capable of self-determination and independence of thought, has long been valued as a goal of professional nursing education.

Several studies showed that the quality of learning engagement does not depend on students' cognitive abilities alone, but is also influenced by complex motivational and affective factors.^(12,13,14) A necessary component for developing autonomy in nursing students is autonomy in approaches to learning, where students can specify what they want to learn, how they want to learn it, how to demonstrate learning, and the criteria to measure learning. The learning climate, which supports students' autonomy, will enhance their intrinsic motivations, whereas climates that control students' behavior and diminish their sense of volition and choice will undermine this natural motivation.⁽¹⁵⁾ Many studies revealed that learners who are involved in making choices and decisions about the aspects of the learning programs are self-motivated and

reflective learners and are likely to feel more secure in their learning.⁽¹⁶⁻¹⁹⁾

The role of clinical instructors in nursing education is to support the students' autonomy to facilitate their growth educationally and personally. The clinical supervision during clinical practice allows student nurses to focus on personal and professional strengths and difficulties. There are number of educators-behaviors that affect students' autonomy support, these behaviors include providing choice, minimizing the use of controls, and acknowledging the students' perspectives and feelings.⁽²⁰⁾

Supporting students' autonomy has many outstanding benefits; one of them is the positive effect it will have on students' perception of self as well as how they view their peers, experience emotional stability and being less vulnerable to depression and psychological distress. It will also create confident, independent thinkers, who will be motivated leaders in nursing profession and this ever-changing global society.^(21,22) Although autonomy supportive contexts in nursing education may hold promise for enhancing students' achievement and psychological development, few researches were done to investigate autonomy support among nursing students in different nursing specialties. Yet, a descriptive study was conducted by Karagozoglu (2009) aimed at determining the level of autonomy of final-year university students. He found that the nursing students' level of autonomy was lower than the students' level of autonomy in other health-related branches.⁽¹²⁾ Another study revealed that clinical accompaniment was perceived as being the availability of nurse educators in clinical settings, it provides autonomy support to student nurses⁽¹³⁾

Learning strategies in maternity and psychiatric clinical practice can either prepare or be an obstacle to the students' thinking and acting like independent professionals. Therefore, this study aimed to investigate the maternity and psychiatric nursing students' perception of their instructors autonomy support during clinical experience.

Aim of the study:-

This study aims to identify the nursing students' perception of their clinical instructors autonomy support.

Research questions:

- 1- What is the nursing students' perception of their clinical instructors autonomy support?
- 2- Is there a difference between Psychiatric and Maternity nursing students' perception of their clinical instructors autonomy support?

2. Materials and Method

Materials

Design:

A descriptive correlation research design was utilized in this study.

Setting:

The study was conducted at Faculty of Nursing, in Alexandria University.

Subjects:

A total of 250 undergraduate nursing students who were enrolled in the BSN program and who just finished their clinical practice in maternity and psychiatric Nursing courses at the previously mentioned setting (130 of them were maternity nursing students and 120 of them were psychiatric nursing students).

Tools:

Tool (1)

A structured questionnaire sheet was developed by the researchers .It entailed information related to: socio-demographic data of the students such as name, age, sex, residence, and academic achievement.

Tool(2)

A modified version of the learning climate questionnaire (LCQ) that was originally developed by William (1996)⁽²³⁾. It assesses the perceived autonomy support among students at different learning settings. It comprises 15 items .Each item is scored on a 5 point Likert-scale that ranges from one to five where one denotes, two indicates, three to 5. The total score ranges between 15 and 75 with higher average scores represents a higher level of perceived autonomy support.

Methods:-

-Permission to conduct the study was obtained Official permission to conduct the study was obtained from the head of both Maternity and Psychiatric Nursing Departments.

-Tool (LCQ) was tested for the content validity by experts in the fields of Maternity and Psychiatric nursing education and necessary modifications were done. The reliability of the LCQ with the test - retest was tested. It produced an alpha coefficient of 0.94 for maternity nursing students, and 0.96 for psychiatric nursing students.

-Psychiatric and maternity nursing students were asked to complete a confidential Questionnaire. They were informed of their rights to decline participation or to participate voluntarily.

-A pilot study was carried out on 20 students who were excluded from the study. The aims of the pilot study were to:

-Test the validity, relevance and clarity of the questions.

- Estimate the time needed to complete the tool.

- Find out any problem that might interfere with the process of data collection.

-Appropriate modifications were done prior to data collection.

- Explanation of the aim of the study for students was done and the written consent to participate in the study was obtained.

-Students received research questionnaires and were given 30 minutes to complete the questions. Data were collected in the second semester of academic year 2009/2010.

Statistical analysis

The data was collected and entered into the personal computer. Statistical analysis was done using Statistical Package for Social Science (SPSS/version17) software. A comparison of the overall abilities of the two groups to accurately classify the subjects was performed by a Z test to compare two groups.

Arithmetic mean, standard deviation, number and percent were being utilized. For categorized parameters Chi square test was used while for numerical data t-test was used to compare two groups. The level of significant was 0.05.

3. Results

Table (I) presents number and percent distribution of the study subjects according to their general characteristics. The mean age of the subjects was 20.6 ± 1.56 years for maternity nursing students & 22.1 ± 1.1 years for psychiatric nursing students. More than one- half of the maternity and psychiatric students (68.5% &63.3% respectively) were female. The majority of the maternity and psychiatric groups were from rural areas (75.4% and70.0% respectively).

Concerning the students' clinical grades in maternity nursing specialty, only 3.8 % of students had excellent grade, slightly less than one third of them (33.1%) had very good grade , two- fifths of them (40%) obtained good grade , about one- fifth (19.2%)had pass grade , and only 3.8% of the students failed.

On the other hand, only 5.8% of psychiatric nursing students received excellent grade, one third and slightly more (33.3% &34.2%) had very good and good grade respectively. Less than one quarter of them (23.3%) had pass grade and 3.3% failed.

Table I: Socio-demographic data of the studied sample in the two groups.

	Maternity		Psychiatric		X ² P
	No.	%	No.	%

Total	130	100	120	100	

Table (II) illustrates the study subject's total score of perceived autonomy support. It was noticed that only 15.4% of maternity nursing students perceived high autonomy support. While about half (49.2%) of them had moderate level and 35.4 % experienced low autonomy support. For psychiatric group, only 12.5% of psychiatric nursing students perceived high autonomy support. 50% & 37.5 % experienced moderate and low autonomy support respectively, no statistical significant difference was found between both groups.

Table II: Total score of perceived autonomy support among the two studied groups.

	Maternity		Psychiatric		X ² P
	No.	%	No.	%	
Low	46	35.4	45	37.5	0.46 0.79
Moderate	64	49.2	60	50.0	
High	20	15.4	15	12.5	
Total	130	100.0	120	100.0	

Table (III) shows the comparison between maternity and psychiatric nursing students' perceptions about instructors' support for their autonomy. The table reveals that, a statistically significant differences between the two studied groups in relation to feeling that instructors provide choices and option as well as able to be open with instructor during clinical training. ($p = 0.03$ & 0.021 respectively.)

Furthermore, a significant differences were also found between both groups in relation to feeling a lot of trust in instructors and not feeling very good about the way the instructor talks to student. ($p = 0.031$ & 0.041 respectively).

Table (IV) presents the relationship between total score of perceived autonomy support among maternity and psychiatric nursing students and their gender. As regards to maternity nursing students, it were obvious that high, moderate and low autonomy score of autonomy support were obtained by (7.3%, 24.4% and 68.3%) respectively of male students as compared to (19.1%, 60.7% & 20.2%) of those female student.

Table III: Comparison between the two studied groups regarding autonomy support Questionnaire.

No. of questions	Maternity	Psychiatric	p
1. I feel that my instructor provides me choices and option	2.62±1.00	4.08±0.97	0.03*
2. I feel understood by my instructor	2.92±0.92	3.74±1.00	0.51
3. I am able to be open with my instructor during clinical training.	2.54±1.06	4.01±1.0	0.021*
4. My instructor conveyed confidence in my ability to do well in the clinical setting.	3.77±1.10	3.71±0.98	0.61
5. I feel that my instructor accepts me.	3.80±1.06	3.01±0.99	0.53
6. My instructor made sure I really understood the goals of the clinical training and what I need to do.	3.61±1.01	2.16±1.21	0.34
7. My instructor encouraged me to ask questions.	3.56±1.02	3.27±1.11	0.33
8. I feel a lot of trust in my instructor.	1.85±1.24	3.41±1.00	0.031*
9. My instructor answers my questions fully and carefully.	3.98±1.02	3.41±1.01	0.42
10. My instructor listens to how I would like to do things.	3.96±0.91	3.18±1.00	0.37
11. My instructor handles people's emotions very well.	2.21±1.01	2.38±1.10	0.42
12. I feel that my instructor cares about me as a person	3.44±1.00	3.68±1.00	0.39
13. I don't feel very good about the way my instructor talks to me.	4.21±1.00	3.05±1.04	0.041*
14. My instructor tries to understand how I see things before suggesting a new way to do things.	3.11±1.28	3.42±1.01	0.32
15. I feel able to share my feelings with my instructor	3.31±1.00	3.61±0.94	0.41

Table IV: Relation between total score of perceived autonomy support and gender.

	Maternity						Psychiatric

X ²	12.85						5.65					
P	0.0022*						0.012*					

On the other hand, high, moderate & low score of autonomy support were obtained by 20.5%, 63.9%, & 15.9% (respectively) of male psychiatric nursing students compared to 7.9%, 42.1% , & 50% of those who were female psychiatric nursing students. A statistically significant differences between high , moderate & low of perceived autonomy support among the two studied group regarding gender .where p= 0.0022 & 0.012 for maternity & psychiatric group respectively.

Table (V) reveals the relationship between age and total score of perceived autonomy support

among maternity and psychiatric nursing students. For maternity nursing students it was noticed that about one-fifth (19.7%) of students who were less than 20 years old had high autonomy support compared to only 9.7% of those who were 20 years old and more. On the other hand, for psychiatric nursing students all studied groups (100%) were 20 years old had high (17.5%) , Moderate (50%) and low autonomy support (37.5%). A statistically significant differences were found between age and total score of perceived autonomy support for maternity group where P= 0.0255.

Table V: Relation between total score of perceived autonomy support and age.

Table (VI) shows the relationship between residence and autonomy support among maternity & psychiatric nursing students. For maternity nursing students, it was observed that, 7.1% of the students who came from rural areas had high autonomy support as compared to 40.6% of the students who came from urban areas. In addition, 52% & 40.8% of the students who came from rural areas had moderate and low autonomy support respectively as compared to 40.6% and 18.8% of those who came from urban areas.

Table VI: Relation between total score of perceived autonomy support and residence.

	Maternity						Psychiatric					
	Low		Moderate		High		Low		Moderate		High	
	No.	%	No.	%	No.	%	No.	%	No.	%	No.	%
Rural	40	40.8	51	52.0	7	7.1	30	35.7	42	50.0	12	14.3

Total	46		64		20		45		60		15	
X ²	21.54						0.95					
P	0.0002*						0.621					

Table VII presents the relationship between total score of autonomy support and students' academic grades. It was found that most of the maternity & psychiatric nursing students who had excellent grades experienced high autonomy support (80% & 85.7% respectively). Whereas, the majority of the students in maternity and psychiatric groups who

As for psychiatric nursing students, 14.3% of the students who lived in rural areas experienced high autonomy support as compared to 8.3% of those who lived in urban areas. While 50% & 35.7% of the students who lived in rural areas had moderate & low autonomy support score respectively as compared to 50% & 41.7% of those who lived in urban areas. It was observed that no statistical significant differences between residence and perceived autonomy support among students for both studied groups

failed experienced low autonomy support (100% & 75% respectively). Statistically significant differences were found between perceived autonomy support and students' academic grades for both studied groups.

Table VII: Relation between total score of perceived autonomy support and grade.

4. Discussion

Maternity and psychiatric nursing education requires the nursing students to be more self-directed and engaged in a process of continuous professional development. They need encouragement to participate in social and educational activities that affect the practice of nursing and the quality of health care. The concept of autonomy in nursing education is regarded as an essential element for gaining professional status. Yet, it remains poorly defined and understood, little research has focused on exploring how nursing students in different

specialties perceive autonomy support.^(24,25) Hence, the purpose of this study was to determine the perception of autonomy support among maternity and psychiatric nursing students in their clinical practices.

The results of the present study indicated that nearly half of both maternity and psychiatric nursing students perceived a low level of autonomy support with no significant difference was found between them. This can be explained in the light of lacking of instructors' experience to promote motivational learning climate within the stressful context of the practical area in both specialties. Moreover, these

results are expected because the faculty curricula still focus on the traditional educational practices, where they prioritize conveying knowledge, preventing the apprentices from being creative, innovative, and of becoming responsible for their own learning process.

However, a significant differences were found between both groups regarding student's perception for some aspects of autonomy support as: allowing students to have some choices and options, being opened with instructors and having a lot of trust in instructors. These aspects of autonomy support were more reported by psychiatric nursing students as compared to maternity nursing students. While the aspect of feeling bad about the way that instructors talk to students was more reported by maternity nursing students than psychiatric nursing students. These data are consistent with the findings of Saarikokkia et. al. (2007) who claimed that a good mentor in psychiatric nursing education possesses appropriate professional attributes, knowledge, good communication skills and the motivation to teach and support students as well as maintaining supportive relationships with student nurses.⁽²¹⁾ Freeburn (2009) added that Psychiatric nursing students experience more stressors in Psychiatric settings than any other nursing specialties. Hence, they need supportive learning climate to manage these stressful situations during practice placement.⁽²⁶⁾

Furthermore, the role models in psychiatric nursing education must have the required knowledge, skills, integrity, personal bearing, neatness, empathy, sympathy and willingness to assist and motivate students. Role models are accountable for what happens in their clinical settings and should be trusted by student nurses because they are professional nurse practitioners. The image projected by role models should be positive and acceptable to student nurses at all times.⁽²⁷⁾

Clinical instructor's motivating style influences a great deal of engagement in learning situations and enhances intrinsic motivation among students. It is suggested that whenever students perform under autonomy supportive conditions, they tend to perceive themselves as more competent in cognition-based activities and report higher self-esteem⁽²⁸⁾. This explains why perceived autonomy support was positively correlated with students' final grades among nursing students in the present study for both groups. Several studies have also confirmed the detrimental effects of controlling environment over student's intrinsic motivation and academic performance.^(22, 28,29)

Regarding the relationship between autonomy support and gender differences, the present study showed a significant difference between male and female students in relation to their perception of

autonomy support for both groups. Male students in psychiatric nursing specialty perceived more autonomous support from clinical instructors than female students did. This can be explained by the fact that, culture fosters the sex difference by permitting male independency and assertiveness, while encouraging female dependency and passivity. Other studies reported that female students have less positive attitudes toward autonomous behavior, and participate in fewer relevant extracurricular activities than males. Furthermore, they also revealed that teachers' attitudes toward the inclusion of male students in nursing education indicated overall positive acceptance of males in nursing.⁽³⁰⁻³⁴⁾

As for maternity nursing students, the results of the present study were the opposite. Male students experienced low level of autonomy support than female.

Men in obstetric nursing often find themselves discriminated against, especially in the area of obstetrics. Male nursing students are not allowed to provide personal or intimate care for female patients. The biases that exist for men in nursing might be better described as "glass walls," since they are a barrier that prevents men from functioning in a full nursing role in this nursing specialty. Based on researchers' observation, male students at Faculty of nursing, Alexandria University, in Egypt are prevented from practicing clinical skills on real patients in the maternity hospital for some practical areas such as antenatal care, natal care, post - natal care and family planning. They allowed only carrying out some clinical skills in lab on simulated patients. Many studies revealed that male students have reported increasing numbers of women declining to have male students involved in their care and that some clinical instructors are less helpful than they are to female students. Differences in clinical experience according to sex have been reported in the United States, with women students receiving more experience in seven of 12 skills specific to women and men receiving more experience in two of three skills specific to men. Greatest experience was gained where teacher, student, and patients were of the same sex. This reason can clear up why male students perceived low autonomy support than female and had inferior position when trained in this female-bias specialty.⁽³³⁻³⁵⁾

Descriptions of the meaning of autonomy support in psychiatric and maternity nursing education can add to nursing knowledge by identifying how higher perceived autonomy support is positively correlated with student's academic performance and psychological maturity. Supporting the student's autonomy may increase students' interest and involvement in learning. It allows students to see

themselves as decision makers who are able to influence events in their professional and social lives.

4. Conclusion

According to the findings of the present study it could be concluded that, most of maternity and psychiatric nursing students perceived either low or moderate levels of autonomy support and no statistically significant difference was found. Significant differences were only found between students' perception of clinical instructors autonomy support and gender differences among both groups. The majority of male students in maternity nursing course perceived low level of autonomy support in comparison with male students in psychiatric nursing course. Furthermore, most students who experienced low level of autonomy support had obtained lower academic grades than those with high autonomy support among both groups

Recommendations

Based on the study findings it is recommended that:

1. Clinical instructors of maternity and psychiatric nursing courses need to be aware of their styles of supporting students' autonomy during clinical experience.
2. Teaching programs should be conducted for clinical instructors in both specialties by psychiatric nursing professors to train them to display more autonomy-supportive behaviors.
3. Formative and summative evaluation of students' perception of autonomy support should be conducted periodically in both specialties in order to provide information on program effectiveness and to make early improvements.
4. Undergraduate educational programs should promote self-directed and reflective learning.
5. Structuring the learning environment and using a variety of self learning strategies in both specialties for promoting and supporting students' autonomy.
6. Helping students to set and prioritize goals, and work towards explicit goals when developing and applying maternity and psychiatric care plans in clinical experiences.
7. Maternity nursing educators should develop learning strategies to improve the educational experience for male nursing students .
8. Re-planning of some of the clinical rotations of Maternity Nursing to include substitute clinical experience for the male students .
9. Male students should be oriented to and encouraged to identify with role model of male obstetricians during the clinical practice.
10. Further research is needed for larger sample to compare between nursing students' perception of

autonomy support with other health- related students

Acknowledgements

Our gratitude and appreciation to Maternity and psychiatric nursing students - Faculty of Nursing - Alexandria University for their cooperation to accomplish such study that reflects their real experience in maternity and psychiatric nursing.

Abstract: Doxorubicin, has for long been a major component in the combination chemotherapy for Breast Cancer. At a cumulative dose of 400 and 600mg/m² cardiomyopathies and electrocardiographic changes have been reported which may be worsen in patients who receive external beam radiation treatment to the left chest wall. This study aimed at examining presence of cardiac sequelae that may result from concurrent use of Doxorubicin based chemotherapy and external beam radiotherapy to the chest wall in our breast cancer population. Sixty-five (65) patients with cancer of the breast on combination therapy who received 50mg/m² of Doxorubicin in four divided three weekly doses and had 50Gy of external beam radiation in 25 daily fractions over 5 weeks were evaluated. The patients also had 5-fluorouracil 1000mg/m² and Cyclophosphamide 1000mg/m² as part of the combination chemotherapy. All patients had ECG and Echocardiography before commencement of treatment and at three and nine months post treatment. Only 55 were found evaluable at the end of the study with mean age of 48 years. Eleven patients had history of hypertension while none had any previous history of heart diseases. The pre and post-treatment ECG and Echocardiography were similar (p>0.05). The participants were also symptom free during the follow up period. Though this study suggests a safe combination of Doxorubicin-base chemotherapy and chest wall radiation within the period of evaluation, this may however, not exclude the possibility of long term complications. [A.A. Adenipekun, O. Oladapo, T.N. Elumelu. Concurrent External Radiotherapy And Doxorubicin Based Chemotherapy In Breast Cancer Patients Any Cardiac Side Effects? Journal of American Science 2011;7(6):241-244]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Concurrent Radiotherapy; Doxorubicin Chemotherapy; Cardiac side effect

1. Introduction

Doxorubicin is anthracycline, cytotoxic agent used in combination with Cyclophosphamide and 5-fluorouracil as first line chemotherapy in breast cancer management worldwide.

Doxorubicin has among other side effects, cardiac toxicity^{1, 2}, which necessitates monitoring of cardiac functions by ECG and echocardiograph before commencement of Doxorubicin based chemotherapy regimen. At a cumulative dose of 400mg – 600mg/m² cardiac side effects such as congestive heart failure, cardiomyopathies associated with reduction of QRS voltage, and reduction of the left ventricular ejection fraction have been reported^{3,4,5}, hence the need for regular follow up.

A potential increase in risk of cardiotoxicity is envisaged when Doxorubicin is used concomitantly or prior to External Radiotherapy to the mediastinal pericardial area when delivering radiotherapy to the chest wall of breast cancer patients.^{7, 8}

Concurrent use of Radiotherapy and Chemotherapy is preferred because delay in commencement of radiotherapy has been shown to decrease local control of breast cancer.⁹

There is an inclination towards chemo-radiotherapy because chemotherapy potentiates the effects of irradiation, on this combination reduces total length

of time for treatment, but may increase risks of cardiac toxicity.

This study aims to define the risks of cardiac toxicity in patients on combination therapy.

2. Materials and Method

Sixty five new consecutive patients with confirmed diagnosis of breast cancer attending Radiotherapy clinic of University College Hospital, Ibadan, Nigeria were recruited. Treatment involved 4 courses of combination chemotherapy with Doxorubicin 50mg/m², 5 Fluorouracil, 1000mg/m², Cyclophosphamide 1000mg/m² given intravenously on day 1 and repeated every 21 days. External Radiotherapy commenced 3 days later with 50 Gy in 25 fractions delivered to the chest wall by tangential fields. Cobalt-60 Teletherapy machine of 1.25 MeV energy was used. Each patient was simulated prior to commencement of radiotherapy. All patients were reviewed weekly to monitor any side effects.

All the patients had full blood count, serum urea and electrolyte, ECG and Echocardiography prior to commencement of treatment. The Echocardiography was repeated at the 3rd and 9th month after completion of treatment.

The echocardiography studies defined pre and post left ventricular ejection fraction, left ventricular end-

diastolic volume, (LVED) left ventricular (LVED) end-systolic volume, left ventricular internal Diameter (LVID) (diastolic), left ventricular Internal Diameter(Systolic) and Ejection fraction (Teicholz/Pombo method).

The objective of the study was explained to the patients and informed consent form was signed by them. Ethical clearance was obtained from the Joint University of Ibadan/University College Hospital, Ibadan ethical review committee.

Short interview with a set of questionnaires was conducted to obtain demographic data and medical history. The second part of the questionnaire consisting of data on investigation results was completed by the attending doctor.

Exclusion Criteria: Patients who have had any previous form of cytotoxic chemotherapy were excluded. Patients were withdrawn from the study when chemotherapy could not be tolerated. Patients with other co-morbid illness e.g. diabetes, were also excluded. Data Analysis Package: The data collected was analyzed using SPSS statistical soft ware.

3. Results

A total of 65 subjects were recruited but only 55 were evaluable. The reasons were deviation from study protocol and inadequate parameters for study in their Echocardiogram reports .The age group ranged from 24- 72 years while the age group 50-59 (32.7) were in majority. 37 subjects (67.2%) had parity of 4 and above. Eleven of the subjects had history of hypertension; none had history of heart disease. 48 (87.2%) of them were sedentary workers. All participants had their Full blood Count and Serum Electrolytes and Urea within normal limits. The six parameters mentioned above in the Echo-cardiograph pre and post treatment were compared.

Table 1

T-Test

		Group			
		N	Mea	Std.	Std. Mea

4. Discussion

Chemo-radiotherapy is a regimen of cancer treatment being used for most Head and Neck and gynaecological malignancies, it is also now being used in Breast cancer cases, the idea is to take advantage of the synergistic effect of the cytotoxic chemotherapy and radiotherapy. This prospective study has shown that there is little or no harmful effect on the heart when Doxorubicin based cytotoxic chemotherapy is combined with radiotherapy of the chest wall of breast cancer patients. The differences noticed in the parameters of the echocardiograph of the 55 patients studied pre and post treatment were not statistically significant as shown in the Tables 1 and 2. No serious side effects were observed during the 9 month post treatment follow -up.

As shown in Table 3, correlations were significantly present between Pre treatment Left ventricular end diastolic volume LVEDV1 and Post treatment Left ventricular end systolic volume LVESV P : 0.001. Same was noticed for Pre treatment Left ventricular internal Diameter Diastolic (LVDIAD1) and post treatment Left ventricular internal diameter diastolic LVDIAD2 p: .0001, this was also true for internal diameter systolic pre and post treatment with p: .0001. These observations did not translate to any observable clinical signs among the study group Clement IP et al in their study of cardiac dysfunction following initiation of Doxorubicin therapy reported that LV systolic and diastolic function were not related to doxorubicin dose, however the decrease in LV ejection fraction with Doxorubicin were more notable in patients who received concurrent mediastinal irradiation with Doxorubicin.

In our study there was no notable difference in LV ejection fraction pre and post current irradiation and Doxorubicin.

Minow R.A et al reported cardiomyopathy to be of increase in uncontrolled hypertensive patients exposed to Doxorubicin even at lower doses.

It was also observed that congestive Heart failure was more likely to be fatal if it developed shortly after the last dose of Doxorubicin. There were 11 patients with controlled hypertension among the patients studied, non had any adverse reaction expect for a patient whose last course of Doxorubicin had to be delayed

because of dizziness and easy fatigability she however admitted to having these symptoms periodically even before the commencement of treatment. In conclusion our results on a general note did not reveal any adverse cardiac side effects as seen on the outcome of the echocardiographs within the study period of 9 months, however in view of the limited number of patients involved in this study it might be difficult to conclude on the safety of this regimen of treatment. A larger and longer study will be required to ascertain the long term safety of the regimen.

Acknowledgement

We would like to express our profound appreciation to the University of Ibadan for providing the fund through the Senate research grant to make this study a reality. Our thanks also extend to our research assistant, then Miss Lizzy Elezi, now married, for her efforts in ensuring the success of the study.

Abstract: Tannins are one of the secondary metabolites of plants that tend to combine with protein and reduce parasitic properties in livestock and veterinary industry. The aim of this study was to investigate effects of different levels of Quebracho Condensed Tannins (QCT) on Crude protein (CP) and other excretion parameters during naturally acquired mixed nematode infections in Moghani sheep. Twenty ewes (6-12 months years-old) with average body weight (26.5 ± 3.5 kg) were selected randomly and divided into four experimental groups: Control, A, B and C (were given 0, 1.5, 2 and 2.5 g/kg body weight QCT, respectively) in summer 2010. In order to reduce the undesirable effects of tannins, it was used as a single oral dose drenches. Faecal samples were taken at 24 and 48 hour after treatment. Our result showed that protein excretion has a significant difference in all treatment groups compare to control group after 24 hours from drenching ($P < 0.05$). Also, 48 hours after drenching, CP excretion was significantly decreased in treatment groups ($P < 0.05$) and the QCT has no significant effect on faecal excretion of dry matter (DM), organic matter (OM) and ash ($P > 0.05$). Our results indicate that high levels of tannins intake were decreased protein excretion and increased retention of nitrogen in animal body.

1. Introduction

Plant secondary metabolites are a diverse group of molecules that have not especial role in major plant processes such as Photosynthesis and Respiration. One of the most important secondary compounds can be pointed to the tannins (Karma et al., 2008). Mainly tannins were in all trees, shrubs and leguminous plants (Perevolotsky, 1994) and any altering in soil quality and weather conditions can change the levels of tannin in plant (Van Soest, 1994). Tanin has a very complex chemical structure (polyphenolic substances with various molecular weights and variable complexity) so it define is difficult (Schofield et al., 2001). Tannins are divided into two groups condensed (CT) and the hydrolysable tannins (HT) (Mueller-Harvey, 1999). The most important properties of tannins are mixture with proteins and ions but most tannin tend to combine with relatively large, hydrophobic and rich praline proteins (Hagerman et al., 1992).

Few decades ago, believed the anti nutrition effects of tannins are mixture with dietary protein which causes to reduce feed intake, diet digestibility and rumen fermentation (Barry and McNabb, 1999; Kumar and Singh, 1984; Mueller-Harvey and McAllan, 1992). Also, concluded that the tannins of different plant species have different chemical and

physical properties (Hagerman and Butler, 1991). Therefore, previous researchers demonstrated that ruminants fed by tanniniferous plants cause to benefits such as greater availability of (mainly essential) amino acids for absorption in the small intestine, nitrogen retention, reduce bloating, increase milk production, live weight, wool production and rates of ovulation (Min et al., 2003, 1999; Kriaa and Thewis. 1998/1999; Wang et al., 1996, 1994; McMahan et al., 2000).

On the other hand, gastrointestinal nematodes (GIN) are major problems in the livestock industry which considered decreasing of prolificacy, reducing reproductive performance, poor growth rate, low milk and wool production in ruminants (Max et al., 2005). Additionally, previous researchers reported grazing sheep and goats with tanniniferous hay cause to decrease load of nematode infection. Thus, they believe tannins have anthelmintic effects (Max et al., 2005; Maherisis et al., 2001). It seems CTs are capable formation complex with nematodes cuticle and may be due toxic effects on them (Niezen et al., 1995). The main propose of this study was to investigate short term effects of different levels of QCT as a anthelmintic on CP, OM, DM and Ash

excretion during naturally acquired mixed nematode infections in Moghani sheep.

2. Material and Methods

This study was carried out at Moghan plateau in Ardebil province, Northwest of Iran, which is located around 30°24'35.47" N and 48°18'12.36" E at 98m above sea level. In the first step, faecal samples were taken from the rectum of 200 grazer sheep in plastic containers and sent to lab by cold-temperature process (4°C). The parasite infection was determined in fecal samples. In laboratory, faecal egg counts (FEC) was monitored regularly using the modified McMaster technique (MAFF, 1978). In the second step, Twenty ewes (6–12 months' years old) with averaging body weight (26.5 ± 3.5 kg) with moderate load of GIN infection (the mean of FECs was about 450 per gram) were selected. Animals randomly were divided into 4 treatment groups ($n = 20$). All animals were given 7 hours fasting period then Control group received tap water as a placebo whereas A, B and C groups drenched (1.5, 2, 2.5 g/kg body weight) QCT as a water suspension, respectively for one day. The CT is astringent, so QCT suspended in 300 cc tap water. During the study, all animals fed *ad libitum* in Moghan plateau and free access to water. Faecal samples were taken 24 and 48 hours after drenching QCT. CP, DM, OM and Ash were determined using standard procedure (AOAC 1990). Data were processed in excel and analyzed as a complete randomized design for repeated measurements using SAS Software (version. / 9.1) and the least square means compared with Tukey multiple range tests.

3. Results

The mean \pm SE of the studied parameters was shown in Table 1. Also, the mean variation of CP excretion in different groups during the experiment was shown in Figure 1.

Our results indicate that there was a significant difference in CP excretion at 24 hours after administration of tannin to treatments compare to the control group ($P < 0.05$); however, there was no significant difference between B and C groups and maximum CP excretion was observed in C group. Also, there was a significantly difference in CP excretion at 48 hours after administration of the QCT only between C and other groups ($P < 0.05$).

Additionally, there was no significance differences between groups in DM, OM and Ash levels ($P > 0.05$).

4. Discussions

Tannins are mainly effective on reducing the nutrition ration digestibility but their influence on the proteins to form hydrogen bond that dependent to pH

(3.5 to 8). This combination is strong at pH rumen. It separates easily when the pH is lower than 3.5 or higher than 8 (Hagerman et al., 1992). Most possible mechanisms to reducing food digestibility in rumen by tannins were accepted by previous researchers which tannins due to this manner by substrate, enzyme and microorganisms inhibition (McMahon et al., 2000; Jones et al., 1994; Scalbert, 1991). McAllister *et al.* (1994) had reported to prevent tannins from binding microorganisms to plant cell walls which is necessary for them digestibility. Also, some researchers believe that the tannins have the ability to change the activity of Fibrolytic and Proteolytic enzymes (O'Donovan and Brooker, 2001; Waghorn, 1996). However, some authors observed that tannins may have directly affected by increase the membrane permeability of microorganisms (Scalbert, 1991; Leinmüller et al., 1991).

Table 1- Effect of different levels of Quebracho tannin on CP, DM, OM and Ash excretion in nematode infected ewes

Factors	Groups	Time (hour)	
		24	48
CP%	Control	13.57 \pm 0.21 ^c	13.33 \pm 0.2 ^{cd}
	A	14.2 \pm 0.19 ^b	13.16 \pm 0.18 ^{cd}
	Mean \pm SE	15.34 \pm 0.17 ^a	12.92 \pm 0.15 ^d
DM%	Control	33.44 \pm 0.25	33.4 \pm 0.51
	A	33.75 \pm 0.19	33.88 \pm 0.44
	Mean \pm SE	34.67 \pm 0.22	33.82 \pm 0.45
OM%	Control	77.02 \pm 1.47	76.79 \pm 0.68
	A	76.64 \pm 1.3	77.21 \pm 0.55
	Mean \pm SE	76.03 \pm 1.31	77.56 \pm 0.63
Ash%	Control	22.79 \pm 0.74	23.24 \pm 0.69
	A	23.02 \pm 0.56	22.47 \pm 0.59
	Mean \pm SE	22.53 \pm 0.61	21.76 \pm 0.6
	C	22.2 \pm 0.64	22.78 \pm 0.65

A: 1.5g QCT/kg body weight; B: 2g QCT/kg body weight; C: 2.5g QCT/kg body weight; CP: Crude protein; DM: Dry matter; OM: Organic matter; there is a significant difference among groups with different letters (a, b, c, d, e) in protein and other excretion factors values ($P < 0.05$); SE: Standard error.

One of the most obvious evidence demonstrates that tannins due to reduce protein digestibility by increased nitrogen excretion and increasing amounts of tannin nutrition ration (Silanikove et al., 1994). Excreted protein has 2 sources: Endogenous and exogenous; tannins have to be inclined with both of the protein so it's difficult to determining site of excreted protein (Waghorn, 1996). Research showed that feeding sheep with the tannin silage Mimosa was

added, protein excretion greater than the sheep fed with hay addition to the chestnut tannin (Deaville et al., 2010). Bengaly et al., (2007) showed that Wattle tannins in food goats (3 g/kg Dry matter of ration) increase the protein excretion. Also, previous researches were reported drenching different levels of Wattle tannin decreased faecal protein excretion in nematode infected Moghani ewes (Hassanpour et al., 2011). However, Kriaa and Thewis (1998, 1999) reported that sheep fed with little amounts of chestnut (0.8 g/kg Dry matter of ration) were decreased protein excretion and increased retention of nitrogen in animal body. Results of this experiment were different with previous researchers (Scalbert, 1991; Deaville et al., 2010; Bengaly et al., 2007). According to our previous results (Maherisis et al., 2011) We believe increasing high levels of QCT cause to decreasing nematode FEC and increase tannin-protein complex and decrease protein degradability in the rumen; thus, increasing NPN and amino acid flow to the small intestine and increased dietary protein absorption. Finally, decreased excretion of protein and increased nitrogen retention in the body.

Figure 1- comparison of mean variations of CP excretion in different groups during the experiment period.

^{*}hae50@hotmail.com

Abstract: Prematurity and intrauterine growth restriction continues to be the major determinant of neonatal morbidity and mortality. The aim of this study was to assess morbidity and mortality of mild and moderate preterm newborns admitted to NICU of Assiut University Children Hospital, and to find out the effect of birth weight on these outcomes. Three hundreds and six preterm cases were included of which 194 were mild preterm (34-36 gestational weeks) and 112 were moderate preterm (32-33 gestational weeks). Cases with birth weight <10th percentile on growth charts were classified as small for gestational age (SGA). Cases were followed during the admission period for neonatal mortality and /or morbidity including respiratory distress (RD), need for mechanical ventilation, sepsis/meningitis, intraventricular hemorrhage (IVH), and necrotizing enterocolitis (NEC). The length of hospital stay was also recorded. Results showed that moderate preterm group had significantly higher susceptibility to RD and IVH, and higher need to mechanical ventilation than the mild preterm group. Furthermore, they showed higher rate of death and longer hospital stay than the mild preterm. There was a significant negative correlation between gestational age and length of hospital stay. According to birth weight it was noticed that SGA moderate preterm showed higher mortality rate and higher rate of IVH and sepsis/meningitis than the corresponding AGA group, while SGA mild preterm newborns had significantly lower rate of RD and higher rate of IVH and sepsis/meningitis than the corresponding AGA group. Both SGA subgroups had significantly longer hospital stay than the corresponding AGA groups. In conclusion, preterm infants especially SGA are at greater risk of neonatal morbidity and mortality. Management strategies and guidelines should be settled to prevent spontaneous preterm deliveries and to early diagnose and manage intrauterine growth restriction.

[Hanaa A. Mohammad, Nafisa H R Abd ElAziz, and Randa Shams Eldeen. Outcome of Mild and Moderate Preterm Newborns Admitted to NICU of Assiut University Children Hospital, Relation to Birth Weight. Journal of American Science 2011;7(6):249-253]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: preterm, small for gestational age, neonatal outcome

1. Introduction:

Prematurity, defined as birth before 37 weeks gestation, is the major determinant of morbidity and mortality for newborns. Preterm births have increased 30% since 1981 and composed 12.5% of all births in some countries⁽¹⁾. Preterm births account for 75% of perinatal mortality and more than half the long-term morbidity⁽²⁾. Kramer *et al.*⁽³⁾ studied the contribution of mild (34-36 gestational weeks) and moderate (32-33 gestational weeks) preterm to infant mortality in United States and Canada. They found that, although the mortality rate of these groups was significantly lower than that of newborns whose gestational age < 32 weeks (severe preterm), yet these infants contribute substantially to over all infant and neonatal mortality. This is because these infants represent ~ 75% of total number of preterm infants and their deaths constitute much larger etiologic fraction of infant and neonatal mortality than do those who are more premature.

Evans *et al.*⁽⁴⁾ found that, in addition to prematurity as the dominant risk factor of mortality, low birth weight for gestational age had a dose-

response effect; the more growth restricted the infant, the greater the risk of mortality.

Advancement in the care of extremely preterm infants has led to a shift of focus away from the more mature preterm, who are being managed as near terms and treated as near normal⁽⁵⁾. The aim of this study was to assess morbidity and mortality of mild and moderate preterm newborns admitted to Neonatal Intensive Care Unit (NICU) of Assiut University Children Hospital, and to find out the effect of birth weight on these outcomes.

2. Patients and Methods

This study was conducted in the NICU of Assiut University Children Hospital in the period between January and December 2010. All admitted cases within the target gestational age range (32-36 weeks) were enrolled. Exclusion criteria included major congenital malformations, cases showed signs of intrauterine infection, and multiple births more than twin.

Prenatal data included maternal age, parity, socioeconomic state, consanguinity, medical

diseases, prenatal medical care, and premature rupture of membrane. Mode of delivery, state of placenta, and multiple births were recorded. Gestational age was calculated in completed weeks from the first day of mother's last menstrual period or according to early gestational ultrasonographic reporting. According to the gestational age, the studied preterm cases were classified into mild preterm group (34-36 gestational weeks) and moderate preterm group (32-33 gestational weeks)⁽³⁾. Birth weight and length was recorded. The birth weight was plotted against the National Center for Health Statistics charts⁽⁶⁾ and patients had weights < 10th percentile for their gestational age were classified as small for gestational age (SGA)⁽⁷⁾. The ponderal index was calculated as follows {PI = weight (g)×100 / length (cm)³}.

All cases were subjected to full physical examination and proper investigations according to their morbidity and managed accordingly. They followed up for the period of admission for neonatal mortality and /or morbidity including respiratory distress (RD), need for mechanical ventilation, sepsis/meningitis, intraventricular hemorrhage (IVH), and necrotizing enterocolitis (NEC). The length of hospital stay was recorded in completed days. The criteria for discharge from the NICU were fixed for all cases.

The study was approved by Ethical Committee of Assiut University. Collected data were coded, analyzed and computed using the Statistical Package for Social Science (SPSS) version 10. Chi-square test was used to assess differences between numerical values and student t-test was used to assess differences between continuous values. Correlations were assessed using Pearson coefficient. Differences were considered significant statistically when P< 0.05

Table (1): Demographic data and risk factors of the studied preterm newborns.

Demographic data & risk factors		Number (%)
Maternal factors	Mother <20 years	24 (7.8%)
	Primipara	53 (17.3%)
	Low socioeconomic	108 (35.3%)
	No antenatal care	94 (30.7%)
	Consanguinity	91 (29.7%)
	Maternal diseases	43 (14.0%)
	PROM	62 (20.2%)
	Cesarean section	117 (38.2%)
	Spontaneous preterm delivery	176 (57.3%)
Fetal factors	Sex (% male)	183 (59.8%)
	Multiple birth	115 (37.5%)
	Gestational age	
	32 – 33 weeks	112 (36.6%)
	34 – 36 weeks	194 (63.4%)
	Birth weight (mean ± SD)	1836.44 ± 421.20 g
Small for gestational age	63 (20.5%)	

3. Results

During the study period, 306 preterm newborns (32-36 weeks gestation) were eligible to the inclusion criteria; of which 194 were mild preterm (34-36 weeks) and 112 were moderate preterm (32-33 weeks). The demographic data and risk factors of the studied preterm newborns are shown in Table (1). In this study, the etiology of prematurity could not be precisely defined. However, depending on reviewing the maternal health record, 20.2% could be attributed to preterm premature rupture of membrane which followed by either induction of labor or cesarean delivery, 22.5% were due to medical indication (either maternal or fetal), and the remaining 57.3% were due to spontaneous preterm delivery. About 38% of the studied preterm cases were delivered by cesarean delivery of which 16% were elective cesarean delivery.

Table (2): shows the rate of adverse outcome of the studied preterm newborns according to gestational age. Moderate preterm group had significantly higher susceptibility to respiratory distress than the mild preterm group. Causes of respiratory distress included transient tachypnea of newborn, neonatal pneumonia, and respiratory distress syndrome. The majority of respiratory distress in the moderate preterm group was due to respiratory distress syndrome and lung immaturity (65/82; 79.2%), while the main cause in the mild preterm group was due to transient tachypnea of newborn (47/68; 69.1%).

Table (3): shows the rate of adverse outcome of the studied mild and moderate preterm newborns according to birth weight

Table (2): The rate of adverse outcome of the studied preterm newborns according to gestational age

	Mild preterm n = 194	Moderate preterm n = 112	P<
Respiratory distress	68 (35.5%)	82 (73.2%)	0.001
Mechanical ventilation	31 (15.9%)	59 (52.6%)	0.001
Sepsis/meningitis	47 (24.2%)	26 (23.2%)	NS
Necrotizing enterocolitis	4 (2.0%)	7 (6.2%)	NS

SGA: small for gestational age AGA: appropriate for gestational age

Differences were calculated between SGA and AGA of each preterm group

* P < 0.05 ** P < 0.01

Statistical difference could not be done due to small number of cases

4. Discussion

In this hospital based prospective descriptive study, we compared the adverse outcome of the admitted mild preterm (34-36 gestational weeks) versus the moderate preterm (32-33 gestational weeks) newborns. It was noticed that moderate preterm group had significantly higher susceptibility to respiratory distress, intraventricular hemorrhage and significantly higher need for mechanical ventilation than the mild preterm group (Table 2). Similar results were reported by Escobar *et al.*⁽⁸⁾. Furthermore, moderate preterm group showed higher rate of death than the mild preterm. Kramer *et al.*⁽³⁾ found, in his population based study, that relative risk (RR) of infant mortality were higher among moderate preterm infants in USA (6.6) and Canada (15.2) than the mild preterm (RR were 2.9, and 4.5, respectively).

In this study, the mean length of hospital stay was significantly higher in the moderate preterm group than the mild preterm group (Table 2). There was a significant negative correlation between gestational age and length of hospital stay ($r = -$

0.047, $P = 0.0217$). Beside the more likely medical problems in the former group, further delay in discharge of these cases may be attributed to delayed establishment of breast feeding which is one criterion of discharge from our unit. It has been reported that feeding problems were the dominant reason for delay in discharge of preterm infants as immature infants are less able to achieve effective suckling and swallowing⁽⁹⁾. However, the larger number of cases in the mild preterm group makes the sum of admission days of this group was higher with subsequent higher cost of admission of these cases than that for the moderate preterm group. This is supported by similar findings reported by several investigators^(9, 10). Although in obstetric and pediatric practice, the mild preterm is considered functionally full term, this group of infants still pause neonatal medical problems.

It is noteworthy to mention that 16.2% of all studied cases were delivered by elective CS which was done between gestational ages 35- 36 weeks. In obstetric practice, 34 completed weeks of gestation began to be considered a maturation milestone,

beyond which active interventions are rarely undertaken to prevent preterm birth⁽¹⁰⁾. Based on results reported by many investigators^(9,11,12), late or mild preterm infants are at greater risks of neonatal morbidity and mortality than full term infants

Gestational age, however, is just one factor in newborn and infant morbidity and mortality; additional risk is associated with being small for gestational age. So we sub-classify each studied preterm group into SGA and AGA. Small for gestational age infants constituted 20.5% of the whole studied cases; 18.5% of the mild preterm group and 24.1% of the moderate preterm group. The association between growth restriction and prematurity has been reported^(13,14). The explanation of this association may depend on the underlying condition; firstly growth restriction occurs and if the underlying pathology is severe premature labor supervenes⁽¹⁵⁾. The outcome of SGA preterm might differ than that of AGA preterm.

To study the effect of the birth weight on the adverse outcome of the preterm neonates, we compare the SGA group versus the corresponding AGA group of each gestational age group. It was noticed that the SGA moderate preterm group showed higher mortality rate than the corresponding AGA group, whereas, this finding was not found when we compared the SGA mild preterm group with the corresponding AGA group (Table 3). The SGA mild preterm group had significantly lower mean ponderal index than the moderate SGA preterm group (2.2 ± 0.41 , 2.69 ± 0.26 $P < 0.05$). This means that the SGA mild preterm infants were of the asymmetric type (wasted: normal length and head circumference but with low weight for length) while those of the SGA moderate preterm group were of the symmetric type (stunted: symmetrical reduction in weight, length and head circumference). It has been hypothesized that symmetric SGA occurs early in gestation and is due to genetic and chromosomal abnormalities, while asymmetric SGA occurs late in pregnancy and is due to inadequate nutrition⁽⁷⁾. This finding may denote that the growth restriction of moderate preterm are due to fetal causes rather than the prenatal malnutrition which may explain the high rate of their mortality.

Win *et al.*⁽¹⁶⁾ found that there was a 3.6-fold greater risk of neonatal mortality in preterm SGA, when used neonatal growth standards, as compared with AGA infants. Piper *et al.*⁽¹⁷⁾ showed that the neonatal mortality of infants with birth weight of less than the 10th percentile was higher than the AGA neonates at each gestational age up to 36 weeks.

Basso *et al.*⁽¹⁸⁾ summarizes that neonatal mortality of SGA infants is not due to the growth restriction itself, but is due to some confounding

factors causes the growth restriction and also causes the neonatal mortality. Such factors would include malformations, fetal or placental aneuploidy, infections or others.

Small for gestational age mild preterm infants had higher rates of intraventricular hemorrhage and sepsis/meningitis than the corresponding AGA group. Similarly, SGA moderate preterm infants had significantly higher rates of intra ventricular hemorrhage and sepsis/meningitis than the corresponding AGA group (Table 3). Simchen *et al.*⁽¹⁹⁾ found that SGA preterm infants had a higher mortality rate and high culture proven sepsis than the AGA preterm. Moreover, Win *et al.*⁽¹⁶⁾ found that the neonatal morbidity including RDS, assisted ventilation, intraventricular hemorrhage were high among preterm SGA infants than the AGA group.

In this study it was noticed that SGA mild preterm infants had significantly lower respiratory distress than the AGA group. Whether the intrauterine growth restriction is protective from respiratory distress or not is still a point of conflict. Simchen *et al.*⁽¹⁹⁾ found that growth restriction in the preterm neonate was not found to protect against neonatal outcomes associated with prematurity. They added that the presence of intrauterine growth restriction adversely affected survival independently of other variables. On the other hand, Sharma *et al.*⁽²⁰⁾ and Gortner *et al.*⁽²¹⁾ observed a lower incidence of RDS in preterm infants with IUGR.

Furthermore, both SGA mild and moderate preterm groups had significantly longer hospital stay than the AGA groups. There was a significant negative correlation between birth weight and length of hospital stay ($r = - 0.036$, $P = 0.0341$). Rocha *et al.*⁽²²⁾ found that preterm SGA newborns had significantly longer hospital stay and greater need for NICU treatment than the AGA preterms.

A limitation of this study was that we did not include a full term group for comparison. We recommend further follow up of preterm infants throughout the first year of life to detect morbidity and mortality of this category of infants. Management strategies and guidelines should be settled to prevent spontaneous preterm deliveries and to early diagnose and manage intrauterine growth restriction. When considering elective preterm delivery for this high risk group of pregnancies, the increased risks in the neonatal period should be taken into account.

LMI Based Switching Congestion Controller for Multiple Bottleneck Packet Switching Networks

Roohollah Barzamini¹, Masoud. Shafiee²

¹ PhD Candidate of Control Engineering, Amirkabir University of Technology, Tehran, Iran

² Professor of Electrical Engineering, Amirkabir University of Technology, Tehran, Iran
m.shafiee@aut.ac.ir

Abstract: In this paper a new Linear Matrix Inequality (LMI) based switching controller for multiple Bottleneck packet switching Network has been considered. The main goal is to illustrate the effects of the Switching Control methodology on the congestion control problem of the packet switching Networks with dynamically varying parameters such as Link capacity and time delays. The congestion dynamic for congested network is presented and LMI based switching controller is being discussed. Then, the proposed control method has been applied on a case study in ATM Congested Network and simulations are conducted, and simulation results will be compared with old method.

Keywords: Congestion Control; Linear Matrix Inequality (LMI); Multiple Bottleneck; Packet switching Network; Switching Control Methodology.

1. Introduction

High-speed computer communication networks are generally store-and-forward backbone networks consisting of switching nodes and communication links based on a certain topology. All the links and all the nodes are characterized by their own capacities for packet transmission and packet storing, respectively. A node which reaches its maximum storing capacity due to the saturation of its processors or one or more of its outgoing transmission links is called congested. Some of the packets, arriving at a congested node, cannot be accepted and have to be retransmitted at a later instance. This would lead to a deterioration of the network's throughput and delay performance or even the worst situation—network collapse. Therefore, congestion control is an important problem arising from the networks management. It follows that congestion is essentially a result of a mismatch between the network resources and the amount of traffic admitted for transmission. Consequently, congestion control can be linked to the classical problem of feedback control in which the main aim is to match the output to the input of dynamical systems [1].

Many algorithms have been proposed for computing explicit rates in single congested node. In general, these algorithms are of two types: the queue length and arrival rate of queue. The stability of the closed-loop system is critical in any congestion control scheme due to the fact that propagation delay encountered in high-speed networks may cause the controllers and the whole network to operate at an unstable point. This yields the notorious oscillation

problem that greatly degrades the network performance [2]. But many of these algorithms are not shown to be asymptotically stable in steady state situation, and also these algorithms cannot able to use of full capacity of resources in transient states [3-6]. In [7] an analytical method for a design of a congestion control scheme in multiple congested nodes in packet switching network is presented. The control method is rate based with a local feedback controller associated with each switch node. The controller is a generalization of the standard proportional-plus-derivative controller. It is shown that there exist a set of control gain that result in applying asymptotic stability of the linearized network model for delay in networks.

In this paper a new LMI based switching controller for multiple Bottleneck packet switching Networks has been considered. The main goal is to illustrate the potential impact of the Switching Control methodology [8], [9] on the congestion control problem of the packet switching Networks with dynamically varying parameters and time delays.

2. Congestion Dynamics

Three types of dynamic equations are defined:

1. The equations which are related to the trend of x on which the input rate to the congestion link has affect and its difference with the link transition capacity is c . With only one bottle-neck node there is only one x but when there are multiple bottle-neck nodes (i.e. when multiple nodes are congested), for each $x_i, i \in \mathbb{N}$ there is a equation for the changes of

the queue length in buffer. $x_i, i \in N$, denote the number of packets buffered for transmission on link i and $N = \{1, 2, K, N\}$ denote the set of links in network.

2. The calculating allowed sending rate q_i and its changes made new equations. This is the control algorithm equations. If there were multiple bottle-neck nodes, there would be separate suggested source sending rates calculations – according to the queue length and the implemented control algorithm – for each of them and the signals are sent to different traffic-sending nodes.

3. All the information about the suggested sending rates are sent to the source by control packets and the applicable traffic rate would be the minimum of the suggested rates and the rate of the source. The point here is that there is delay between calculating the suggested allowed sending rate and their delivery to the source. According to what mentioned above, for multiple bottle-neck nodes congestion equations are more complicated than single bottle-neck node but they follow the same concept. Generally, regardless of the complexity of the model, it is suitable to benefit from the concepts used in single bottle-neck node models in cases of multiple bottle-neck nodes and therefore it is worth investigating both together. The three equations of the network for multiple bottle-neck nodes are as follows [2]:

$$x_i^{ab}(n+1) = x_i^{ab}(n) + \min \left\{ \psi_i^{ab}(n - \tau_i^{ab}), \frac{\psi_i^{ab}(n - \tau_i^{ab})}{f_i(n)} (X - x_i(n) + \psi_i(n)) \right\} - \psi_i^{ab}(n)$$

$$q_i(n+1) = \text{Sat}_{q_i} \left\{ q_i(n) - \sum_{j=0}^{j_i} a_{ij} (x(n-j) - x^0) - \sum_{k=0}^{K_i} b_{ik} q_i(n-k) \right\} \quad (1)$$

$$\psi_{e_{ab}}^{ab}(n) = r_{ab}^{ab}(n) = \min \left\{ q_m(n+1 - d_{ma}^{ab}), m \in p(ab); r_{ab}^o(n) \right\}, i \in N \quad (ab) \in C(i)$$

Where a_{ij} and b_{ij} are the controller gains and $x_i^{ab}(n)$ is the queue length for (ab) connection traffic stored in buffer link i in the moment n , $\psi_i^{ab}(n)$ is the passing traffic of connection (ab) on link i on a time interval of $[n, n+1)$. The feedback delay d_{ma}^{ab} is equal to $\lceil \tau_{ma}^{ab} \rceil$. $\lceil \tau_{ma}^{ab} \rceil$ is smallest integer greater or equal to τ_{ma}^{ab} .

Since q_m is generated in time T , the most updated feedback information in node a in the moment n is $q_m(n-1 + d_{ma}^{ab})$ which may be arrived any time in the interval time $(n - d_{ma}^{ab}, n + 1 - d_{ma}^{ab})$. It is important to know that the equations are not closed with respect to the variables because in the equations, ψ_i^{ab} is not expressed in terms of the state variables x_i^{ab}, q_i and the applied traffic r_{ab}^o . We can simplified network dynamic equations as below [7]:

$$x_i(n+1) = \text{sat}_x \left\{ x_i(n) + \sum_{k=0}^{D_i} I_i^k(n) q_i(n+1-k) + f_{i1}(n) - c \right\}$$

$$q_i(n+1) = \text{sat}_{q_i} \left\{ q_i(n) - \sum_{j=0}^{j_i} a_{ij} (x_i(n-j) - x^0) - \sum_{k=0}^{K_i} b_{ik} q_i(n-k) \right\} \quad (2)$$

Then network can be divided into two sections: bottle-neck sub-network (the links in which congestion occurs) and non-bottle-neck sub-network. Equations (3) are for bottle-neck sub-network ($i = 1, \Lambda, N1$):

$$x(n+1) = \text{sat}_x \left\{ x(n) + \sum_{i=0}^D I_i(n) q(n+1-i) + r^o(n) - c \right\} \quad (3)$$

$$q(n+1) = \text{sat}_{q_i} \left\{ q(n) - \sum_{j=0}^J a_j (x(n-j) - x^0) - \sum_{k=0}^K b_k q(n-k) \right\}$$

$I_i^k(n)$ is the number of passing connections from i , limited by i , with a RTD delay of k and $f_i(n)$ is the summation of the connection traffic rates passing from i which are not limited by i (this kind of traffic may be limited by another bottle-neck link). Here, limited means a link creates a minimum suggested sending rate for a specific connection. Queue equations for link i is:

$$x_i(n+1) = \text{Sat}_x \left\{ x_i(n) + f_i(n) - c \right\}, i \in N \quad (4)$$

Where $x_i(n), f_i(n)$ are the total occupancy of the buffer of link i and the aggregate input flow to link respectively and x is buffer size [7].

3. Problem definition

Since congestion control methods are inefficient in confront of variation in Network condition and directly depends on input traffic rate and network uncertainty, the multiple switching-based logic controllers are used to reduce the inefficiency and also improve the performance of the network. In addition in order to solve the problems caused by unknown system parameters, robust controllers are used. The goal of congestion control in a network is to queue length (x) to be achieved to desire value of x_0 . If a buffer becomes full, it is saturated. Here, the controller objective is to control the number of the packets entering the buffer in order to keep it in a desired value. Suppose that a part of a network is congested. This part may include a number of connected links which are affected by several data streams. Figure 1 shows a part of a network affected by $r_A, r_B, r_C, r_D, r_E, r_F$ connection data stream.

4. Material and Methods

4.1. Proposed Method

In the proposed method for all network conditions a controller based on LMI should be determined. When network condition changed, then working area changed then controller should be

changed. In this paper uncertainty in the number of the transfer packets which causes some changes in the parameters of the equations is considered. In order to design a controller some areas should be defined. These working areas are defined according to the buffer saturation. For each working area a dynamic equations can be defined according to how the buffers are saturated. The best tool for designing the controller that guarantees the robustness of the network is LMI [10].

During the congestion control of the network the areas change and make different dynamics then switching control is used for stabilizing the system [8], [9]. In such type of switching, it is assumed that the system remains in a single working area for a certain period of time. The Switching Control system based on the LMI theory, used for the design of congestion control scheme, is described In Figure 2. The set of candidate controllers is taken to be LMI should be selected by switching index function that recognized the network area based on network feedback.

4.2. Switching

Plant models are inherently inaccurate, and controllers regulating processes described by such models must be able to ensure satisfactory closed-loop performance in the presence of exogenous process disturbances which cannot be measured. Modern linear control theories (e.g., pole placement/observer theory, linear quadratic theory, H^∞ theory, ...) are very highly developed and can be used to design controllers with such capabilities. Processes admitting linear models, provided the model uncertainties are time invariant and “sufficiently small.” But for “large” model uncertainties derived from real-time changes in plant dynamics, common sense suggests and simple examples prove that no single, fixed-parameter linear controller can possibly regulate in a satisfactory way. Such large uncertainties might arise in real time because of changes in operating environment, component aging or failure, or perhaps a sudden change in plant dynamics due to an external influence.

Fig. 1. A network with several bottle-neck nodes.

Fig. 2. congestion control structure

To deal with these types of uncertainties a controller better than linear feedback theory can provide, is obviously required. What is needed is a controller which can change or be changed in response to perceived changes in plant dynamics. If plant changes can be predicted in advance or can be directly measured when they occur, then controller gain scheduling will be often sufficient. But if plant changes cannot be predicted or directly measured, online controller selection or “tuning” must be carried out.

The aim of this paper is to describe a simply-structured “high-level” controller called a “supervisor” which is capable of switching into feedback for congestion control of a communication packet switching networks. A sequence of linear positioning controllers from a family of candidate controllers should be identified in order to output of the network approach and track x_0 .

4.3. LMI Theory

Linear Matrix Inequalities (LMIs) and LMI techniques have emerged as powerful design tools in areas ranging from control engineering to system identification and structural design. Three factors make LMI techniques appealing: A variety of design specifications and constraints can be expressed as LMI. Once formulated in terms of LMI, a problem can be solved exactly by efficient convex optimization algorithms (the “LMI solvers”). While most problems with multiple constraints or objectives lack analytical solutions in terms of matrix equations, they often remain tractable in the LMI framework. This makes LMI-based design a valuable alternative to classical “analytical” methods. See[10] for a good introduction to LMI concepts.

Theory [11], [12]: undetermined closed loop system equation (6) with the input signal mentioned in equation (5), is totally exponentially stable if symmetric and positive definitive matrix X and a set of matrices Q_1 can be found such that equation (8) holds. The feedback gain needed for stabilizing the closed loop system is expressed in equation (9).

$$u(t) = \sum_{i=1}^m \mu_i K_i x(t) \quad (5)$$

$$x(t+1) = \sum_{j=1}^m \mu_j (A_j + B_j K_j) x(t) \quad (6)$$

$$V(x) = x^T X^{-1} x \quad (7)$$

$$\begin{bmatrix} -X & XA_1^T + Q_1^T B_1^T \\ A_1 X + B_1 Q_1 & -X \end{bmatrix} < 0 \quad (8)$$

$$K_1 = Q_1 X^{-1} \quad (9)$$

5. Applying the proposed control method

The Figure (1) shows a network with several nodes. The traffic applied to each buffer is presented in Table 1 and Table 2. The reason for selecting the second and third type of the applied traffic is to investigate the efficiency of previously discussed method in the case of changing the working area. In this paper uncertainty in link capacity (c) which causes some changes in the parameters of the equations is considered. The goal of this paper is definition of the problem and the investigation of the proposed method in comparison to the one presented in [2], the addition of uncertainty is not considered.

Table. 1. Traffic applied to A

The applied traffic rate	End time	Start time	Link
0.6	3000	20	1
0.1	2500	50	2
0.1	3000	500	3
0.7	2500	1000	4
0.1	3000	1500	5
0.7	3000	2000	6

Table. 2. The applied traffic to B

The applied traffic rate	End time	Start time	Link
0.9	3000	20	1
0.8	2500	50	2
0.9	3000	500	3
0.9	2500	1000	4
0.9	3000	1500	5
0.8	3000	2000	6

According to the system equations of the multiple bottle-neck node network presented in [7] and the conditions in the following table also by ignoring the waiting time in the buffer, the initial value of system equations is $x_0 = 30, c = 60, \tau_{pr} \ll \tau_s$, RTD- Sampling time = T, $x=100$ and $10 \times \tau_s =$ Propagation delay τ_p^1 .

Now by considering the network in figure (1) the working area have been defined according which buffers are saturated as below:

- no buffer is saturated**
- buffer 2 is saturated**

- buffer 3 is saturated**
- buffer 1 and buffer 2 are saturated**
- buffer 2 and buffer 3 are saturated**
- all buffers are saturated**

These are all working areas, in the following the details of proposed method for all of working area have been presented.

If no buffer is saturated

In this working area $x_i(n) + f_i(n) \leq c$, i.e., the buffer capacity is not full so the equations are as follows:

$$x_i(n+1) = Sat_x \{x_i(n) + f_i(n) - c\}, i \in \{1, 2, 3, 4\}$$

$$\Rightarrow x_i(n+1) = 0, i \in \{1, 2, 3, 4\} \quad (10)$$

It can be seen that input traffic affects the performance of the system and the network traffic behavior is much more desirable and no control is needed.

If buffer 2 is saturated

Buffer 2 being saturated, a new working area is created in which $x_2(n) + f_2(n) > c$ and for other buffers, $x_i(n) + f_i(n) \leq c, i \in \{1, 3, 4\}$. The fact that the saturation in one buffer may result in saturation in other buffers is not considered here, because if another buffer becomes saturated due to saturation of buffer2, another working area is created. Here, the control goal is that this working area, $x_2(n)$, converges to x_0 . It should be noticed that the possibility of other buffers become saturated due to convergence of $x_2(n)$ to x_0 is not the point because in this case a new working are is created. Assuming that buffer 2 is saturated, the dynamic equations is as follows:

$$x_i(n+1) = 0, i = 1, 3, 4$$

$$x_2(n+1) = x_2(n) + r_B + r_C + r_A + r_E - c \quad (11)$$

In order to achieve the control objective in this area, a dynamic error is added to the system which expressed by the following equation:

$$e_2(n+1) = e_2(n) + x_0 - x_2(n) \quad (12)$$

Since there is no uncertainty in the governing equations of the network, convergence of $e_2(n)$ to zero is sufficient to achieve the control objective. In order to do, pole placement method and the control rule $u = kx$ should be applied where the state vector is $\bar{x} = [x_2, e_2]$.

$$K_{10} = \begin{bmatrix} 0.075 & -0.005 \\ 0.075 & -0.005 \\ 0.075 & -0.005 \\ 0.075 & -0.005 \end{bmatrix}$$

If buffer 3 is saturated

Saturation of buffer 3 creates a new working area in which $x_3(n) + f_3(n) > c$ and for other buffers

we have $x_i(n) + f_i(n) \leq c, i = \{1, 2, 4\}$. According to Figure 5, the input $r_D(n)$ and $r_F(n)$ enter the third buffer immediately and the input $r_A(n)$ can enter the buffer either immediately or with delay. The bi-aspect behavior of $r_A(n)$ makes us consider it as an uncertainty. The dynamic equations of the network for this working area are as follows:

$$x_i(n+1) = 0, \quad i = 1, 2, 4$$

$$x_3(n+1) = x_3(n) + r_B + r_C + r_A + r_E - c \quad (13)$$

where $\Delta r_A(n)$ represents the uncertainty in $r_A(n)$ which may appear as:

$$r_A(n-4), r_A(n-3), r_A(n-2), r_A(n-1) \quad (14)$$

Design of a controller for this working area should be based on robust control theories such as LMI. In order to design the dynamic control, the buffer error of x_3 from x_1 and the delays related to $\Delta r_A(n)$, considered as uncertainty, should be added to the dynamic equations of the system. Therefore, the uncertainty in $\Delta r_A(n)$ is implicitly taken into account in the controller design.

$$x_3(n+1) = x_3(n) + r_D(n) + r_F(n) + r_A(n) - c + \Delta r_A(n)$$

$$x_3(n-1+1) = x_3(n) \Rightarrow x_3(n-2+1) = x_3(n-1)$$

$$e_3(n+1) = e_3(n) + (x_0 - x_3(n)) \quad (15)$$

$$r_A(n-1+1) = r_A(n) \Rightarrow r_A(n-2+1) = r_A(n-1)$$

$$\Rightarrow r_A(n-3+1) = r_A(n-2) \Rightarrow r_A(n-4+1) = r_A(n-3)$$

Hence, system dynamic matrices are:

$$A = \begin{bmatrix} 1 & 0 & 0 & 0 & p_1 & p_2 & p_3 & p_4 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ -1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \end{bmatrix}, B = \begin{bmatrix} w & 1 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Where $w \in \{0, 1\}$ is the uncertainty of matrix B. If one of the p_i is equal to 1, other p_i and w is zero. In other words, in set $\eta \in \{w, p_i\}$ only one of the members can be 1 at the same time. Therefore, the control input is considered in the form of $u = Kx$ to ensure the robustness of the system. Then, the state vector X is defined as follows:

$$[x_3(n), x_3(n-1), x_3(n-2), e(n), r_A(n-1), r_A(n-2), r_A(n-3), r_A(n-4)]$$

By using LMI, K is:

$$K_{01} = \begin{bmatrix} -0.0149 & -0.0094 & -0.0005 & -0.0280 & -0.4312 & -0.3027 & -0.0469 & -0.0022 \\ 0.7730 & 0.0251 & 0.0011 & -0.0927 & 0.2518 & 0.1811 & 0.0291 & 0.0014 \\ 0.7730 & 0.0251 & 0.0011 & -0.0927 & 0.2518 & 0.1811 & 0.0291 & 0.0014 \end{bmatrix}$$

If both buffer 1 and buffer 2 are saturated

In this case, for buffer 1 we have $x_1(n) + f_1(n) \geq c$ and since the all the data stream passing through buffer 1 enters buffer 2, then buffer 2 becomes saturated and the dynamic equations of the system considering the buffer error dynamics of x_2 from x_0 is as follows:

$$x_1(n+1) = x_1(n) + r_1 + r_5 - c$$

$$x_2(n+1) = x_2(n) + r_3 + r_2 - c$$

$$x_i(n+1) = 0 \quad i = \{3, 4\} \quad (16)$$

$$e_2(n+1) = e_2(n) + (x_0 - x_2(n))$$

This system does not contain any uncertainty. buffer 2 cannot be controlled while buffer 1 is still saturated and therefore, this working area should be omitted. In order to exit this working area it is assumed that buffer 2 is saturated. The design of this controller in this case is similar to the case in which buffer 2 is saturated. Since only buffer 2 is saturated.

If both buffer 2 and buffer 3 are saturated

In this case, for buffer 2 we have $x_2(n) + f_2(n) \geq c$ and for buffer 3 we have $x_3(n) + f_3(n) \geq c$. Therefore, by adding the new variables, buffer error integral x_2 from x_0 and x_3 from x_0 , the governing equations of the system are as follows:

$$x_i(n+1) = 0 \quad i = \{1, 4\}$$

$$x_2(n+1) = x_2(n) + r_A + r_B + r_C + r_E - c \quad (17)$$

$$x_3(n+1) = x_3(n) + r_D + r_F + \delta - c$$

where δ is the uncertainty of buffer 3 which can be defined as follows:

$$\delta = \begin{pmatrix} (x_2^A + r_A(n-i)) \\ x_2(n) + r_A + r_E + r_C + r_B \end{pmatrix} \quad i = 0, 1, 2, \dots \quad (18)$$

By adding the new equations we have:

$$e_2(n+1) = e_2(n) + (x_0 - x_2(n)) \quad (19)$$

$$e_3(n+1) = e_3(n) + (x_0 - x_3(n))$$

As it can be seen in the above equations, the input to buffer 2 and buffer 3 are independent and therefore, distributed controller design methods can be applied for designing the controller. Hence, first for buffer 2 and then for buffer 3 controllers are designed separately. Because in the dynamics of buffer 3, some deterministic terms appear, LMI is used for controller design. In this case, the coefficient of buffer 2 and the coefficient of buffer 3 are as follows. Since in this problem the uncertainty has the form of noise and causes instability in the closed loop system, only if it is unbounded, decentralized controller is used for x_2 and the uncertain norm which

is a part of x_2 is bounded. Therefore, the problem is to design a decentralized controller for which the state feedback gain is as follows:

$$K_{11} = \begin{bmatrix} 0.075 & 0 & -0.005 & 0 \\ 0.075 & 0 & -0.005 & 0 \\ 0.075 & 0 & -0.005 & 0 \\ 0 & 0.15 & 0 & -0.01 \\ 0.075 & 0 & -0.005 & 0 \\ 0 & 0.15 & 0 & -0.01 \end{bmatrix}$$

If all buffers are saturated

In this case, the working area in buffer 1 is c , in buffer 2 is $x_2(n) + f_2(n) \geq c$ and in buffer 3 we have $x_3(n) + f_3(n) \geq c$. Therefore the governing equations of the system by adding the new variables, buffer error integral of x_2 from x_0 and x_3 from x_0 are obtained as follows:

$$\begin{aligned} x_1(n+1) &= x_1(n) + r_A(n) + r_E(n) - c \\ x_2(n+1) &= x_2 + r_C(n) + r_B(n) \\ x_3(n+1) &= x_3(n) + r_D(n) + r_E(n) + \delta - c \\ x_4(n) &= 0 \end{aligned} \tag{20}$$

where δ is the uncertainty related to buffer 3 and may have the following form:

$$\delta = \left(\frac{\left(x_2^A + \frac{x_1 + r_A(n-i)}{x + r_A(n) + r_E(n)} \times c \right)}{x_2 + c + r_B(n) + r_C(n)} \times c \right) \quad i = 1, 2, \dots \tag{21}$$

By adding the new variable we have:

$$\begin{aligned} e_2(n+1) &= e_2(n) + (x_0 - x_2(n)) \\ e_3(n+1) &= e_3(n) + (x_0 - x_3(n)) \end{aligned} \tag{22}$$

In this case, similar to the case in which buffers 1 and 2 are saturated, we assume that only buffer 2 is saturated and since saturation of buffer 3 is taken into account, the controller design is the same as the design for the case mentioned before.

If there is no space in the buffer, the system will be saturated, i.e. if $X - x_i(n) + \psi_i(n) < f_i(n)$ then definitely $x_i(n) + f_i(n) > c$ because since $x \gg c$, we have $c < X + \psi_i(n) < f_i(n) + x_i(n)$. In this case the equations are as follows:

$$x_i(n+1) = x_i(n) + (x_0 - x_i(n) + \psi_i(n)) - c \Rightarrow x_i(n+1) = x_0 \tag{23}$$

which shows that there is no need for analysis because in this case the system does not obey the input and therefore, this should be prevented.

6. Simulation

Considering above, for the presented example there are four working areas: The working area in which only the second buffer becomes saturated, the working area in which only the third buffer becomes saturated, the working area in which the second and third buffer become saturated and the working area in which none of buffers become saturated. For each of these working areas the appropriate controller is designed based on the robust control theory and by applying the silence time switching logic the appropriate controller is selected and used.

Since if there isn't available any saturated buffer, transition rate will be upper limit i.e. full capacity of link ,therefore using of controller isn't necessary and for other working area following control signal is applied: $r_A, r_B, r_C, r_D, r_E, r_F=c$.

By applying these controllers and using the silence time switching logic, the following results for the applied traffic are presented in Table 1 and Table 2. Figure 3 – 7 depict the results of comparison between the obtained results and the response of the closed loop system controlled by a single controller. The comparison criteria is the response of the closed loop system according to the output performance and the control signal.

Figures 3 and 4 shows the response of the closed loop system when the traffic in Table 1 is applied. By considering the output response of the closed loop system it is obvious that the proposed design method results in an enhancement in the performance of the closed loop system and by using the proposed controller the control signal is enhanced (Figure 5).

Figure 3. The output of the second queue lentgh.

Figure 4. The output of the third queue lentgh.

Figure 5. The control signals.

Figure 6 depicts the response of the closed loop system when the traffic is applied according to Table 2. By comparing between the closed loop system response, it is obvious that the performance of the closed loop system is improved by using the proposed method and the controller signal is also enhanced (Figure 7).

Figure 6. the output of the third buffer

Figure 7. The resulted control signal

7. Conclusion

In this paper a new LMI based switching controller for multiple Bottleneck packet switching Networks was presented. The main goal was to illustrate the impact of the Switching Control methodology on the congestion control problem of the packet switching Networks with dynamically varying parameters such as link capacity (c) and time delays. Depends on network condition different working area defined and for each of these working areas the appropriate controller was designed based on the robust control theory. By applying the silence time switching logic the proposed method has been stable because there is no interference between controllers. Simulation result depicts that by considering the output response of the closed loop

system, it is obvious that the proposed design method results in an enhancement in the performance of the closed loop system and by using the proposed controller the control signal is enhanced.

Designing Affordable Solar Dryer for the Small Scale Holder

Nnorom ACHARA PhD

MDPGA, Ministry of Defence, Wethersfield, Braintree, United Kingdom
nnoromeluwa@btinternet.com

Abstract: The local farmer preserves the farm produce either by drying over the cooking tripod flue or by the use of natural sunlight. The quantity of produce that can be accommodated over the cooking flue is limited and the traditional solar drying is inefficient because the produce is exposed to vagaries of nature, birds and occasionally to rodents. The produce is preserved for use during the lean period, sold when the price is right and stored to provide seeds for the next planting season. The cost of building the typical glass covered solar dryer is generally beyond the means of the average rural farmer. There is therefore a need to find cheaper construction materials to replace the major cost components such as glass. Two solar dryers with glass and plastic covers have been designed and constructed for the purpose of assessing the suitability of plastic sheet as a replacement for glass. The drying performance of the two dryers has been compared. The results from the plastic covered solar dryer compare favourably with those of the glass dryer. It is therefore concluded that glass can be replaced with plastic sheet without significant performance loss.

Key Words: transparency; incident; angle of inclination; absorption coefficient; reflection coefficient; tracking; dimensionless parameters.

1. Introduction

The harvest season for most grains and seeds in Aba district starts around July. Unfortunately however this is the same period when the rain fall starts to peak, a situation which is unfavourable for drying. The farmer needs to preserve the harvest both for use during the lean months and to sell when the price is right for maximum returns. The local farmer does not have the facilities to store and preserve fresh produce as the mechanised farms do. The capital outlay required for such an undertaking is well beyond the capability of the average rural small scale holder. The local farmer is well aware that there is more money to be made if fresh produce storage facilities are used but it is an option he, as an individual, cannot afford. Where fresh produce storage facilities are available the cost of leasing a small space is well beyond his means. Drying, as a result, is the option that the local farmer traditionally uses for farm produce preservation.

Before the grains and seeds can be stored they need to be dried. There are two main methods used in drying for preservation: the natural sunlight and heat from the cooking flue. Solar drying is prevalent especially where the grains and seeds are in reasonable quantity. Wood that used to be the main source of fuel for drying fairly large quantities of grain (Achara 1987) has shown is now hard to come by because of deforestation.

1.1 Cooking Tripod Drying:

After harvest, maize not yet husked is hung in bundles over the cooking tripod. The flue heat from cooking dries the grains. This fresh but mature produce would be dried and preserved to provide the seed for the next planting season, food during the lean months and extra cash when sold to other farmers the next planting season. The quantity that can be dried is limited by the space above the cooking tripod. To accommodate a fairly large quantity, the farmer resorts to drying in batches. The batch that the farmer considers dry enough but still not yet to the pre-determined storage level, makes way for a new batch while still hanging within reach of the warm cooking flue gases. In this traditional method of preservation, the farmer has learnt that for the seeds and grains to survive till the next planting season they cannot, at this stage, be completely removed from above the cooking tripod. If completely removed before the dryness level is reached, the tendency is for insects/pests to attack and destroy the grains. The farmer however, has to watch out to ensure the seeds and grains do not over dry. If the seeds and grains over dry, grinding to make meal becomes difficult and on occasion, the seeds cannot germinate when planted/sewn the next planting season.

For seeds, a woven basket with cover to prevent the ingress of insects and rodents is used. The basket is woven from material sourced locally from palm trees. The basket filled with seeds is hung over the tripod for drying. The seeds when completely dry, are

transferred to huge clay pots that serve as silos. Traditionally this basket serves other purposes for example the drying and preservation of fish and meat

1.2 Natural Sunlight:

The other technique for drying the harvest is by the use of natural sunlight. In this technique the grains and seeds are spread on a mat without any protection from inclement weather. To ensure that his produce is not destroyed, the farmer has to detail a member of the family to keep watch over the grains. The person on watch has to drive the birds and domestic animals away from the area and when the weather threatens, has to hurriedly pack up before the rains arrive. The pitfalls in this arrangement include the use of scarce human resource to keep watch over the grains, the unpredictability of the weather and the introduction of sand in the grains when hurrying to pack up as the rains threaten.

In this study, the construction of affordable solar energy dryer is considered. Two types of dryers have been designed, constructed and trialed and the results analysed. The basic difference in construction between the two designs is the transparent cover. The most common transparent cover for solar energy devices is glass but the small scale rural farmer is unable to provide one. There is a need therefore to look elsewhere for alternative transparent cover that is cheap to procure and yet in performance, comparable to glass cover. Any alternative material selected must be transparent to incoming solar radiation and able to block long wavelength radiation to reduce heat loss from the solar dryer. Glass cover itself is not entirely transparent at all wavelengths of solar radiation. However energy loss by reflection and absorption is considered insignificant.

There have been studies in the literature of solar energy dryers but unlike in the current work, non could be found that considered the cost implication to the rural small scale farmer. Folaranmi (2008), for an example, has studied solar energy dryer where the heat needed for drying is generated in a separate compartment and then transported to the dryer. The cost of a dryer unit of this type will still be beyond the resources of the target user, the small scale farmer.

2. Heat and Mass Balance

All modes of heat transfer are involved in solar drying devices but radiation and convection are predominant. For a given incidence, the energy balance is resolved by summing the following: the incident solar energy, energy absorbed by the wet grain and the base surface, energy absorbed and reflected by the transparent cover and that reflected from the drying grain. The energy absorbed by any surface varies with the time of the day since

reflectivity depends on the incident angle. This can explain the reason why some solar installations track the sun. Tracking the sun could however be an expensive undertaking especially in small and medium scale installations. For locations between latitudes 0 and 46° and where the tilt of the solar dryer is fixed, (Cooper 1970) has shown that the variation in absorption rate is insignificant for solar energy devices having transparent cover and angle of inclination not exceeding 60°. The absorption and reflection coefficients are assumed constant.

For convenience and to aid understanding of the physical processes taking place, the heat transfer in the solar dryer may be considered in two parts: that external to the transparent cover and that within the dryer itself. In reality however these are coupled. The main distinction between the two is that while within the dryer heat transfer by convection and mass transfer occur simultaneously especially at the early drying stages, there is no significant mass transfer effect outside the dryer. Within the dryer also the heat reflected to the transparent cover is unable to escape since it is within the infrared spectrum. Unless the base of the dryer is adequately insulated, considerable conductive heat losses would also occur.

The convective heat transfer term has in appearance a simple expression (the product of heat transfer coefficient, the surface area and the temperature difference) but in reality the heat transfer coefficient, a member of the product, is complex to express. It depends on the fluid flow characteristics, the geometry of the system under consideration as well as the physical properties of the fluid. Usually, the evaluation of the heat transfer coefficient is based on the correlation of data obtained from experiments using dimensional analysis. There are four dimensionless parameters used in the literature to relate the heat transfer coefficient and these are the Reynolds number, the Nusselt number, the Grashof number and the Prandtl number. In this study, the only relevant convective transfer is the free or natural convection. (Jacob 1947) has expressed the Nusselt number as a function of the Grashof number and the Prandtl number and shown that the Grashof number increases with the magnitude of convection. The Grashof number increases as the flow changes from laminar to turbulent. In this study, the convective heat transfer is by natural convection and all flows are within the laminar regime.

3. Solar Dryer Design

Two identical solar dryers have been designed and constructed with transparent cover as the only major difference. Each of the dryers measured 1.0m long by 0.4m wide and 0.2m high to form a rectangular box. One end of the 0.4m side is hinged

and the framework lined with sealing material to provide tight seal when the hinged ends is closed. Material for the dryer is timber board 0.3m wide and 25mm thick joined to make up the dimensions. The interior of both boxes is lined with locally sourced black plastic sheet derived from bin bags. The top of one of the boxes is covered with transparent plastic sheet and the other with glass. Holes 8mm in diameter are drilled at 50mm intervals all around each of the boxes, just below the transparent cover to aid the escape of moisture formed during the drying process. This is the main difference between this study and others found in the literature, where transparent covers other than glass, have been investigated. In this study moisture is considered a waste product and the aim is to get rid of it as soon as possible whereas the other studies considered the distillation of brackish water where the moisture when condensed forms the main product. Qasim

(1978) studied a solar still greenhouse combination in which polyethylene was used to cover the greenhouse. Similar work by Kumar et al (1981) as well as Moustafa and Brusewitz (1997) employed a wick-design in the desalination process. Kumar et al (1980) further studied the performance of solar stills with reference to the moisture deposition on the transparent cover.

Wood has been selected for the framework and main body of the dryer because of its fairly good thermal insulation properties, it is readily availability and cheap to buy locally. The choice of materials for construction is driven by the requirement in the study to design and build a solar dryer whose cost is within the financial capabilities of the rural farmer. The glass covered dryer is only used as a comparator to the performance of the transparent plastic covered dryer. Figure.1 is a schematic sketch of the dryers.

Figure.1 Solar Dryer Design

4. Testing

The experiments in this study were carried out in Aba, Abia State Nigeria, a city that lies at latitude 5° 10' north of the equator and between harvest months of July and November. The period chosen for the tests was dictated by the time in the year when the farm produce that require drying are abundantly available. Although other grains and seeds were tried, the tests finally settled on maize/corn and melon seeds because they were more readily available. In the original design 12mm holes were provided for moisture escape. Later, in the course of the tests the 12mm holes were replaced by the 8mm design in order to prevent the ingress of rodents into the dryer.

In each batch of the tests, two equal weights of the seed or grain were measured out and fed to the dryer through the hinged window ensuring even spread of the seeds or grain on the base. The maize used was husked and the melon seed was the type already washed and stored in a basket to drain some of the excess water. The decision was taken at the outset to reduce human handling to the barest minimum once the tests have been set up for compliance with the requirement to release human resources otherwise employed to keep watch in the traditional drying process. At the end of each day, the grains or seeds were weighted to check the weight loss for the day and whether the target weight had been reached. This

was the only handling allowed. However weighing the grains served another purpose of turning over the grains and seeds to prevent the burning of the side directly exposed to the incident solar energy.

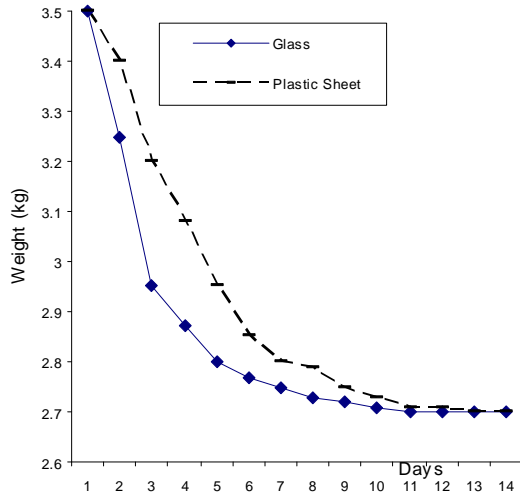

Figure.2 Performance of Glass and Plastic Dryers (High moisture)

Figure.3 Performance of Glass and Plastic Dryers (low moisture)

5. Result and Discussion

Maize and melon seeds as common produce in the Aba district have been dried in transparent plastic sheet and glass covered dryers and the weight losses

measured at the end of each day. Typical results for melon seeds are recorded in figures 2 and 3. The produce in these figures is considered dry when the weight loss has reached a predetermined level.

Earlier in the drying process when the grains were very wet the drying was found to be sluggish because of the water vapour that settled on the inner transparent surface and inhibited the amount of solar energy transmitted. This phenomenon appeared to cause a physical reduction of the transparency of the cover and an increased reflection of solar energy back to the outside environment. At the initial stages, when the water moisture build-up was highest, the 8mm holes near the top of the dryer could hardly cope with getting rid of the moisture. The interest in this study is to find a cheap dryer design option which can be considered simple enough to construct as well as within the financial means of the average local farmer. As a result, the glass covered dryer on the bases of cost is used only as a performance comparator with the plastic sheet covered dryer. Figure. 2 is the result of weight loss as a function of time in days plotted for both the plastic sheet and glass covered dryers when the initial moisture content was high. This batch has an extra 6% of moisture by weight. Similarly figure.3 shows the result also for melon seeds when the pre-drying initial water content is considerably reduced. In the early period of these experiments, the glass covered dryer performed better than the plastic dryer but with time the two curves describing the performance tend to converge. This finding is consistent with those of Howe and Tleimat (1967) who in a study of solar distillation of brackish/salty water showed that the performance of a plastic covered build was about 82% that of glass distiller. In general, the plastic dryer performs considerably more poorly at high initial moisture content and this can account for longer period (13 days) for the two curves in figure 2 to converge. The agreement in weight loss between the two dryers gets better as the water content at the pre-drying stage is reduced, figure. 3 and convergence occurs earlier in 11 days. In all cases in the performance, the plastic dryer lags behind the glass dryer and this may be attributed to the fact that the plastic dryer has the tendency to clog up with moisture more easily than the glass dryer. This misty cloud inhibits the amount of solar energy transmitted into the inner part of the dryer.

There is hardly any noticeable difference in drying performance between the dryers in figure.3, however the glass dryer is still marginally better in weight loss than the plastic sheet covered dryer. At the initial stages, the weight loss per given time in both cases is more pronounced than towards the final stages this accounts for the asymptotic drop in the

plot at these stages. Towards the end however, the graph tends to level off for convergence as hardly any noticeable weight drop is observed. The trend in figure.2 and figure.3 agree with those of (Oladosu and Egusoje 1985) on glass covered solar energy fish dryer as well as a similar design work by (Arinze, 1985). At one stage in this study, the plastic cover had to be replaced as it was attacked in the night by rodents. The attack left a number of holes on the plastic sheet. After this incident a fine wire mesh was constructed around the dryers to prevent further attack. Although there was no question of the rodents attacking the glass, it was also enclosed within the wire mesh in order to provide a true like-to-like comparison. If the presence of the wire mesh affects the drying performance, this should not alter the performance comparison since each of the two dryers would equally be affected. Some other low cost material would have to be found for the farmer to protect the transparent plastic sheet if the overall construction cost of the dryer is to be kept low as originally planned. The wire mesh if used as cover on the production dryer will significantly add to the overall product cost. As time progressed towards the end of the tests, the plastic cover started to deteriorate in appearance turning yellowish in colour hence increased physical loss of transparency. At this stage, although there was no significant loss in performance, it was decided that the plastic sheet would have to be replaced if it was found necessary to run the experiment again.

6. Conclusion

1. Two dryers identical in all respects but covers have been designed, built and used to compare the performance of plastic sheet covered dryer against the conventional glass covered version.
2. For low product cost, plastic cover can be used since comparison with glass cover has shown that performance loss is minimal.
3. In each case the weight loss at the earlier stages of the drying process is rapid and occurs asymptotically levelling off with time for convergence as the grain/seed becomes drier.
4. To ward off rodent attack, the farmer is advised to cover the plastic top before retiring for the night and in compliance with low cost requirement, corrugated sheet is recommended as a cover.

8. Acknowledgement

I would like to register my gratefulness to Mr. Okoroafor and his students not only for their help in running part of the tests but also for their perseverance especially after the rodent attack. The rodent incident did not in any way dampen their enthusiasm.

Assessing techniques in Participatory Rural Appraisal (PRA)¹Zahra Kaveie and ²Fakhteh Ghahramani^{1,2}Damavand Branch, Islamic Azad University, Damavand, Iran

*Corresponding author: leila11070@yahoo.com

Abstract: PRA requires researchers / field workers to act as facilitators to help local people conduct their own analysis, plan and take action accordingly. It is based on the principle that local people are creative and capable and can do their own investigations, analysis, and planning. The basic concept of PRA is to learn from rural people. Chambers (1992) has defined PRA as an approach and methods for learning about rural life and conditions from, with and by rural people. He further stated that PRA extends into analysis, planning and action. PRA closely involve villagers and local officials in the process. Similarly, Rapid Rural Appraisal (RRA) reflects the new thinking about development, needs, and people oriented responsibilities. It is a process that is highly systematic and structured, relying on interdisciplinary teamwork and special strategies for data collection and analysis such as triangulation, probing, and iteration. Some critics consider RRA to be a quick and dirty technique. There are a wide range of participatory tools and techniques available. People can use these tools and techniques according to their situation or needs. Generally, the application of different tools may vary from one situation to another. However, the process for conducting RRA/PRA remains the same.

[Zahra Kaveie and Fakhteh Ghahramani. **Assessing techniques in Participatory Rural Appraisal (PRA)**. Journal of American Science 2011;7(6):267-271]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Participatory Rural Appraisal (PRA)

Introduction:

RRA is a social science approach that emerged in the late 1970s. The basic idea of RRA is to rather quickly collect, analyse and evaluate information on rural conditions and local knowledge. This information is generated in close co-operation with the local population in rural areas. Therefore, the research methods had to be adjusted to local conditions, i.e. they had to meet the communication needs of illiterate people or people who are not used to communicating in scientific terms. Participatory Rural Appraisal (PRA) as a method falls under the qualitative and participatory group of research methods. PRA is intended to enable local communities to conduct their own analysis and to plan and take action. PRA involves project staff learning together with villagers about the village. The aim of PRA is to help strengthen the capacity of villagers to plan, make decisions, and to take action towards improving their own situation. Participatory Rural Appraisal (PRA) is considered one of the popular and effective approaches to gather information in rural areas. This approach was developed in early 1990s with considerable shift in paradigm from top-down to bottom-up approach, and from blueprint to the learning process.

The most common methods are the following:

- 1- Diagramming, Mapping and Modeling:
 - transects
 - maps (resource, social, farm)
 - venn diagrams
 - seasonally analysis

- historical analysis (time lines, trend lines, activity profiles)

2- Ranking and scoring

- pair wise ranking
- matrix ranking
- matrix scoring
- well-being analysis and wealth ranking
- proportional piling
- pie charts (injera charts)

3- Problem analysis

- identification and specification
- causal chaining
- prioritization

Community Sketch Maps

The purposes of community sketch map or a model: is a visual representation of what the community perceives as their community space. This include showing the shape (appearance) of the community, boundary and all the major features as understood and known by the community (Scrimshaw and Gleason, 1992).

The map shows where resources, activities, problems and opportunities are located, as well as the dimension and scope of issues to be investigated. It is critical to understanding the boundaries and characteristics of the community involved.

Topographical data (elevation, slope, drainage etc.)

Topographical data are basic when drawing a map of community, so is information on soils, vegetation, water availability, road, schools, health facilities etc.

There are different sketch maps known for different purposes. Some of them include(Dunn, 1992):

A. Social maps: Specific type of topical map representing households according to certain indicators.

- Indicates where people live and how many people live in an area
- Social and residential differences in status and wealth
- Buildings where people live or work, uses of space in a house

B. Physical and resource maps: drawn by the people to show natural resource of an area, location and use of natural resources.

- fields and land uses
- physical land features
- water location, quality and use
- soil types, uses, location

C. Topical maps: specific topic maps are drawn to draw attention to a particular type of information of the area, example:-

- location of forest resources
- soil types
- different crops grown
- houses and the number of people live in
- social & economic infrastructures etc.

D. Farm sketch: Making a farm or compound sketch highlight details that would otherwise be lost in a smaller scale maps.

Gender daily calendar:

Purpose

Most daily activities in traditional rural, societies are managed along gender lines. There are activities that are specifically performed by women, men or children. In some communities gender role divisions are still pronounced. In such cases it is necessary for the PRA team to be aware in order not to be seen as interfering with the community cultural norms specific gender roles so that new programmers are not introduced to overburden an already overworked group. Introducing gender awareness in PRA helps a community to begin examining itself(NCAER, 1993).

Who

Community members both men and women, young and old should be in attendance. PRA team members, men and women and local extension staff in the analysis of gender roles and responsibilities.

How

It is better if the community is allowed to lead gender related discussions. The PRA team facilitates discussions through a neutral process of mapping out a gender daily calendar. Men and women discuss on each daily activities on agreed season (raining or dry season). The groups on their timetable, from the time

they wake up in the morning to the time they got to sleep in the evening.

Application

Gender daily calendar provides a clear picture of who does what in the community. It will help in the formulation of the community Action Plan. The community will become aware that unless some changes in gender relations are effected rural development will not proceed as quickly as they would like it to be(Holland, 1998).

_ Daily-activity profiles -- Researchers can explore and compare the daily-activity patterns of men, women, youth, and elders by charting the amount of time taken to complete tasks.

_ Semi structured interviewing -- A semi structured interviewing and listening technique uses some predetermined questions and topics but allows new topics to be pursued as the interview develops. The interviews are informal and conversational but carefully controlled(Chambers, 1994).

Semi structured interviews (SSI)

SSI is a guided interview here the major topics and a few key questions are formulated before the interview. But many new additional are asked during the interview based on answers to the key question.

Types of SSI:

1. The individual interview

- Get representative information about the society form individual informants
- Ask individuals at a time

2. The key informant interview

- Get specialized information from one or group of persons about the community
- Informants with specialized knowledge

3. Group interviews:

- Useful for obtaining general information about the community
- Better for cross checking information
- Group interviews require very careful preparation
- The ideal group is 8 – 15 people

_ Types, sequencing, and chain interviews -- Individual, pair, and group interviews are combined in a sequence to take advantage of key informants and specialist groups.

Using secondary sources

- Secondary sources of information include previously written documents maps, diagrams, tables etc
- Review secondary sources before beginning field survey is census data, aerial photos, marketing reports, etc.

- In reviewing secondary sources, you should keep summary notes, in the form of short paragraphs, diagrams, charts, etc
- In reviewing secondary sources, you should keep summary notes, in the form of short paragraph, diagrams, charts, etc.
- Be as critical as possible in reviewing secondary sources
- To develop understanding of local livelihoods
- Short period of time

Venn Diagram (Institutional analysis)

Venn diagramming is a method to find out who, what person or organizations are important in and for a community.

Purpose

To identify groups and institutions operating in the community and to show how they interact with each other To show the degree of their cooperation and involvement in development programs. To discover their important or influence on decision making in the community.

What?

Venn diagrams have been used with in PRA in institutional context to discuss:

- The role and significance of various institutions
 - Levels of communication between organizations
 - The role of project bodies and their intervention
- Improving missing links between existing organizations,
- Potential for working through existing organizations, which ones and with which links.
 - Potential roles for new organization
 - Formal and non-formal groups and their levels of cooperation
 - Communities perceptions of the institutions, always

Who?

The PRA team, key informants as elders, religious leaders, extension staff and other knowledgeable person take the responsibility of listing and evaluation of individuals and institutions influencing decision making of the community.

How?

List institutions in the community and discuss importance of each institution and what they do. Make different sized circles and not which circle represents each institution i.e. big circle very important and decision maker, small circle with little importance. During overlapping the circles, the size of the circle indicates the importance of the institution, the distance between the circles indicate the degree of contact between institutions. For instance a large overlap high interaction. No overlap distant relationship.

Application

Identify individuals, groups or institutions. Important in the lives of people and establish close relationship with them. Provide the necessary support and effectively utilize their skills and experiences.

– **Participatory diagramming** -- People are encouraged to display their knowledge on pie and bar charts and flow diagrams.

– **Wealth and well-being rankings** -- People are asked to sort cards (or slips of paper) representing individuals or households from rich to poor or from sick to healthy. This technique can be used for crosschecking information and for initiating discussions on a specific topic (for example, poverty). The technique can also be used to produce a benchmark against which future development interventions can be measured or evaluated(Blackburn, 1999).

CONCLUSION:

As a result of the PRAs, the communities are expected to attain many benefits including:

- Expressing their own ideas and concerns;
- Organizing their knowledge about the past and present;
- Identifying as a community their problems, the causes of these problems and possible solutions;
- Developing a common plan to address these problems;
- Developing the ability to use their own resources more effectively and attract more resources from the outside.

The academicians/researchers involved in the PRAs are expected to get the following benefits:

- Developing better understanding of rural environments and social as well as economic dynamism taking place there;
- Appreciating the fact that communities are capable of analyzing their problems and outlining possible solutions to their problems;
- Participating in designing possible solutions to community problems;
- Utilizing the results of the PRA work as a research output for publications and presentations;
- Building their research and problem investigation capabilities;
- Supporting their classroom discussions to students with practical examples from the PRA findings.

The main objectives of the current PRA are:

1. empowerment of rural communities by assisting them to systematically utilize their local knowledge to identify problems and strengths, develop skills of analysis, and design appropriate mechanisms for intervention by themselves and/or by development agents;

2. advancement of understanding by academicians/researchers of local knowledge and acknowledgement of the capacity of communities to gather data, conduct analysis, and identify as well as prioritize problems and solutions;

3. utilization of the research questions/problems identified during the PRAs for further investigation;

4. documenting and presenting the outcomes of the PRAs to development agents (governmental and non-governmental) and other stakeholders so that they could undertake interventions in line with the findings.

PRA consists of a series of participatory exercises which help community members better assess their history, resources, and overall situation as concerns agriculture, health, marketing, credit, coping mechanisms, education, and other important areas.

During the conduct of the PRAs, rural communities in the selected villages will gather information on the resources they already possess; organize their knowledge; share experience among themselves; learn from each other; identify and prioritize local development needs; and develop action plans which respond to these needs.

Abstract: In conventional face to face education, as far as teaching approaches are concerned everything is left up to the teacher concerned. Though the infrastructure is available the problem lies in its proper communication. In order to gauge the distance perceived across various aspects in the educational system, the researcher conducted the present study. After consulting the literature, nineteen factors were identified and an opinionnaire was accordingly prepared for teachers of Economics from the conventional face to face education. The nineteen factors and the teachers' opinion show how conventional educational system has not taken into consideration the communication aspects which would hamper overall performance of teachers as well as students. It has taken for granted that no communication distance can be present because of physical proximity between teacher and students and institution. Therefore there is a need to reconstruct the conventional curriculum taking into consideration the factors and compensate for them. To compensate for this distance, one can look towards the distance education mechanisms. The face-to-face education has thus a number of lessons to learn from distance education. In distance education, distance is presumed and attempts are made to create devices to compensate for it. As this study has showed, there is no reason to believe that the face-to-face education does not have any communication distance. It is a rather serious matter that most of the teachers in the face-to-face system perceive a communication distance.

[Hadi Ghaffari, Ali Younessi. Distance in Economics Education: A Study of Factors. Journal of American Science 2011;7(6):272-276]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Economics, Distance Education, Conventional Education, Communication Distance.

1. Introduction

As a teacher for the last 15 years in conventional face to face education the researcher realized that the students failed to do the given homework. Even after face to face teaching sessions the percentage of failure is high (Meyer, 2003). During oral examinations it is found that students are not able to analyse or synthesise the prescribed text material (Twigg, 2003). Also there is system present which will give guidelines as to how to carry on evaluation. Also the system of feedback is not present in conventional educational system. As far as teaching approaches are concerned everything is left up to the teacher concerned. Though the infrastructure is available the problem lies in its proper communication (Johnson et al. 2002). In order to gauge the distance perceived across various aspects in the educational system, the researcher conducted the present study. Distance education (DE) theory and practices are based on the principles of how to achieve communication in an otherwise physically distanced learner (Reiboldt, 2001). Hence help was sought from DE discipline to locate the factors which could be leading to communication distance in face to face education (Aycock et al. 2002).

Techniques of Distance Education System

Distance Education System is a non traditional system of education. It imparts education through innovative and modern techniques. Self instructional material, radio, television, audio and video cassettes, computer and satellite are some of the means through which distance education is imparted. Teleconferencing, radio paging, satellite communication and group telephone tutorials are new watchwords for interactive communication.

Differences between Face-to-Face and Distance Education Systems

There are many merits of distance education system which are reflected in the growth and diversification of the system. These are as follows:

1. It provides a second chance to those who have missed the opportunities of higher education, in their early years due to some reason or the other;
2. It helps in extending education to people at large and in equalizing educational opportunities;
3. It can provide instruction to those living in remote areas where formal education opportunities are scarce;
4. It offers a vast scope for innovations in teaching methods, provides scope for variety of subjects and inter-disciplinary options;

5. It is highly economical compared to formal system;
6. It is flexible and enables the learner to learn at his own place, pace and time;
7. It enables the workers to acquire knowledge, skills and capabilities without drawing them from work place i.e. it facilitates professional competence and earning while learning;
8. The institutions can ensure proper organization of instruction and motivate learners to evolve a careful study programme;
9. It involves all media of technology such as the radio, TV, audio cassettes and video tapes to supplement the print media;
10. It helps the individuals to utilize their leisure time for educational purposes;
11. It helps those who are interested in pursuing advanced studies in the subject of their interest;
12. It provides education for all irrespective of disparities-social, cultural and economic;
13. It is accessible to potential students regardless of their formal qualifications; and
14. It overcomes the disadvantages of private study where no instruction is available to the students.

2. Materials and Methods

After consulting Holmberg (1981), Moore (1973), Wedemeyer (1977), Thorpe (1989) and Ramiszowski (1984); nineteen factors were identified and an opinionnaire was accordingly prepared for teachers of Economics from the conventional face to face education (Appendix 1). The prepared opinionnaire was initially given to five experts from conventional and open education, to pretest if the opinionnaire was transparent enough for expressing opinions. After incorporating necessary changes, a pilot study was carried out to validate the opinionnaire. A three point scale was used. While preparing the opinionnaire statements due care was taken to ensure that a casual and less serious respondent did not provide misleading data. Thus only statements which needed careful rendering and reading were included.

Teachers of economics are choose from the universities in the provinces of Tehran, Isfahan, Fars, Markazi, Hamedan and Semnan including: Tehran University, Payame Noor University, Islamic Azad University, Isfahan University, Shiraz University, Boo Ali Sina University and Shahrood University of Technology.

3. Results and Discussion

The main point of interest in the study is to find out which factors contribute to the communication distance. The opinions of the teachers were therefore grouped into the 19 factors pre-defined from a survey of DE literature. We now discuss the impact of each

of these factors on the perceived communication distance. Before giving the results for each factor, an explanation of the factors, has been given, as understood by the DE theoreticians and practitioners.

1. Document Clarity

Documents provided by the university to the teachers and the students are limited to syllabus statements. Syllabus has inherent lacunae such as it is unclear, ambiguous, vague and provides insufficient information. These documents do not provide aims and objectives of study in terms interpretable by the teachers and learners. So there remains a vast scope for misunderstanding and misinterpretation. The view with which the syllabus makers have prepared the document should be clearly communicated to the students. The channel for this communication is the documents. Therefore document clarity is of utmost importance to achieve this transparency.

More than 50% of teachers did not find syllabus statements sufficiently clear to tell them what to teach.

2. Time Frame

It is generally wrongly assumed that face to face education offers ample amount of time for face to face contact. In actuality however, the time is generally limited to forty hours of teaching for each prescribed course. While deciding that this time is optimum, only administrative criterion has been applied. It is clear that this time is insufficient, since many teachers are seen engaged in taking 'extra' classes.

Only 15% teachers found that the time frame given by the university to complete the syllabus to be enough. About 50% of them have to conduct extra classes to complete the portion. However, almost all of them found the time given for the practical to be sufficient.

3. Statement of Objectives

In the conventional system of Economics education, it is assumed that objectives are generally known to all those who are part of the system. It is also assumed that a student need not really know the objectives, since it is the responsibility of teachers to take the necessary steps to achieve learning.

Both these assumptions are dangerous. This lack of direction directly hampers their progress of learning. Because of the lack of a clear statement of objectives, an Economics teacher is not able to perceive the course as a whole, but sees it in bits and pieces. Such type of lack of continuity creates a feeling of distance in the mind of the Economics teacher.

4. Self-Study

Economics teachers do give homework to students as was revealed in their responses to the opinionnaire. However how to go about it is generally not described. There is no study guide incorporating how to develop study skills.

Almost all the teachers expected their students to do any homework.

5. Textbook

The textbooks which are recommended by the Economics teacher to the students are generally those which are written in accordance with the syllabus prepared by the university. There is no prescription of books directly from the Board of Economics Studies of the university. The prescribed textbooks generally do not provide study aims, lack proper organisation and structure.

About 25% of the teachers did not find the language used in the textbook student friendly. 75% of them realized the need to present textbooks in different manner. About half of them felt that students are not able to understand from the textbook to a certain extent and they felt that the textbook is not correct for the level of students. Nobody agreed that the textbook is rich in content and is significant.

6. Learner Autonomy

Here we mean that the learner has to have a wide variety of subjects to choose from. It has been found that most undergraduate Economics colleges offer a typical Economics-Management-Accounting-Mathematics-Statistics subject combination and later specialisation in one of the subjects. A few colleges offer Economic Development and Econometrics as specialization. Even if a student wants a slightly different combination, it is generally not available for administrative reasons. This may create a feeling of distance in students as his individuality is not recognized.

There was unanimous dissatisfaction among the teachers regarding the lack of variety of subjects for the students to choose from.

7. Layout

This factor is associated with most of the teaching colleges. Layout aspects do lead to disturbance and can lead to communication distance despite the physical proximity between the learner and the teacher.

About 50% of teachers had problems with the layout of the class.

8. Teacher Personality

Despite the presence or absence of the above factors, the type of teacher personality will affect the

communication in the classroom. A teacher with a certain type of personality can either greatly reduce or increase the communication distance in the setting.

About 50% of the teachers felt that students' understanding depends on the type of teacher personality.

9. Language

Most of the school Economics education is done through verbal medium. Language thus plays an important role in creating or reducing the communication distance. The fact of English being the medium of science education at undergraduate level is thought about too often. The crux of the problem could actually lie in the use of a comprehensible language.

Half of the sample felt that the language of communication does create a communication gap as far as students are concerned.

10. Interaction

The classrooms generally follow the lecture method, sometimes leaving some scope for occasional questioning and seeking clarifications from the students. This lack of interaction adds to the communication distance.

Owing to the individuality of the students 15% of the teachers did not find the problem of academic communication among students. About 75% were not satisfied regarding the amount of academic interaction among the students. Everybody wanted an increased amount of interaction between teacher and students in classroom. 75% of them felt that the system does not provide sufficient time for teacher-student contact.

11. Student Pace

A teacher generally tries to complete the course in the given forty hours of time. On very few occasions he has time to match the student's pace learning. Changing the mode and method of teaching according to the feedback received in the classroom is very necessary to reduce the communication distance. However, around 60% of teachers admitted that they do not accommodate any such change in their teaching behavior.

12. Teacher Accessibility

It is very well known that in the conventional system of education the teachers' vacations frequently coincide with the examinations of the students. At these crucial times, therefore, the teacher's time is not available to the students.

In case of 60% of teachers the time required to be spent by the teacher on extra-curricular activities affected the teaching schedule.

13. Student Individuality

Student personalities differ and they definitely affect the communication distance present in the educational setting.

80% of the teachers found that the number of students working on a computer was a bit too large, while 70% of them found that the number of students in the class was too large.

14. Facilities

Learners need reading rooms, private space in libraries, discussion rooms and a resource centre. It is however questionable how many institutions really plan to build such resources.

For about 50% of teachers facilities were not available as and when needed.

15. Library

The textbooks and reference books available are not present in the required numbers. One reason could also be the lack of space. For 80% of teachers audio-videos are not readily available for teaching activity. 60% voiced the opinion that references books are not available in sufficient number for the students.

16. Examination System

Confidentiality in this system generally takes over the academic and instructional principles. Very little thought has been given to techniques like Open Book Examinations which encourage more creative and evaluative thinking on the part of the students.

75% of the teachers felt that the weightage given to the final examination is inadequate. However, 50% of them were of the opinion that the examination system is in contradiction with the aims and objectives of teaching science.

17. Question Papers

The format of the question papers is seldom communicated to the students. The students as well as the teachers are therefore generally not aware of the behaviors and skills expected of the learner during the examinations. The question papers themselves are never communicative. Culturally, it is generally believed that a question paper has to be written in minimum words and should be as terse as possible. The paper setters generally shy away from giving explanations and necessary help in the question paper itself. A student therefore may perform poorly not for want of knowledge or skills, but for his misunderstanding of the question. Instructions given to the students at the beginning of the question paper are also vague, unclear and written in a difficult language.

More than half the sample were not sure of the validity of questions posed in the examination.

18. Evaluation Methods and Techniques

The way a process or content is evaluated will affect the way teaching is conducted. If the evaluation systems demand less communication and more recall of facts, this will affect the teaching-learning processes and these processes will not give much importance to communication.

More than 90% of teachers agreed that when teachers evaluate answer sheets he does not have guidelines for it. Therefore marks given by two teachers may not match.

19. Feedback Comments

There is no system to provide feedback to the students from the university. Similarly, there is a need to provide a corrective, constructive and meaningful feedback to the learner when the teacher assessed their written work. It is however generally found that the feedback comments consist of marks on the work of the learner, that seldom make any sense to him.

Almost all of them agreed to that there is no corrective feedback after examination, and students do not realize where they had gone wrong.

4. Conclusion

The nineteen factors discussed above and the teachers' opinion show how conventional educational system has not taken into consideration the communication aspects which would hamper overall performance of teachers as well as students. It has taken for granted that no communication distance can be present because of physical proximity between teacher and students and institution. Therefore there is a need to reconstruct the conventional curriculum taking into consideration the above factors and compensate for them.

To compensate for this distance, one can look towards the distance education mechanisms. The face-to-face education has thus a number of lessons to learn from distance education. In distance education, distance is presumed and attempts are made to create devices to compensate for it. As this study has showed, there is no reason to believe that the face-to-face education does not have any communication distance. It is a rather serious matter that most of the teachers in the face-to-face system perceive a communication distance.

Rumen degradation of dry matter and organic matter digestibility of Cherry tree leaves in ruminant nutrition using *in vitro* gas production and *in situ* techniques

Morteza Kiyani Nahand, Ramin Salamat Doust-Nobar, Naser Maheri-Sis and Abolfazl Ghorbani

Department of Animal Science, Shabestar branch, Islamic Azad University, Shabestar Iran

Abstract: This study was carried out to determine the chemical composition and estimation of nutritional value of cherry tree leaves in the ruminant nutrition. In this study *in vitro* gas production and *in situ* techniques were used to evaluate nutritional value of cherry tree leaves. Cumulative gas production was recorded at 2, 4, 6, 8, 12, 24, 48, 72 and 96 h of incubation also, *in situ* disappear of dry mater for experimental samples was measured at 0, 4, 8, 16, 24, 36, 48, 72 and 96 h of incubation. Chemical composition including dry matter (DM), crude protein (CP), crude Ash (Ash), ether extract (EE), neutral detergent fiber (NDF), acid detergent fiber (ADF) and tannin compounds, 91.11, 2.76, 9.3, 8, 27.6, 20 and 2.185 percent, respectively measured. Gas production test and *in situ* rumen degradability with of three Taleshi native male cattle rumen fistulae were performed. Digestibility of organic matter (OMD) 65.74 percent and metabolizable energy (ME) 10.27 (MjKg⁻¹) were estimated. The Polyethylene Glycol (PEG) supplementation had also a significant ($p < 0.05$) increase in the estimated parameters of gas production, OMD and ME of samples. Potential degradation (a+b) for dry matter and Effective rumen degradable (ED) at a rate of 0.05/h were estimated, 84.12 % and 52.20% respectively.

[Morteza Kiyani Nahand, Ramin Salamat Doust-Nobar, Naser Maheri-Sis and Abolfazl Ghorbani. **Rumen degradation of dry matter and organic matter digestibility of Cherry tree leaves in ruminant nutrition using *in vitro* gas production and *in situ* techniques.** Journal of American Science 2011;7(6):286-289]. Keywords: In situ, Cherry leaf, Gas production, Metabolizable energy and Dry matter degradability

1. Introduction

Tree leaves and shrubs have always played a role in feeding livestock. Trees and shrubs are increasingly recognized as important components of animal feeding, especially as suppliers of protein and energy (FAO, 1997. Gutteridge, 1990. Ikhimiya, 2005).

In difficult environmental conditions, where the available grazing is not sufficient to meet the maintenance requirements of animals for part of the year, the contribution from trees and shrubs is significant. Trees and shrubs are valuable sources of fuel wood, shelter, timber, herbal medicines and food for people, and also help to maintain soil fertility. Tree fodders contain high levels of crude protein and minerals and many show high levels of digestibility. They are readily accepted by livestock and presumably because of their deep-root systems, they continue to produce well into the dry season. However, Anti-nutritive Factors such as polyphenol and tannin compounds can be a problem in some species (Paterson, 1998).

The presence of tannins and other phenolic compounds in a large number of nutritionally important shrubs and tree leaves hampers their utilization as animal feed. High levels of tannins in leaves due to decrease voluntary food intake, nutrient digestibility and N retention (Silanikove, 1996).

There are many method for reduce negative effects of tannins, such as polyethylene glycol (PEG) supplementation. The PEG a non-nutritive synthetic polymer having high binding capacity with tannin compounds (Makkar, 1995), therefore PEG has been widely used to reduce the detrimental effect of tannin compounds in ruminant diets (Makkar, 1995 Pritchard, 1998). There is little information available on the nutritive value of tree leaves in Iran, Therefore the present study was, carried out to determine the chemical composition, phenolic composition and degradation of cherry tree leaves.

2. Material and Methods

Forage Samples During fall season from different parts of East Azerbaijan province were collected. Next, there were drying for one week, and uniform mixture were papered for nutritive chemical. The species of Forage Sample was (*Prunus avium*). For determination of PEG effects, we added PEG with 2:1 ratio (400 mg PEG: 200 mg sample) into gas test syringes.

After drying samples were milled through a 1-mm sieve for chemical analysis. DM was determined by drying the samples at 105°C overnight and ashing the samples in a muffle furnace at 550°C for 6 h. Nitrogen (N) content was measured by the Kjeldahl method (AOAC, 1990). Crude protein was calculated as $N \times 6.25$. Neutral detergent fibre (NDF) and acid

detergent fibre (ADF) contents were determined by the method of AOAC (1990).

Animals: Tree fistulated Taleshi steers (5 years old, about 550 kg weights) were used for rumen application in nylon bag and gas production techniques.

In vitro gas production

Forage samples milled through a 1-mm sieve were incubated in vitro in rumen fluid in calibrated glass syringes following the procedures of Menke and Steingass (1988). Rumen fluid was obtained from three fistulated cattle fed twice daily with a diet containing alfalfa hay (60%) and concentrate (40%). The samples were incubated in the rumen fluid in calibrated glass syringes following the procedures of Menke and Steingass (Menke, and Steingass, 1988) as follows. 0.200 g dry weight of the sample was weighed in triplicate into calibrated glass syringes of 100 ml in the absence and presence of 400 mg PEG. Syringes were pre-warmed at 39°C before injecting 30 ml rumen fluid-buffer mixture into each syringe followed by incubation in a water bath at 39°C. Syringes were gently shaken 30 min after the start of incubation and every hour for the first 10 h of incubation. Gas production was measured as the volume of gas in the calibrated syringes and recorded after incubation of 2, 4, 6, 8, 12, 24, 48, 72 and 96 hours. Total gas values were corrected for blank incubation which contained only rumen fluid. Cumulative gas production data were fitted to the model of Ørskov and McDonald (1979).

$$y = a + b(1 - e^{-ct})$$

Where:

a = the gas production from the immediately soluble fraction (ml)

b = the gas production from the insoluble fraction (ml)

c = the gas production rate constant

a + b = the potential gas production (ml)

t = the incubation time (h)

y = the gas produced at the time t

The OMD of forages was calculated using equations of Menke et al.(1979) as follows:

$$\text{OMD (\%)} = 14.88 + 0.889 \text{ GP} + 0.45 \text{ CP} + \text{XA}$$

Where:

GP= is 24 h net gas production (ml / 200 mg),

CP = Crude protein (%)

XA = Ash content (%)

ME (MJ/kg DM) = content of forages was calculated using equations of Menke et al.(1979) as follows:

$$\text{ME (MJ/kg DM)} = 2.20 + 0.136 \text{ GP} + 0.057 \text{ CP} + 0.0029\text{CP}^2$$

Where:

GP = is 24 h net gas production (ml/200 mg)

CP = Crude protein

In situ DM disappearance

In situ nylon bag technique: For determine the *in situ* degradation characteristics of the samples, 4 g of dry sample milled through a 3 mm screen was weighed in nylon bags (16*8 cm, pore size 45 to 60 um). The bags were incubated in the rumen of three fistulated cattle. Nylon bags were withdrawn at 0, 4, 8, 16, 24, 36, 48, 72 and 96 h after insertion. For soluble fraction (0h) measurement was obtained by soaking the two bags of sample in warm water (370°C) for 1 h. The 0 h and incubated bags were then washed with cold water for 15 min in a washing machine and dried for 48 h at 60°C. The DM degradation data were fitted to the exponential equation $p = a+b(1-e^{-ct})$ (Ørskov and McDonald, 1979).

To determine the degradation characteristics (a, b, a+b, c, ED); where p is the DM degradation at time t, a denotes washing loss (representing the soluble fraction of the feed); b insoluble fraction; c is the rate of degradation of fraction b; ED denotes effective degradability, calculated at an outflow rate of (0.02, 0.05 and 0.08 per h). After incubation, DM degradability (DMD) for each bag, for each incubation period and for each cattle were calculated with formulas suggested by Susmel et al. (1990)

Where:

y = DM disappearance in rumen at time t

a = the rapidly soluble fraction

b = the potentially degradable fraction

c = the constant rate of degradation of b (%/h)

Effective DM Degradability (EDMD) was calculated applying the equation of Orskov and McDonald (1979).

Statistical Analysis

All of data were analysis by using SAS software (1999) and means of two sample groups were separated by independent samples t-test (Torrie JH, 1980). All data obtained from three replicates (n= 3).

3. Results and discussion

The chemical composition of Cherry leaves has shown in table1

Chemical composition including dry matter (DM), crude protein (CP), crude Ash (Ash), ether extract (EE), neutral detergent fiber (NDF), acid detergent fiber (ADF) and tannin compounds, 91.11, 2.76, 9.3, 8, 27.6, 20 and 2.185 percent, respectively measured.

Table 1: The chemical composition of cherry tree leaves (%)

Dry matter	91.11
ether extract	8
Crude protein	2.76
Neutral detergent fiber	27.6
Acid detergent fiber	20
Ash	9.30
tannin compounds	2.185

***In vitro* gas production**

Gas production volumes (ml/200mg DM) at different incubation times has shown in figure 1.

There are a steadily increase in the gas production for over a period of 24h.

The gas production parameters, are given in Table 2. The soluble fraction (a) and insoluble but fermentable fraction (b), for with PEG and without PEG treatments were -1.44, 54.38 and -4.25, 52.90 ml, respectively. The negative (a) value for both treatments due to delay in onset of fermentation and microbial attachment were in agreement with Chumpawadee et al (2005) and Maheri-sis et al (2008). The PEG supplementation increased the gas production from the gas production of immediately soluble fraction (a) and gas production from the gas production rate (c), Whereas PEG supplementation had no significant effect on the gas production from insoluble fraction (b) and the potential gas production (a+b), also there were significant increases ($P<0.05$) in the OMD and ME content of the Cherry leaves in the addition of PEG.

***In situ* degradability characteristic of apple leaves shown in table 3.**

The DM degradability from the soluble fraction (a) and Potential degradability (a+b) were, 14.32 and 84.12 percent respectively and the rate degradability(c) was 0.060/h estimated. The total degradability of the sample is given by a + b which obviously cannot exceed 100. It follows that 100 - (a+b) represents the fraction which will appear to be undegradable in the rumen. If 'a' is positive, then there is a component which is degraded rapidly and/or a component which is soluble, or fine enough to escape from the bags simply by soaking and washing. Whether 'a' represents rapid degradation, or simply washing losses, can be determined with control bags which are simply soaked in water and then washed and dried in the normal way. When a negative value for 'a' is obtained this means that there has to be an initiation period for degradation to start (termed the lag phase).

Effective degradability (ED) of the examined nutrient components were calculated using the outflow rates of 0.02, 0.05 and 0.08/hr, according to Ørskov et al. (1980), model: $ED = a + [bc/(c+k)]$ where ED is effective degradability and 'a', 'b' and 'c' are the constants as described earlier in the non-linear equation above and 'k' the rumen fractional outflow rates.

Effective rumen degradable dry matter at a different rate were determine, Effective degradability (ED) of DM decreased with increase in outflow rates DMD decreased of 66.46% ($k=0.02$) to 44.13% ($k=0.08$) in the leaves.

Fig1. *In vitro* gas production volume of cherry tree leaves at different incubation time in the presence Of (PEG)

Table 2. The estimated parameters from the gas production of cherry tree leaves.

Estimated Parameters	Without PEG	With PEG	P value	SEM
a	-4.25 ^b	-1.44 ^a	$P<0.0001$	0.201
b	52.90	54.38	$P<0.022$	0.530
a +b	57.15	55.82	$P<0.026$	0.680
c	0.097 ^b	0.135 ^a	$P<0.0001$	0.005
OMD	62.74 ^b	68.14 ^a	$P<0.003$	0.402
ME	10.27 ^b	11.10 ^a	$P<0.003$	0.02

a: the gas production from soluble fraction (ml/200mg DM)

b: the gas production from insoluble fraction (ml/200mg DM)

c: rate constant of gas production during incubation (ml/h)

(a + b): the potential gas production (ml/200mg DM),

OMD: Organic matter digestibility (%),

ME: Metabolisable energy (MJ/kg DM), and

S.E.M: standard error of the mean.

Table 3. The parameters of estimated from the *In situ* degradability of cherry leaves (%)

Cherry tree leaves DM	Estimated Parameters			
	a	b	a+b	c
	14.32	69.79	84.12	0.060
effective degradability				
	Lag time	0.02	0.05	0.08
DM	0.782	66.46	52.20	44.13

a = washing losses, soluble or rapidly degradable:

This value is the intercept of the degradation curve at time 0 h (%)

b = the insoluble but potentially fermentable (%)

c = degradability rate (h)

a+b = Potential degradability (%)

Conclusion

In conclusion, this study has demonstrated that the use of cherry leaves, which have low crude protein (about 2.76% of DM) therefore, recommended the use of these resources be used to supplement protein

in ruminant diets also, the high percentage of gas production, dry matter degradation and low percentage of tannin compounds having tested samples, we can say that the cherry tree leaves have relatively good nutritional value in ruminant nutrition. However, further study is needed to investigate of use of tree leaves in ruminant diets.

PEG supplementation had a significant increased ($P<0.05$) on the gas production, OMD and ME content of cherry tree leaves.

PEG addition, significant increased ($P<0.05$) the gas volumes in all different incubation times, gas production from soluble fraction (a), and gas production rate (c), but had no effect on the gas production from the insoluble fraction (b) and the potential gas production (a+b).

PEG supplementation to improve the nutritive value of tannin-containing tree leaves.

Abstract:The aim of this research were to evaluated effect of canola oil on the EPA and DHA fatty acid contents in the abdominal fat of Iranian native turkeys. A total of 90 turkey chicks were randomly divided into 3 experimental treatments with 3 replicates were arranged in a completely randomized design. The experimental period lasted 20 weeks. Experimental diets consisted of: Basal diet with 0% canola oil; basal diet with 2.5% canola oil and basal diet with 5% canola oil. Results show that different level of canola oil could not affect significantly EPA and DHA content but DPA percent significantly increased in experimental treatments compare with control group.

[Ramin Salamatdoust nobar¹, Abolfazl Ghorbani¹, Kambiz Nazeradll, Saeid Ghaem Maghami¹. **Canola oil and its effect on the EPA and DPA content of abdominal fat of Iranian native turkey.** Journal of American Science 2011;7(6):290-292]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Turkey, abdominal fat, DHA, EPA, DPA

1. Introduction

Omega-3 fatty acids (n-3) are a group of polyunsaturated fatty acids (PUFA) which include - linolenic acid (ALA, C18:3 n-3), its long chain metabolites eicosapentaenoic acid (EPA, C20:5 n-3) and docosahexaenoic acid (DHA, C 22:6 n-3). Humans can synthesize EPA and DHA through desaturation and elongation of ALA [1]. However, this conversion has been found to be limited [2]. Major sources of ALA include the seeds and oils of flaxseed, soybean and canola, with flaxseed containing 50-60% ALA [3]. EPA and DHA are obtained in the diet from aquatic and marine products only such as fish, shellfish, algae and their oils[4]. Increased knowledge of the health benefits of omega-3 fatty acids especially EPA and DHA has led to a growing demand for products rich in omega-3 fatty acids [5]. Abdominal fat are excellent sources for fat which are one of the components of the diet of individuals living in the developed countries [6]. Some of vegetable oils such as canola oil enriched with the perfect balance between omega 3 fatty acids and omega 6 fatty acids. How ever the aim of this research were evaluate canola oil effects on the incorporated DHA and EPA fatty acid to abdominal fat and increase their omega-3 PUFA contents.

2. Material and methods

Animals and Diets

Ninety Iranian native turkey male chicks were divided into 3 groups of 30 chicks each. One group was fed a control diet and the other two with two different experimental diets enriched in omega-3 fatty acids (diet 1 containing 2.5% canola oil and diet 2 containing 5% canola oil are given in Table 1 The experimental diets formulated isonitrogenouse and isoenergetic, accordance with the 1994 recommendations of the

National Research Council (table 1). Fattening period was performed at four period 4-8, 8-12, 12-16 an 16-20 week.

Abdominal Fat

Abdominal fat pad (including fat surrounding gizzard, bursa of Fabricius, cloaca, and adjacent muscles) was removed at 20 wk of age for turkeys. The abdominal fat was stored at -20 C until analysis. Fatty acid composition was determined by gas chromatography (GC).

Gas chromatography of fatty acids methyl esters

Sample preparation

Total lipid was extracted from breast and thigh according to the method of Folch [8]. Approximately 0.5 g of meat weighed into a test tube with 20 mL of (chloroform: methanol = 2:1, vol/vol), and homogenized with a poltroon for 5 to 10 s at high speed. The BHA dissolved in 98% ethanol added prior to homogenization. The homogenate filtered through a Whatman filter paper into a 100-mL graduated cylinder and 5 mL of 0.88% sodium chloride solution added, stopper, and mixed. After phase separation, the volume of lipid layer recorded, and the top layer completely siphoned off. The total lipids converted to fatty acid methyl esters (FAME) using a mixture of boron-trifluoride, hexane, and methanol (35:20:45, vol/vol/vol). The FAME separated and quantified by an automated gas chromatography equipped with auto sampler and flame ionization detectors, using a 30 m´ 0.25 mm inside diameter fused silica capillary column, as described. A (Model 6890N American Technologies Agilent) (U.S.A) Gas chromatography used to integrate peak areas. The calibration and identification of fatty acid peak carried out by comparison with retention

times of known authentic standards. The fatty acid results form gas chromatography with Chem Station software analyzed and expressed as weight percentages.

Figure 1. Least Square

Statistical Analysis

The performance and analytical data obtained were analyzed by variance analysis using the procedure described by the SAS version 8.2 [9]. The Duncan mean separation test was used to determine significant differences between mean values.

$$y_{ij} = \mu + a_i + \varepsilon_{ij}$$

Where

y_{ij} = all dependent variable

μ = overall mean

a_i = the fixed effect of oil levels ($i = 1, 2, 3$)

ε_{ij} = the random effect of residual

3. Results and discussion

Results of fatty acids content was shown in table 2. Results show that canola oil could affect beneficial fatty acid content in the abdominal fat fatty acid. EPA content from 2.8226 percent in the control treatment reached to 2.4456 and 2.0535 percent in experimental treatments, respectively, but this change were not significant. DPA contents significantly increased in the treatment with usage canola oil and from 3.2516 percent in control group reached to 6.9323 and 8.0224 percent in experimental treatments and between treatment with 2.5 and 5 percent canola oil were have significant deference and 5 percent canola oil have good effect on the increased DPA content, but DHA content have not significant deference in treatments and partials increased in treatment and from 2.3414 percent in control group and reached to 2.5786 and 2.6517 percent. EPA and DHA are among the most biologically important fatty acids included in the human diet. A high EPA content would improve not only the meat but also the regulation of human lipid metabolism [10, 11]. However result show that usage of enrich vegetable oil such as canola oil could improve fatty acid profile of animal tissue and application animal product in human nutrition help to social health.

4. Conclusion

Usage canola oil could increase DPA content in abdominal fat and this status have beneficial effect on the abdominal fat tissue and this status help to human health.

Investigation of dip coated ZnO thin film: X-ray reflectivity and Fourier analysis

Ghahraman Solookinejad

Department of Physics, Marvdasht Branch, Islamic Azad University, Marvdasht, Iran
ghsolooki@gmail.com

Abstract: In this study we fabricated Zinc Oxide thin film by sol-gel dip coating method on glass substrate. X-ray reflectivity (XRR) and its optimization have been used for characterization and extracting physical parameters of the film. Genetic Algorithm (GA) has been applied for this optimization process. Independent information was exploited from Fourier transform of Fresnel reflectivity normalized X-ray reflectivity. The Auto Correlation Function (Fourier transformation of X-ray reflectivity) yields thickness of each coated layer on substrate. This information is a starting point for constructing optimization process. Specular X-ray reflectivity optimization yields structural parameters such as thickness, roughness of surface and interface and electron density profile of the film. Acceptable agreement exists between results obtained from Fourier transformation and X-ray reflectivity fitting. [Ghahraman Solookinejad. Investigation of dip coated ZnO thin film: X-ray reflectivity and Fourier analysis. Journal of American Science 2011;7(6):293-298]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: X-ray Reflectivity, dip coating, roughness, Fourier Transformation

1. Introduction

Sol-gel thin film technology is being applied for producing new novel devices and has been extensively explored for optical and electrical applications due to their very low cost and fast fabrication procedure (Banerjee, *et al.*, 2001, Morelhao, *et al.*, 2002). Application of these materials in solid state lasers, integrated circuits, light emitting devices, magnetic heads and tapes and coated window glass make them interesting in industry. Mechanical, magnetic, optical and electrical properties of these materials make use of them in industry. These aspects are related to their structural parameters such as thickness, roughness and electron density profile. Therefore research, development of applications, production and characterization of new thin films is essential effort (Dane, *et al.*, 1998, Zhu, *et al.*, 1998).

Fabrication of Zinc Oxide thin film can be accomplished with different techniques such as chemical vapor deposition (Nishino, *et al.*, 1997), sputtering (Hsu, *et al.*, 2008) and sol-gel process (Shao, *et al.*, 2006). Among these techniques sol-gel technique contests with the others due to its low cost and this technique is a process well suited to large scale production (Habibi, *et al.*, 2008).

There is a populous use of thin layered films with layer thickness in some nanometer range of thickness in modern technology and industry. Also manufacturing of high quality light emitting devices with longer operational lifetime needs smooth interface between hetero-junction structures. Controlling of structural parameters such as roughness at the surface and interface is essential in making high-performance devices, based on low-dimensional structures such as thin films and

quantum wells. So analyzing the structure of the thin films is technologically very significant. Material characterization enables the improvement of new materials, structures and technologies. By developing instrumentation for improved measurement methods, there is an analogous need for the progress of techniques in order to operate these tools to their maximum benefits.

One of the most excellent techniques to study the structural and physical aspects of thin films is X-ray reflectivity (XRR). XRR is well established and nondestructive technique used for extraction density, thickness and roughness of surface and interface of thin film structures. In grazing incidence X-ray reflectivity (GIXR) technique, the X-ray beam is incident on the film at grazing angle and the interfered reflected beam is aggregated by X-ray detector. Presence of interfaces in the film causes interference process. The thickness of the layers causes interference periods and the amplitude of the interference oscillations depends on the both interfacial roughness and the electron density difference between the layers (Stoev, *et al.*, 1999).

A distinctive way to characterize the structural parameters of a film from its X-ray reflectivity is to construct a model that we expect logically qualifies its structure and from which we can simulate X-ray reflectivity. By calculating the differences between the experimental and simulated curves using a number of fitness functions, the model fitted by some optimization methods in order to minimize the difference between the two curves. This procedure is repeated until the difference between the two curves is arbitrated to be sufficiently small, at which point we believe that the model to be an

accurate representation of the structure (Wormington, *et al.*, 1999).

A disadvantage of the X-ray reflectivity fitting for exploiting structural parameters of thin films is that more than one electron density profile may be used to generate a single reflectivity result. Therefore we require model independent information about the system to estimate a close model of the system for correct analysis of the data.

Fourier transformation process of the X-ray reflectivity is the quick method to obtain useful model independent information concerning to the real space structure. Use of the Fourier transformation of X-ray reflectivity (Auto Correlation Function - ACF) can prepare useful layer thickness measurements for constructing fitting procedure. The combined use of Fourier analysis and fitting procedures would make X-ray reflectivity data more practicable for realistic analysis of thin films.

Fitting algorithm, which minimizes the discrepancy between theory and experiment, is the main part of iteration process. Classical gradient based optimization procedures show acceptable performance but remain unreliable due to trapping in local extreme. In contrast genetic algorithms (GAs) combine the advantages of stochastic search with intelligent strategy of solution finding. G. R. Liu *et al.* (Liu, *et al.*, 2002) suggested computational method for material characterization of composites, by combining the advantages of least squares method and Genetic Algorithm in the inverse procedure. They applied displacement response as the structure action data for material characterization of composite plates. The material property can be found by minimizing error functions formulated using the measured displacement response. Application of GA in science and engineering has made this technique to be robust and effective (Dane, *et al.*, 1998).

Surface morphology and its acceptable characterization play an essential role in the study of thin films from different aspects. Generally each existing and future application of thin films needs specific optical, electrical, chemical and mechanical properties, which almost all strongly depend on the surface quality of the film. For this reason in this study Auto Correlation Function of Zinc Oxide thin film, obtained by calculating the Fourier transformation of the ratio of reflectivity data and Fresnel reflectivity, was applied for extracting layer thicknesses of Zinc Oxide thin film. This thickness information of the film is the starting point for constructing fitting procedure between the experimental and theoretical X-ray reflectivity. Genetic Algorithm was applied for optimization of the fitness function between logarithmic experimental and theoretical X-ray reflectivity. Structural

parameters such as roughness of surface and interface, layer thickness and electron density profile were extracted by fitting procedure.

2. Material and Methods

2.1. Sample preparation

A Zinc Oxide thin film was fabricated by sol-gel dip coating method (Habibi, M.H, *et al.*, 2008). ZnO thin film preparation by dip coating was carried out at room temperature onto the substrate with a controlled withdrawal speed of 1 cm min⁻¹. For each layer, the film was preheated at 275 °C for 10 min and annealed at 350 °C for an hour. The deposition was repeated five times to obtain five-layered film of Zinc Oxide. X-ray reflectivity measurement was performed using Bede GXR1 reflectometer at Durham University, Physics Department. The specular reflectivity curve was recorded with -2 scan.

2.2. X-ray reflectivity

X-ray reflectivity is a method used to characterize the surface structure of materials irrespective of their crystalline perfection. Hence this technique can be applied to crystalline, polycrystalline and amorphous materials. Application of this technique for thin films provides information about thickness, roughness and electron density in the film.

By impinging X-ray beam (I_0) with a grazing incident angle on the film, a reflectivity is specified as

$$R = \frac{I}{I_0}$$

Here I_0 and I are incident and reflected X-ray intensities.

The recursive formula for reflectivity is (Parratt, 1954)

$$r_{i,i+1} = \left[\frac{r_{i+1,i+2} + F_{i,i+1}}{r_{i+1,i+2} \times F_{i,i+1} + 1} \right] \times a_i^4$$

Where

$$F_{i,i+1} = \left[\frac{g_i - g_{i+1}}{g_i + g_{i+1}} \right] \times \exp(-8\pi g_i g_{i+1} \sigma_{i+1}^2 / \lambda^2),$$

$$a_i = \exp(-i\pi g_i d_i / \lambda)$$

$$g_i = \sqrt{n_i^2 - \cos^2(\theta)} = \sqrt{(1 - \delta_i + i\beta_i)^2 - \cos^2\theta}$$

where θ , λ , d_j and σ_j are incident angle, X-ray wavelength, j th layer thickness and surface roughness respectively.

The recursive equation was first obtained by Parratt for X-ray reflectivity simulation (Parratt, 1954). The roughness term was introduced in the framework of the Distorted Wave Born Approximation (DWBA)

(Tidswell, *et al.*, 1990). This expression indicates that the reflectivity profile will have series of minimum and maximum giving interface fringes, called Kiessig fringes, and the successive maxima in q -space ($q = \frac{4\pi}{\lambda} \sin \theta$) is inversely related to the thickness of the film.

For exploiting structural parameters of film GA optimization was performed in order to minimize the fitness function. The selection of a suitable fitness function is crucial for data-fitting procedure independent of the optimization method used. A number of fitness functions can be assumed, but in the case where a measured and a calculated curve are compared, a fitness function consisting of the Root Mean Squared Error (RMSE) of measured and the calculated data has been observed to work well in practice (Wormington, *et al.*, 1999). We used the mean-squared error of the log transformed data as a fitness function

$$E = \frac{1}{N-1} \sum_{j=1}^N [\text{Log} I_{\text{exp},j} - \text{Log} I_{\text{cal},j}]^2$$

where N is number of data points.

Before starting optimization, the thickness of the film was extracted by ACF of normalized X-ray reflectivity. For fitting the program with the experimental data, the Zinc Oxide thin film is considered to be made of a number of slabs of same thickness with varying electron density. Electron density in each slab and roughness of each interface are other fitting parameters.

2.3. Fourier transformation

The use of classical Maxwell equations for Fresnel reflectivity in terms of the scattering wave vector q yields (Tidswell, *et al.*, 1990)

$$R_F(\theta) = \frac{q - \sqrt{q^2 - q_c^2 + \frac{2i}{\mu}}}{q + \sqrt{q^2 - q_c^2 + \frac{2i}{\mu}}}$$

where $q_c (= \frac{4\pi}{\lambda} \sin \theta_c)$, is the critical wave vector in air and is independent of wavelength.

If scattering wave vector is greater than the critical value q_c , then we can represent X-ray reflectivity as a Fourier transform of the derivative of the electron density profile ($\rho'(z) = \frac{d\rho(z)}{dz}$) (Banerjee, *et al.*, 2004).

$$R(q) = R_F(q) \left| \frac{1}{\rho_\infty} \int_{-\infty}^{\infty} \rho'(z) \exp(iqz) dz \right|^2$$

Here ρ_∞ is the substrate electron density and $R_F(q)$ is the Fresnel reflectivity of substrate. By taking

Fourier transform of the fraction of reflectivity data and Fresnel reflectivity of substrate we can extract Auto Correlation Function of the derivative of the density profile.

$$ACF[\rho'(z)] = \int_{-\infty}^{\infty} \rho'(t) \rho'(t-z) dt = \text{const} \int_{-\infty}^{\infty} \frac{R(q)}{R_F(q)} \exp(-iqz) dz$$

The position of peaks in Auto Correlation Function corresponds to the distances between regions where electron density changing rapidly, or between interfaces.

Topography explanation of thin films by optical Fourier Transformation was investigated by J. Jaglarz (Jaglarz, 2008). In his work, the major problems about the scattering of light by real surfaces and films are presented in view of results achieved with the bidirectional reflection distribution function (BRDF) method and optical profilometry (OP). The BRDF and OP studies permit one to get information about surface topography. The surface power spectral density (PSD) function for rough film has been found from the optical data. This function has been evaluated from the Fourier transform (FT) of the surface profiles. The utility of BRDF and OP methods in characterization of real surfaces was confirmed when analyzing the optical data obtained for metallic TiN thin films. J. Borowski *et al.* (Borowski, *et al.*, 2001) analyzed the effect of the Fourier transform of the incident beam on the measured diffracted intensity in X-ray diffraction. Their theory is a more precise physical picture of X-ray diffraction in the case of a narrow incident beam than the typically supposed spherical-wave theory. Their suggested method may be applied for direct calculations of the correlation function for electromagnetic fields and studies of the coherence degree of X-ray radiation.

3. Results

Fig. 1(a) indicates the measured X-ray reflectivity, normalized to Fresnel reflectivity, of Zinc Oxide thin film. Fig. 1(b) represents Auto Correlation Function computed from the Fourier transform of $\frac{R(q)}{R_F(q)}$. The peaks of Auto Correlation

Function (ACF) represent the interfaces between different layers of the film. As can be seen from this figure, the first layer of Zinc Oxide has 90, 2nd 74, 3rd 68, 4th 78 and 5th layer 80 Å Thicknesses and the total thickness of the film is 390 Å. Since this calculation was done independent of the fitting procedure, extracted information is unambiguous and model independent. Also existence of the broad peaks in the ACF suggests that there are inter diffusions between film layers. C. Renard *et al.* (Renard, *et al.*, 2006) investigated The existence of a

highly disturbed thin layer on top of the GaInAs by applying a model-independent Fourier transform procedure, applied to the high-resolution X-ray diffractometry profile. This procedure gave two thicknesses, one corresponding to the thickness from thin-layer to the sample surface and the other one corresponding to the thickness from thin-layer to the substrate surface. These calculated layer thicknesses must be compared with equivalent parameters derived from electron density profile perpendicular to the surface that extracted from fitting the X-ray reflectivity by genetic algorithm. Information that extracted from ACF is appropriate keyword for constructing 40-layer model for fitting and derivation physical parameters of the film.

The thicknesses of individual layer in addition to multi-layers of SrZrO₃ thin films were extracted with reflectometry measurements by K. Galicka-Fau et al. (Galicka-Fau, *et al.*, 2008). They applied the model independent Fourier-inversion method to reflectivity curve to determine the individual thin thicknesses and multi-layers of a stack formed in the SrZrO₃/Si films. Fourier-inversion technique applied to XRR profiles corresponds to a one-dimensional Patterson analysis of the interface positions and gives the Auto-Correlation Function (ACF) of the electronic density derivative, leading to distances between interfaces.

Fig. 2.a exhibits measured experimental X-ray reflectivity and best fit of theoretical reflectivity of Zinc Oxide thin film. The circles represent the experimental data and solid line represents recursive formalism based data after fitting process. This 40 layer model also applied for extracting electron density profile (EDP) perpendicular to the film surface from the XRR data fitting. This electron density profile is shown in fig. 2(b). We have considered 40 boxes each of 10 Å sizes for extracting electron density profile of X-ray reflectivity data.

One observable feature in the fit is that the electron density gradually increases from surface and decreases near interface. Three extra boxes added for extracting electron density of substrate. This electron density for silicon substrate was determined to be $0.77 \text{ e}/\text{Å}^3$. The peaks in EDPs are imputed to transition layers formed at interfaces during annealing process, which have been reported by others (An, *et al.*, 1994). From oscillatory behavior of electron density with thickness one can deduce that with each application of new layer during spin coating, the whole film was not reconstructed and softened but they have inter diffusions. Oscillation of electron density profile corresponding to fit was also obtained by others (Morelhaio, *et al.*, 2002) in sol-gel derived systems.

Figure 1. (a) Fresnel reflectivity normalized XRR scans (b) Fourier transformation

The electron density profile shows position of interfaces of 5 layers of the film. The peak in the electron density around a depth of 90 Å could be due to interface between first and second layers in the film. In the EDP profile, we observe a jump down of the electron density beyond 390 Å and it approaches to a constant value of $0.77 \text{ e}/\text{Å}^3$ which is the value of substrate electron density. The fitting was carried out using an average electron density $0.96 \text{ e}/\text{Å}^3$ for the film. The total film thickness obtained from electron density profile after optimization process has good agreement with amount that obtained from Auto Correlation Function of X-ray reflectivity. The prominent oscillations in the electron density profile may be explained in terms of repulsive interactions between layers of the film.

The thickness of layers of chemisorbed hydrocarbon monolayer films coated on silicon substrate were extracted by fitting the data to reflectivity calculated from models of surface electron density and by calculating Patterson function directly from the data (Tidswell, *et al.*, 1990). The surface and interface roughness and thickness of Mo/Si multilayer was calculated by considering additional interlayer of Mo-Si in addition to a pure layer of Mo and Si due to roughness phenomenon

(Modi, *et al.*, 2003). Recently G. Krishna Mohana Rao et al, by using neural networks and genetic

density of layers only can be extracted from X-ray reflectivity fitting.

Figure 2. (a) XRR scans (circles) and calculated reflectivity after fitting (solid line) for Zinc Oxide thin film (b) corresponding electron density with thickness.

algorithm optimization, have optimized surface roughness of die sinking electric discharge machining by considering the simultaneous effect of various input parameters (Krishna, 2009). C. L. Tien et al. (Tien, *et al.*, 2009) presented the measurement of surface roughness of optical thin films based on fast Fourier transform (FFT) associated with a Gaussian filter. With the aim of progress the accuracy, they normalized the fringe pattern to remove the background variation before using the FFT. The roughness profile was filtered by the Gaussian filter after the phase change was converted to surface height distribution. The root-mean-square value of surface roughness of optical thin films was extracted by their proposed method.

Table 1 summarizes results of parameters calculation of Zinc Oxide thin film by autocorrelation function method and X-ray reflectivity fitting. As can be seen from this table, layer thicknesses extracted from both methods have acceptable agreement. Also surface and interface roughness and mean electron

Table 1: Comparison of results from XRR and ACF

	XRR fitting			ACF
	Thickness(Å)	Roughness(Å)	Mean ED	Thickness(Å)
First	87±5	8.1±1	1.04±0.02	90±5
2 nd layer	72±5	7.2±1	0.9±0.02	74±5
3 rd layer	70±5	6.9±1	0.6±0.02	68±5
4 th layer	74±5	7.4±1	0.72±0.02	78±5
5 th layer	78±5	6.5±1	1.2±0.02	80±5
Substrate	∞	7.2±1	0.77±0.02	∞

4. Discussions

We have shown that one can fit the reflectivity profile using recursive formalism by considering a number of layers and extracting EDP from the fit parameters. As an independent calculation, the information about film thickness can be extracted directly from Auto Correlation Function of X-ray reflectivity normalized to the Fresnel reflectivity. The theoretical model that used in this study exhibits excellent agreement with experimental XRR pattern and give accurate information of thickness, roughness of surface and interface and EDP of each layer of the film. Frequency analysis of X-ray reflectivity data is feasible and significant when some careful analysis is need without depending on special model. We used Fourier transformation of X-ray reflectivity as independent process for extracting thickness of layers in the film. Combination of modern fitting procedures such as genetic algorithm with frequency analysis methods will make X-ray reflectivity more reliable in realistic analysis.

New look to indigenous knowledge in developing countries

Abbas Emami

Darab Branch, Islamic Azad University, Darab, Iran
E-mail: hossein11070@yahoo

Abstract: in the process of agriculture renovation in the third world that is indeed unavoidable, the indigenous agriculture knowledge and local methods in management of agriculture resources is to be destroyed and simultaneously environmental regions are on the verge of destruction. Modern agriculture prefers huge profit from resources and didn't pay attention to environmental, cultural, social and economic varieties of traditional agriculture. So incongruities of agriculture development plans are not compatible with rural needs and talents and also rural conditions. By recognizing indigenous agriculture features such as traditional classification for identifying plant and animal species and using of indigenous practices like simultaneous cultivation of compatible crops, we can get useful information about suitable ways for agriculture. Surely these guidelines will be more compatible with rural needs and agriculture and environmental features of each region and won't be reckless to social, economic and environmental complex issues.

[Abbas Emami. **New look to indigenous knowledge in developing countries**. Journal of American Science 2011;7(6):299-303(ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: indigenous knowledge, developing countries

Introduction:

From Robert Chambers' view, power and wealth are at industry and at cities, and poverty and deprivation are part of villager's life. Power and wealth of cities of world has absorbed experts, sources and needed research facilities for producing and disseminating knowledge. Knowledge of these modern centers is considered scientific, advanced, and valid and enjoys premium technology. He labeled this group as "first" and in contrast "last" for deprived villagers. Because, preferences and values of these two groups are different. Their knowledge and attitudes are also different. he believes that since "first" development remedies and their attitudes have led to fault , irregular and deprivation , so deprived villager's attitudes and knowledge should be considered serious in order to reach to improve conditions for this part of human society as they need and demand(Azkiya, M and Imani, 2008) .

Some of these features are as follow:

Indigenous knowledge is holistic: indigenous knowledge is gained by sense and inspiration force and leads information unity. In spite of formal knowledge that is aural, visual and analytic.

Indigenous knowledge is verbal: writing and documenting indigenous knowledge would make it out of reach of villagers who can add to it, if it would not follow applied activities.

Indigenous knowledge is practical: it is possible to write about indigenous knowledge but it is impossible to educate and learn it through books and articles. Only way to learn it is close view and follow professor.

Indigenous knowledge isn't explanatory: it isn't possible to expect one master (e.g. mason, apothecary, farmer) to explain his method efficiency in a way that is apprehensible to us (literate people)

Indigenous knowledge is local: villager's knowledge has formed in itself environmental and climate framework. Effective indigenous knowledge at one geographical area isn't necessarily effective at other area (Nowroozi, A and Alagha, 2000).

Indigenous knowledge is general: while, formal knowledge emphasis is on saving time and removing ideas and also monopoly of knowledge at universities and research institutes , but indigenous knowledge is, receptive, incentive and needs to more people's participation at learning , developing and add to it. Furthermore, in verbal cultures, it is impossible to separate science from world and even include it to computer and book. Every human are important in indigenous knowledge.

Indigenous knowledge is deteriorating quickly: by every death of old indigenous people, great knowledge resources would be lost also, so every action toward gathering indigenous knowledge is necessary.

Learning by doing: repeating action in order to sustain and enforce indigenous knowledge through "learning by doing" is one of features of indigenous knowledge in real operation environment (Emadi and Abbasi, 2001)

Villager's knowledge and especially indigenous knowledge systems have various dimensions that include linguistic knowledge, zoology, ecology, climate, agriculture, ranching and professional skills. Range and value of this knowledge hasn't been

considered. Four aspects of various dimensions of rural knowledge were selected and were analyzed, In order to change attitudes and reformer's behavior of rural development. These dimensions are: agriculture operations, rural knowledge about nature, rural people's aptitudes and abilities and their experiences (Razavi, 2002).

In Chambers' opinion, indigenous knowledge or rural knowledge has various dimensions that he classified them to four parts in order to explain more and better about diversity of indigenous knowledge that are as follow: A: farming activity; B: knowledge in relation to nature; C: indigenous people's aptitude and ability; D: indigenous people's test. indigenous people's knowledge originated from exact viewing of environment; since indigenous villagers have direct contact with phenomenon and also see all different processes at nature so have especial aptitude and ability compared to outside people. Maybe least known aspect of indigenous villager's knowledge is essence of tests that they do which maybe these tests are available to choose "bests" and some other for "minimizing risks" (Dewes, 1998).

Advantage of indigenous agriculture

Studies have given new dimension to agriculture research. Now, in many countries the managers of agriculture resources are the people who are trained in western countries. So if the manager become familiar with the culture and environment roots of indigenous system of resource management, they won't do mistake. Indigenous agriculture is based on cooperation of farmer with nature. Recently researchers of ecological agriculture have more attention to these systems. The result of these studies is important from two sides:

- 1- At the first, in the process of agriculture renovation in the third world that is indeed unavoidable, the indigenous agriculture knowledge and local methods in management of agriculture resources is to be destroyed and simultaneous environmental regions are on the verge of destruction. Modern agriculture prefers huge profit from resources and didn't pay attention to environmental, cultural, social and economic varieties of traditional agriculture. So incongruities of agriculture development plans are not compatible with rural needs and talents and also rural conditions. By recognizing indigenous agriculture features such as traditional classification for identifying plant and animal species and using of indigenous practices like simultaneous cultivation of compatible crops,

we can get useful information about suitable ways for agriculture. Surely these guidelines will be more compatible with rural needs and agriculture and environmental features of each region and won't be reckless to social, economic and environmental complex issues (Appleton and Jeans, 1995).

- 2- Second, with studying indigenous agriculture we can get points that will help us to design the same systems in industrial countries. Sustainable agriculture which is taken from indigenous systems will remedy the shortcoming of modern agriculture. In a single-product of modern farm, life circles of nature has changed by using chemical poison that give no chance for using principles of ecological agriculture. But completeness (evolution) of culture and environment is the result of local agricultural systems (Ahmed, 2000). In indigenous agriculture, variety and alternation of cultivation make minimize the possibility of farming products destruction. Although these systems have resources limitation, but they use of learning advantage and intellectual ways for use of animals, soil and compatible farm species. For this reason, researchers of ecological agriculture know these systems as unexampled kinds to specify constant static scales for agriculture activities. In industrial countries they use of these scales for designing and managing ecological production systems (Emadi and Amiri Ardekani, 2004).

With all the advantage we account for native knowledge we should contemplate that for reaching a balanced understanding of this knowledge, we shouldn't indicate it very important or not very unmeaning as Chambers say. Also we shouldn't consider rural people an intellectual people. Because they can make mistake like any other people or group. And also this knowledge is not reliable forever. In some places this knowledge is combined with some superstition believes and we should not forget its spiritual and mental aspect (Warren, 1999).

Dictated pattern's failure through western development countries to third world countries show that native knowledge is necessary to reach development.

Untrop believe that usage of local knowledge is efficient and useful in development and native knowledge's researchers believe that they achieved to an important source for innovation in agriculture methods and a good farming production to improve the rural people's life. On his idea, some of researchers call native knowledge as a good supplement and replacement for modern knowledge and they have tried to spread the usage of this

knowledge all around the world. These plans as a “communion research with farmers” or “first is the first” are introduced. In this research method, private organs and local groups have the main role and unlink the current research plans, the tests are done with the farmers attendance in their farms and not in research centers and far from environment condition. The ways that farmers and rural people use for management of their living environment are the most scientific ways, although we couldn't understand it at the first sight (Chambers, 2000).

Eshraghi (2000) explained that by introducing sustainable development model or development environmental model and according to world food organization (FAO), sustainable development will create when applied technologies in rural development are in proportion with rural people's knowledge and also are acceptable by them. Also he says that one the main ways to reach sustainable development in society is that to have enough and necessary attention to the rural's native or local knowledge (Merrewij, 1998). It is also explained that attention to this knowledge needs a complete recognition of rural people and their knowledge that through assembling of this knowledge we can find a correct way to reach a sustainable development and we should know that the movement toward sustainable development is not possible without correct using of native knowledge. Many development experts believe that the Sustainability of this concept is at the studying of this knowledge and in becoming popular in development. Indeed, native knowledge with its holist features had known the relation between nature's components better and had smoothed the way to Sustainability of development (Gigler, 2003).

We can summarize the usage of native knowledge in development as follow:

- 1- Protection and maintenance of natural sources. Native methods in management of natural sources are suitable pattern for managing natural sources in sustainable development.
- 2- The success of sustainable development plans is depended to rural people's communion at designing, schematization, performance and assessment. Use of native knowledge is necessary for rural people's communion.
- 3- Native and modern knowledge should be combined because according to our needs and vulnerability of remained natural sources, none of them are able to remove our needs a lonely.
- 4- For recognizing development needs, trouble shooting problems should be polestar from rural people's view and recognizing problems and making efficient relation with rural people are possible through native knowledge.

- 5- In industrial countries, native methods are forgotten completely because of using modern knowledge in production process. As native methods are the most suitable way for achieving sustainable development goals so, many efforts were done to make this knowledge alive.

As a result not only we shouldn't forget the native knowledge but also we should use of this knowledge in developmental plans. Using native knowledge in developmental projects will help to have sustainable development in villages. So developing and not developing that were using of western development patterns for many year, should use of their native and local knowledge which is the result of many years experience and by helping these plans they can reach to a sustainable development (Brouwer, 1998).

Conclusion:

At sustainable human development, people are considered as “goal” of social and economic policies that their range of their selections would be extended in order to actively participate at decision making. Therefore, people's participation is one of tools of sustainable agriculture development. But active rural people's participation at extension programs as a form of sustainable would not be possible unless by believing role of rural people's knowledge, vision and skills (Brouwer 1998).

So, not only attendance of indigenous knowledge is necessary for applied researches but is important at compatibility researches and it enforced importance of attending to indigenous people and their knowledge. Therefore, applying affective strategy for transmitting technology has been among from affective fields at attending to indigenous people's knowledge and especially experts; because, development institutes realized positive their affects for doing this more than ever (Merrewij 1998).

Indigenous knowledge has been manifested at sustainable process and improving extension programs at industrial countries of world, very well. Indigenous knowledge related to agriculture, medicine, food and architecture has been widely used At European countries, USA, Canada, Australia, by new names.

So, effort and national commitment and multi-dimensional support is very critical for recording, valuing, extending and exchanging this rich source and also preparing mechanism and practical strategy for synthesizing this knowledge with new knowledge and agricultural development programs.

Agricultural extension was identified as one powerful IT focused area, due to role variation at knowledge

system and agriculture information at one hand and at the other hand due to its dependence on various exchanges among farmers, that can has great affect on rural society and developing agriculture. So that work and productions of farmers would increase by farmer's access and use of Internet and subsistence farmers at all over the world are at developing by gaining needed knowledge and information that during time would becoming as commercial producers. Transmitting from system-cycle source of agriculture to technology-cycle system of agriculture placed more responsibility on agricultural extension because agriculture extension system is as vital technology transfer crossing to farmers at one hand and as crossing for referring feedbacks, needs and agriculture issues, researchers and policy makers of market.

What that is obvious is that extending and researching agriculture can help to sustainability through close relation to farmers , attending to their experiences , gaining their information and logical understanding of agriculture activities , attending to their vital needs for doing "demand-base" researches and extension education efforts for developing agriculture , at process of improving agriculture development.

In the past half century, modern knowledge has provided new and modern technologies in agriculture that has caused a main evolution in production process. Also this technology has caused problems in environment, production and social aspects and has forced thinkers and deciders to think about them carefully. One of the ways to solve these problems is that to use of our ancestor's tentative knowledge. Using of our ancestor's knowledge and experience is called native knowledge and this provide an opportunity to use of local knowledge in the process of specifying needs and designing suitable technologies and applying it. The native and modern knowledge not only are not in contrast with each other but also are each other's supplement to reach a sustainable development and we can use of them in our needed technologies. Believe of educated people to native people and their knowledge "precondition for making them close" is called combination and compilation. Making evolution in modern system for attention to tentative knowledge is the main necessity for this compilation. Another necessity for this evolution is the researcher's attention to experimental accumulated wisdom and historical exploit by using qualitative and communion methods. Also applying compilation methods and making evolution among government, educational centers, farmers and peasant is the necessity and pre condition for combination of modern and native knowledge.

On the research which was done by Bozarjomhari (2004) with this title "analyzing native knowledge position on rural sustainable development". It was specified that although there are many differences between native and modern knowledge but they are not in contrast with each other, because they are each other's supplement and we can't be success when we use them separately. According to new parameters in rural development, for solving rural problems, at the first we should use of native solutions and if it was not efficient, we can use and test external solutions.

The role of distance learning tools in Increase the efficiency of adult education

Akram Ghaffari

Darab Branch, Islamic Azad University, Darab, Iran
Email: sharif11070@yahoo.com

Abstract: Adult learners are often those that distinguish each other and have many different targets at the same time and will follow a common challenge to fulfill the goals of building self motivation vectors as educational materials to learn and use the forge Adult illiteracy is like a disease that infects virtually every dimension of Kentucky life. Adult illiteracy saps the energy and capability of Kentucky's people and its economy. Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Adult illiteracy severely hinders the life chances of young children, undermines school reform, and limits the opportunities for postsecondary education. Despite landmark reforms in public schools, too many Kentuckians continue to drop out of school, thereby perpetuating the chronic problem of adult illiteracy. Too many young Kentucky parents are unable to read and lack the basic literacy necessary to provide the necessary stimulating, supportive family environments for young children. It is known that children's literacy levels are strongly linked to the educational level of their parents and that children of parents who are unemployed and have not completed high school are five times more likely to drop out. To be successful, the Commonwealth's strategies must energize and gain the commitment of all the state's political, education, business, and civic leaders. No strategy will succeed unless it engages leaders in each community and county to identify needs and develop programs and services appropriate to the community's unique circumstances.

Keywords: adult education, distance learning

Introduction:

The most serious challenge will be to motivate low-skilled, under-educated adults within the working age population to seek further education. Simply expanding the number of providers and programs will not necessarily increase demand from the populations and communities where the needs are greatest. Deepseated social, economic and cultural barriers—many dating back generations—lead people to undervalue education. In addition, in many counties it is difficult for people to see a direct relationship between better education and better-paying jobs. Either there are no jobs available or many existing employers do little to emphasize the connection between better education and the possibilities for getting a job, keeping a job, or earning a higher wage. For many, getting more education and earning a high school diploma or a college degree has little positive meaning. While there is still prejudice surrounding some distance learning, it is increasingly being accepted as an alternative to traditional classroom learning. Courses can be offered via the Internet, where students are able to interact with instructors and other students without physically being in the same room. Getting a college education can be difficult for people with inflammatory bowel disease (IBD). Frequent trips to the restroom, exhaustion, doctor visits, and medication side effects are all barriers to the traditional college experience. What if

you could get the degree without ever setting foot on a campus? You can do just that through distance or virtual learning. Distance learning has been around for a long time (we've all seen the commercials on TV).

Only the negative consequences are obvious: getting more education often means leaving one's family and community for jobs and opportunities for advancement somewhere else. The future of Kentucky depends on uplifting the quality of life and economy of all of Kentucky. The social and economic costs of neglect of large parts of the state will drag down the rest of the state and seriously hinder its capacity to compete in the global economy. Much like strategies to curb epidemic, strategies to reduce illiteracy and raise the educational attainment of Kentucky's population must include both short-term efforts to face the immediate crises as well as long-term strategies to get at the underlying causes. Short-term crises include the imperative to keep helping welfare clients make the transition from welfare to work within the constraints of federal and state mandates and the need to train workers for immediate employer demands. Long-term prevention must address the underlying, persistent problems of the state's economic structure as well as the low awareness--if not appreciation--among segments of the population of the vital connection among

education, employment, and improved standards of living.

Distance Learning Program

Distance learning is one of the fastest-growing components of higher education. Almost 3.5 million students were enrolled in at least one distance learning course in the fall of 2006 and online enrollments are increasing every year. The convenience of taking classes at any time from any location appeals to today's adult learner, especially those who work, have families or live in rural areas. Below are several important factors to consider in choosing a distance learning program.

1. **Accreditation.** Accreditation is a means of ensuring the quality and effectiveness of higher education institutions and programs in the United States. Eight regional accrediting agencies accredit most of the colleges and universities in the United States. A host of national and professional accrediting organizations also exist, including the Distance Education and Training Council (DETC), an organization that identifies and accredits distance learning programs. These twelve questions outlined by the Council for Higher Education Accreditation are helpful in examining a distance learning program's claims of accreditation.

In evaluating distance learning paralegal programs, determine if the school is accredited by one of the regional accrediting bodies and by the American Bar Association (ABA). ABA-approval signifies that the school has met certain standards in terms of academics, facilities and instruction. Graduating from an ABA-approved school may give you an advantage in the legal job market.

2. **Reputation.** The reputation of the distance learning program you attend may hinder or enhance your post-graduate employment prospects. In evaluating the reputation of a distance learning program, you should not solely rely on the school's website or marketing materials. Other ways to investigate the reputation of a distance learning program include:
 - Visiting the school.
 - Talking to alumni (contact the career services department for alumni names and contact information).
 - Researching the distance learning program's record with the Better Business Bureau.
 - Talking to paralegals, attorneys and legal employers about the reputation of the school you are considering.

- Researching the school in print publications, news articles and on the Internet.

1. **Academic Offerings.** When evaluating distance learning programs, it is also important to consider the program's academic offerings. A quality distance learning program offers a comprehensive curriculum with a variety of options, electives and advanced coursework. Talk to professors or an academic dean regarding the content and delivery of courses. The American Association for Paralegal Education (AAfPE) recommends that paralegal instructional content include courses in legal research and writing, litigation, ethics, contracts, business organizations and torts. In addition, courses should develop students' critical thinking, communication, computational, computer and organizational skills, and competency to handle ethical issues, according to the AAfPE.

Legal programs should also offer an experiential learning component such as an internship, practicum, pro bono work or clinical experience. These are great resume-building opportunities and allow you to learn practical skills and gain real-world experience.

2. **Instructional Technologies.** Distance learning courses can be delivered in a variety of ways through a growing array of technological tools including audio tapes, CD or DVD ROM's, e-mail, telephone conferences and web-based delivery systems. Questions to ask include whether the program employs a mix of instructional technology? Is hands-on training and support provided? Can students preview courses online and try out the technologies before enrolling?
3. **Teaching Staff.** The faculty is the backbone of any distance learning program. Are the courses taught by professors or are the courses pre-taped correspondence instruction? If the courses are taught by instructors, what is the background and qualifications of the teaching staff? Are classes taught by paralegals, attorneys or a mix of both?
4. **Career Services.** Another important consideration in any distance learning program is the extent and quality of its career services program. Research indicates that the greater the resources offered by the career services department, the greater the program's job placement success. You might inquire as to what percentage of graduates find related employment following graduation and whether the career center offers personalized career counseling, job placement assistance, job search seminars, online job boards or resume assistance.

Conclusion:

Beyond the issues relating directly to DAEL(Department of Adult Education and Literacy), the task force heard a number of concerns about the Commonwealth's overall approach to adult literacy.

- Lack of coherent statewide leadership and coordination among multiple complementary initiatives aimed at the same problem.
- Lack of continuity in state leadership. Cited in particular was the difficulty sustaining a high level commitment to the issue long enough to make a difference because of changes in priorities of the state's political leaders. A high level of turnover in the leadership of the Department of Adult Education and Literacy has also contributed to the instability.
- Tendency to think of adult education as a separate categorical program rather than a strategy that cuts across the mission and responsibility of multiple Commonwealth programs and initiatives (e.g., early childhood education, welfare reform, economic development, and corrections).
- Multiple uncoordinated categorical federal initiatives that tend to drive (and fragment) policy for an overall state effort that is largely funded by Kentucky.
- A tendency to commingle and confuse different functions. The most important distinction is between functions focused on the needs of clients (adult learners, employers, communities, regions, and the Commonwealth as a whole) and functions associated with the operations and performance of providers. It is important that each of these functions receive attention, yet the tendency is for one (e.g., overseeing a network of providers) to drive out attention to overall system strategy.
- Inadequate coordination of services to meet the needs of individual adults, communities, employers, and regions is hindered by:
 - Vertical financing and regulatory relationships between separate federal and state programs and local providers and administrative units. These vertical relationships can hinder the horizontal coordination of services for individual adult learners, communities, and employers.
 - Turf wars among providers, local politics, and long-standing conflicts among neighboring counties.
- Inadequate links with and leverage of other public and private initiatives and investments to reach the target population. Major sources of

help include employers, postsecondary education, and workforce development.

- Lack of a state financing policy and strategy for provider performance incentives and collaboration, and tax and other employer incentives for leverage of non-state resources.
- Lack of programmatic and administrative flexibility to meet the rapidly changing needs of adult learners, employers, regional economies, and communities.

Additional material for the next stage of learning often means to be expected when developing your learning skills. Learners to increase awareness and enjoyment of reading and studying to operate.

To improve the quality of life, learning materials should reinforce the skills they acquired previous. This material should have access to information and provide new technology. should also have to make learning more fun. Additional materials should provide opportunities for literacy skills to read and to strengthen their cognitive awareness.

Track materials (continued) which increased literacy skills and knowledge gained is also effective in enriching learning environment for learners are important. Participatory materials to ensure the participation of learners in the learning process and codification are included out of class activities, dialogue, role playing, etc.

In traditional programs that the principles of psychology and curriculum planning, less attention is the form of content presentation ie codification and providing books, original format and have the dominant form, while for adult content that could have valuable experience in addition to writing, other ways also be provided Affect the selection of pictures and images related to the concepts and content produced by including them.

Learning activities such as activities outside the classroom, dialogue, role playing and ... Another type of content is presented. Duties are placed on the learner, a resource for developing knowledge, skills and insights he considered.

Curriculum content only from the training provided to learners or not, but put together their learning through activities that can inform or does, skills and attitude to achieve. In this case, apart from learning that the essays taught learners directly to sustainable and effective learning occurs in his.

Another way of providing content that is educational activities outside the learning environment possible for learning more and better enables adult learners. For example, hits, field trip experiences for learners or transfer is provided, develop knowledge, insight and skills they will.

To ensure that science curriculum and educational aspects, according to community needs and

audiences, application form is provided or not, the content selection criteria should be considered. These criteria is being include knowledge, effectiveness, flexibility, diversity, relevance and practical learning

Assessing relationship between rural women empowerment and employment

Akram Ghaffari

Darab Branch, Islamic Azad University, Darab, Iran
E-mail: sharif11070@yahoo.com

Abstract: Rural women constitute about half of the world's population and in the world production supply they have energetic communion and constitute a great part of agriculture workforce. They constitute% 50 of the workforce and they participate in the production of half of the foods in the agriculture section. As an example the rural women constitute about 70 to% 80 of agriculture workforce in sub-Saharan Africa, %65 in Asia, %45 in Latin American & Caribbean, %80 in Nigeria & Tunisia and %80 in India, but their role in production system is the men's supplements roles and this causes a big responsibility inside their mother & wife duties and it takes a great time and energy of them. Studies in this field show that women spend about two thirds of their time for production, management & organize of their house as the men spend only one third of their time for such things. In the development countries, rural societies which are poverty for geographic reasons such as being far from urban societies or because of mountainous of zone and also as the roads are impassable and some other reason, they became deprived of many human development programs. Unfortunately these societies are suffering of mortality because of poverty but what is clear here is that we can't attribute such privation to geography and nature of the zone. Every country is trying to solve such critical conditions by applying depoverity policies.

[Akram Ghaffari. **Assessing relationship between rural women empowerment and employment.** Journal of American Science 2011;7(6):309-313]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Employment, rural women, empowerment

Introduction:

If rural women can work through receiving credits, loan and others finance facilities at favorite jobs and live through earned income (as it called "self-reliance and independence"), so undoubtedly we would see changes in social, economic and cultural relations of village.

paying part of cost of life by government or charities, establishing forums to analyze family supervisor women's problems, supplying necessary facilities to grow and improve child's life quality and paying facilities to provide sustainable employment, are among most important approaches to support family supervisor women. Paying credit facilities to access sustainable employment with easy terms at limited time, is one of the most important approaches to support family supervisor women. Because alongside supplying their continues needs, their esteem wouldn't be marred. Currently, this approach is used at many countries and positive results have emerged. (Ghaffari, 2000).

Increasing Suffrage, lack of relying on vast patriarchal families, increasing cultural acknowledgment, relation with newer institutions, having intellectual independence, making decision for marrying, occupation, emigration and etc are those rights that they gain. gaining aforementioned rights by women in context of cultural and social framework followed some changes that maybe lead to disfunctions and even create disorders and

abnormalities at traditional, familial and kinship relations that dominated on villages (Fakhraee 2002)

What that performing credits programs, has made in recent years, was on broad outlook with purpose to access to same results as above findings.

Thus, in one inclusive outlook, it is possible to use micro-credits programs to solve those issues which involved with rural women's economic limitations, so that lead them toward social empowerment, in the context of economic growth(Rahmani andalibi, 2001).

Poverty spreading in village is a global issue. According to the Fao finding about % 75 of world's poor people that are more than 1 milliard people are living in rural zone and more than % 70 of this poverty people are women. As the most of the people who are poor are living in village and are women is the reason for insufficiency of rural development programs.

One of the other basic barriers in development of rural women is their independent inaccessibility to get credits for investment in their job. Although their illiteracy is the big barrier to use of bank credits, but this view that women are dependent people that their husband should decide about their financial decisions is the other reason that rural women couldn't access to official credits. Maybe these barriers are the reason why rural women are happy about applying micro-credit thought in village. (Najafi, 2007).

One of the raised strategy, in order to accelerate investment process and reinforcing financial

foundations, and saving, at deprived and rural areas, has been empowering and eradicating poverty of rural societies through efficiency with emphasize on applying micro-credits. Micro-loans as useful tool to fight against poverty and starvation, has proven its capabilities and values to develop these areas. These tools have ability to change and improve human's life, especially poor peoples. Supplying credits and analyzing credits approaches cause opportunity to activate poor men's working power, establishing field for sustainable production and income, prevent usurers and pre shoppers of agriculture productions to plunder poor rural men and finally empowering poor people especially women who can work but were deprived to have capital and work tools, and extension accordance to their activities such as needs assessment, identifying target group, organizing poor people, giving needed specialized and public training and ... have important role on effectiveness and make effective activities of these credits.

Aforementioned plan, due to containing special advantage such as giving accessible loan with low commission fee and no interest rate and also long-term repayment, could provide chances for many farmers to release from dealers and broker jobbers. In this approach, giving micro-credits to rural women seems more effective. because alongside agricultures activities that needed more investments, women by enjoying of very micro-credits not only could create remarkable creativities in rural productions but also gained worthy economic and social abilities, and even improved their field of social presence, well. (Lahsaeizadeh, 2000).

Having investment (capital) independency enforce people to think about economic from different angles. He should study the ways for using capital, he must consult with authority and experienced people and he will investigate about relevant markets. Such things will help him to be authoritative & independent. But how rural women can get such independency? Are the women created inherently for housekeeping, parenting and working or is there any opportunity for rural women to show their skills in economic & social development?

It seems that experiences which are obtained from performing financial programs in some villages in the developing countries could answer clearly to such questions.

A glimpse to previous planning about rural development in the world shows that from 1950 many developing countries understood that the main reason for making their economic growth (development) slowly in their countries is the weakness of investment in the agriculture part. Although many countries by patterning from developed societies have proceeded to improve &

develop their industrial agriculture part and by this action not only had irreparable damages to many traditional farmers but also the main problem (the lack of capital sources) is also remained in the rural regions. (Rahimi, 2001).

In recent years, the point was well clear that a major share of the income of rural households are obtained through the women activity, and sometimes even share of women income in the household economy is more than the share of men. For example, in 2000, about 854 million women that include 32 percent of the workforce of the world are active economically and their major activity in third world countries are in the agriculture sector and 60 percent of cultivated rice, 90 percent produce vegetables and, 50 percent cotton and oilseeds, 30 percent had affairs and gardens, 90 percent silkworm related activities and 65 percent of rearing livestock-related activities and handicrafts have the highest proportion (Emadi, 2001). This shows that the role of women as agricultural work force, not only isn't less than men but they have greater share in the process of planting, cropping, and more importantly in the sale of crops and livestock and a research specialized that 50 percent of food global production activities were owed to women (souri, 2002). Aside from the economic role of women that clearly has been made in the past decades, the vital role of women in social and cultural dimensions of development process in rural areas has remained hidden from the polls. They train the next generation of farmers and teach them the next generation necessary knowledge. A Chinese proverb says, "If training a man, just training a man but if you teach a woman you teach a family." Women are local knowledge and local educators themselves, in preparing and providing food, health treatments and cultural values are the next generation (Fami, 2003).

Empowering rural women:

The empowerment is equality that women for financial self-reliance and self-sufficiency can obtain by controlling their emotional decisions. The empowerment can be defined as an evolution and development of activity through private organizations that guides empowerment in the society toward economic improvement.

Empowerment is a process through which people can do activities to conquest on development obstacles that enable them to assign their destiny.

The word empowerment is not the meaning of overcome to main in equalities so it is different with the word self-reliance. (Ruhail amin, 2010).

Empowerment enable person to overcome any difficulties by a suitable management. Finally we can

say empowerment provide energy to conquest on mental problems & outer difficulties.

On conclusion we can give a suitable definition to women's empowerment as this: the process of realization of women about themselves (and also the men's realization about them) for the thing they want or have to do.

It should be reminded that the main point should be attended in women's ability is the omission of subjective & social problems and providing economic & social communion for women in all aspects. The mean of women communion is their presence in all of village affairs such as making decision, presence in organization & councils that includes their communion in all economic & social aspects. (Araghzadeh, 2002)

Conclusion:

Woroniuk Schalkwyk (1998) at their conducted research believe that now, micro credits, micro finance sources and small business unites are most effective mechanism to decrease poverty.

Plitt and others, conducted research as they called it "do credits programs, can empower women"? Results showed that corporation at credits programs helps empowering women.

Goetz Sengupta (2003), presented negative image of credits effects on empowering women. They concluded that most women have minimum control on their loans. And when repayment period is short, this shortage of control has devastating effects on women welfare.

Hashemi and others (2004) found that joining to Gramin Bank, has meaningful positive affects on controlling women, and helps to family income.

In researches that conducted by Nanda (2004) became clear that women participation in credits programs had positive affects on their demand about health care.

Fiona Steele and etal (2008) in researches that conducted as called " influences of credits programs on empowering women at Bangladesh, found that women who joined to credits programs, have participated in more educational programs and have married with more educated men and also they have saved more and they had more cash.

Giving the right that women make decision, independency to their family, increasing the cultural knowledge among them& making relation with new institutions, having independency in making decision about marriage, occupation, migration & something like this are the right that women have got it.

Women by getting these rights can make change in the rural cultural & social issues which make disfunction & crudity in their family's relation. However, rural women's self-reliance has caused

improvement in the economic, social & cultural issues. For solving women's self-reliance problems we can do these activities:

- Giving promotional services for increasing rural women's skills in various fields.

- Giving promotional instructions to men for believing their women's economic role & their women opportunity to participate in all economic, authority & aspects.

- Increasing rural women's knowledge in all social, political, cultural & economic fields.

- Making use of micro-credits programs to motivate & support women for doing economic affairs better & finally to make women self-reliance.

According to the most important factor of economic population development and growth rate are human resources of that community and also each community consists of activist men and women that under the social interaction have direct influence on community economic and development therefore strategies are required to developed community base on more and active participation of women that include the half of society instruct in economic, political and social foundation. Women as an effective member of society, can crystalline their lead roles in various responsibilities formations. These responsibilities include promoting the concept of participation and employment in life and building the suitable areas for freely activity and introduce the right of economic management, ownership and... This requires that all fees and necessary training for women to be considered. Due to the fact that the concept of women's participation, is not necessarily the female employment, although certainly part of the participation of women will be crystallized in their employment, but in this context, home and family affairs by women and their role in nutrition and child growth and Their education are also many responsibilities that women often are responsible for them. Throughout history we have always been seen that women have always been active but in culture and tradition, this mentality largely exists that if the job exists, it would be for men. Because they are responsible for their families Economic or wherever there is a good opportunity for participation, men have a prior right.

Perhaps the reason that women are less important in the development is this thought and action. Because women are in occurred opportunities in the second stage, or even sometimes do not come into account. Zanjani in the article "Women's Empowerment" according to economic, social and cultural characteristics, one of the important subjects that have investigated is the effect of number of children in female employment in urban and rural communities. In Iran urban, employment opportunity

population continually reduces by increasing the number of children. This reduction is weak, up to the third child and then takes the intensity. So that the employment opportunities of women decrease in pay to first child to the second 3 / 2 percent and the second child to the third 9 / 6 percent, while this reduction from third child to the quarter is 3 / 27 percent. But in rural society due to the household problems, type of activity and employment, increasing numbers of children not only make no reduction in women employment opportunities so with increasing the number of children, women's job opportunities is also growing and by having 7 child reaches its peak. Since then relegated to minor finds, in a way that employment opportunities of rural women that has nine child is equal to the job opportunities of a woman with one child. Thus children are effective on women employment so that increasing the number of children in urban society has negative effect and in rural society has positive effect (Zanjani, 2002). Lhsay Zadeh in a research by the name that (considering the role of Iranian rural women in the economic scene), first specified the women's place in job structure, and then compared it with the job site of rural men. His study demonstrated that the employment of rural women is important as men. Because the rural economy includes three separated and also related parts, namely agriculture, industry and services and the author, with the share of women in agricultural activities come to the conclusion that in addition to their considerable added value contribution in agriculture, unfortunately, the real value of their activity is not known has been formed in the article. (Lahsaezadeh, 2004)

Safiri in his PhD thesis, as "study of quantitative and qualitative aspects of women's employment and its relationship with economic development", knows that a part of the employment problems is because of some barriers that relates countries structure and also other parts is because of some non development barriers an some parts is also from the social - economic, and cultural barriers as development obstacles.

If rural women could provide a job for them by getting credits, loan and other financial convenience, through their income they can get self-reliance or financial independency and we will see social, cultural & economic change in village. The question here is that if these changes have positive or negative aspects in the village? It's natural that every change in social phenomenon has both positive and negative aspect, but which is Important here is that which aspect is more than the other and it depends to different condition in various societies. In our rural society there is an especial social & cultural kind that

it's outcome maybe different and in some case inconsistent. With these actions rural women could be in idealistic economic condition and they could live with out dependency to their husband's income. In most of the villages in Iran there is patriarchy in the families which is not acceptable for the most of the rural people and groups. When rural women became financially independent, it's acceptable to see its cultural & social outcomes.

In some countries where are not appropriate and much needed job, women are damage more. In some where that the social hierarchy is base on physical strength, force and tyranny both in the family system and the hiring of women in institutions and organizations makes the difficult situation for them. Surely also the cultural background are continuing these economic and social conditions, Safiri, the knows the Personality barriers and physiological barriers as non- development knowledge barriers and he say they are effective on women's employment (Safiri, 2000).

Importance of educators' knowledge about teaching methods in adult education

Fatemeh Bakhtiar

Darab Branch, Islamic Azad University, Darab, Iran
E-mail: abbasrezazadeh80@yahoo

Abstract: Complex role of adult learning and training process is significant, his role gradually changed from the donor information and active for many years will assume that the principles and techniques that are used in teaching children to contribute equally in the adult learning process. On the other hand is effective in children for adult education teachers were employed. Later that person was well trained (ie the experts), who could well slow or a group leader to manage the program, was selected as an adult educator. Thus learners directly in adult education programs that are based on experience were used, and adult As a mature child which has its own characteristics and is unique is that the principles and techniques of the different techniques used for the education of children is needed. As a result the role of adult educator gradually from non-skilled person without the expertise of individual specialists and trained to be changed and Instructors for training and educational opportunities were provided at all levels are therefore unable to work for educators from institutions with short-term training courses for users of the guidance program (project leaders) through summer workshops for professional leaders through programs Training of Master and PhD levels in schools of higher education courses were provided. other procedures, where the role of teacher has changed the theoretical concepts first, an understanding of adult learning was unfounded on the principle that the concept of adult education is based on transferring knowledge to them and saying what they should know or duty to interpret absorption educator their training. In recent years the practice has changed and the role of educator as a "change agent" and reform as a donor and an "auxiliary roles" or "facilitators" were raised as his understanding of adult personal and community among people.

[Fatemeh Bakhtiar. **Importance of educators' knowledge about teaching methods in adult education.** Journal of American Science 2011;7(6):314-317]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: teaching methods, educator, adult education

Introduction:

In developing countries and backward because the problems in primary education, lack of resources and facilities, poverty, social existence, economic and cultural concept of adult education is different. In such countries the concept of adult education, literacy education.

Concept of adult education in revolutionary countries, is a combination of these two concepts. Changes in these countries due to social, political and cultural revolution, resulting from, literacy and continuing education necessary to find because of the revolution, there is cultural poverty on the other hand the implementation of development plans and the need for skilled personnel are expert. General adult education system based on economic conditions - social and cultural community is different and each specific goals will follow. General objectives of adult education and literacy in two categories is divided into professional education.

Educational materials on adult education with daily life, needs, goals, aspirations and past experiences of adults and their relationship helps to results learned in life and career are used.

adult who is able to recognize their needs. He is who knows what will. Refers to individual adults in their lives cross and understand their responsibilities

and has accepted the role is social. Adult learners are often those that distinguish each other and have many different targets at the same time and will follow a common challenge to fulfill the goals of building self motivation vectors as educational materials to learn and use the forge. in developed countries, adult education is a form of informal education for people above 24 years is presented. In fact, a means of expanding knowledge, skills and abilities of adults. In these countries, adult education helps adults to variable conditions of political, social, economic and cultural adjustment, and pay to fix their shortcomings.

Adult characteristics:

to understand the characteristics of adult learners, their mental and physical condition should be considered in the following referred to some of them.

Operating speed:

slow reaction in adults is natural that necessarily means reducing the logic and practice skills, not due to weakness and increased awareness of natural forces and their skills.

Consciousness:

no stimulus and incentives encouraging, despite inhibiting stimuli, slow transfer rate, mental, and weak inhibitors of natural forces (mostly visual and

auditory) are factors that slow reaction affect individual mental and cognitive activities, but never able to understand, understanding and learning ability (which varies with the speed of learning) is not relevant.

Health:

what is most age, longer duration is necessary to be heard by listening issue. Why is that when elderly people and old could not hear well, their confidence and vulnerable to the possibility that negative beliefs about their find, they are great. Visual abilities can be like other people, usually decreases with age.

Background of knowledge - skills and beliefs of adults:

adults, social experiences, many have already learned different values and beliefs in their pronouns have stabilized, so changes in the new act very cautiously. The idea of such a manner that skill and applying them older and longer life is, Similar resistance to accept new ideas will be more and more severe. Thus, the adult criteria for the built and paid for their ideas and beliefs that are forming. Because of these criteria and the beliefs that they are afraid of failure, Therefore, to prevent it, sometimes against the resistance of new phenomena are only the material taught and its face that make reinforced concrete and tangible interference situation is.

The role of adult educator:

Complex role of adult learning and training process is significant, his role gradually changed from the donor information and active for many years will assume that the principles and techniques that are used in teaching children to contribute equally in the adult learning process On the other hand is effective in children for adult education teachers were employed. Later that person was well trained (ie the experts), who could well slow or a group leader to manage the program, was selected as an adult educator. Thus learners directly in adult education programs that are based on experience were used, and adult As a mature child which has its own characteristics and is unique is that the principles and techniques of the different techniques used for the education of children is needed. As a result the role of adult educator gradually from non-skilled person without the expertise of individual specialists and trained to be changed and Instructors for training and educational opportunities were provided at all levels are therefore unable to work for educators from institutions with short-term training courses for users of the guidance program (project leaders) through summer workshops for professional leaders through programs Training of Master and PhD levels in schools of higher education courses were provided.

Other procedures, where the role of teacher has changed the theoretical concepts first, an understanding of adult learning was unfounded on the principle that the concept of adult education is based on transferring knowledge to them and saying what they should know or duty to interpret absorption educator their training. In recent years the practice has changed and the role of educator as a "change agent" and reform as a donor and an "auxiliary roles" or "facilitators" were raised as his understanding of adult personal and community among people. In addition, a person well trained teacher who is fluent in adult education as a change agent responsibility is beyond routing plans and activities, In recent years the practice has changed and the role of educator as a "change agent" and reform as a donor and an "auxiliary roles" or "facilitators" were raised as his understanding of adult personal and community among people. In addition, a person well trained teacher who is fluent in adult education as a change agent responsibility is beyond routing plans and activities. His role in the educational process as a facilitative (helpful), leader (leading), incentives, consultant and source of information (not move), regular (planned), judge poster and Is. The ultimate goal of people helping him to his ability to help raise up to be adult. Fact that the adult educator role of a marginal position in society has changed to a central location for this position change the natural outcome of many social problems such as wars, crime, illiteracy and disease Can easily be resolved through processes of adult education. a well trained teacher who is fluent in adult education as a change agent responsibility is beyond routing plans and activities, In recent years the practice has changed and the role of educator as a "change agent" and reform as a donor and an "auxiliary roles" or "facilitators" were raised as his understanding of adult personal and community among people. In addition, a person well trained teacher who is fluent in adult education as a change agent responsibility is beyond routing plans and activities. His role in the educational process as a facilitative (helpful), leader (leading), incentives, consultant and source of information (not move), regular (planned), judge poster and Is. The ultimate goal of people helping him to his ability to help raise up to be adult. Fact that the adult educator role of a marginal position in society has changed to a central location for this position change the natural outcome of many social problems such as wars, crime, illiteracy and disease Can easily be resolved through processes of adult education.

Although two decades of adult education a fundamental instrument of national policy and local governments, state and national cost millions of

dollars for adult education began (1950), and cost requests in the years 1960 million by the sectors of trade, industry, universities, religious institutions and government agencies will pay increased. Where adult education resources in 1950 are allocated only for the welfare of individuals found with increasing social problems such as urban crisis, Nvady inequality, unemployment and illiteracy. In these areas was also widely added. So the mission developed its adult education and its usefulness for human growth and development became clearer.

Comparison of adult education in various countries:

Literacy goals include:

- Providing primary education in childhood that adults were deprived
- raising awareness for adults;
- knowledge bases and adults about their cultural heritage;
- increase confidence in adults.

Professional education goals include:

- Equipped with the necessary skills to adults living;
- providing the necessary manpower for the country's goals;
- achieving social equality and equity and eliminate the existing differences between different classes.

Conclusion:

Material often set different types of materials and educational content in books and pamphlets, books, training guides, trainers, equipment auxiliary audio, visual and material are included such that during actual teaching sessions, are used in the transmission and content but also to achieve the goals of making education programs are important.

Additional material for the next stage of learning often means to be expected when developing your learning skills Learners to increase awareness and enjoyment of reading and studying to operate.

To improve the quality of life, learning materials should reinforce the skills they acquired previous. This material should have access to information and provide new technology. should also have to make learning more fun. Additional materials should provide opportunities for literacy skills to read and to strengthen their cognitive awareness.

Track materials (continued) which increased literacy skills and knowledge gained is also effective in enriching learning environment for learners are important. Participatory materials to ensure the participation of learners in the learning process and

codification are included out of class activities, dialogue, role playing, etc.

Some research findings that can be a learning process for the Guidelines for training operations are applied, is given below:

1- - Preparation for adults to learn how much he depends on previous learning. Knowledge that has accumulated because of an ability to absorb new information more person is. Past educational experience features a diverse group of adult learners, the starting point of any activity on the diversity training is emphasized.

2- intrinsic motivation, learning a deeper and make them sustainable. When the need is met directly by the learning itself, what is learned, but is complementary learning. Creating a training activity in adult learning needs, learning ensures stable

3- Positive reinforcement (reward) learning to reinforce the negative (punishment) is more effective. Many adults because of negative experiences at the beginning of schooling, are weak and afraid. Feeling of success in adult learning for continuous learning and adult participation is essential.

4- To maximize learning, information must be provided an organized manner. Entries can be simple or complex can be arranged around related concepts are organized. Starting point for organizing content knowledge for adults and adults is linked to past experiences

Numerical Analysis of the Geomembrane Behavior in the Sar Cheshmeh Copper Mine Tailings Dam

Hamidreza Ahmadaghaei

Department of Civil Engineering, Damavand Branch, Islamic Azad University, Damavand, Iran

Corresponding author: h_ahmadaghaei@yahoo.com

Abstract: The use of Geomembranes as Tatrava surface can be considered as valuable and affordable solution compared to other techniques for sealing of earth dams. In one Of the earth dams in Iran (Sar Cheshmeh Copper mine dam), the Geomembrane is used to increase the height of the dam. In this study, using by software modeling to try to achieve the optimum thickness for Geomembranes used in The shell was added to the old dam, based on analysis of Seepage and slope stability downstream slope of dam, So using by obtained thickness of the Geomembrane, the smallest leak can cause, and Downstream slope of dam can maintain its consistency and economic aspects are also considered for implementation. To achieve this purpose, Geomembranes with different thickness in the respective place, Considered as a model and determine the optimal thickness of the Geomembrane By comparing the results from the analysis of leakage. Then downstream slope dam stability will examine. then with using of SIGMA/W program from GeoStudio software is applied to evaluate Geomembrane behavior in addition crust to old dam and research be done about sufficiency and insufficiency against enter forces that this evaluation is done base on stress- strain analysis.

Keywords: Geomembrane, Earth dams, Numerical Analysis, Sealing.

1 – Introduction

Geomembrane is made of polymer plastic or rubber membranes that have very low permeability. Polymeric materials which are mainly used in the manufacture of Geomembranes is a thermoplastic polymer. The most important application of Geomembranes, confront with leakage phenomenon or infiltration water or other liquids and gases, toxic and hazardous in their care sites. According to the International Committee Geosynthetic (IGS: Society Geosynthetics International), Geomembrane which are used to in civil engineering are panels, relatively impermeable and the polymer in contact with soil, rock or other geotechnical material. Between the Geomembrane and other Geosynthetic (Geotextile, a Geogrid, etc.), there are important differences. Geomembranes They are designed so that have a low permeability as possible. In other words, the Geomembrane to restrict fluid flow, while other Geosynthetic cause flow of liquid or conduct of it. Geomembrane types include: 1) polymer Geomembrane 2) and Bituminous Geomembrane. Polymeric Geomembranes include thermo plastic (EIA - PVC), the crystalline thermoplastic (VLDPE - LLDPE - HDPE), Thermoplastic Alastvmtrhay (CPE - CSPE). Geomembranes are used in earth dams, the core of earth dams, to increase of dam height, Walls of water and to repair leaking dams.

2 - Sar Cheshmeh Copper Mine Tailings Dam

Sar cheshmeh Copper Mine is located 60 kilometers from city of Rafsanjan. It is used for recovery operations of the copper and water . Therefore, the required water is supplied from the wells, Salt rivers, Return water and in the output in mining, the amount of weakest water flow is 1000 liters per second. that, Firstly it must be maintained and control in place to prevent environmental pollution, And secondly, after separating

the dry material through sedimentation, water returned to the factory and it is used again. The sediment retention dam about 21 km downstream of the mine site In order to collect the weakest water plant was launched and was operating. The primary Sediment retention dam was kind of gravel dams with copper core and have been Height of 70 meters of river bottom. In terms of specifications, such as the dam has a width of 10m in the crest, Geomembrane is used Because of the low width clay core in the primary sediment retention dam (about 3 meters). Consequently, The initial stage of sediment retention dam Consisting of gravel with a clay core height of 70 m, has been changed to The gravel dam with a mixture of clay and Geomembrane sealing system and with a height of 110 meters, And a total of 37,000 square meters of PVC Geomembrane is used.

3- Analysis of the leak in the Sar cheshmeh Copper dam

The GeoStudio software is used to analysis of the Leak in the mentioned dam. GeoStudio software is including geotechnical software Based on Finite Elements. Through its, can be examine analyzes such as the stress - strain, leakage, flow, Slope stability and Dynamic Analysis. This software includes parts SIGMA / W for the analysis of the stress - strain, SEEP / W for the analysis of the flow and Leakage, SLOPE / W for the analysis of the slope stability, QUAKE / W for the dynamic analysis and other application areas. In this section, using the SEEP / W will be analysis of the Leakage in the sar cheshmeh cooper dam. Sar cheshmeh copper dam is shown in Figure 1. Also the geotechnical parameters and leakage barrier material is presented in Table 1.

Figure 1 - section of the Sar Cheshmeh Copper dam

Table 1 - Geotechnical parameters and leakage of the barrier materials

Material properties	Specific gravity (KN/m ³)	Drained angle of internal	Cohesion Drained (K.na)	Shear Modulus	Bulk Modulus	horizontal permeability (cm/s)
upstream gravel	20	47	-	80	170	10 ⁻¹
clay core	19	22	20	10	90	10 ⁻⁶
downstream weir	20	47	-	86	115	10 ⁻²
the shell was added	22.5	44	-	86	115	10 ⁻³
Geomembrane	-	-	-	-	-	10 ⁻¹²
The andesite Foundation	22.5	-	-	700	2600	5×10 ⁻⁶

Axial standard test results on Geomembrane cover show antiseptic values like delivery stress 1700 Pa, rapture stress in 3500 Pa tension and rapture strain 10% . For finding useful and optimized width of Geomembrane in dam, it is necessary that Geomembrane with different widths are modeled like Figure 1. With using of SEEP/W program is analyzed leakage of Sar cheshmeh copper mine Tailings Dam. First, said dam section is modeled in SEEP/W program (Figure 2), then Geomembrane with 1, 2, 3 and 4 mm thickness is modeled in add crust location to old dam and in three section of dam, the rate of passing flow rate is calculated from their sections by software. Finally, with notice to passing flow rate and economical aspect of plan, optimize thickness get base on leakage analysis. Water head is shown with red color point on dam body.

Figure 2- modeling section of Sar cheshmeh copper mine in SEEP/W program

Sections that are considered for passing flow rate calculation are:

1. One section is considered from dam upside to dam substratum.
2. A section that pass from dam center
3. A tangent section to dam body in downside that get final sediment rate from substratum and dam body (total sediment).

Section number 1

This section is shown in Figure 3 that starts from upside part and it continues to dam substratum. This section is chosen with error and exam way that can say about most of passing flow rate in dam body is related to this section.

Figure 3- Section Number 1

After choosing section, are done analysis activities. Passing flow rate from section is shown for different states in Table 2.

Table 2- passing flow rate from section number 1 under influence of Geomembrane with different thicknesses

Geomemb rane thickness	1	2	3	4	Without Geomemb rane
Passing flow rate	9.527×10^{-3}	4.26×10^{-3}	1.28×10^{-3}	0.237×10^{-3}	14.903×10^{-3}

With notice to Table 2, reduce percentage of passing flow rate is illustrated in Table 3 for different thicknesses of Geomembrane in proportion to without Geomembrane state for section number 1.

Table 3- reduce percentage of passing flow rate for different thicknesses of Geomembrane in proportion to without Geomembrane state for section number 1.

Geomembrane thickness (mm)	1	2	3	4
Reduction of passing flow rate in proportion to without Geomembrane (%)	36	72	92	98

With notice to Table 3 can be said that optimize thickness for Geomembrane base on passing flow rate from section number 1 is 3 mm because passing flow rate reduces in proportion without Geomembrane as 92% and so the reduction rate of passing flow rate for thickness less than 3 mm in comparing with without Geomembrane state is less than threshold that it can proper dam stability. About 4 mm thickness however passing flow rate in proportion to without Geomembrane state reduce 98 percentages but with notice to cost of Geomembrane performance, using of 4 mm thickness is not acceptable of economical aspect.

Section number 2

This section is shown in Figure 4 and it passes from dam center.

Figure 4- Section Number 2

After choosing section, are done analysis activities. Passing flow rate from section is shown for different states in Table 4.

Table 4- passing flow rate from section number 2 under influence of Geomembrane with different thicknesses

With notice to table 2, reduce percentage of passing flow rate is illustrated in Table 3 for different thicknesses of Geomembrane in proportion to without Geomembrane state for section number 2.

Geomemb rane thickness	1	2	3	4	Without Geomemb rane
Passing flow rate (m ³ /s)	11.246×10^{-3}	4.899×10^{-3}	1.3824×10^{-3}	0.2988×10^{-3}	16.6294×10^{-3}

Table 5- reduce percentage of passing flow rate for different thicknesses of Geomembrane in proportion to without Geomembrane state for section number 2.

Geomembrane thickness (mm)	1	2	3	4
Reduction of passing flow rate in proportion to without Geomembrane (%)	32.36	70.54	91.68	98.2

With notice to Table 5 can be said that optimize thickness for Geomembrane base on passing flow rate from section number 2 is 3 mm because passing flow rate reduces in proportion without Geomembrane as 91.68% and so the reduction rate of passing flow rate for thickness less than 3 mm in comparing with without Geomembrane state is less than threshold that it can proper dam stability. About 4 mm thickness however passing flow rate in proportion to without Geomembrane state reduce 98.2 percentages but with notice to cost of Geomembrane performance, using of 4 mm thickness is not acceptable of economical aspect.

Section number 3

This section is shown in Figure 5; it is a section that is tangent on dam body in downside that it gives final sediment rate from dam substratum and body (total sediment). For clearing this section should be clicked on all points of dam body fundamental in downside.

Figure 5- Section Number 3

After choosing section, are done analysis activities. Passing flow rate from section is shown for different states in Table 6.

Table 6- passing flow rate from section number 3 under influence of Geomembrane with different thicknesses

Geomembrane thickness	1	2	3	4	Without Geomembrane
Passing flow rate (m ³ /s)	8.2843 × 10 ⁻³	3.3876 × 10 ⁻³	1.0135 × 10 ⁻³	0.2278 × 10 ⁻³	13.5082 × 10 ⁻³

With notice to table 6, reduce percentage of passing flow rate is illustrated in Table 7 for different thicknesses of Geomembrane in proportion to without Geomembrane state for section number 3.

Table 7- reduce percentage of passing flow rate for different thicknesses of Geomembrane in proportion to without Geomembrane state for section number 3.

Geomembrane thickness (mm)	1	2	3	4
Reduction of passing flow rate in proportion to without Geomembrane (%)	38.67	74.92	92.49	98.31

With notice to Table 7 can be said that optimize thickness for Geomembrane base on passing flow rate from section number 3 is 3 mm because passing flow rate reduces in proportion without Geomembrane as 92.49% and so the reduction rate of passing flow rate for thickness less than 3 mm in comparing with without Geomembrane state is less than threshold that it can proper dam stability. About 4 mm thickness however passing flow rate in proportion to without Geomembrane state reduce 98.31 percentages but with notice to cost of Geomembrane performance, using of 4 mm thickness is not acceptable of economical aspect.

With notice to results of three sections, can be said base on leakage analysis that for using Geomembrane as add crust cover to old dam is considered 3 mm thickness. After selecting a thickness of 3mm for Geomembranes used in the shell was added to the old dam, check dam downstream slope stability are addressed in two modes. One case is when do not use the Geomembrane and the latter is when the Geomembrane thickness 3mm to be used. To check the stability of the dam downstream slope from SLOPE / W section, GeoStudio software is used. For this purpose, the stable flow is considered. In Figure 7 slip surfaces in the downstream of the dam when is not used the Geomembrane is displayed. And In Figure 8 slip surfaces in the downstream of the dam

when the Geomembrane thickness 3mm to be used is displayed.

Figure 7 - The slip surfaces related to Without the Geomembrane

Figure 8 - the Slip surfaces associated with the use of Geomembranes with a thickness of 3mm

It should be noted that the red color shown in Figures 3 and 4, Shows the critical mode of the slip. And farther away from the red, we can reduce the risk of slip. Obtained Coefficient of confidence is obtained in the case without the Geomembrane by 0.68 and in the 3mm thickness of the Geomembrane by the 1.604. That means when is not used the Geomembrane, the lower dam would be unstable, when the Geomembrane thickness 3mm to be used, stability of the Dam will provide.

Stress – strain Analysis with the SIGMA/W program

Modeling section of dam in SIGMA/W program is shown in Figure 9.

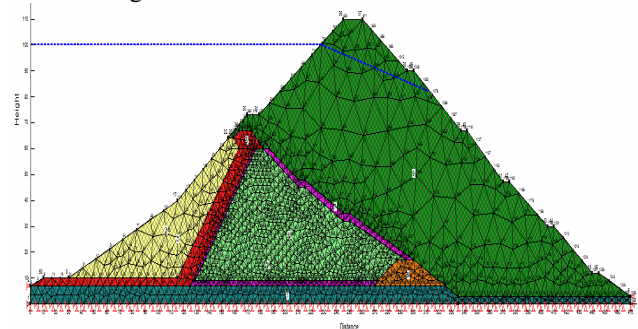

Figure 9 - cross of the modeling at the Dam Copper in the SIGMA/W program

Results of SIGMA/W program is shown in figure 10-16 as graphical.

Fig 10- meter of horizontal total stress

Fig 13 - meter of vertical effective stress

Fig 11 - meter of vertical total stress

Fig 14 - meter of Pressure of hole water

Fig 12 - meter of horizontal effective stress

Fig 15 - meter of horizontal strain

Fig 16 - meter of vertical strain

Conclusion

Impermeable Geomembrane used as cover in the dams is a new method. Similar dams used in the lower elevations of the dam with height Copper is very limited. Similar application of that in dams with lower height than Sar cheshmeh Copper dam, With increase of the height is very limited. In the Sar cheshmeh Copper dam due to dam construction, its sealing to prevent destructive leakage is of considerable importance. Because of the low width of the clay core in the old dam to increase the height of the dam must be used Geomembrane for the sealing barrier. Due to the high cost of the Geomembrane implementing, Geomembrane thickness used will impact significantly on project costs. So, the Geomembrane must be used with required minimal thickness. We can say optimized for Geomembranes used in shell thickness was added to the old dam, is 3mm. Obtained Coefficient of confidence is obtained in the case without the Geomembrane by 0.68 and in the 3mm thickness of the Geomembrane by the 1.604 That means when is not used the Geomembrane, the lower dam would be unstable, when the Geomembrane thickness 3mm to be used, stability of the Dam will provide. With notice to figures 10-16 have seen that regions that are used Geomembrane cover in their surface are illustrated stress in acceptable range dominantly blue and green. In figure 7 that is meter of hole water pressure, have been seen that in upside of dam from base floor to approximately height 18 m from upside base, hole water pressure have maximum value. Best way for decreasing water leakage in this area will be use of Geomembrane to decrease until range rate that is happen maximum hole water pressure. With notice to tension meter, maximum of produce tension is 938.299 Pa and is tensional in a range that is used Geomembrane And with notice to tension rate and rupture tension in tensional for using Geomembrane is 1700 Pa and 3500 Pa respectively. So using Geomembrane against enter tension show enough resistance. Also maximum rate of produce strain in Geomembrane is 3.26% and with notice to Geomembrane rupture strain is 10%, so produce strains in geomembrain is located in acceptable range too.

Keywords: adult education, children education

Introduction:

Much like strategies to curb epidemic, strategies to reduce illiteracy and raise the educational attainment of Kentucky's population must include both short-term efforts to face the immediate crises as well as long-term strategies to get at the underlying causes. Short-term crises include the imperative to keep helping welfare clients make the transition from welfare to work within the constraints of federal and state mandates and the need to train workers for immediate employer demands. Long-term prevention must address the underlying, persistent problems of the state's economic structure as well as the low awareness--if not appreciation--among segments of the population of the vital connection among education, employment, and improved standards of living. Adult who is able to recognize their needs. He is who knows what will. Refers to individual adults in their lives cross and understand their responsibilities and has accepted the role is social. Adult learners are often those that distinguish each other and have many different targets at the same time and will follow a common challenge to fulfill the goals of building self motivation vectors as educational materials to learn and use the forge.

Concept of adult education:

Several definitions of adult education has been done Community

- Adult Education is a in the following examples are given of them. conscious effort by public institutions or voluntary organizations to promote community awareness comes action.
- adult education teaching is typically specific age group above the legal age} limits as formal and informal, voluntary and at different levels of time, place

- Adult Education is a process in which people who} and education is presented. somehow been cut course they consciously
- to change or advance their skills in information and do organized activities.
- Adult education includes all formal and informal training and volunteer after} school, which by experienced educators and aware of the system.

Educational materials on adult education with daily life, needs, goals, aspirations and past experiences of adults and their relationship helps to results learned in life and career are used.

Adult characteristics:

to understand the characteristics of adult learners, their mental and physical condition should be considered in the following referred to some of them.

Operating speed:

slow reaction in adults is natural that necessarily means reducing the logic and practice skills, not due to weakness and increased awareness of natural forces and their skills.

Consciousness:

no stimulus and incentives encouraging, despite inhibiting stimuli, slow transfer rate, mental, and weak inhibitors of natural forces (mostly visual and auditory) are factors that slow reaction affect individual mental and cognitive activities, but never able to understand, understanding and learning ability (which varies with the speed of learning) is not relevant.

Health:

what is most age, longer duration is necessary to be heard by listening issue. Why is that when elderly people and old could not hear well, their confidence and vulnerable to the possibility that negative beliefs about their find, they are great. Visual abilities can be like other people, usually decreases with age.

Background of knowledge - skills and beliefs of adults:

adults, social experiences, many have already learned different values and beliefs in their pronouns have stabilized, so changes in the new act very cautiously. The idea of such a manner that skill and applying them older and longer life is, Similar resistance to accept new ideas will be more and more severe. Thus, the adult criteria for the built and paid for their ideas and beliefs that are forming. Because of these criteria and the beliefs that they are afraid of failure, Therefore, to prevent it, sometimes against the resistance of new phenomena are only the material taught and its face that make reinforced concrete and tangible interference situation is.

Issues Beyond the Department of Adult Education and Literacy

Beyond the issues relating directly to DAEL(Department of Adult Education and Literacy), the task force heard a number of concerns about the Commonwealth's overall approach to adult literacy.

- Lack of coherent statewide leadership and coordination among multiple complementary initiatives aimed at the same problem.
- Lack of continuity in state leadership. Cited in particular was the difficulty sustaining a high level commitment to the issue long enough to make a difference because of changes in priorities of the state's political leaders. A high level of turnover in the leadership of the Department of Adult Education and Literacy has also contributed to the instability.
- Tendency to think of adult education as a separate categorical program rather than a strategy that cuts across the mission and responsibility of multiple Commonwealth programs and initiatives (e.g., early childhood education, welfare reform, economic development, and corrections).

Comparison of adult education in various countries:

in developed countries, adult education is a form of informal education for people above 24 years is presented. In fact, a means of expanding knowledge, skills and abilities of adults. In these countries, adult education helps adults to variable conditions of political, social, economic and cultural adjustment, and pay to fix their shortcomings.

In developing countries and backward because the problems in primary education, lack of resources and facilities, poverty, social existence, economic and cultural concept of adult education is different. In such countries the concept of adult education, literacy education is.

Concept of adult education in revolutionary countries, is a combination of these two concepts. Changes in these countries due to social, political and cultural revolution, resulting from, literacy and continuing education necessary to find because of the revolution, there is cultural poverty on the other hand the implementation of development plans and the need for skilled personnel are expert. General adult education system based on economic conditions - social and cultural community is different and each specific goals will follow. General objectives of adult education and literacy in two categories is divided into professional education.

Characteristics of adult education:**flexibility in time:**

In the past, usually one of the obstacles in the way of learning and development of adult education was being inflexible and time courses were programs. But now most countries have to consider that the speed limit of time and learning ability and facilities must be adults. Flexibility in time means that not only should the time classes and programs for adults is appropriate, but necessary facilities should be provided for independent study.

Flexibility in the location:

One of the aspects of flexible space is that individuals can, regardless of their residence to the study and advancing their knowledge and skills pay. For example, adults in remote villages should like people who live in the city use of educational programs. After flexibility in other places is that the issue of specificity of location is not considered primarily educational.

Flexibility in age:

Educational opportunities for certain age should not use it for all regardless of their age, is possible. In fact, educational programs must use people of different ages to prepare.

Flexibility in admission:

No adult should not only be deprived of education because of the necessary conditions for admission in the class does. Of course this is not such a person without academic records to participate in university classes is accepted, Adoption order is that the adults in educational programs at different levels, according to the possibility of using the opportunity that is provided must be based on the experience and knowledge and their knowledge is.

To combine education and job responsibilities:

Adults should be able to work during that time engaged in training classes take them. In other words, their presence in the class should be considered part of their work. This means that low-literate or illiterate

working people who are allowed to work an hour of your daily spending surpassed participation in educational programs.

Conclusion:

To improve the quality of life, learning materials should reinforce the skills they acquired previous. This material should have access to information and provide new technology. should also have to make learning more fun. Additional materials should provide opportunities for literacy skills to read and to strengthen their cognitive awareness.

Track materials (continued) which increased literacy skills and knowledge gained is also effective in enriching learning environment for learners are important. Participatory materials to ensure the participation of learners in the learning process and codification are included out of class activities, dialogue, role playing, etc.

In traditional programs that the principles of psychology and curriculum planning, less attention is the form of content presentation ie codification and providing books, original format and have the dominant form, while for adult content that could have valuable experience in addition to writing, other ways also be provided Affect the selection of pictures and images related to the concepts and content produced by including them.

Learning activities such as activities outside the classroom, dialogue, role playing and ... Another type of content is presented. Duties are placed on the learner, a resource for developing knowledge, skills and insights he considered.

Curriculum content only from the training provided to learners or not, but put together their learning through activities that can inform or does, skills and attitude to achieve. In this case, apart from learning that the essays taught learners directly to sustainable and effective learning occurs in his.

Another way of providing content that is educational activities outside the learning environment possible for learning more and better enables adult learners. For example, hits, field trip experiences for learners or transfer is provided, develop knowledge, insight and skills they will.

To ensure that science curriculum and educational aspects, according to community needs and audiences, application form is provided or not, the content selection criteria should be considered. These criteria is being include knowledge, effectiveness, flexibility, diversity, relevance and practical learning

The role of Distance education in improving adult education

Abstract: Distance learning is one of the fastest-growing components of higher education. Almost 3.5 million students were enrolled in at least one distance learning course in the fall of 2006 and online enrollments are increasing every year. The convenience of taking classes at any time from any location appeals to today's adult learner, especially those who work, have families or live in rural areas. Today a growing number of paralegal and legal secretarial programs have a distance learning component (no law schools currently grant credit for distance learning studies). However, not all distance learning programs are of equal quality. Moreover, the increasing popularity of distance learning programs have led to "diploma mills" or "accreditation mills" that offer bogus degrees and certificates. Choosing a distance learning program requires careful research and evaluation. Below are several important factors to consider in choosing a distance learning program. In evaluating distance learning paralegal programs, determine if the school is accredited by one of the regional accrediting bodies and by the American Bar Association (ABA). ABA-approval signifies that the school has met certain standards in terms of academics, facilities and instruction. Graduating from an ABA-approved school may give you an advantage in the legal job market.

Keywords: Distance education, adult education

Introduction:

Adults learn best when learning is focused on them, not the teacher. This is called andragogy, the process of helping adults learn.

Malcolm Knowles, a pioneer in the study of adult learning, observed that adults learn best when:

1. They understand why something is important to know or do.
2. They have the freedom to learn in their own way.
3. Learning is experiential
4. The time is right for them to learn.
5. The process is positive and encouraging.

Teaching adults can be very challenging, but also very rewarding. Most teachers would agree that the benefits derived from a successful adult education program in agriculture far outweigh the costs. In addition to the direct benefits to adult participants, the teacher, the school, the community, and the secondary program also benefit from a quality adult education program in agriculture.

Adults in agriculture use a number of sources to gain new information that can be used to help them solve problems. Persons employed in agriculture utilize newspapers, magazines, newsletters, radio, television, government publications, internet, and meetings to gather information which can be directly utilized in their business activities. In many communities, the agriculture teacher is the primary source of agricultural information.

Successful adult education programs develop and utilize an Agricultural Education Program Advisory Committee to assess the informational needs of adults in the community. Agriculture teachers should utilize the expertise and communications link, which an effective advisory committee provides. Specifically, the advisory committee should be asked to provide advice regarding planning, conducting, and evaluating the adult education program in agriculture. Adult education programs in agriculture should emphasize practical application of the information presented. Topics and information included in adult programs should be provided which fulfill needs of the local community. Providing information which cannot be applied to solve a local problem or address a local issue will generally be viewed as frivolous and over time will result in decreased interest (i.e. participation) in the adult education program.

The role of the agriculture teacher should be as a facilitator of the learning process. Most adults reject the traditional teacher-student relationship, which is necessary to maintain in secondary programs. Teachers should be encouraged to view themselves as partners with adult participants in the learning process. The democratic philosophy of shared responsibility for planning, conducting, and evaluating adult education programs distinguishes adult education from secondary education.

A local plan for adult education in agriculture should consist of two major components. Namely, a broad statement of philosophy, goals, and objectives of the

local adult education program, and an annual calendar of program activities.

Adult education in agriculture is important for continued community prosperity, growth, and improvement.

The local Agricultural Education program has a responsibility to provide up-to-date information, training, and retraining for all adults interested in agriculture.

The goals of the Adult Education Program are:

1. To assist adults in establishing personal and business goals.
2. To enhance the self-confidence and decision making skills of adults in agriculture.
3. To develop agricultural leaders.
4. To maintain the local agricultural knowledge and technology base.
5. To improve the home, living, and business conditions of persons employed in agriculture.
6. To encourage adults to participate in cooperative efforts.

The objectives for the local Adult Education program are:

1. To increase the net farm income of local agricultural producers.
2. To improve the safety practices of adults employed in agriculture in the local community.
3. To educate the public about the significant role in agriculture in the local economy.
4. To encourage the use of practices that protect and conserve natural resources to maintain a good environment for everyone.
5. To assist local producers in the development of marketing plans that are tailored to their individual needs.
6. To assist local producers in developing strategies to make optimum use of agricultural support agencies (e.g. FSA, MO Department of Agriculture).

A comprehensive program of adult education in agriculture includes three major components: (a) organized instructional classes for adults, (b) a Young Farmers/Young Farm Wives Chapter, and (c) Farm Business Management Analysis (FBMA). State Agricultural Education Program standards implemented in 1992 indicate that a minimum of 20 clock hours of organized adult education classes be provided. Many local agriculture programs will far exceed this minimum standard. Salary reimbursement Procedures for "Full Time" and Short Term adult programs are.

Getting a college education can be difficult for people with inflammatory bowel disease (IBD). Frequent trips to the restroom, exhaustion, doctor

visits, and medication side effects are all barriers to the traditional college experience. What if you could get the degree without ever setting foot on a campus? You can do just that through distance or virtual learning. Distance learning has been around for a long time (we've all seen the commercials on TV). While there is still prejudice surrounding some distance learning, it is increasingly being accepted as an alternative to traditional classroom learning. Courses can be offered via the Internet, where students are able to interact with instructors and other students without physically being in the same room. Before considering if distance learning is a viable option for you, there are several questions you should ask yourself:

- What course of study would you pursue?
- Are you interested in pursuing a degree? Brushing up on existing skills?
- Would your course of study require some traditional classroom time (such as laboratory or field work)?
- After obtaining a degree, would you be able to obtain employment that allows for your illness (such as telecommuting or flexible hours)?

Distance Education:

Distance education is any type of schooling that takes place away from a physical campus. Distance education is also known as:

- distance learning
- virtual learning
- online learning
- e-learning
- online education
- web-based training

Types of Distance Education Programs:

There are two types of programs offered by distance education schools: synchronous learning programs and asynchronous learning programs. With synchronous learning, distance education students must log on to the school's website at a set time. Often, they interact with their peers and professors via group chats, web seminars, video conferencing, and phone call-ins. With asynchronous learning, distance education students complete all coursework on their own time. They often learn via assignment sheets, message boards, email, pre-recorded video lectures, mp3s, and traditional mail correspondence. Many students find that distance education courses give them the freedom to complete a degree while meeting their personal and professional obligations. Motivated learners are often able to complete distance education degrees in a fraction of the time often required. Distance education courses also allow students to network with participants from all over

the nation. On the downside, distance education courses do not offer the face-to-face interaction found in traditional classrooms. Some students find that they struggle to stay motivated and meet deadlines due to the independent nature of distance education courses.

When searching for a distance education program, the most important factor to consider is accreditation. Make sure the distance education school you choose is recognized by a regional accreditor or the Distance Education Training Council.

Choosing a Distance Learning Program:

Distance learning is one of the fastest-growing components of higher education. Almost 3.5 million students were enrolled in at least one distance learning course in the fall of 2006 and online enrollments are increasing every year. The convenience of taking classes at any time from any location appeals to today's adult learner, especially those who work, have families or live in rural areas.

Today a growing number of paralegal and legal secretarial programs have a distance learning component (no law schools currently grant credit for distance learning studies). However, not all distance learning programs are of equal quality. Moreover, the increasing popularity of distance learning programs have led to "diploma mills" or "accreditation mills" that offer bogus degrees and certificates. Choosing a distance learning program requires careful research and evaluation. Below are several important factors to consider in choosing a distance learning program.

1- Accreditation. Accreditation is a means of ensuring the quality and effectiveness of higher education institutions and programs in the United States. Eight regional accrediting agencies accredit most of the colleges and universities in the United States. A host of national and professional accrediting organizations also exist, including the Distance Education and Training Council (DETC), an organization that identifies and accredits distance learning programs. These twelve questions outlined by the Council for Higher Education Accreditation are helpful in examining a distance learning program's claims of accreditation.

In evaluating distance learning paralegal programs, determine if the school is accredited by one of the regional accrediting bodies and by the American Bar Association (ABA). ABA-approval signifies that the school has met certain standards in terms of academics, facilities and instruction. Graduating from an ABA-approved school may give you an advantage in the legal job market.

2- Reputation. The reputation of the distance learning program you attend may hinder or enhance your post-graduate employment prospects. In evaluating the

reputation of a distance learning program, you should not solely rely on the school's website or marketing materials. Other ways to investigate the reputation of a distance learning program include:

- Visiting the school.
- Talking to alumni (contact the career services department for alumni names and contact information).
- Researching the distance learning program's record with the Better Business Bureau.
- Talking to paralegals, attorneys and legal employers about the reputation of the school you are considering.
- Researching the school in print publications, news articles and on the Internet.

3- Academic Offerings. When evaluating distance learning programs, it is also important to consider the program's academic offerings. A quality distance learning program offers a comprehensive curriculum with a variety of options, electives and advanced coursework. Talk to professors or an academic dean regarding the content and delivery of courses. The American Association for Paralegal Education (AAfPE) recommends that paralegal instructional content include courses in legal research and writing, litigation, ethics, contracts, business organizations and torts. In addition, courses should develop students' critical thinking, communication, computational, computer and organizational skills, and competency to handle ethical issues, according to the AAfPE.

Legal programs should also offer an experiential learning component such as an internship, practicum, pro bono work or clinical experience. These are great resume-building opportunities and allow you to learn practical skills and gain real-world experience.

4- Instructional Technologies. Distance learning courses can be delivered in a variety of ways through a growing array of technological tools including audio tapes, CD or DVD ROM's, e-mail, telephone conferences and web-based delivery systems. Questions to ask include whether the program employs a mix of instructional technology? Is hands-on training and support provided? Can students preview courses online and try out the technologies before enrolling?

5- Teaching Staff. The faculty is the backbone of any distance learning program. Are the courses taught by professors or are the courses pre-taped correspondence instruction? If the courses are taught by instructors, what is the background and qualifications of the teaching staff? Are classes taught by paralegals, attorneys or a mix of both?

6- Career Services. Another important consideration in any distance learning program is the extent and quality of its career services program. Research indicates that the greater the resources offered by the career services department, the greater the program's job placement success. You might inquire as to what percentage of graduates find related employment following graduation and whether the career center offers personalized career counseling, job placement assistance, job search seminars, online job boards or resume assistance.

Conclusion:

To improve the quality of life, learning materials should reinforce the skills they acquired previous. This material should have access to information and provide new technology. should also have to make learning more fun. Additional materials should provide opportunities for literacy skills to read and to strengthen their cognitive awareness.

Track materials (continued) which increased literacy skills and knowledge gained is also effective in enriching learning environment for learners are important. Participatory materials to ensure the participation of learners in the learning process and codification are included out of class activities, dialogue, role playing, etc. In traditional programs that the principles of psychology and curriculum planning, less attention is the form of content presentation ie codification and providing books, original format and have the dominant form, while for adult content that could have valuable experience in addition to writing, other ways also be provided Affect the selection of pictures and images related to the concepts and content produced by including them. Learning activities such as activities outside the classroom, dialogue, role playing and ... Another type of content is presented. Duties are placed on the learner, a resource for developing knowledge, skills and insights he considered. Curriculum content only from the training provided to learners or not, but put together their learning through activities that can inform or does, skills and attitude to achieve. In this case, apart from learning that the essays taught learners directly to sustainable and effective learning occurs in his.

Another way of providing content that is educational activities outside the learning environment possible for learning more and better enables adult learners. For example, hits, field trip experiences for learners or transfer is provided, develop knowledge, insight and skills they will.

To ensure that science curriculum and educational aspects, according to community needs and audiences, application form is provided or not, the content selection criteria should be considered. These

criteria is being include knowledge, effectiveness, flexibility, diversity, relevance and practical learning

Rural women empowerment and rural development

*Corresponding author: saba11085@yahoo.com

Abstract: in the rural community of Iran, there are gaps between the ruling class (capital owners) and villagers, between literate and illiterate, and between men and women. Especially in villages women have fewer possibilities in terms of investment and less power and credit. Role of rural women, over of men, is more influenced with different economic, social, cultural and ecologic factors. Rural women are considered as a noticeable potential in the community either directly (crops production, livestock, handicrafts, cottage industries) or indirectly by helping the agricultural sector (as labor). About 5.6 million women are involved in agricultural production, and activities related to planting... harvesting, preparation of animal food, and taking care of livestock and poultry and some certain activities related to trading and marketing are all different fields of rural women's role and participation. Based on current statistics, women in rural area participate about 50% in conversion industries, 22% in producing crops and livestock, 75% in handicrafts and in areas related to planting...harvesting, respectively, 25, 24 and 4.26. And also in activities related to livestock, they handle 23% of livestock grazing, 42% of animal care and 100 percent of total poultry in the village. Therefore their role in achieving food security is undeniable. But, like most developing countries, this crucial role in society and in process of rural development, is not obvious. In Iranian rural community, about 80% of women work, but they are mostly considered as housewives, unpaid employment, domestic workers, family workers, or independent employers. The statistics often do not take into account seasonal, part-time, unpaid employment, and housekeeping activities. In economics and social sciences, those of women's activities that have emerged out of house and affected national economy, are the ones to be noticed. In most research and statistics men are known as the heads of household and they are also the owners of lands and fields. That only 1% of the rural lands are belonging to women does confirm such matter.

[Nooshin Javadi and Mona Habibi. **Rural women empowerment and rural development.** Journal of American Science 2011;7(6):332-336]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: empowerment, rural women, rural development

Introduction:

For an active participation of women in development, first we need to give a definition for their role in development and then barriers related to their role will be discussed. Although apparently there is no difference of gender in development programs but reality is that women are less considered in participatory programs and most of these plans are planned for men. Finally, planner's optimistic look toward women's participation will be greatly helpful improve rural family budget and will increase the difference between urban and rural families. If, by credit, loans and other financial facilities, rural families are able to build up their own business and make a living through the income and become financially self-reliance or independent, no doubt we will witness some social, economic and cultural changes in villages (Varzgar and Azizi, 2001).

participation is to guide people caught by disability, to help them realize their potentials and to empower them to make the best use of life.

According to preceding definition of participation, and the ability of participation to turn potential into imminence power, women should participate more

actively in economic affairs. Statistics regarding women and girls' activities, especially in rural areas, are always presented much lower than the real numbers (Ghaffari, 2000).

Village with the word "woman" removed will lose its literally in production and economic activities, their everyday activities in different fields all are evidence of woman being required in rural production. Rural girls and women are responsible for a variety of roles and duties including wife, mother, producing crops, livestock and agricultural activities, making and marketing handicrafts which are common in each area, and food preparation.

Daily activities of girls and women in different fields all are evidence of woman being required in rural production sector. Women are the major potential for developing the rural economy which leads to further growth of rural production. Increasing awareness towards the role of this class in production and towards necessity of their broader participation in economical and social development, have forced the countries to consider and support their activities while making new rural, Local and national policies (Rahmani Andalibi, 2001).

Being aware of women and girls' important role in rural activities, many countries have established institutes and organizations to advance women's progress. These organizations try to remove legal barriers that prevent women to participate in development activities as much as men. And finally improve their social, political and economic status in society. With continues evaluation and analysis of current development plans, we can provide especial conditions to ease women's access to production recourses and social services, and considering women's social situation in every society, we can provide the opportunity for them to increase their participation, share income like men, and take part in decision-making (FAO, 1998).

If rural women could provide a job for them by getting credits, loan and other financial convenience, through their income they can get self-reliance or financial independency and we will see social, cultural & economic change in village. The question here is that if these changes have positive or negative aspects in the village? It's natural that every change in social phenomenon has both positive and negative aspect, but which is Important here is that which aspect is more than the other and it depends to different condition in various societies. In our rural society there is an especial social & cultural kind that it's outcome maybe different and in some case inconsistent. With these actions rural women could be in idealistic economic condition and they could live with out dependency to their husband's income. In most of the villages in Iran there is patriarchy in the families which is not acceptable for the most of the rural people and groups. When rural women became financially independent, it's acceptable to see its cultural & social outcomes.

Giving the right that women make decision, independency to their family, increasing the cultural knowledge among them& making relation with new institutions, having independency in making decision about marriage, occupation, migration & something like this are the right that women have got it.

Criteria of empowering women:

Enabling as a theory of policy making for women, in it present five criteria:

Welfare, access, Concientisation, participation and control.

1- welfare criteria :

In this criteria, men and women as human resources of development should enjoy of desirable welfare conditions and equality (Paknazar, 2000).

Most of timing developmental programs, have worked on base of women's welfare. They have considered and provided some services for women who were passive recipient of these services. But

these services were limited to physical needs and mostly were considered to revive their role of productivity, again. sometimes, it has been said that this approach has begun at colonial era and has considered women from poor country and intended services for them that dose not exceed from that poverty level . Agricultural and industrial projects were designed for men and social programs for women and children. Most of welfare programs were inadequate or its success was limited. Considerable point in this criteria is that men and women as human resources of development should enjoy equality and desirable welfare conditions. At this stage, women's material welfare and their enjoyment of welfare programs, compared to men (nutrition, death rate and ...) were considered. And women's role as producer to supply their own needs isn't very important.

2- access criteria :

Lack of access or limited access for women to sources including (fields, job, capital and training) cause that their functions at production is less than men (Paknazar 2000). Access to facilities, sources, designed program and projects for women and access to schools and ... are in this part. Just whenever most of other legal, cultural and social issues being solved, men and women would equally access to sources and facilities. Concept of enabling at this stage is that women have equal right to access to sources at family and greater society.

3- Concientisation criteria

Women should know that their problems aren't due to their individual inefficiency and shortage but it has emerged by social system in which discriminations has become formal and acceptable issue. (Araghzadeh, 2002). This stage is more critical and important than other stages. Because women can participate at development activities not just be passive users. Women have real equality at development, just when be aware. Concientisation will help to increase women's ability to equality at participation at society. At this stage, women face with critical analysis with society and will find that what has been considered natural and unchangeable reality, is changeable. (Bakhshoodeh, 2005).

4- Participation criteria

One the most important items that this criteria has considered , is men and women's equal participation at decision making process of affairs of family at society (Paknazar 2000) . Men and women both should participate at process of assessment needs, designing, performing and evaluation of projects and development programs (UNICEF, 1998). In summary, this criterion means women's participation at all stages of surveying needs, detecting problems, planning, management, performing and valuation.

5- Control criteria

This criterion emphasize on this point that in addition to equal access of men and women to development sources, they must have adequate control on these sources that this issue is balance criterion, between men and women so that no one exceed other one (Paknazar 2000). Women should have opportunities for decision making at workplace and home. If woman is producer, should be shared with part of her interest and wage. Women like men, should be able to choose her individual and social field and able to make decision and also development activities should be facilitator of these processes.

FAO (food and agricultural organization) addresses these three purposes as strategic goals while enabling women:

- 1- equality between men and women to access production sources
- 2- women's participation at policy and decision making
- 3- decreasing rural women's workload and increasing job opportunity and income for them (Paknazar 2000)

within theoretical framework of enabling women, having control on sources is presented as highest stage at women's participation process on development, but existing data at most developing countries, indicates that not only rural women haven't any control on financial resources of family but even they were deprived to access to sources and credits, specially through formal credits system (Shaditalab, 2002).

The question that arises here is that what relation is there between enabling women and micro-credits programs? Nowadays, micro-credits are considered as effective mechanism to eradicate poverty for women. Interests of micro-credits further increasing women's income, include:

- improving women's role in family
- Increasing women's confidence, not only through obtain financial success through business activity, but through increasing women's access to social services and communication with other women.
- Changing at social level (social class) at perspective of women's role.

Discussion:

Some barriers to women's participation which can be categorized in 3 groups of personal, familial, and social include: law literacy level, large volume of work both inside and outside of home for many reasons including seasonal migration of men and the great diversity of rural women's activities (nursing, housekeeping, agriculture, handicrafts, livestock,...), malnutrition, law health indicator, Patriarchal structure of society, father or husbands disagreement with a

woman's participation in social and economic activities for various reasons like cultural reasons or unwilling to lose the labor force at home, negative attitudes towards women's abilities, gender discrimination, family's poverty, superstitious beliefs, misleading customs like fatalism, law access of women to credit and facilities, inaccessibility of extension services, men-orientated social activities and participation plans, deficiency of professionals needed to educate rural women, problems of access to health services and social facilities, low income of rural women compared with men, lack of non-governmental organizations dealing with rural women's problems, few women managers in rural area. (Rahimi, 2001)

Nowadays, micro-credit and micro-financing have changed people's lives; it has brought back life to poorest and richest communities of the world. So we can easily observe a great increase in people's access to general financial services. Facilitating the access of families to financial services, they begin to invest on educational expenses, healthcare, healthy nourishment, trading, and housing based on their priorities. Overall in many countries financial plans mostly focus on women. Women, provided with financial facilities, will receive a loan, guarantee to pay it back, keep their saving account and also they'll have insurance coverage. Micro-financial plans have an important message for families and communities. Many studies have proven that women's access to mentioned facilities may improve their conditions in family and society; it also helps them feel more self-confident and makes them aware of their own abilities. Thus providing micro-credit services for the poor in society is a powerful tool to reduce poverty and so that they are able to create assets, earn more money and become less vulnerable against the economic pressure. Of about 1.3 billion poor in the world there are 900 million poor women, this obviously shows that poverty has a feminine face. According to UN's development fund, 10% of world's income and less than 10% of world's assets belongs to women. While a majority of them never possess the capital needed for their activities, women still play an important role in the economic development of country. Therefore women draw the micro-credit policy maker's attention more than others. Choosing women as the main target of micro-credit plans is an effective strategy to eradicate poverty; because their income will upgrade the family welfare; furthermore earning money improves their social status. In some countries this choice is influenced by society's attitude and culture (Araghzadeh, 2002).

For instance founder of Grumman Bank of Bangladesh, Mohammad Yunes, has stated that: "women have plans for themselves, their children, and

their family life; they always have an overlook while men just look for fun” to explain why 94% of their clients are women.

Women’s access to micro-credits have shown that their income benefit to improve their family and provide livelihood. In addition to all these another reason of women being the target of micro-credit plans is that women have higher loan recovery rates. Totally, expanding women’s access to micro-credits may lead to many useful results which in economy is mentioned as “virtuous spiral”; because their access to micro-credits results in family welfare and in a broader point it’ll improve community’s welfare and shall be increased welfare this process is repeated.

In researches that conducted by Nanda (2004) became clear that women participation in credits programs had positive effects on their demand about health care. Fiona Steele and et al (2008) in researches that conducted as called “ influences of credits programs on empowering women at Bangladesh , found that women who joined to credits programs , have participated in more educational programs and have married with more educated men and also they have saved more and they had more cash .

Shahnaj and Chaudhury(2009) in research as “credits and its role on empowering women “ concluded that there is meaningful relation between attending in credits programs and empowering women , at economical dimensions .

Thus it is obvious that credits programs and its educational and empowering programs can be affective on social, humane and economic development or rural society, if it be associated with proper and gradual practices and base on reciprocal communications principles and apply opinion of local society.

A study conducted by Chabokru et al (1384) shows the crucial importance of micro-credits for farmers who do not possess physical financial assets (land, building, livestock, well...) and work in agricultural sector because of environmental conditions (such as living in a village) or because it’s their ancestral occupation.

So today, women’s participation in sustainable economic, social, and cultural development in rural areas is not optional but an essential matter. Those communities that have not seriously considered the necessity of participation faced failures and delayed community’s development, welfare and security process. In any community, village, or social group, broad participation of every women in decision-making and any other matter related to national or local development programs, is a key variable in social sciences and in the last few decades, it has interested many scholars of socio-economic and especially cultural issues, and is considered as one of the most fundamental democratic rights of women in a society. As we know in a popular participation, all people are given the opportunity to participate in planning and decision making for their society and for their own future. When in practice women feel that they can be involved in

planning, policy making and deciding or solving problems in the society certainly they’ll feel more solidarity and become more interested in social, economic, and cultural development programs.

Abstract: Among developing countries, millions of women always are in farms and lands, work in engaged industries, keep the cattle, store firewood and water and earn livelihood and participation in economic activities is one of their important characteristics. But Despite their widespread presence in economic activities and benefits associated with it, they always face with discrimination. The discrimination has never tired them, but as a major force in economic activities is discussed around the world. In Semi-desert areas in Africa, women traditionally are active in keeping poultry and Vegetarian animals and wild plants and trees fruit collected. In Turkey, women are employed to produce vegetables and dairy products. Among Indians, agricultural activities of women include the region around the home and caring small animal, garden products and collective activities such as spinning, weaving, wool weaving, and the cheese production. In China, when the job opportunity outside the farm is not available, the men are trying to produce crops and women are keeping livestock, doing crafts and spending to food products. In that case, women are responsible for all the agricultural tasks and do some activities such as the poultry production.

Keywords: Employment, rural women

1- Introduction:

In recent years, the point was well clear that a major share of the income of rural households are obtained through the women activity, and sometimes even share of women income in the household economy is more than the share of men. For example, in 2000, about 854 million women that include 32 percent of the workforce of the world are active economically and their major activity in third world countries are in the agriculture sector and 60 percent of cultivated rice, 90 percent produce vegetables and, 50 percent cotton and oilseeds, 30 percent had affairs and gardens, 90 percent silkworm related activities and 65 percent of rearing livestock-related activities and handicrafts have the highest proportion (Emadi, 2001). This shows that the role of women as agricultural work force, not only isn't less than men but they have greater share in the process of planting, cropping, and more importantly in the sale of crops and livestock and a research specialized that 50 percent of food global production activities were owed to women (souri, 2002).

In recent years, the point was well clear that a major share of the income of rural households are obtained through the women activity, and sometimes even share of women income in the household economy is more than the share of men. For example, in 2000, about 854 million women that include 32 percent of the workforce of the world are active economically and their major activity in third world countries are in the agriculture sector and 60 percent of cultivated

rice, 90 percent produce vegetables and, 50 percent cotton and oilseeds, 30 percent had affairs and gardens, 90 percent silkworm related activities and 65 percent of rearing livestock-related activities and handicrafts have the highest proportion (Emadi, 2001). This shows that the role of women as agricultural work force, not only isn't less than men but they have greater share in the process of planting, cropping, and more importantly in the sale of crops and livestock and a research specialized that 50 percent of food global production activities were owed to women (souri, 2002).

Aside from the economic role of women that clearly has been made in the past decades, the vital role of women in social and cultural dimensions of development process in rural areas has remained hidden from the polls. They train the next generation of farmers and teach them the next generation necessary knowledge. A Chinese proverb says, "If training a man, just training a man but if you teach a woman you teach a family." Women are local knowledge and local educators themselves, in preparing and providing food, health treatments and cultural values are the next generation (Fami, 2003).

2 - Factors associated with employment of rural women:

Women's share of the total lot of manpower required in the agricultural sector worldwide, and Iran form. Facts and figures and statistics in relation to women in productive activities are offered much less than

real, because the statistics many times, often including seasonal employment, part time and unpaid, and housekeeping activities Women are not considered (lahsaeizadeh, 2001). Perhaps the most fundamental problems brought on participation rate of women in rural agricultural economy; this is a topic that participation and employment of women more than men, influenced by economic conditions and various factors - social, cultural and ecological is. As a result of how women's employment in different areas or within a country is different. Here are some important factors are mentioned:

2-1 - Structure of agricultural and social classes:

Women as the first group are known to have paid agricultural work, and evidence shows that women farmers have been the first. Important factor causing women's participation in agricultural activities has been, among them we can mention the following (Fami, 2003):

A - Seasonal agricultural employment, and intensified the need for labor in certain seasons.

B - Men migrate to find better jobs and to assume responsibility for home and farm and agricultural work and its management by women:

In some countries men migrate to cities, or on bringing those to wage jobs have led to women's responsibility for 30 to 40 percent of agricultural plants and are responsible, in some areas this figure reaches 70 percent (lahsaeizadeh, 2001).

C - Effect of cultural - social conditions on women work:

Sociological experience shows that kinship networks status and community practices determine that who and in which areas women can have activity and employment. Several Kinship networks provide different economic roles for women based on age, marital status and their place in father and husband family (Movahedi, 2005).

2-2 - cultivation and diversity of products system:

The decisions to change cultivation products, whether the products have domestic consumption or export aspects are taken, can have an important effect of working pressure on women.

The fact that women traditionally reserve can't have the means that they don't have any ability or interest to generate cash products. If they feel that a cash product yields is higher than a livelihood one, they cultivate it and play the role in its production that have much more widespread that it is thought. For example, 70 percent of coffee production activities are performed by women in Rwanda (Saleh Nasab, 2004) the role of women in rice and tea production is very important in Iran. Based on research carried, 76 percent of rice productions in some Lahijan villages (in Iran) are carried by women. The effect of improving the plantation related to rural poverty is

different. Food and increase production affected farmers and workers increasing income. Rising agricultural and production incomes, lead to labor force employed by them are and this reduce the work pressure on women and make some free time for them(fani, 2001).

2-3 - agricultural modernization

Towards expansion and agricultural intensification activities, rural activity rates also increased. Thus it need for a tool which reduces the men and women working pressure. Agricultural Modernization and technology development, lead to business development orientation, and investments are seeking more money. In capitalist development, monetary employment takes the money force and the separates the workforce and capital. Overcome these two variables have interaction effect on the type and amount of work that women should spend for plantation. If the Modernization development doesn't increase women's agricultural participation, it leads to separation of housework from productive activities. In some cases, with the agricultural trading and the technology boom, men have more responsibilities that previously were done by women. Some development theorists, believe that with technology development and application of agricultural machinery, employment of women, have been affected (Mehrabi Basharabady 2000) Of course, this theory can be discussed from different angles and study, but what can affect on agricultural labor force modernization structure, is that the every day dependence of farmers to new agricultural and investment methods, small farmers are likely to get out from stage. The reason can search in increasing costs and decreasing prices of agricultural products that the petty peasants were forced to sell their land. This led to inequality rural employment in (Azkia and imani, 2006) that lead to reduced wages and in this case is whether women as agricultural workers or housewives impact by politics.

2-4 - Family status:

Women are considered as labor in the family, for example, every woman in the animal economy, can bleed a few sheep and goats and this implied that the number of women in families is high. By considering that in developing countries, the economic power is in men hands, men for supply their required labor, married again and in some cases, women go to woo for their husbands second marriage, because it reduces their exploitation (Aly and et al, 2000). young families with many children in villages often are an obstacle for agricultural and non-farm employment of women and diminish their working time, but with the growth of children their free times increase to acquire more working on the farm(zanjani, 2003) .Being Households head is being

one of the important factors determining the participation rate of women. For example, in Colombia when a woman is household's head, her entering to market, increases to 47 percent, but for women who are not heads of households, entering the job market is only 21 percent. So the family status is one of the factors affecting rural women's work and leads their participation or non participation.

2-5 - participation rate of women in decision making:

a positive relationship between women's participation in agricultural and non-agricultural employment of men can be seen, so that in some countries men migration to cities or bringing them on a day wage jobs has led them responsibilities in the absence of their husbands take charge of 30 to 40 percent of work related to home and agriculture. In some areas this figure reaches to 70 percent. Number of factors also led to a kind of common gender division of labor, especially in rural societies and one the most veteran of these factors is a particular power and ability of women to provide sustenance (Ghaffari, 2005).

Conclusions:

Women as an effective member of society, can crystalline their lead roles in various responsibilities formations. These responsibilities include promoting the concept of participation and employment in life and building the suitable areas for freely activity and introduce the right of economic management, ownership and.... This requires that all fees and necessary training for women to be considered. Due to the fact that the concept of women's participation, is not necessarily the female employment, although certainly part of the participation of women will be crystallized in their employment, but in this context, home and family affairs by women and their role in nutrition and child growth and Their education are also many responsibilities that women often are responsible for them. Throughout history we have always been seen that women have always been active but in culture and tradition, this mentality largely exists that if the job exists, it would be for men. Because they are responsible for their families Economic or wherever there is a good opportunity for participation, men have a prior right.

Perhaps the reason that women are less important in the development is this thought and action. Because women are in occurred opportunities in the second stage, or even sometimes do not come into account. Zanjani in the article "Women's Empowerment" according to economic, social and cultural characteristics, one of the important subjects that have investigated is the effect of number of children in female employment in urban and rural

communities. In Iran urban, employment opportunity population continually reduces by increasing the number of children. This reduction is weak, up to the third child and then takes the intensity. So that the employment opportunities of women decrease in pay to first child to the second 3 / 2 percent and the second child to the third 9 / 6 percent, while this reduction from third child to the quarter is 3 / 27 percent. But in rural society due to the household problems, type of activity and employment, increasing numbers of children not only make no reduction in women employment opportunities so with increasing the number of children, women's job opportunities is also growing and by having 7 child reaches its peak. Since then relegated to minor finds, in a way that employment opportunities of rural women that has nine child is equal to the job opportunities of a woman with one child. Thus children are effective on women employment so that increasing the number of children in urban society has negative effect and in rural society has positive effect (Zanjani, 2002). Lasay Zadeh in a research by the name that (considering the role of Iranian rural women in the economic scene), first specified the women's place in job structure, and then compared it with the job site of rural men. His study demonstrated that the employment of rural women is important as men. Because the rural economy includes three separated and also related parts, namely agriculture, industry and services and the author, with the share of women in agricultural activities come to the conclusion that in addition to their considerable added value contribution in agriculture, unfortunately, the real value of their activity is not known has been formed in the article. (Lahsaezadeh, 2004)

Safiri in his PhD thesis, as "study of quantitative and qualitative aspects of women's employment and its relationship with economic development", knows that a part of the employment problems is because of some barriers that relates countries structure and also other parts is because of some non development barriers an some parts is also from the social - economic, and cultural barriers as development obstacles.

In some countries where are not appropriate and much needed job, women are damage more. In some where that the social hierarchy is base on physical strength, force and tyranny both in the family system and the hiring of women in institutions and organizations makes the difficult situation for them. Surely also the cultural background are continuing these economic and social conditions, Safiri, the knows the Personality barriers and physiological barriers as non- development knowledge barriers and

he say they are effective on women's employment (Safiri, 2000).

Razavi during a study has shown those women's achievements in academic and social areas in the past 30 years; according to their status in the labor market has not improved. Women's participation rates are low and their non-employment rates increase in these years their and their career options are still limited (lahsaeizadeh, 2004).

Hashemi (2000) with the employment status of women in Iran has shown that the rate of economic participation of women in Iran were similar with developing countries, while their literacy and education rate are comparable with advanced countries. He believes that formal institutions, namely laws and regulations have the most effective on women's employment levels that in their turn are under the social and cultural effects.

Bamdad during his study on socio-economic status of women has shown that social and economic improvement of society is associated by increasing employment rate of women. There are also differences in cultural and social discrimination between men and women, is a serious obstacle in increasing the economic participation of women. Finally, increasing women's economic participation is the function of social development – economic factor (Banihashem, 2002).

The positive effect of government spending in women employment indicates the fact that, there are limitations and discrimination for women in the labor market that the market mechanism can not destroy it thus recognizing these limits, discrimination and government intervention in the market (of course in cooperation with people) is necessary to eliminate them.

Today there is this belief that communities rather than, affected by mood men and environmental conditions, affect by personality and education of women. Thus in the process of economic and social development, women affects are more than men, and the non-developed countries have understood the undeniable fact that to achieve the economic development should employ women creative and effective forces. Structure of female employment in different countries shows that there is a direct relationship between population growth and increasing employment rates of women. In other words, in countries where female employment rate is lower, the population growth and economic development is slower. So if the state goal and the country's development policies, be the attention to women's active participation in society as half of the labor community, the cultural, social, political and economic area of their presence should allow to

provide till we can use their intellectual power, creativity, innovation and The large number of workforce innovation for family and society economic development, otherwise, with the slogan and write policies and strategies and using no proper tools and executive Migration, like the former, manpower of this huge group saw little presence in the various community activities. Different economic sectors (particularly industry and service sector) have the capacity to create many job opportunities for active participation of rural women that can be more benefit in more employment opportunities. Some variables such as marriage to divorce ratio, the share of government expenditure of GDP, the degree of development and Underdevelopment, number of children born and household expenditure are impressive on rural women's employment rates. Thus, if policy makers intend to predict the employment status of rural women, they should attend to affective factors on this group employment.

Adult learning principles

Nooshin Javadi¹ and Maryam Zandieh²

^{1,2} Bojnourd Branch, Islamic Azad University, Bojnourd, Iran

*Corresponding author: saba11085@yahoo.com

Abstract: adult education in the local agricultural education program is an essential component of the "total" program. Offering adult education programs helps to keep farmers and agribusiness employees better informed of current trends and provides them with opportunities to learn new skills and improve existing ones. Teaching adults can be very challenging, but also very rewarding. Most teachers would agree that the benefits derived from a successful adult education program in agriculture far outweigh the costs. In addition to the direct benefits to adult participants, the teacher, the school, the community, and the secondary program also benefit from a quality adult education program in agriculture. Adults in agriculture use a number of sources to gain new information that can be used to help them solve problems. Persons employed in agriculture utilize newspapers, magazines, newsletters, radio, television, government publications, internet, and meetings to gather information which can be directly utilized in their business activities. In many communities, the agriculture teacher is the primary source of agricultural information.

[Nooshin Javadi and Maryam Zandieh. **Adult learning principles**. Journal of American Science 2011;7(6):342-346]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: adult learning, adult education

Introduction:

Successful adult education programs develop and utilize an Agricultural Education Program Advisory Committee to assess the informational needs of adults in the community. Agriculture teachers should utilize the expertise and communications link, which an effective advisory committee provides. Specifically, the advisory committee should be asked to provide advice regarding planning, conducting, and evaluating the adult education program in agriculture. Adult education programs in agriculture should emphasize practical application of the information presented. Topics and information included in adult programs should be provided which fulfill needs of the local community. Providing information which cannot be applied to solve a local problem or address a local issue will generally be viewed as frivolous and over time will result in decreased interest (i.e. participation) in the adult education program. The role of the agriculture teacher should be as a facilitator of the learning process. Most adults reject the traditional teacher-student relationship, which is necessary to maintain in secondary programs. Teachers should be encouraged to view themselves as partners with adult participants in the learning process. The democratic philosophy of shared responsibility for planning, conducting, and evaluating adult education programs distinguishes adult education from secondary education.

A local plan for adult education in agriculture should consist of two major components. Namely, a broad statement of philosophy, goals, and objectives of the

local adult education program, and an annual calendar of program activities.

Adult education in agriculture is important for continued community prosperity, growth, and improvement.

Principles of Adult Learning

1) Purpose:

The Financial Literacy Foundation has prepared this document to provide education materials developers with information on the key principles of adult learning. It is a short summary of a very broad area of research and advice, prepared with the input of Adult Learning Australia, the national peak body representing organisations and individuals in the adult learning field.

2) NEEDS, WANTS, CONCERNS AND ABILITIES OF YOUR LEARNERS

Assess the needs, wants, concerns and current abilities of the target learners. Each target group will have their own special needs and probably expect different outcomes from undertaking your training program. Common themes you can prepare for are: no-one readily admits to not knowing something fundamental that may impact on their life chances. Therefore program material, particularly that designed for adult learners should always treat aspects of why learners are in the training sensitively. Describe the outcomes expected from the training in positive, enhancing terms and not as redressing a

weakness or failure on the part of the learner. For example, "Undertaking this program will improve (rather than redress a failing) the way you manage your money".

learners may well enter programs like this with poor past experiences of money matters or at least some trepidation about handling personal finances in the future. Recognise this in the program introduction but individual learners should never be required to expose any of their negative experiences in a group. It might seem a good 'ice-breaker' to ask a new group of learners to share what they expect from the program but resist going too far when asking learners to talk about past problems they may have had with finances. Firstly, they may be uncomfortable doing this in a group and secondly you could start the program in a sea of negative views about financial matters generally. A successful program introduction will focus on where the learners will go rather than dwell too much on where they may have been.

Gauge the likely capabilities of your target groups. Overestimating their current skills in dealing with money could mean the program misses fundamental principles and understandings. Underestimating existing knowledge is also not good as plodding through basic material most already are familiar with will bore participants and the full program content will not be assimilated.

above all these target groups will want to be hands on and demonstrate to themselves and their peers that that can do something they could not before the training; and do it well. Let them know right at the beginning that they will be able to do things that will be of great benefit to them, not just know more.

if a target group of learners has had limited positives in their life or work experiences its important to provide small and regular 'success' points in the program. Simply exposing the content and assuming everyone is assimilating it, putting it all together holistically and building up their skills is not enough. The beginning of the program should be designed so that a discrete piece of learning that the learners can use right away builds their confidence to move on. The program should be a series of steps where the learners confirm their progress and reinforce one new skill by relating it to another they can already confidently apply.

many adults and people not regularly engaged in learning fear testing. Many may have had bad experiences of assessment in school and view the practice among peers as stressful. Make sure they understand that what they are in is a life skills program and no-one can 'fail' as such. In fact each can support others in things they do well that fellow learners may need help with so it's a cooperative not competitive environment that they are learning in.

Build in some teamed exercises and assessments to avoid people feeling isolated in their learning and fearful of failure in front of the group.

You need to consider learners with special needs and those who have English as their second language. Reasonable adjustment should be made depending on each individual learner's particular needs and abilities. Your program material should include advice to the trainer on how to determine the need to make adjustments which, depending on a learner's abilities may include:

- providing interpreters for people who are deaf;
- ensuring access, for example by conducting training and assessment in facilities which have ramps for people using wheelchairs and adjustable desks for people with physical disabilities;
- allowing for access of personal assistants or note takers;
- allowing additional time for assessments;
- allowing oral instead of written responses to questions;
- adaptive technology such as screen readers, speech synthesisers, computer software or hardware;
- and,
- assistance with managing stress and anxiety.

3) HOW DO ADULTS LEARN?

Your program needs to account for:

- Motivation of the learner;
- Reinforcement of the skills and knowledge being developed;
- Retention of key learning; and,
- Transference of what is learnt to new situations.

Motivation - Adults learn most effectively when they have an inner motivation to develop a new skill or gain new knowledge. They resist learning material if it is forced on them, or if the only reason given is that the material will, in some vague way, be "good for them to know." Adults need to know why they are being asked to learn something; and they definitely will want to know what the benefits will be before they begin learning. This means the best motivators for adult learners are explicit interest and self benefit. If they can be shown that the program will benefit them pragmatically and practically, they will learn better, and the benefits will be much longer lasting. Typical motivations include a desire for better handling of personal money matters, say in retirement, wanting a new or first job, promotion, job enrichment, a need to reinforce old skills in say, handling credit or learn new ones, a need to adapt to community changes such as on-line banking and so on. Remember the tone of the program should be motivating. Your program should employ methodologies so that your trainers establish a

friendly, open atmosphere that shows the participants they will help them learn rather than present as 'experts' imparting knowledge. No-one engages well with a trainer/teacher who is just 'showing off' what they know. Financial services have a plethora of jargon and complicated ideas that can put many lay people off. Exposing this sort of terminology and explaining it in simple terms – or deciding whether some of it needs exposure at all – is paramount to keeping your learner's trust and interest.

Appropriate level of difficulty. The degree of difficulty of your financial literacy program should be set high enough to expose all the essential elements of the topic and challenge learners to succeed, but not so high that they become frustrated by information overload. Too much financial industry terminology strung together can be a complete turn off for people who may already struggle with the fundamentals – is it really a necessary part of the skills they need?

So start with financial information and techniques that relate directly to the learner's own personal needs and wants. Personal budgeting is always useful and less complicated than say, comparing mortgage options. Don't make what could be a lesser used skill so important in the program it de-motivates the learners and loses their interest.

Motivational reward does not necessarily have to be in the monetary sphere; it can be simply a demonstration of social or workplace benefits to be realised from new financial management skills. Older participants could perhaps learn how to help their children with financial decisions. People could be shown how to utilise better financial planning in a club or society they belong to. Its about improving whole of life experiences not just direct monetary reward. The overall thrust of the program should be motivating and, like all good teaching and learning programs, course material should ensure other key adult learning elements are covered.

Reinforcement. As we know reinforcement is a very necessary part of any teaching/learning process. Through it, trainers encourage correct modes of behaviour and performance and discourage bad habits. Your program should use both reinforcement techniques throughout. Positive reinforcement is normally used when participants learn new skills. As implied, positive reinforcement is "good" and reinforces "good" (or positive) behaviour. Negative reinforcement is useful in trying to change bad habits or inappropriate modes of behaviour. The intention is extinction -- that is, the trainer uses negative reinforcement until the "bad" behaviour disappears or the learner understands why past practice is not

beneficial to them. Examples could be ensuring participants always compare different rates of interest available to them before signing up for any new debt (a positive reinforcement) and not considering credit purchases that leave them with no income safety net for unforeseen circumstances (negative reinforcement).

Retention. Learners must retain what the program delivers to them in order to benefit from the learning. In order for participants to retain the information taught, they must see a meaning or purpose for that information. They must also understand and be able to interpret and apply the information in their own real life contexts. Understanding includes their ability to assign the correct degree of importance to the material and its application in the future. The amount of retention is always directly affected by the degree of original learning. In other words if the learners did not learn the material well initially, they will not retain it well either. Retention by the participants is directly affected by their amount of practice during the learning. After the students demonstrate they can apply new financial skills, they should be urged to practice in their own time and for their own personal needs to retain and maintain the desired performance.

Transference. Transfer of learning is the result of training and is simply the ability to use the information taught in your program but in new settings and contexts. As with reinforcement, both types of transfer: positive and negative should be used in the program approach. Positive transference, like positive reinforcement, occurs when the learner uses the skill learnt in your program. It is very important for any learner's orientation to the new skills they develop that they can practice in their own situations. Using knowledge from financial literacy training to work out the best way to use (or not use) credit in their lives is an important tool that many participants could use immediately. Participants can check how much credit debt they have, what interest they are paying and what alternatives there may be. Negative transference, again like negative reinforcement, occurs when the learners applying the skill do not do what they are told not to do. This also results in a positive (desired) outcome. This means it's important to find out what the participants in your program have been using their new skills for. Check to see if they are applying the techniques properly or whether they have misunderstood a key aspect of the program. Once wrong information is absorbed and used again and again it simply becomes another bad habit that could make financial decision-making worse instead of better.

Transference is most likely to occur in the following situations:

- **Association:** participants can associate the new information with something that they already know. What skills have the learners already mastered that they can bring to bear on better financial planning for example? Perhaps they have a hobby where it is necessary to access information from written materials or the Internet and the same skills could be used to obtain and analyse better financial data to use in their budgeting.

- **Similarity:** the information is similar to material that participants already know; that is, it revisits a logical framework or pattern. Using calendars or electronic planners to plan future holidays, work shifts etc can be transferred to setting up a long-term budget planner for financial payments and income.

- **Critical attribute element:** the information learned contains elements that are extremely beneficial (critical) in personal life or in the workplace. Try to reinforce the importance of aspects of the financial literacy program to the learner's own goals, whether these are in their home life, getting a job or improving their prospects in work they already have. People can even start their own small business ventures if they have the financial skills to work out the costs and benefits first.

Results:

The local Agricultural Education program has a responsibility to provide up-to-date information, training, and retraining for all adults interested in agriculture.

The goals of the Adult Education Program are:

1. To assist adults in establishing personal and business goals.
2. To enhance the self-confidence and decision making skills of adults in agriculture.
3. To develop agricultural leaders.
4. To maintain the local agricultural knowledge and technology base.
5. To improve the home, living, and business conditions of persons employed in agriculture.
6. To encourage adults to participate in cooperative efforts.

The objectives for the local Adult Education program are:

1. To increase the net farm income of local agricultural producers.
2. To improve the safety practices of adults employed in agriculture in the local community.
3. To educate the public about the significant role in agriculture in the local economy.
4. To encourage the use of practices that protect and conserve natural resources to maintain a good environment for everyone.

5. To assist local producers in the development of marketing plans that are tailored to their individual needs.

6. To assist local producers in developing strategies to make optimum use of agricultural support agencies (e.g. FSA, MO Department of Agriculture).

A comprehensive program of adult education in agriculture includes three major components: (a) organized instructional classes for adults, (b) a Young Farmers/Young Farm Wives Chapter, and (c) Farm Business Management Analysis (FBMA). State Agricultural Education Program standards implemented in 1992 indicate that a minimum of 20 clock hours of organized adult education classes be provided. Many local agriculture programs will far exceed this minimum standard. Salary reimbursement Procedures for "Full Time" and Short Term adult programs are.

The field of adult education and literacy is plagued by confusion about definitions. Over the years definitions have evolved from provisions in federal law and initiatives of groups advocating particular methodologies or the needs of specific adult populations. The result is that definitions tend to merge statements about the goals to be achieved (e.g., improving the literacy of a particular population) with a particular means (e.g., adult basic education) to achieve the goal.

Abstract: Adult who is able to recognize their needs. He is who knows what will. Refers to individual adults in their lives cross and understand their responsibilities and has accepted the role is social. Adult learners are often those that distinguish each other and have many different targets at the same time and will follow a common challenge to fulfill the goals of building self motivation vectors as educational materials to learn and use the forge. Adult illiteracy is like a disease that infects virtually every dimension of Kentucky life. Adult illiteracy saps the energy and capability of Kentucky's people and its economy. Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Adult illiteracy severely hinders the life chances of young children, undermines school reform, and limits the opportunities for postsecondary education. Despite landmark reforms in public schools, too many Kentuckians continue to drop out of school, thereby perpetuating the chronic problem of adult illiteracy. Too many young Kentucky parents are unable to read and lack the basic literacy necessary to provide the necessary stimulating, supportive family environments for young children. It is known that children's literacy levels are strongly linked to the educational level of their parents and that children of parents who are unemployed and have not completed high school are five times more likely to drop out.

Keywords: distance learning, adult education

Introduction:

There are two types of programs offered by distance education schools: synchronous learning programs and asynchronous learning programs. With synchronous learning, distance education students must log on to the school's website at a set time. Often, they interact with their peers and professors via group chats, web seminars, video conferencing, and phone call-ins. With asynchronous learning, distance education students complete all coursework on their own time. They often learn via assignment sheets, message boards, email, pre-recorded video lectures, mp3s, and traditional mail correspondence. Many students find that distance education courses give them the freedom to complete a degree while meeting their personal and professional obligations. Motivated learners are often able to complete distance education degrees in a fraction of the time often required. Distance education courses also allow students to network with participants from all over the nation.

On the downside, distance education courses do not offer the face-to-face interaction found in traditional classrooms. Some students find that they struggle to stay motivated and meet deadlines due to the independent nature of distance education courses.

To be successful, the Commonwealth's strategies must energize and gain the commitment of all the state's political, education, business, and civic leaders. No strategy will succeed unless it engages leaders in each community and county to identify needs and develop programs and services appropriate

to the community's unique circumstances. The most serious challenge will be to motivate low-skilled, under-educated adults within the working age population to seek further education. Simply expanding the number of providers and programs will not necessarily increase demand from the populations and communities where the needs are greatest. Deepseated social, economic and cultural barriers—many dating back generations—lead people to undervalue education. In addition, in many counties it is difficult for people to see a direct relationship between better education and better-paying jobs. Either there are no jobs available or many existing employers do little to emphasize the connection between better education and the possibilities for getting a job, keeping a job, or earning a higher wage. For many, getting more education and earning a high school diploma or a college degree has little positive meaning.

Only the negative consequences are obvious: getting more education often means leaving one's family and community for jobs and opportunities for advancement somewhere else. The future of Kentucky depends on uplifting the quality of life and economy of all of Kentucky. The social and economic costs of neglect of large parts of the state will drag down the rest of the state and seriously hinder its capacity to compete in the global economy. The field of adult education and literacy is plagued by confusion about definitions. Over the years definitions have evolved from provisions in federal law and initiatives of groups advocating particular

methodologies or the needs of specific adult populations. The result is that definitions tend to merge statements about the goals to be achieved (e.g., improving the literacy of a particular population) with a particular means (e.g., adult basic education) to achieve the goal. Therefore, it is helpful to distinguish between at least these dimensions of the issue:

1. "Literacy" refers to the knowledge, skills, and competencies of individuals. The federal Adult Education and Family Literacy Act (Title II of the Workforce Investment Act)¹ defines literacy as "an individual's ability to read, write, speak in English, compute and solve problems, at levels of proficiency necessary to function on the job, in the family of the individual, and in society." Literacy is often defined in terms of specific domains such as "basic academic skills," "workplace skills," "life skills," "parenting skills," or skills

necessary to exercise one's rights and responsibilities for citizenship. Different dimensions of literacy are often categorized by terms that cluster several dimensions of literacy important for different clients. Examples include workplace literacy (combining both basic academic skills and workplace skills), and family literacy (combining basic academic skills and other skills essential for successful parenting).

2. "Education attainment" usually refers to the numbers of years of schooling completed or the level of credential (e.g., high school diploma or associate degree) an individual has obtained. Despite concerns about the meaning of credentials, there is a strong correlation between educational attainment and literacy.

3. "Literacy initiatives" often are defined in terms of the needs of a particular target group. These may be parents of young children, youth who have dropped out of high school without earning a high school diploma, welfare recipients, persons with limited English-speaking ability, incarcerated adults, or adults in the workforce.

Getting a college education can be difficult for people with inflammatory bowel disease (IBD). Frequent trips to the restroom, exhaustion, doctor visits, and medication side effects are all barriers to the traditional college experience.

What if you could get the degree without ever setting foot on a campus? You can do just that through distance or virtual learning.

Distance learning has been around for a long time (we've all seen the commercials on TV). While there is still prejudice surrounding some distance learning, it is increasingly being accepted as an alternative to traditional classroom learning. Courses can be offered via the Internet, where students are able to

interact with instructors and other students without physically being in the same room.

Before considering if distance learning is a viable option for you, there are several questions you should ask yourself:

- What course of study would you pursue?
- Are you interested in pursuing a degree?
Brushing up on existing skills?
- Would your course of study require some traditional classroom time (such as laboratory or field work)?
- After obtaining a degree, would you be able to obtain employment that allows for your illness (such as telecommuting or flexible hours)?

Adult characteristics:

to understand the characteristics of adult learners, their mental and physical condition should be considered in the following referred to some of them.

Operating speed:

slow reaction in adults is natural that necessarily means reducing the logic and practice skills, not due to weakness and increased awareness of natural forces and their skills.

Consciousness:

no stimulus and incentives encouraging, despite inhibiting stimuli, slow transfer rate, mental, and weak inhibitors of natural forces (mostly visual and auditory) are factors that slow reaction affect individual mental and cognitive activities, but never able to understand, understanding and learning ability (which varies with the speed of learning) is not relevant.

Health:

what is most age, longer duration is necessary to be heard by listening issue. Why is that when elderly people and old could not hear well, their confidence and vulnerable to the possibility that negative beliefs about their find, they are great. Visual abilities can be like other people, usually decreases with age.

Background of knowledge - skills and beliefs of adults:

adults, social experiences, many have already learned different values and beliefs in their pronouns have stabilized, so changes in the new act very cautiously. The idea of such a manner that skill and applying them older and longer life is, Similar resistance to accept new ideas will be more and more severe. Thus, the adult criteria for the built and paid for their ideas and beliefs that are forming. Because of these criteria and the beliefs that they are afraid of failure, Therefore, to prevent it, sometimes against the resistance of new phenomena are only the material taught and its face that make reinforced concrete and tangible interference situation is.

The World of Distance Education:

Distance education programs are more popular than ever. College and high school students now have hundreds of legitimate distance education schools to choose from. If you're new to the idea of learning through distance education, this article will help you understand the basics.

Distance education is any type of schooling that takes place away from a physical campus. Distance education is also known as:

- distance learning
- virtual learning
- online learning
- e-learning
- online education
- web-based training

There are two types of programs offered by distance education schools: synchronous learning programs and asynchronous learning programs. With synchronous learning, distance education students must log on to the school's website at a set time. Often, they interact with their peers and professors via group chats, web seminars, video conferencing, and phone call-ins. With asynchronous learning, distance education students complete all coursework on their own time. They often learn via assignment sheets, message boards, email, pre-recorded video lectures, mp3s, and traditional mail correspondence.

Many students find that distance education courses give them the freedom to complete a degree while meeting their personal and professional obligations. Motivated learners are often able to complete distance education degrees in a fraction of the time often required. Distance education courses also allow students to network with participants from all over the nation.

On the downside, distance education courses do not offer the face-to-face interaction found in traditional classrooms. Some students find that they struggle to stay motivated and meet deadlines due to the independent nature of distance education courses.

When searching for a distance education program, the most important factor to consider is accreditation. Make sure the distance education school you choose is recognized by a regional accreditor or the Distance Education Training Council.

Choosing a Distance Learning Program:

Distance learning is one of the fastest-growing components of higher education. Almost 3.5 million students were enrolled in at least one distance learning course in the fall of 2006 and online enrollments are increasing every year. The convenience of taking classes at any time from any

location appeals to today's adult learner, especially those who work, have families or live in rural areas.

Today a growing number of paralegal and legal secretarial programs have a distance learning component (no law schools currently grant credit for distance learning studies). However, not all distance learning programs are of equal quality. Moreover, the increasing popularity of distance learning programs have led to "diploma mills" or "accreditation mills" that offer bogus degrees and certificates. Choosing a distance learning program requires careful research and evaluation. Below are several important factors to consider in choosing a distance learning program.

1. **Accreditation.** Accreditation is a means of ensuring the quality and effectiveness of higher education institutions and programs in the United States. Eight regional accrediting agencies accredit most of the colleges and universities in the United States. A host of national and professional accrediting organizations also exist, including the Distance Education and Training Council (DETC), an organization that identifies and accredits distance learning programs. These twelve questions outlined by the Council for Higher Education Accreditation are helpful in examining a distance learning program's claims of accreditation.

In evaluating distance learning paralegal programs, determine if the school is accredited by one of the regional accrediting bodies and by the American Bar Association (ABA). ABA-approval signifies that the school has met certain standards in terms of academics, facilities and instruction. Graduating from an ABA-approved school may give you an advantage in the legal job market.

2. **Reputation.** The reputation of the distance learning program you attend may hinder or enhance your post-graduate employment prospects. In evaluating the reputation of a distance learning program, you should not solely rely on the school's website or marketing materials. Other ways to investigate the reputation of a distance learning program include:
 - Visiting the school.
 - Talking to alumni (contact the career services department for alumni names and contact information).
 - Researching the distance learning program's record with the Better Business Bureau.
 - Talking to paralegals, attorneys and legal employers about the reputation of the school you are considering.
 - Researching the school in print publications, news articles and on the Internet.

1. **Academic Offerings.** When evaluating distance learning programs, it is also important to consider the program's academic offerings. A quality distance learning program offers a comprehensive curriculum with a variety of options, electives and advanced coursework. Talk to professors or an academic dean regarding the content and delivery of courses. The American Association for Paralegal Education (AAfPE) recommends that paralegal instructional content include courses in legal research and writing, litigation, ethics, contracts, business organizations and torts. In addition, courses should develop students' critical thinking, communication, computational, computer and organizational skills, and competency to handle ethical issues, according to the AAfPE. Legal programs should also offer an experiential learning component such as an internship, practicum, pro bono work or clinical experience. These are great resume-building opportunities and allow you to learn practical skills and gain real-world experience.
2. **Instructional Technologies.** Distance learning courses can be delivered in a variety of ways through a growing array of technological tools including audio tapes, CD or DVD ROM's, e-mail, telephone conferences and web-based delivery systems. Questions to ask include whether the program employs a mix of instructional technology? Is hands-on training and support provided? Can students preview courses online and try out the technologies before enrolling?
3. **Teaching Staff.** The faculty is the backbone of any distance learning program. Are the courses taught by professors or are the courses pre-taped correspondence instruction? If the courses are taught by instructors, what is the background and qualifications of the teaching staff? Are classes taught by paralegals, attorneys or a mix of both?
4. **Career Services.** Another important consideration in any distance learning program is the extent and quality of its career services program. Research indicates that the greater the resources offered by the career services department, the greater the program's job placement success. You might inquire as to what percentage of graduates find related employment following graduation and whether the career center offers personalized career counseling, job placement assistance, job search seminars, online job boards or resume assistance.

Conclusion:

In traditional programs that the principles of psychology and curriculum planning, less attention is the form of content presentation ie codification and providing books, original format and have the dominant form, while for adult content that could have valuable experience in addition to writing, other ways also be provided Affect the selection of pictures and images related to the concepts and content produced by including them.

Learning activities such as activities outside the classroom, dialogue, role playing and ... Another type of content is presented. Duties are placed on the learner, a resource for developing knowledge, skills and insights he considered.

Curriculum content only from the training provided to learners or not, but put together their learning through activities that can inform or does, skills and attitude to achieve. In this case, apart from learning that the essays taught learners directly to sustainable and effective learning occurs in his.

Another way of providing content that is educational activities outside the learning environment possible for learning more and better enables adult learners. For example, hits, field trip experiences for learners or transfer is provided, develop knowledge, insight and skills they will.

To ensure that science curriculum and educational aspects, according to community needs and audiences, application form is provided or not, the content selection criteria should be considered. These criteria is being include knowledge, effectiveness, flexibility, diversity, relevance and practical learning. Some research findings that can be a learning process for the Guidelines for training operations are applied, is given below:

1- intrinsic motivation, learning a deeper and make them sustainable. When the need is met directly by the learning itself, what is learned, but is complementary learning. Creating a training activity in adult learning needs, learning ensures stable

2- Positive reinforcement (reward) learning to reinforce the negative (punishment) is more effective. Many adults because of negative experiences at the beginning of schooling, are weak and afraid. Feeling of success in adult learning for continuous learning and adult participation is essential.

3- Learning, especially regarding skills development, will be added frequently.

4 - Duties and meaningful content than meaningless subjects are learned more easily and are later forgotten. This issue, especially for older adult learners is true. Challenges of adult learning facilitators by the way that content was significantly

associated with the experiences and needs of learners is.

5- Passive than active participation in learning activities, learning increases. Adult educators are allowed to participate actively in India, a stable and meaningful learning to help

The task force's policy recommendations are guided by these principles:

- Recognize that adult illiteracy is not an isolated problem but a fundamental barrier to every major challenge facing Kentucky. Without significant improvements in adult literacy the Commonwealth will be unable to make progress on issues such as early childhood education, education reform (elementary/secondary and postsecondary), economic development, and improving the health and well-being of Kentucky's families and communities.
- Shift from top-down implementation of a federal or state program to leading a statewide public campaign that depends fundamentally on a bottom-up commitment of communities, employers, and educational institutions. The campaign must engage all aspects of Kentucky life—all dimensions of state and local government, all education levels, the state's business and civic leaders, voluntary organizations, and all others whose work affects—or is affected by—the problem of adult illiteracy.
- The future of Kentucky depends on narrowing the disparities among counties by improving the adult literacy of the population in all regions of the state.

Assessing process of Adult Learning in agricultural educationMona Habibi ¹ and Nooshin Javadi ²^{1,2} Bojnourd Branch, Islamic Azad University, Bojnourd, Iran*Corresponding author: allahyari121@yahoo.com

Abstract: Adult illiteracy is like a disease that infects virtually every dimension of Kentucky life. Adult illiteracy saps the energy and capability of Kentucky's people and its economy. Adult illiteracy feeds the state's unemployment, its welfare rolls, and the correctional institutions. Adult illiteracy severely hinders the life chances of young children, undermines school reform, and limits the opportunities for postsecondary education. Learning activities such as activities outside the classroom, dialogue, role playing and ... Another type of content is presented. Duties are placed on the learner, a resource for developing knowledge, skills and insights he considered. Curriculum content only from the training provided to learners or not, but put together their learning through activities that can inform or does, skills and attitude to achieve. In this case, apart from learning that the essays taught learners directly to sustainable and effective learning occurs in his. Another way of providing content that is educational activities outside the learning environment possible for learning more and better enables adult learners. For example, hits, field trip experiences for learners or transfer is provided, develop knowledge, insight and skills.

Keywords: adult learning, education

Introduction:

Despite landmark reforms in public schools, too many Kentuckians continue to drop out of school, thereby perpetuating the chronic problem of adult illiteracy. Too many young Kentucky parents are unable to read and lack the basic literacy necessary to provide the necessary stimulating, supportive family environments for young children. It is known that children's literacy levels are strongly linked to the educational level of their parents and that children of parents who are unemployed and have not completed high school are five times more likely to drop out.

The field of adult education and literacy is plagued by confusion about definitions. Over the years definitions have evolved from provisions in federal law and initiatives of groups advocating particular methodologies or the needs of specific adult populations. The result is that definitions tend to merge statements about the goals to be achieved (e.g., improving the literacy of a particular population) with a particular means (e.g., adult basic education) to achieve the goal. Therefore, it is helpful to distinguish between at least these dimensions of the issue:

1. "Education attainment" usually refers to the numbers of years of schooling completed or the level of credential (e.g., high school diploma or associate degree) an individual has obtained. Despite concerns about the meaning of credentials, there is a strong correlation between educational attainment and literacy.

2. Other literacy initiatives are defined in terms of a particular educational service, strategy, or means to

address a target population's literacy problems. "Adult basic education" and "family literacy" are examples. These initiatives are often defined in terms of a particular configuration of services for the target population (e.g., assessment and information and counseling services).

Goal six of the National Education Goals illustrates a broadly stated goal that incorporates expectations about both adult literacy and the kinds of policies and services that should be in place to improve literacy. Goal six, "Adult Literacy and Lifelong Learning," states that, "By the year 2000, every adult will be literate and possess the knowledge and skills necessary to compete in a global economy and exercise the rights and responsibilities of citizenship."

Adult characteristics:

to understand the characteristics of adult learners, their mental and physical condition should be considered in the following referred to some of them.

Operating speed:

slow reaction in adults is natural that necessarily means reducing the logic and practice skills, not due to weakness and increased awareness of natural forces and their skills.

Consciousness:

no stimulus and incentives encouraging, despite inhibiting stimuli, slow transfer rate, mental, and weak inhibitors of natural forces (mostly visual and auditory) are factors that slow reaction affect individual mental and cognitive activities, but never able to understand, understanding and learning ability

(which varies with the speed of learning) is not relevant.

Health:

what is most age, longer duration is necessary to be heard by listening issue. Why is that when elderly people and old could not hear well, their confidence and vulnerable to the possibility that negative beliefs about their find, they are great. Visual abilities can be like other people, usually decreases with age.

Background of knowledge - skills and beliefs of adults:

adults, social experiences, many have already learned different values and beliefs in their pronouns have stabilized, so changes in the new act very cautiously. The idea of such a manner that skill and applying them older and longer life is, Similar resistance to accept new ideas will be more and more severe. Thus, the adult criteria for the built and paid for their ideas and beliefs that are forming. Because of these criteria and the beliefs that they are afraid of failure, Therefore, to prevent it, sometimes against the resistance of new phenomena are only the material taught and its face that make reinforced concrete and tangible interference situation is.

Classification of Adult Education

1. reading and writing literacy level
2. Technical and professional education, people are ready for work
3. in the field of health, behavior and health in the family
4. tutorials political, social, religious. Operating political social goals
5. to satisfy emotional needs and entertainment, like art, literature and the like

Adult education goals:

a) Literacy goals:

1. To provide primary education and to allow other adults to learn skills during childhood and youth have been deprived of them.
2. Increase the ability and skills for adults over the executive government and community programs.
3. Preparation of programs and classes that form the adult intellectual development is dedicated to the goal, get a job or degree is better.
4. Increased confidence in adults, through increased awareness and knowledge.
5. raising awareness of adult interest to participate in decision-making
6. to raise awareness of citizens rights, their duties and responsibilities
7. Adults develop abilities to solve problems of personal and social
8. to inform adults the skills and talents.

9. Spread knowledge about their heritage

b) vocational training objectives:

1. Adults equip the skills necessary for subsistence.
2. To provide staffing to promote industry and economy, the third
3. the elimination of class differences and achieve social equality
4. Training of workers with their employment conditions and industrial variables are consistent.

Principles of Adult Learning

1- DELIVERY STRATEGIES

in developing your program consider that adults have different personal and social lives than young people in formal schooling or college. Unlike children and teenagers, adults have many responsibilities that they must balance against the demands of learning. Because of these responsibilities, adults may have barriers against participating in learning. These barriers could include lack of time, money, confidence, or interest, lack of information about opportunities to learn, scheduling problems, "red tape," and problems with child care and transportation. Try to consider these factors when scheduling the program. If it is to be delivered to people in a workplace it should fit around their work times and not require them to come back hours later well after they have completed a hard day's work. Week-ends might seem like good free time to learn but many adult learners are conditioned to week-ends being for family pursuits and are likely to be reluctant to give up hours away from this for financial training. Try to identify groups of learners for each program that can support each other in transport to where the program is delivered, assistance in minding young children and common interests outside of the formal learning. Groups seeking employment or those soon to retire are obvious examples of participants who will have similar interests and motivations and can help each other to access the training and learn collaboratively to use the new skills.

2) ENGAGEMENT OF THE LEARNER

Good program strategies encourage real learning, where the learner increasingly:

- takes responsibility and ownership of their learning;
- engages in experiential learning;
- partakes in cooperative learning; and,
- engages in reflective learning.

By requiring or encouraging your learners to take a more directive and active role in the program as it is delivered you are encouraging them to engage in the critical processes of:

- making meaning out of the new financial management knowledge they have;
- distilling principles from the program, which will aid their transference of financial skills to new contexts; and,
- practising their financial planning skills and mastering processes to improve their money management.

In your financial literacy program learner directed activities can also encourage greater levels of motivation. The learning is more purposeful, because they have a sense of ownership over what they achieve and identify themselves as the key beneficiaries of the outcomes. An abstract exercise in developing a savings plan for an imaginary person or family may appear to introduce the right principles but it may not resonate with the individuals you are training. Think of your target group. What are their savings goals?

What aspects of their income are available to saving and how can they work this out?

What form of saving is best for them in terms of achievable targets, regular contributions and limited risk?

Teachers and trainers often develop example exercises based on imaginary situations because, frankly, they appear to put everyone on the same testing level and it is easier to assess because there are a common set of 'right' answers. This is not the way to make financial literacy learning work for the target groups. They should be encouraged to work on individual situations entirely relevant to them. This may mean more effort on the part of the trainer in assisting with the work each person is doing and assessing outcomes but the result will be practical exercises that keep the learners involved and motivated.

3) ASSESSING PROGRESS AND OUTCOMES

Good assessment is a collaborative process involving the assessor, learners and others, where appropriate. Your assessment process should be transparent and allow for ongoing feedback from and to the learners. Remember these adult learners want to improve their skills in managing money and are not necessarily interested in formal recognition or being ranked against their peers in the group. Where possible, presenters should emphasise from the start that no-one is going to 'fail' the program. Even where students are seeking formal certification of their achievement, presenters can advise that there is no competition between the learners in the group or between an individual and the topic material – it's all achievable and everyone can make it work for them. Make sure they understand that they will all leave with better financial skills than they have at the

beginning. If someone in the group is somehow 'better' or 'faster' at understanding superannuation than others that is their good fortune but makes no difference to the benefits everyone in the group gains from knowledge and skills in handling this important financial tool. Everyone will improve their life chances through participating in the program and outside of training for formal certification, assessment is to demonstrate this to them and no-one else.

If you want further Information on collaboration in the design of assessment materials and the role of learners in the assessment process this can be found in:

- Guide One – Training Package Assessment Materials Kit and Guide Five – Candidate's Kit in the Training Package Assessment Guides; and,
- Learning Circles Resource Manual for Facilitators and Learners (developed by Adult Learning Australia).

Conclusion:

In traditional programs that the principles of psychology and curriculum planning, less attention is the form of content presentation ie codification and providing books, original format and have the dominant form, while for adult content that could have valuable experience in addition to writing, other ways also be provided Affect the selection of pictures and images related to the concepts and content produced by including them.

Learning activities such as activities outside the classroom, dialogue, role playing and ... Another type of content is presented. Duties are placed on the learner, a resource for developing knowledge, skills and insights he considered.

Curriculum content only from the training provided to learners or not, but put together their learning through activities that can inform or does, skills and attitude to achieve. In this case, apart from learning that the essays taught learners directly to sustainable and effective learning occurs in his.

Another way of providing content that is educational activities outside the learning environment possible for learning more and better enables adult learners. For example, hits, field trip experiences for learners or transfer is provided, develop knowledge, insight and skills they will.

To ensure that science curriculum and educational aspects, according to community needs and audiences, application form is provided or not, the content selection criteria should be considered. These criteria is being include knowledge, effectiveness, flexibility, diversity, relevance and practical learning

Utilization of micro-credit for rural women and improving livelihood¹ Fakhteh Ghahramani and ² Zahra Kaveie^{1,2} Damavand Branch, Islamic Azad University, Damavand, Iran*Corresponding author: fakhteh1358@yahoo.com

Abstract: In the countries that credits are provided in a proper financial manner, not only it has increased production and income but also it has encouraged poor to save a part of their income. These savings can be an important support for the institutes providing micro-credits and can be a financial base for more loans and all these result in institutes' financial dependence. With the new way of micro-credit payments, in addition to covering poor's financial needs, a combination of other services and facilities are available for them; such as saving accounts, educational services, and cooperation possibilities. If rural women can work through receiving credits, loan and others finance facilities at favorite jobs and live through earned income (as it called "self-reliance and independence"), so undoubtedly we would see changes in social, economic and cultural relations of village. However these actions caused that women stand in good economic condition and also gain self reliance and rely themselves with no help from husbands, but dominant cultural space on villages may create some disorders. At most of villages in Iran, patriarchal with all features dominate and women's financial self reliance may not being pleasant for some human and rural groups.

[Fakhteh Ghahramani and Zahra Kaveie. **Utilization of micro-credit for rural women and improving livelihood.** Journal of American Science 2011;7(6):357-361]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: micro-credit, rural women

Introduction:

By looking at women's history of economic and social life, we can find that this great group, continuously have played basic role in forming economic condition of country. This great group consistent with men have had active role at areas of social-economic activities and always have had major part on economic production of society. Nowadays, supporting family supervisor women is adopted by universal society, as politic, economic a social concern and nearly all countries applied related approaches, and however these efforts have resulted in failure, in so many cases (Banihashem, 1999). paying part of cost of life by government or charities, establishing forums to analyze family supervisor women's problems, supplying necessary facilities to grow and improve child's life quality and paying facilities to provide sustainable employment, are among most important approaches to support family supervisor women. Paying credit facilities to access sustainable employment with easy terms at limited time, is one of the most important approaches to support family supervisor women. Because alongside supplying their continues needs, their esteem wouldn't be marred. Currently, this approach is used at many countries and positive results have emerged. (Ghaffari, 2000).

Aforementioned plan, due to containing special advantage such as giving accessible loan with low commission fee and no interest rate and also long-term repayment, could provide chances for many farmers to release from dealers and broker jobbers. In this approach, giving micro-credits to rural women seems more effective. because alongside agricultures

activities that needed more investments, women by enjoying of very micro-credits not only could create remarkable creativities in rural productions but also gained worthy economic and social abilities, and even improved their field of social presence. (Lahsaeizadeh, 2000).

Increasing Suffrage, lack of relying on vast patriarchal families, increasing cultural acknowledgment, relation with newer institutions, having intellectual independence, making decision for marrying, occupation, emigration and etc are those rights that they gain. gaining aforementioned rights by women in context of cultural and social framework followed some changes that maybe lead to disfunctions and even create disorders and abnormalities at traditional, familial and kinship relations that dominated on villages (Fakhraee 2002). What that performing credits programs, has made in recent years, was on broad outlook with purpose to access to same results as above findings.

Thus, in one inclusive outlook, it is possible to use micro-credits programs to solve those issues which involved with rural women's economic limitations, so that lead them toward social empowerment, in the context of economic growth (Rahmani and alibi, 2001).

The major beneficiaries of micro-credit programs are rural women and low-income groups who use the micro-credits to improve their social and economic status. Bowman (1997) gives a short but clear definition of micro-credit in his book, which is as follows:

"Small, short, collateral-free"; In other words micro-credit means providing small loans without

any thing as security for low income people and they'll pay back the loan in a short period of time. (Arab Mazar and Motamed, 2005)

For the past two decades, micro-credit has been one of the solutions considered in order to expedite investment process and strengthen the financial bases in rural and deprived areas. Empowerment and poverty eradication in deprived communities through improving productivity are all results of micro-credit. Micro-credit has proven its value in development as an effective tool in struggling poverty and hunger. It has the ability to change and improve people's lives, especially people in need.

paying part of cost of life by government or charities, establishing forums to analyze family supervisor women's problems, supplying necessary facilities to grow and improve child's life quality and paying facilities to provide sustainable employment, are among most important approaches to support family supervisor women. Paying credit facilities to access sustainable employment with easy terms at limited time, is one of the most important approaches to support family supervisor women. Because alongside supplying their continues needs, their esteem wouldn't be marred. Currently, this approach is used at many countries and positive results have emerged.

In micro-credit programs there are some other parts like small saving accounts and deposits; that's why they are presented as a credit-saving program (Moazami and et al, 2005).

The two terms in "micro-credit" refer to two fundamental concepts that it is dealing with. The first term "micro" refers to inefficiency of classical economists' development methods. Focus on the term "micro" implies revising the market's economical recommendation in rural development. Small and micro-scale activities are the ones done within the local markets with goal of providing livelihood for households and with least link to the national and international economy. The second term "credit" refers to rural circumstances and lack of official sources which is a critical problem for them. By designing a micro-credit plan, the system is trying to provide credit sources for poor families and increase efficiency of rural market. In micro-credit system, production is mostly local and industrial, therefore economic surplus in these programs is relatively low. Micro-credit system is widely applied in countries that their national economic program is not capable of creating job and income generating opportunities for the majority of society. (Najafi, 2006)

Micro-credit characteristics:

1- Empowerment

Empowerment is one of the major goals of micro-credit and it's considered as a proper index to evaluate it. Creating self-reliance and self-confidence in people, empowerment is one of the important factors to deal with poverty. It also creates social capacity.

Empowerment plans include:

1. Forming financial groups and creating social capacity
2. Education as a supplementary factor of credit-saving
3. Assigning management of credit plans to members

2- Stability

Stability is a fundamental characteristic for a comprehensive development program and leads to continuance of the program and makes credit-saving plans different from others.

Stability indicators:

- reduce dependence on external financial resources
- reduce trading expenses
- cut the loan subsidies (Banihashem, 1999)

3- creating and expanding income generating activities

A study conducted by World Bank about micro financial institutions highlights three most frequent goals:

1. Creating employment opportunities for members
2. Increasing vulnerable groups' income and productivities
3. Reduce family's dependence on agriculture in droughts' prone areas

The role of micro-credits in Poverty Reduction:

The first application of micro-credit was about 20 years ago with the establishment of Grameen Bank in Bangladesh. This bank, providing credit for the poor (particularly women as 94% of its clients are them), has managed to increase income and economic welfare. Now the program is running in most parts of world especially Asia, Africa and Latin America. One interesting point is that unlike prior perceptions, the poor covered by micro-credit programs has been very successful in paying back their loans.

In the countries that credits are provided in a proper financial manner, not only it has increased production and income but also it has encouraged poor to save a part of their income. These savings can be an important support for the institutes providing micro-credits and can be a financial base for more loans and all these result in institutes' financial dependence.

With the new way of micro-credit payments, in addition to covering poor's financial needs, a combination of other services and facilities are available for them; such as saving accounts, educational services, and cooperation possibilities (Goetz and Sengupta, 2003).

Conclusion:

Woroniuk, Schalkwyk (1998) at their conducted research believe that now, micro credits, micro finance sources and small business unites are most effective mechanism to decrease poverty.

Plitt and others, conducted research as they called it "do credits programs, can empower women"? Results showed that corporation at credits programs helps empowering women.

Goetz, Sengupta (2003), presented negative image of credits effects on empowering women. They concluded that most women have minimum control on their loans. And when repayment period is short, this shortage of control has devastating effects on women welfare.

Hashemi and others (2004) found that joining to Gramin Bank, has meaningful positive affects on controlling women, and helps to family income.

In researches that conducted by Nanda (2004) became clear that women participation in credits programs had positive affects on their demand about health care.

Fiona Steele and etal (2008) in researches that conducted as called "influences of credits programs on empowering women at Bangladesh", found that women who joined to credits programs, have participated in more educational programs and have married with more educated men and also they have saved more and they had more cash.

Ellen and her colleagues (2009) used approach called it "credits and education at Bolivia, Ghana, Honduras, Mali and Thailand". This approach looks for empowering women through financial services with education. In this approach, women get familiar with importance of credits through education and extension and also familiar with ways to access it through establishing different groups.

Shahnaj and chaudhury(2009) in research as "credits and its role on empowering women" concluded that there is meaningful relation between attending in credits programs and empowering women, at economical dimensions.

Ruhal amin and others (2010) found that those who joined credit funds had more ability rather than those who didn't.

Jameela (2010) presented that credit programs has shown lot of affects on empowering women so that

has increased their social, politic and economic ability.

Thus it is obvious that credits programs and its educational and empowering programs can be affective on social, humane and economic development or rural society, if it be associated with proper and gradual practices and base on reciprocal communications principles and apply opinion of local society.

Maybe the main challenges that threaten credits associations, is lack of necessary emphasizes on social dimensions and on reinforcing their basics, that practically cause that this social foundations lose its efficiency soon and practically changed to unsuccessful institution.

In order to overcoming dominant consideration, experts believe that we should consider following in protection process of these social institutions.

- establishing and reinforcing through supporting without ant direct government involvement
- evaluating and constant modifying of financial management mechanisms
- improving organization effectiveness
- establishing constant relation and interaction with similar and equal systems.
- establishing local, regional and national networks
 - establishing support and cover systems in order to decrease risk
 - establishing balance and interaction with financial systems greater decision making include: capital market (local, regional, national) and governmental.

also following suggestions have been offered:

- helping to marketing and establishing many exhibitions for member's productions, credit programs, guiding and training them in line with group and workshop activity, can assist them on economic empowerment.
- since women have pointed to education deficiency as major barrier for empowering them, thus educating rural women at the field of exploiting different credits and channels of receiving credits, and also various educations, is so that lead to enabling them, that contain considerable importance.
- providing extension educations for men in order to believe economic role of their women, and give them chance of corporation on all economic, credits fields

- Since that base of credit association, forms base on People Corporation, so it's good chance to use these communities to expand extension-education activities. so it is better to consider special programs on different extensional filed such as agriculture , ranching , family health , housekeeping economy and other fields accordance to condition of region and rural women's needs .
- it is suggested that vast and exact programming happens at following fields:
 - a- extending insurance, facilities for amenities
 - b- educating women about awareness of their own individual and social rights
 - c- persuading rural women about importance of participating at cooperatives and other educational institutes
 - d- educating women about job management and income management

Using Participatory Rural Appraisal (PRA) in rural research

¹ Fakhteh Ghahramani and ² Zahra Kaveie

^{1,2} Damavand Branch, Islamic Azad University, Damavand, Iran

*Corresponding author: fakhteh1358@yahoo.com

Abstract: Robert Chambers (2004) describes PRA as “a growing family of approaches, methods, attitudes and behaviours to enable and empower people to share, analyze and enhance their knowledge of life and conditions, and to plan, act, monitor, evaluate and reflect”. While RRA focuses on data collection or extraction, PRA focuses on empowerment. It needs to be noted that although RRA and PRA carry the term ‘rural’, they can both be and have been applied in urban settings. To make it more inclusive and to emphasize the empowerment aspect, the term Participatory Learning and Action (PLA) is used interchangeably with PRA. PRA has many sources. The most direct is rapid rural appraisal (RRA) from which it has evolved. RRA itself began as a response in the late 1970s and early 1980s to the biased perceptions derived from rural development tourism (the brief rural visit by the urban-based professional) and the many defects and high costs of large-scale questionnaire surveys. PRA has much in common with RRA but differs basically in the ownership of information, and the nature of the process: in RRA information is more elicited and extracted by outsiders as part of a process of data gathering; in PRA it is more generated, analyzed, owned and shared by local people as part of a process of their empowerment. The term Participatory Rural Appraisal (PRA) is being used to describe a growing family of approaches and methods to enable local people to share, enhance and analyze their knowledge of life and conditions, to plan and to act.

[Fakhteh Ghahramani and Zahra Kaveie. **Using Participatory Rural Appraisal (PRA) in rural research.** Journal of American Science 2011;7(6):362-366]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Participatory Rural Appraisal (PRA), rural research.

Introduction:

PRA involves project staff learning together with villagers about the village. Much of the spread of participatory rural appraisal (PRA) as an emerging family of approaches and methods has been lateral, South-South, through experiential learning and changes in behavior, with different local applications. Rapid spread has made quality assurance a concern, with dangers from “instant fashion”, rushing, formalism and ruts. Promising potentials include farmers’ own farming systems research, alternatives to questionnaire surveys, monitoring, evaluation and lateral spread by local people, empowerment of the poorer and weaker, and policy review. Changes in personal behavior and attitudes, and in organizational cultures, are implied. PRA parallels and resonates with paradigm shifts in the social and natural sciences, business management, and development thinking, supporting decentralization, local diversity, and personal responsibility.

PRA flows from and owes much to the traditions and methods of participatory research, applied anthropology, and field research on farming systems and has evolved most directly from a synthesis of agroecosystem analysis and rapid rural appraisal (RRA).

PRA techniques:

There are six popular techniques/methods that are used to facilitate PRA exercise that enables the

community to develop and compile a detailed profile of themselves and their situation.

• Venn Diagram

Venn Diagrams are drawn to help understand the current formal and informal institutions in the area under study and the nature of relationship between the communities and these existing institutions and structures. The community is led to identify their needs, analyze these needs and assess the **cause and effect** relationship. This process provides an opportunity for the community to arrive at the most pressing or priority need utilizing a logical format and this often culminates into a problems tree (Clayton, 1997).

• Time line

This technique describes chronologies of events, listing major remembered events in a village with approximate dates. The process involves elderly people in a village to narrate their life history, summarizing major events and changes that have taken place over a period of time. Major events and political regimes including their significance and influence to the change in the lives of the community over time are recorded. Time line shows a broad movement of different aspects in a village during the community’s lifetime (Chambers, 1994).

• Time trend

This is a technique where people given an opportunity to account about their past and discuss how things close to them have changed. Issues such as ecological history, changes in land-use, cropping

patterns, changes in customs, practices & trends in population, migration, education, health, prices, yields, etc. This technique is more precise in giving indication of change (increase or decrease) about a particular item/activity(KGVK, 1991).

• Mapping

This is where people use ground, floor or flip charts to map and draw the different aspects of their village e.g. social issues, demographic, resources, health, wealth, literacy, livestock, economic activities, water resources, trees, housing layout etc. This technique portrays the image dwellings in a village(Holland and Blackburn, 1998).

• Transect Walk

This is a systematical walk with the Community members through the village observing, discussing, identifying different forms, local techniques, introduced technologies, seeking their uses, problems, solutions and opportunities. It is done to ensure that the team fully explores the spatial differences in the community, assessing the infrastructure that exists and any possible activities that might be taking place within the village.

• Matrix

Matrix is a ranking & scoring technique that is used to discover local attitudes and perceptions about a particular resource. This may be about the land use, water conservation measures, seasons, weather conditions, rainfall pattern or rainfall distribution, intensity and efficiency. These are assessed to determine the extent they affect and influence the way of life within the community. This helps to provide a better understanding of constraints and opportunities for possible development interventions. A graph is usually drawn in a matrix format displaying these constraints and opportunities.

Steps in participatory planning

PRA has steps of planning:

1. Defining the objective of PRA
2. Site selection and clearance from local administrative officials. For programmed implantation (or) problem solving purpose. For site selection, use-ranking methods with local people and outsiders; then select the sites for intervention(Ekins, 1992).
3. Preliminary visit
 - Survey team visit
 - Extended discussion with local leaders
 - Agreement to do a PRA
 - Sharing responsibilities with the people
4. Data collection
 - Local people and survey team collect information
 - The data includes:
 - Spatial data
 - Time related information

- Data on institutions and social structures
- Technical information
- 5. Data analysis
 - PRA team spends days organizing information
 - Make large charts and tables of trends, maps transects etc
 - Compile a list of all the problems mentioned
 - Summarized the problems
- 6. Ranking problems
 - Present to the community data collected in a large meeting
 - Include line department staff DA s etc
 - Rank the problems by discussion and voting
- 7. Formulate and rank opportunities
 - From discussion groups on the solutions of the problems
 - Obtain advise from the technical officers on:
 - Feasibility
 - Sustainability
 - Productivity
 - Equity of the solutions
 - Rank opportunities
 - Set an action plans
- 8. Adoption of action plans
 - Look for technical information to develop a comprehensive plan
 - Specific expert join PRA team
 - Line ministry departments take part in the implementation
- 9. Implementation
 - All partners in development contributes to activities as:
 - Manpower allocation
 - Materials needed
 - Time needed
 - Funds required(Pretty, 1993)

PREPARATIONS BEFORE THE PRA:

Proper preparations determine the success of PRA for it involves learning-by-doing and depends on team contributions. In addition to selecting the site where PRA is to be conducted and collecting secondary information regarding the specific sites and their neighborhoods, it is necessary to:

- Establish a PRA Team;
- Establish a Kuset PRA Committee;
- Conduct Preliminary Visits to the Community;
- Developing PRA Schedule.

1. The PRA Team:

The PRA Team consists five faculty members of the faculty of business and economics.

Note that other member(s) already involved in development activities in or near the specified areas shall be included if found necessary, for in PRA, the Team is expected to have the necessary technical

know how in different areas (agriculture, health, education, infrastructure, credit, marketing, culture, etc.). It also needs to have a fair gender composition. Although every team member should be familiar with all aspects of the PRA, each team member is also designated for specific tasks which are described as follows (NCAER, 1993):

a. PRA team leader: One of the PRA Team members will be designated as a leader in each of the four PRAs. That is one team leader will be assigned for each of the four villages. The team leader will be selected in such a way that four members will alternatively serve as team leaders for each of the four PRAs. The role of the team leader is to (Scoones, 1993):

- Play the leading role in the formation of the village PRA committee;
- Ensure that all preparatory work has been done;
- Make sure that the objectives of each session are achieved;
- Coordinate preparation of the PRA report;
- Resolve any problems which may arise;
- Assign facilitators and note-takers for each session;
- Organize the reports from the note-taker/s into a coherent whole;
- Work as the principal editor of that particular PRA report.

Importantly, the PRA team leader is also responsible for ensuring that all technical areas are appropriately covered. Though not intended to do so, many PRA exercises may reflect the technical bias of the facilitators or note-takers as opposed to community needs and interests. This should be avoided at all costs, and the PRA team leader should ensure that.

b. Facilitator: For each PRA session, one individual should be designated as the lead facilitator (note that the team leader may also serve as a facilitator in some of the sessions). As a key objective of the PRA is to promote active community participation, the role of the facilitator is very important and includes:

Before the Session:

- Knowing the contents of their session very well in order that they rarely have to look at the manual for guidance
- Ensuring that the site is well prepared – that there are enough places to sit, that there is not too much noise close by, that the area is well shaded, etc.
- Ensuring that the seating arrangement is good – and that participants can be seated in a circle so that they can see the facilitator, other participants, as well as any flipchart or blackboard which may be

used. Important: if participants are not properly seated, have everyone get up and rearrange the meeting place. During the Session

- Ensuring that all participants understand and contribute to the discussions.
 1. If one participant is talking too much, thank him/her for his/her comments and ask another opinion;
 2. If some participants are not contributing at all, ask them directly what they think;
 3. Do not let only one person or a small group of participants dominate the discussions;
 4. Pay special attention to women and the poor who may not feel comfortable contributing.
- Ensuring that team members share their ideas only after the community members have provided their own, and that the team members avoid influencing the community's decisions.
- Managing the time available for the session to ensure that all objectives are achieved.
- At the end of the session, thank participants for their contributions and explain to them the next activity (Drummond, 1992).

Conclusion:

As a result of the PRAs, the communities are expected to attain many benefits including:

- Expressing their own ideas and concerns;
- Organizing their knowledge about the past and present;
- Identifying as a community their problems, the causes of these problems and possible solutions;
- Developing a common plan to address these problems;
- Developing the ability to use their own resources more effectively and attract more resources from the outside.

The academicians/researchers involved in the PRAs are expected to get the following benefits:

- Developing better understanding of rural environments and social as well as economic dynamism taking place there;
- Appreciating the fact that communities are capable of analyzing their problems and outlining possible solutions to their problems;
- Participating in designing possible solutions to community problems;

- Utilizing the results of the PRA work as a research output for publications and presentations;
- Building their research and problem investigation capabilities;
- Supporting their classroom discussions to students with practical examples from the PRA findings.

The main objectives of the current PRA are:

1. empowerment of rural communities by assisting them to systematically utilize their local knowledge to identify problems and strengths, develop skills of analysis, and design appropriate mechanisms for intervention by themselves and/or by development agents;
2. advancement of understanding by academicians/researchers of local knowledge and acknowledgement of the capacity of communities to gather data, conduct analysis, and identify as well as prioritize problems and solutions;
3. utilization of the research questions/problems identified during the PRAs for further investigation;
4. documenting and presenting the outcomes of the PRAs to development agents (governmental and non-governmental) and other stakeholders so that they could undertake interventions in line with the findings.

PRA consists of a series of participatory exercises which help community members better assess their history, resources, and overall situation as concerns agriculture, health, marketing, credit, coping mechanisms, education, and other important areas. During the conduct of the PRAs, rural communities in the selected villages will gather information on the resources they already possess; organize their knowledge; share experience among themselves; learn from each other; identify and prioritize local development needs; and develop action plans which respond to these needs.

The many different perspectives on daily reality and the visualisation offer good opportunities to go beyond the most obvious and dominant points of view in the community. The only warning here should be that too much attention to group discussions/ -activities might enable some groups to dominate the discussion. The methodology is open to modification; everybody can develop new tools and new ways of organising things. This makes PRA applicable in a very wide range of situations. Indeed, it has been used in both rural and urban areas, both in developing countries and industrial countries, in agriculture, in health care and in social programmes. PRA can also be used to collect data; local people are able to generate and/or collect reliable data which they themselves analyze and use for planning.

The role of indigenous knowledge in Reaching to sustainable development

¹Zahra Kaveie and ²Fakhteh Ghahramani

^{1,2}Damavand Branch, Islamic Azad University, Damavand, Iran

*Corresponding author: leila11070@yahoo.com

Abstract: Indigenous knowledge is local knowledge that is restricted to one specific culture and/or certain society. Indigenous knowledge is different with scientific knowledge that was established by universities and scientific communities. This knowledge is basis for decision making at field of agriculture, health, education, food and natural sources. Indigenous knowledge is set of all knowledge and skills that people enjoy in one geographical area (in one environmental conditions) that most of their skills and knowledge be transmitted to next generation, and new generation would be adapted with them and add to it. Since, each knowledge is consequent of individual interaction with environment, so indigenous knowledge is consequent of indigenous people interaction with their environment. Chambers with emphasis on people's role at development process believes that "rural people's knowledge" term is more eloquent than other terms for indigenous knowledge. Our purpose of rural people are producer farmers, input buyers, agriculture production sellers and etc. "people" in above phrase emphasis that this knowledge is more verbal and less has been written. This word also referred to whole knowledge system which contains concepts, beliefs, and attitudes and also contains gain, store and transmitting knowledge process.

[Zahra Kaveie and Fakhteh Ghahramani. **The role of indigenous knowledge in Reaching to sustainable development.** Journal of American Science 2011;7(6):367-371. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: sustainable development, indigenous knowledge

Introduction:

In recently years, from Renaissance till now, as much as human had developed, they also had contradictions and collisions in their world (Azkia and imani, 2008). One of these contradictions is the contrast between tradition and modernism. Maybe we can find these contrast roots in colonial era, the time when colonists promote their innovation in their colonies. Mostly these techniques and innovations show their Indigenous knowledge and the way of their living is foolish and inefficient and tried to enter industrial ways in to their life to increase production efficiency through this way. Thus the way of their living which was been formed during thousands of years has gone to be forgotten little by little (Bouzarjmehri, 2004). We can say, agriculture part is bearing the most damage in this rapid industrialization process. Absolving old and compatible ways in agriculture part and replacing and using of implant, harvest patterns without any proportions with environment has caused decrease of production efficiency, soil erosion and hard destruction of environment during a long time. Finally, at the end of the 20th century decades, some solutions were suggested to solve these inconsistencies and problems. So the importance of Indigenous knowledge and effort in compilation of that with modern knowledge were considered and it was tried to make general and stable view in relation with environment and the way of living through this way (popzan, 2002).

By first of 21 century, world see some sings of great concerns about social, economic and environmental system sets. It is expected that world population reach to 8 billion people at 2025. Increased consumption and poverty have led to high pressure on environment. At so many areas, environment condition is more fragile than before. We have faced decay at environmental issues, especially at vast parts of developing areas of world, in spite of considerable improvement of rivers conditions and air quality at some area such as Europe and north of America. Increased consumption, rare sources and factors such as population growth and imbalanced growth, would endanger, development of different countries (Popzan, 2002). Obviously, economic development can follow unexpected social and environmental affections involving weather changes, using freshwater sources inordinately, decrease living diversity and increase inequality (Gigler, 2003). Sustainable development is outcome of development that follow multi dimensional economic activities with protect environment and its related social issues. So in current decade, presenting indigenous knowledge issue was reinforced in order to present modern approach of development, in which the issue of human-oriented of development would be insisted. In this modern attitude toward development process, environmental, social and cultural concerns were emphasized over economic interests. Indigenous knowledge is part of national capital of each nation which encompasses their beliefs, values, practices,

tools and local acknowledges. This is the same knowledge that , different nations had found their foods from nature , prepared their clothing , settled in home , educated their children , organized their society and kept health of themselves and poultries , during the centuries thereby(Eshraghi, 2004) .

Many experts believe that for making a sustainable development, Indigenous and modern knowledge should be combined. Nowadays, so much efforts have done to make use of Indigenous knowledge but main part of these efforts were done for derivation and making it scientific (Burger, 1997).

Amiri Ardakani and Shah vali (2003) believe that the undesirable outcomes of development on people and rural environment is the result of using new science by scientist, so by blending and making relation between modern and Indigenous knowledge we can solve this problem.

Millar believe that by combining Indigenous and modern knowledge we can make trust between researchers and rural people, because by using this way researchers and rural people know themselves as a partner that are responsible for a common process and product. Millar believe that the trust is the reason for future development (Penny, 2001).

Experts believe that there is no way to reach sustainable development except to combine Indigenous and modern knowledge.

Indigenous and modern knowledge will complicate when:

- 1- We solve structural barriers such as political, economical, cultural and social difficulties.
- 2- We correct the thoughts on educational systems by emphasizing on learning and thought process and also correct the thoughts on research systems by emphasizing on audience and beneficiaries needs.
- 3- We solve communication barriers that cause inactivity on relation process and steady and dynamic flow of knowledge between peasants, experts and scholars. (Emadi and Amiri Ardakani. 2004).

Sustainability and sustainable development:

Sustainability is meaning to make economic, social and environment's views in harmony with our constant needs. Sustainability includes widespread and comprehensive points and is depended on interference in social issues. It is concentrated on future and today's issues and is a world movement and in harmony with our authorities (Kolawopole, 2001).

The correct concept of Sustainability has followed a certainly and warranty of life satisfaction quality for

everybody. Of course for reaching to this constancy, it is not enough to decrease pollutant activities or prevent of increasing levels of consumption, but also we should make a suitable schematization for decreasing poverty and making activity for reaching to equanimity and improvement of chances in and out of countries. Sustainability had implication on steady and sustainable conditions. Steady condition encompasses distant horizons (Dewes, 1998).

The concept of sustainable development is a complicated concept that is explained by different people in different ways. From international viewpoint, the more famous definition of sustainable development is obtained through 1978 reports by Brandt land commission with this title" our common future" that is defined as fallow: sustainable development is a development that contain our modern needs without making any problems in providing future generation's needs.

Sustainable development recognize that social, economic and environmental results are related to each other and they should be equally in harmony for making decisions process. Decisions which are based on Sustainability will help future generation in reaching to a well environment and success economic (Box, 1999).

infrastructural information in sustainable development:

Ideal and infrastructural information in sustainable development consist of:

- 1- Environment and economic integration: economic decisions should be made according to their effect on environment.
- 2- Making guarantee between generations: decisions should be made according to their effect on future generation's environment
- 3- Social justice: all the people have this right to have an environment to grow on it and be successful
- 4- Environmental protection: it is needed to protect of natural sources and support plants and animals.
- 5- Quality of life: a widespread definition of human welfare should be given which is more important than economic welfare.

Reaching to sustainable development through Indigenous knowledge:

Dictated pattern's failure through western development countries to third world countries show that Indigenous knowledge is necessary to reach development.

Untrop believe that usage of local knowledge is efficient and useful in development and Indigenous knowledge's researchers believe that they achieved to

an important source for innovation in agriculture methods and a good farming production to improve the rural people's life. On his idea, some of researchers call Indigenous knowledge as a good supplement and replacement for modern knowledge and they have tried to spread the usage of this knowledge all around the world. These plans as a "communion research with farmers" or "first is the first" are introduced. In this research method, private organs and local groups have the main role and unlink the current research plans, the tests are done with the farmers attendance in their farms and not in research centers and far from environment condition. The ways that farmers and rural people use for management of their living environment are the most scientific ways, although we couldn't understand it at the first sight (Chambers, 2000).

Eshraghi (2000) explained that by introducing sustainable development model or development environmental model and according to world food organization (FAO), sustainable development will create when applied technologies in rural development are in proportion with rural people's knowledge and also are acceptable by them. Also he says that one the main ways to reach sustainable development in society is that to have enough and necessary attention to the rural's Indigenous or local knowledge (Merrewij, 1998). It is also explained that attention to this knowledge needs a complete recognition of rural people and their knowledge that through assembling of this knowledge we can find a correct way to reach a sustainable development and we should know that the movement toward sustainable development is not possible without correct using of Indigenous knowledge. Many development experts believe that the Sustainability of this concept is at the studying of this knowledge and in becoming popular in development. Indeed, Indigenous knowledge with its holist features had known the relation between nature's components better and had smoothed the way to Sustainability of development (Gigler, 2003).

We can summarize the usage of Indigenous knowledge in development as fallow:

- 1- Protection and maintenance of natural sources. Indigenous methods in management of natural sources are suitable pattern for managing natural sources in sustainable development.
- 2- The success of sustainable development plans is depended to rural people's communion at designing, schematization, performance and assessment. Use of Indigenous knowledge is necessary for rural people's communion.

- 3- Indigenous and modern knowledge should be combined because according to our needs and vulnerability of remained natural sources, none of them are able to remove our needs a lonely.
- 4- For recognizing development needs, trouble shooting problems should be polestar from rural people's view and recognizing problems and making efficient relation with rural people are possible through Indigenous knowledge.
- 5- In industrial countries, Indigenous methods are forgotten completely because of using modern knowledge in production process. As Indigenous methods are the most suitable way for achieving sustainable development goals so, many efforts were done to make this knowledge alive.

As a result not only we shouldn't forget the Indigenous knowledge but also we should use of this knowledge in developmental plans. Using Indigenous knowledge in developmental projects will help to have sustainable development in villages. So developing and not developing that were using of western development patterns for many year, should use of their Indigenous and local knowledge which is the result of many years experience and by helping these plans they can reach to a sustainable development(Brouwer, 1998).

Sustainable agriculture

Sustainable agriculture is kind of agriculture that is toward human's interests and has more efficiency of using resources, and also is in balance with environment. This definition is in harmony with changing social and politic factors at agriculture development .and also it referred to kind of agriculture that is enable to produce enough foods without destroying world sources or polluting environment. It is also kind of agriculture that is follow with social values, agriculture family's welfare and supplying needed foods.

Generally sustainable agriculture is every kind of production system which follows theses goals:

More complete mixing of natural processes such as food cycles, nitrogen fixation, and relation of pests and natural disasters with agriculture productions processes.

Decreasing use of that non-farming, outside and non-renewable inputs in order to reduce damage to environment or less damage to farmers and consumer's health.

More fair access to interests and productions opportunities and progress in order to access to forms of agriculture that is fairer, and also increasing self

reliance between farmers and villagers (Chambers, 2000).

Using more potential biologic and genetic aptitude of plant and animal species.

Using more local knowledge including innovative approaches that scholars didn't understand it completely or farmers didn't accept it extensively.

Combined agriculture would prepare this opportunity for common systems to apply needed reforms without creating inclusive changes in it toward organic systems. Therefore, aforementioned systems are considered as medium between common intensive agriculture and organic agriculture methods.

Two principles have especial importance at sustainable agriculture that is:

at early 1980's, with the emergence of new concepts, renewable agriculture and sustainable agriculture evolved and indeed it was based on "ecological interplay affect". now, this concept forms alter indigenous agriculture philosophy.

Sustainable agriculture presented from 1987 at global scale. In this principle, "agricultural interplay affects with society" is presented. Three issues are important about sustainability: first is enough income especially between poor people. Second is increasing access opportunity to food and its consumption. This means that more food should be prepared through increasing production and improving marketing. Third issue contains protecting and improving natural resources (Louise, 2000).

Conclusion:

Indigenous knowledge has been manifested at sustainable process and improving extension programs at industrial countries of world, very well. Indigenous knowledge related to agriculture, medicine, food and architecture has been widely used At European countries, USA, Canada, Australia, by new names.

At one research as a name of "analyzing position of indigenous knowledge at sustainable rural development" that was done by Buzarjomhore (2005) it was signified that although there are some differences between indigenous and formal knowledge, but they should not be compared, because they are complementary of each other and it is possible to gain successes by synthesizing them that is impossible lonely. Base on new paradigms of rural development in order to solve rural problems, we should first refer to indigenous solutions and if it was working, then we should reinforce it; if not we should test and use outside solutions. Findings of one research done by Emadi and Amiri (2004), as "Synthesizing indigenous knowledge and formal knowledge as necessity for accessing to sustainable rural development", has shown that dominated belief

among educated groups toward Indigenous and their knowledge is precondition of every interaction, synthesis and relation. Creating revolution in formal education systems in order to attending empirical knowledge area is considered as one of main necessity of this synthesis that is outcome of years of researches. Researchers attention to "exploiter's accumulated experimental and historical wisdom" is one of other necessities of this revolution by using cooperative, qualitative and filed methods. Also, applying mutual extension ways and creating revolution at communication system between governmental, education-extension centers and farmers and rural people so that they be interacting, was considered as precondition and necessities. At researches as "indigenous knowledge at development process" done by Karimi (2003), findings show that indigenous knowledge is principal factor and main source at the field of research of sustainable development, decreasing poverty, enabling local men and attracting their participation at activities and rural development programs, developing and producing appropriate technology, self-reliance of rural societies and country.

Financial self-reliance of rural women through micro-credit¹ Maryam Nikmanesh and ² Mina Abarashi^{1,2} Damavand Branch, Islamic Azad University, Damavand, Iran*Corresponding author: allahyari121@yahoo.com

Abstract: If rural women could provide a job for them by getting credits, loan and other financial convenience, through their income they can get self-reliance or financial independency and we will see social, cultural & economic change in village. The question here is that if these changes have positive or negative aspects in the village? It's natural that every change in social phenomenon has both positive and negative aspect, but which is Important here is that which aspect is more than the other and it depends to different condition in various societies. In our rural society there is an especial social & cultural kind that it's outcome maybe different and in some case inconsistent. With these actions rural women could be in idealistic economic condition and they could live without dependency to their husband's income. In most of the villages in Iran there is patriarchy in the families which is not acceptable for the most of the rural people and groups. When rural women became financially independent, it's acceptable to see its cultural & social outcomes. Giving the right that women make decision, independency to their family, increasing the cultural knowledge among them& making relation with new institutions, having independency in making decision about marriage, occupation, migration & something like this are the right that women have got it.

[Maryam Nikmanesh and Mina Abarashi. **Financial self-reliance of rural women through micro-credit**. Journal of American Science 2011;7(6):372-375]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: financial self-reliance, rural women

Introduction:

Rural women constitute% 50 of the workforce and they participate in the production of half of the foods in the agriculture section. As an example the rural women constitute about 70 to% 80 of agriculture workforce in sub-Saharan Africa, %65 in Asia, %45 in Latin American & Caribbean, %80 in Nigeria & Tunisia and %80 in India, but their role in production system is the men's supplements roles and this causes a big responsibility inside their mother & wife duties and it takes a great time and energy of them. Studies in this field show that women spend about two thirds of their time for production, management & organize of their house as the men spend only one third of their time for such things. (Varzegar & Azizi 1367).

Poverty spreading in village is a global issue. According to the Fao finding about % 75 of world's poor people that are more than 1 milliard people are living in rural zone and more than % 70 of this poverty people are women. As the most of the people who are poor are living in village and are women is the reason for insufficiency of rural development programs.

One of the other basic barriers in development of rural women is their independent inaccessibility to get credits for investment in their job. Although their illiteracy is the big barrier to use of bank credits, but this view that women are dependent people that their husband should decide about their financial decisions is the other reason that rural women couldn't access to official credits. Maybe these barriers are the reason

why rural women are happy about applying micro-credit thought in village. (Najafi, 2007).

It seems that experiences which are obtained from performing financial programs in some villages in the developing countries could answer clearly to such questions.

A glimpse to previous planning about rural development in the world shows that from 1950 many developing countries understood that the main reason for making their economic growth (development) slowly in their countries is the weakness of investment in the agriculture part. Although many countries by patterning from developed societies have proceeded to improve & develop their industrial agriculture part and by this action not only had irreparable damages to many traditional farmers but also the main problem (the lack of capital sources) is also remained in the rural regions. (Rahimi, 2001).

Women's self-reliance and independency were the outcome of giving credits to women and in some cases were the obstacle of receiving credits by women which is necessary to explain about them shortly.

Cultural & social effects of rural women's financial self-reliance

As it mentioned before the traditional culture in villages was the reason for weakening women rights and made them oppressed, it is possible that women's self-reliance & financial independency in villages

make some crudities (malformation) in the family and village for a short a short time, but we can't disregard it's positive outcome in the social & cultural occasions in the long time, here we will discuss about some of these outcomes (Goetz and Sengupta, 2003)

1- Preferment of women role and their social place:

Women's financial self-reliance can increase the women's social role & place in the villages. In the new condition some of their assignment roles could change to acquisitive roles. The women should use of all their power & energy for doing their acquisitive roles. Thus they can find active view to different functions. The people & groups could increase their social place in the village with improving their social role. If their role and social place preferment be accompanied with the increasing of social intelligence & knowledge, it can have more effect culturally. (Amiri, 2000)

2- Increasing self-confidence:

Self-reliance in different life aspects can increase people's self-confidence. Rural women who are financially independent can live peacefully. With decreasing their problems in life, their self-confidence will increase. And self-confidence is one of personality & mentally condition for being success in life.

3- Family consistency:

At the first, it seems that rural women's financial independency is not acceptable by their husband and this causes some gaps in their family's relations. But little by little these problems will be solved by increasing the rural people's knowledge. Usually poverty is one of the reasons which will destroy or decrease family's consistency. Women by working and having income can help their husband & family. (Fakhraee, 1381)

4- Change in family's relation:

The rural women with having a job and financial independency can change the viewpoint of people who live in villages and cities and they will not look at the rural women as a weak and dependent people. But also their title and place will increase among their families. So by changing people's view to the women, gently we can see some changes in their family's relation which will have respect to the women's right. By increasing women's knowledge and by introducing new rural institution which give financial & authority service to the women, their stimulus (motivation) for reaching their social rights will increase and they try more than before (Amiri, 2000).

5- Making patriarchy weak in the family:

Gently, with changing family's relation in the villages and by increasing rural people's knowledge,

we can make the men and women's right equal and also we won't have patriarchy in the family, although patriarchy has historic and olden root in our villages but with improving women's position and increasing their cultural and social know ledge we can destroy patriarchy in the rural families. . (Chowdhury, 2005).

6- Population and family adjustment:

The practitioner women's view about the number of the children is different; studies show that practitioner women are interested to fewer children to the house keeper women.

By decreasing families in the village and women's financial independency we are more hopeful to adjust family's population in the future because villages have important role in the population increase in Iran. (Shaditalab 75).

Conclusion & discussion:

The question here is that if these changes have positive or negative aspects in the village? It's natural that every change in social phenomenon has both positive and negative aspect, but which is Important here is that which aspect is more than the other and it depends to different condition in various societies. In our rural society there is an especial social & cultural kind that it's outcome maybe different and in some case inconsistent. With these actions rural women could be in idealistic economic condition and they could live without dependency to their husband's income. In most of the villages in Iran there is patriarchy in the families which is not acceptable for the most of the rural people and groups. When rural women became financially independent, it's acceptable to see its cultural & social outcomes.

Giving the right that women make decision, independency to their family, increasing the cultural knowledge among them& making relation with new institutions, having independency in making decision about marriage, occupation, migration & something like this are the right that women have got it.

Honduras, Mali and Thailand". This approach looks for empowering women through financial services with education. In this approach, women get familiar with importance of credits through education and extension and also familiar with ways to access it through establishing different groups.

Shahnaj and chaudhury(2009) in research as "credits and its role on empowering women " concluded that there is meaningful relation between attending in credits programs and empowering women , at economical dimensions .Ruhail amin and others (2010) found that those who joined credit funds had more ability rather than those who didn't. Jameela

(2010) presented that credit programs has shown lot of affects on empowering women so that has increased their social, politic and economic ability. Thus it is obvious that credits programs and its educational and empowering programs can be affective on social, humane and economic development or rural society, if it be associated with proper and gradual practices and base on reciprocal communications principles and apply opinion of local society. Maybe the main challenges that threaten credits associations , is lack of necessary emphasizes on social dimensions and on reinforcing their basics , that practically cause that this social foundations lose its efficiency soon and practically changed to unsuccessful institution .

In order to overcoming dominant consideration, experts believe that we should consider following in protection process of these social institutions

- Relating public established institutions with each other and networking established institutions
- Emphasis on stability and self reliance of management system of credits institutions from financial and economic dimensions
- Efforts to gain local confidence and credibility among contacts
- Effectiveness of costs and economic and financial efficiency inside established institutions

Also following suggestions has been offered:

- providing extension educations for men in order to believe economic role of their women , and give them chance of corporation on all economic , credits fields
- Since that base of credit association, forms base on People Corporation, so it's good chance to use these communities to expand extension-education activities. so it is better to consider special programs on different extensional filed such as agriculture , ranching, family health, housekeeping economy and other fields accordance to condition of region and rural women's needs.

Giving the right that women make decision, independency to their family, increasing the cultural knowledge among them& making relation with new institutions, having independency in making decision about marriage, occupation, migration & something like this are the right that women have got it.

Women by getting these rights can make change in the rural cultural & social issues which make disfunction & crudity in their family's relation. However, rural women's self-reliance has caused improvement in the economic, social & cultural issues. For solving women's self-reliance problems we can do these activities:

- Giving promotional services for increasing rural women's skills in various fields.
- Giving promotional instructions to men for believing their women's economic role & their women opportunity to participate in all economic, authority & ... aspects.
- Increasing rural women's knowledge in all social, political, cultural & economic fields.
- Making use of micro-credits programs to motivate & support women for doing economic affairs better & finally to make women self-reliance.

Its result is that, exploiter can't access to desirable condition of production efficiency at first. Secondly, he would incapable for loan repayment. Third, his activity doesn't contain consistency. Fourth, remarkable part of provided credits would exit from production cycle due to exploiter's incapability and lack of skill in exploiter. His technical and occupation skill would improve, if credit is being provided for exploiter as a credit program. and he knows and can applies loan properly and well timed for production and activity, so condition of production and level of income , level of life and ... would improve .

Women by getting these rights can make change in the rural cultural & social issues which make disfunction & crudity in their family's relation. However, rural women's self-reliance has caused improvement in the economic, social & cultural issues. For solving women's self-reliance problems we can do these activities:

- Giving promotional services for increasing rural women's skills in various fields.
- Giving promotional instructions to men for believing their women's economic role & their women opportunity to participate in all economic, authority & ... aspects.
- Increasing rural women's knowledge in all social, political, cultural & economic fields.
- Making use of micro-credits programs to motivate & support women for doing economic affairs better & finally to make women self-reliance.

Status of indigenous knowledge in rural (in developing countries)Maryam Zandieh¹ and Nooshin Javadi²^{1,2} Bojnourd Branch, Islamic Azad University, Bojnourd, Iran*Corresponding author: allahyari121@yahoo.com

Abstract: Indigenous agriculture is based on farmer's cooperation with nature. Sustainable agriculture that inspired by indigenous systems would rectify most of deficiencies of modern agriculture. Indigenous agriculture systems is production of centuries of cultural and subsistence revolution. These systems are collections of farmer's experiences that haven't enjoy sources except inputs, capital and indigenous knowledge. And consequently they accessed to such sustainable agriculture that just is dependent on using restricted local resources and existing humane and animal power. At indigenous agriculture, culture diversity and frequency would minimize possibility of loss crops in spite of simple technology. These systems despite of limitation of sources enjoy merits of sponsors traditions and intelligent methods of using animals, fields, and compatible crop species. Thus ecological agriculture scholars consider these systems as unique samples to determine sustainability standards in agricultures activities. This knowledge would rise at different fields such as language, botanical and zoology and also skills and manual and agriculture professions that all are product of human efforts in his environment. This information contain best, useful and consistent collocation of exploiting methods and living in special environment which be transmitted through verbal and empirical way from one generation to another.

[Maryam Zandieh and Nooshin Javadi. **Status of indigenous knowledge in rural (in developing countries)**. Journal of American Science 2011;7(6):376-380]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Indigenous knowledge, rural women

Introduction:

In recently years, from Renaissance till now, as much as human had developed, they also had contradictions and collisions in their world (Azkia and imani, 2008). One of these contradictions is the contrast between tradition and modernism. Maybe we can find these contrast roots in colonial era, the time when colonists promote their innovation in their colonies. Mostly these techniques and innovations show their native knowledge and the way of their living is foolish and inefficient and tried to enter industrial ways in to their life to increase production efficiency through this way. Thus the way of their living which was been formed during thousands of years has gone to be forgotten little by little (Bouzarjmehri, 2004). We can say, agriculture part is bearing the most damage in this rapid industrialization process. Absolving old and compatible ways in agriculture part and replacing and using of implant, harvest patterns without any proportions with environment has caused decrease of production efficiency, soil erosion and hard destruction of environment during a long time. Finally, at the end of the 20th century decades, some solutions were suggested to solve these inconsistencies and problems. So the importance of native knowledge and effort in compilation of that with modern knowledge were considered and it was tried to make general and stable view in relation with environment and the way of living through this way (popzan, 2002).

Maybe the main reason for inattention for native knowledge in third world countries is that colonist countries don't pay any attention to the people knowledge and information in these countries and always have reminded the people of these colonized countries as a stubborn, superstitious and retrogressive people (Karami and Moradi, 2003). On the other hand, the colonist countries attention to industrial productions and agriculture policies has caused to promote industrial and single product agriculture which will influence the native farmer's knowledge about different productions and will make it inconspicuous. Also, colonized plans and imported extension programs have intensified the alienation of native knowledge (Nowroozi and Alagha, 2000). In the middle of 1980 decade, there was a new view "giving priority to farmer" that increased the attention to native knowledge. This view that emphasized on "listen people and learn of them" emphasized on people's active communion on developing and searching process. Before using of this way, understanding rural society's culture was in another way and it was thought that rural people have failed in economic, politic, innovation and its transfer, creation of knowledge and using of that in rural societies. Before representation of this attitude "giving priority to farmer", it was thought that development need in other people management who are not living on that village. But in this way, we look rural people as the one who are able to solve their

problems with relying on their knowledge and experience (Eshraghi, 2000).

Different definitions were presented about indigenous knowledge by experts that each of them present their idea about this knowledge from their viewpoint. Each of them emphasis on a special aspect of indigenous knowledge according to their viewpoint. Oxford vocabulary define the word indigenous knowledge such this" it is created naturally in a region which is related to the people of that region. (Azkia and Imani, 2008). Indigenous knowledge is a knowledge that has been grown in a long time and has transferred from one generation to other generation in hereditary form (Karami and Moradi, 2003). Williams and Molina have defined indigenous knowledge such this: indigenous knowledge is the learning methods, understanding and attitude to the world which is the result of experience and solving problems according to test and error by the people who are active and have used their available resources on its suitable time. Chambers with emphasizing on people's role in development process, believed that the phrase rural people's knowledge is more sensible than the other phrase such ethnic ecology, ethnographic knowledge, ethnic classification. He also believed that indigenous knowledge is a knowledge that is created naturally and is emanated from geographical circle. (Chambers, 2000).

Characters of indigenous knowledge :

The characters of indigenous knowledge like the definition of this knowledge are presented by experts in different ways which we will explain about them as follow:

1- it is based on experience:

Indigenous knowledge is the result of people's experience during many centuries.

2- it was tested during centuries by working on it.

3- it is compatible with indigenous environment and culture:

Indigenous knowledge was created through native societies and it was formed according to their needs and during time the things which were not compatible with indigenous environment were omitted, so what was remained was compatible with the environment and culture of that society (Amiri Ardekani and 2003).

4- it is dynamic and is changing:

Simultaneously with changing indigenous culture, the indigenous knowledge was changing too.

5- the knowledge of rural people was not technical:

This knowledge was consisted of rural people's wishes, values and preferences.

6- the rural people's knowledge is not statistic:

This knowledge was formed according to people's culture, social and economic history. The history which was written by these rural people shows that their manner and activities were efficient in changing of their conditions.

7- rural people's knowledge is not enough.

Maybe the rural people are knowledgeable but they like to know more and more. Because they want to be powerful in their discussions with political, economical and social forces who made these people poverty before give them technology (Zare and Yaghoubi, 2003).

8- rural people's knowledge has root on their political economy and is more important in political field.

The advantages that rural people can get from indigenous knowledge are the knowledge that is created and released locally and is on their authority and also depends on main factors in regional politic economy (land distribution, marketing relations, and vertical links and ...). So improvement of their livelihoods depends on interferences which were made to pervade on these main factors.

9- most of the rural people are public-oriented

Mostly, they have a little information about many things which is in contrast with academic educations. Specialist people in universities have deep knowledge in little fields (of course some of these native people are specialist too) (Razavi, 1999).

10- indigenous knowledge systems are holist:

Local people consider the other people's problems as their problems and try to solve these problems in a whole frame with using their knowledge.

11- indigenous knowledge systems combine the culture and religious believes.

Religious believes as a part of indigenous knowledge are not separated from technical knowledge and these believes effect on people' do and don't

12- indigenous knowledge systems prefer the less risk to most profit

Escaping of risk is important for native people, for example a native person usually keeps some goats for possible cases such as disease of his children and he and he didn't expect any incomes of these cases.

Advantage of indigenous agriculture

It is more than one hundred century that is passed from anthropologist studies in farming societies and production systems and during the last thirty years, comprehensive reports were obtained of subsistence practices. These reports consist of important information about social relations of production, operational practices and environmental protection that includes indigenous methods for using of earth and rural people's encounter with their environment (Smita, 2003).

These studies have given new dimension to agriculture research. Now, in many countries the managers of agriculture resources are the people who are trained in western countries. So if the manager become familiar with the culture and environment roots of indigenous system of resource management, they won't do mistake. Indigenous agriculture is based on cooperation of farmer with nature. Recently researchers of ecological agriculture have more attention to these systems. The result of these studies is important from two sides:

1- At the first, in the process of agriculture renovation in the third world that is indeed unavoidable, the indigenous agriculture knowledge and local methods in management of agriculture resources is to be destroyed and simultaneity environmental regions are on the verge of destruction. Modern agriculture prefers huge profit from resources and didn't pay attention to environmental, cultural, social and economic varieties of traditional agriculture. So incongruities of agriculture development plans are not compatible with rural needs and talents and also rural conditions. By recognizing indigenous agriculture features such as traditional classification for identifying plant and animal species and using of indigenous practices like simultaneous cultivation of compatible crops, we can get useful information about suitable ways for agriculture. Surely these guidelines will be more compatible with rural needs and agriculture and environmental features of each region and won't be reckless to social, economic and environmental complex issues (Appleton and Jeans, 1995).

2- Second, with studying indigenous agriculture we can get points that will help us to design the same systems in industrial countries. Sustainable agriculture which is taken from indigenous systems will remedy the shortcoming of modern agriculture. In a single-product of modern farm, life circles of nature has changed by using chemical poison that give no chance for using principles of ecological agriculture. But completeness (evolution) of culture and environment is the result of local agricultural systems (Ahmed, 2000). In indigenous agriculture, variety and alternation of cultivation make minimize the possibility of farming products destruction. Although these systems have resources limitation, but they use of learning advantage and intellectual ways for use of animals, soil and compatible farm species. For this reason, researchers of ecological agriculture know these systems as

unexampled kinds to specify constant static scales for agriculture activities. In industrial countries they use of these scales for designing and managing ecological production systems (Emadi and Amiri Ardekani, 2004).

With all the advantage we account for native knowledge we should contemplate that for reaching a balanced understanding of this knowledge, we shouldn't indicate it very important or not very unmeaning as Chambers say. Also we shouldn't consider rural people an intellectual people. Because they can make mistake like any other people or group. And also this knowledge is not reliable forever. In some places this knowledge is combined with some superstition believes and we should not forget its spiritual and mental aspect (Warren, 1999).

Conclusion:

At sustainable human development, people are considered as "goal" of social and economic policies that their range of their selections would be extended in order to actively participate at decision making. Therefore, people's participation is one of tools of sustainable agriculture development. But active rural people's participation at extension programs as a form of sustainable would not be possible unless by believing role of rural people's knowledge, vision and skills .

So, effort and national commitment and multi-dimensional support is very critical for recording, valuing, extending and exchanging this rich source and also preparing mechanism and practical strategy for synthesizing this knowledge with new knowledge and agricultural development programs.

Agricultural extension was identified as one powerful IT focused area, due to role variation at knowledge system and agriculture information at one hand and at the other hand due to its dependence on various exchanges among farmers, that can has great affect on rural society and developing agriculture. So that work and productions of farmers would increase by farmer's access and use of Internet and subsistence farmers at all over the world are at developing by gaining needed knowledge and information that during time would becoming as commercial producers. Transmitting from system-cycle source of agriculture to technology-cycle system of agriculture placed more responsibility on agricultural extension because agriculture extension system is as vital technology transfer crossing to farmers at one hand and as crossing for referring feedbacks, needs and agriculture issues, researchers and policy makers of market.

What that is obvious is that extending and researching agriculture can help to sustainability

through close relation to farmers , attending to their experiences , gaining their information and logical understanding of agriculture activities , attending to their vital needs for doing “demand-base” researches and extension education efforts for developing agriculture , at process of improving agriculture development.

Finally native knowledge as a constant structure, with many years experience could attain a deep understanding and insight of the environment and ecologic exchanges. This knowledge is conveyed to next generation and the next conveyed it to their children. Native knowledge is on the verge of destruction like a curative prescription that has hidden a constant glamour on it. By dying each native person, the great treasury of knowledge will lay underground and these knowledge sources are destroying very speedily.

On the research which was done by Bozarjomhari (2004) with this title "analyzing native knowledge position on rural sustainable development". It was specified that although there are many differences between native and modern knowledge but they are not in contrast with each other, because they are each other's supplement and we can't be success when we use them separately. According to new parameters in rural development, for solving rural problems, at the first we should use of native solutions and if it was not efficient, we can use and test external solutions.

Research findings which was done by Emadi and Amiri (2004) with this title " compilation of native and modern knowledge is necessary for reaching agriculture sustainable development" signify that The believe of educated people to native people and their knowledge " precondition for making them close" is called combination and compilation. Making evolution in modern system for attention to tentative knowledge is the main necessity for this compilation. Another necessity for this evolution is the researcher's attention to experimental accumulated wisdom and historical exploit by using qualitative and communion methods. Also applying compilation methods and making evolution among government, educational centers, farmers and peasant is the necessity and pre condition for combination of modern and native knowledge.

Research findings that was done by Karimi with this title " native knowledge in development process" signify that native knowledge was a essential element and important source for realization of sustainable development, poverty reduction, making local people capable and motivate them to participate in activities for agriculture and rural development, developing and product suitable technology, rural society's self-reliance and self sufficiency. For this reason all side's try, partnership and protection for record and

registration, compatibility, distribution and promotion , exchange of this resources and also suitable and scientific guidelines for compilation of this knowledge with new knowledge and rural and agricultural development plans are needed.

Importance of using information and communication technologies (ICT) in education

Dr. Mahmoud Safari

Department of Educational Management, Damavand Branch, Islamic Azad University, Damavand, Iran

Abstract: ICT provides access to only a small part of the action is created equal. Equal attention should also be applied to ensure the technology really "is used by learners and ways of how well their needs will cure. An educational program that reinforced this approach shows the overall program is bilingual. The program seeks to establish technology learning centers for bilingual teachers, students, teachers, parents and community members. Technical teams from each center three students, two teachers and the director of the Center with at least one female student and a teacher are female. Another example of a general approach to the application of ICT in education, radio education project Gobi Women of Mongolia, which seeks to provide professional and educational structure of women's favorite courses around the nomads and their opportunities for income generation. It contains topics such as livestock rearing, family support (family planning, health, nutrition and health) to create income in the application of local raw materials and basic skills for the job is a new market. Policy makers and service providers have increasingly come to view information and communication technologies (ICT), and particularly the Internet, as an important tool in providing disadvantaged groups and areas with access to information, services and markets that would otherwise be inaccessible. The concept of development of the rural, today, is not just project initiatives and governance; it is much more beyond that. This paper uncovers a whole plethora of ICT emergence as a technology of the new millennium.

[Dr. Mahmoud Safari. **Importance of using information and communication technologies (ICT) in education.** Journal of American Science 2011;7(6):381-385]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: education, information and communication technologies (ICT)

Introduction:

Direct or indirect application of ICT, in rural development sector has also been referred to as "Rural Informatics". Rural economies can be benefited from ICT by focusing on social production, social consumption and social services in the rural areas (Malhotra, 2001). The inculcation of a Citizen-to-Government (C2G) and Citizen-to-Citizen (C2C) interface would provide this link that would also lead to community participation in design and implementation of ICT interventions. This in return could promise better economic opportunities as well as social inclusion of rural people in the processes of governance. Such attributes in the social set up are essential prerequisites for good governance and rural development.

Concerns about educational quality and educational opportunities with the necessity of developing those most vulnerable are the accumulation of globalization is symbiotic. Generally, "the changes of globalization in developing countries, on low-income groups, especially women and girls and" low skill workers, as well as all groups applying for and obtaining new skills to press. (Bellamy and Taylor, 1998).

Technologies (ICT) during the past two decades have had many points of contact with education and training. The development of technology is placing new demands on expertise, and it is also leading to the increased use of information technology (IT) in

instruction and learning. As early as in the 1970s discussions of the future of school systems started to pay attention to the opportunities provided by ICT.

Now with the approach of the new millennium, IT is playing an increasingly central role in almost all future planning of schools and instruction. (World Bank, 1999).

The process of development in a country is to be aided by its governance. The goal of governance "should be to develop capacities that are needed to realize development that gives priority to the poor, and creates needed opportunities for employment and other livelihoods" (The World Bank, 1992, UNDP, 1994). Increased number of poor, hungry or marginalized people in a country represents decrease in its quality of governance. To promote development, various studies have proposed governance in the contextual realities of each country, including veritable participation of citizens in the governmental decision-making process (Grindle, 2004; Evans and David, 2006). Several Institutions and experts accept Governance as a reflexive process, wherein policies, institutions, outcomes and analysis interact, to maximize the process of participatory development (UNDP, 1997; Ludden, 2005; Mehta, 2006).

Information and communication technologies (ICT), including radio and television and the newer digital technologies like computers and the Internet as

potentially are introduced powerful tools and activators of educational reform and changes. different ICT, when properly applied can be developed to help access to education and the relationship between training and workshops to strengthen the increasingly digital, the quality of education also helped to create teaching and learning in an active process connected to real life high take. However, the experience of being raised by ICT in the classroom and other educational sites around the world during the last few decades proves that is not automatic fully realize the potential benefits of ICT training. (Gupta and et al, 2004)

But nowadays, ICT is more than a technology. Although the old technologies such as telephone, radio and television, will be less attention in the past but were used as educational tools. For example, "radio and television are used for over forty years to open and distance education. In this regard, although print remains the most expensive method and therefore available, but in developed and developing countries is provided the most prominent mechanism. Internet and computer use in developing countries still in early stages are spent and if they used are limited due to is expensive infrastructure and access to them.

1- The challenges to educational policy and planning:

To achieve promotion and reform in education through ICT, should be considered explicit and clear objectives, guidelines, mobilize the required resources and political requirements for understanding the primary goal in all levels. Some essential elements in planning for ICT are listed below:

1-1-A correct analysis of the current state of education system. ICT impacts should be considered institutionalized as current methods, respectively, and especially "those ICT to drive forward and the barriers should be recognized, as well as those related to education and training programs, infrastructure, capacity building, language and content and finance.(Collis, 2004).

1-2-Educational objectives at different levels of education, as well as various aspects of ICT applications that can best meet these goals in the state be used. Policymakers must understand the potential of ICT in various different goals when the concepts are used.

As well as may alert best practices around the world, about the priority educational needs, financial and Human resources and capacity bottlenecks the country and how these experiences can be adapted to

the specific needs of the country (Hakkarainen, 2000).

1-3- Identifying stakeholders and coordinating actions among different interest groups.

1-4- Conducting chosen model based on ICT, should are tested on a small scale, best design models or those who proved they can be used in other areas. Such guidance is essential for identifying, correcting, feasibility, etc.

1-5- Preparation of available financial resources and identify strategies to generate financial resources for strengthening the application of ICT in the long run. (Harris, 1999).

2- Infrastructural challenges in education of based on ICT:

Before any program of based on ICT to run, an Educational technology infrastructure is placed above infrastructure of information and telecommunications. Policy makers and planners should carefully take into account the following:

2-1- At first, is there suitable rooms and buildings for placing technology? Building schools in countries that they are too old, is required to ensure an extensive repair of electrical wiring system, building, cooling and heating, ventilation and safety.(Swaminathan, 2002).

2-2- are there electricity and phone? Developing countries, vast areas still lack adequate power and several miles away their nearest phone station. In some African countries are using wireless technology, although expensive approach, but other developing countries with poor telecommunications can try this solution.

2-3- Policy makers must are examined also attending a variety of ICT in the country in general and the educational system (all levels) in particular. For example, "a primary need in education of based on ICT (using a computer and via online) access to computer and Internet services at the community level, especially schools and host families (Virgo, 2008).

3- Challenges of Capacity building:

Various attempts should be occur throughout the educational system integration for success of ICT.

3-1- professional development of teachers should be have five-axis: (Dadgaran, 2002)

- Skills in specific applications
- merging in existing curriculum

- curriculum changes regarding the application of IT (including changes in instructional design)
- Changes in the teacher's role
- to support educational theories

Ideally these should be served in pre-service training of teachers and be upgraded in in-service. In some countries, like Singapore, Malaysia and England, is required to recognize the application of ICT training courses. ICT will change speedily technologies and in this regard even the most elite teachers need to promote ICT skills and are welcome the latest developments and best practices.

Although the first focus is skills with specific applications but other four focus is importance. Research on ICT application in different fields as education and uniform over the years show disability as a barrier to teachers successfully plan, understand why they should use ICT and how to properly get the best teaching aid. (Falk and Wolfmayr, 2008).

Unfortunately, most teacher professional development in ICT has been the emphasis on teaching tools and their application in education. If learning process being Student centered, anxiety of teachers from being struck by the technology or the loss of authority in the classroom, can be prevented and as a deep understanding and feeling a severe change in their role than do not have to be raised.

Whether ICT will replace teachers? Answer is "no". In fact, with promoting ICT in the classroom, teacher's role in learning process is even more important. What can and should change is the role of teacher. Likewise the role of students "developed since the ICT can be opened classroom doors to the outside world, the community could be a new role in class. (Mohseni, 2003).

Since education is transferred in model centered-teacher to centered-student model, the unique authority of teachers was low and are known more than as facilitators, observers and trainers (of the absolute ruler to guide the way).

Primary task of the teacher is teaching students how to ask questions and to discuss the issue, make hypotheses, and then if necessary to reach Information about finding the issues raised in relation to the assessment. (FAO, 2000).

Because of improved ICT training a new experience, even for teachers, teachers learn educational process and new things are discovered among the students.

Plus this is not unusual to see students in a class based on ICT undertake formal and informal roles of teacher to younger friends and students and sometimes even for teachers. (Saadan, 2001).

Teachers and students from different schools, experts, parents, community and business leaders,

politicians and other stakeholders are involved in the educational process areas as resource persons, critic, observer and encouraging.

They also are essential and general customers for student published work on the Web or other media. Not many teachers reluctant to use ICT are especially "computer and internet usage. Hannafin and Savenye were found several reasons for this reluctance:

- Poor design of software,
- pessimism towards Computer effects of increasing efficiency in teaching,
- lack of managerial support,
- the time and efforts to increase technology and learn how to use for training
- Fear of losing authority in the classroom, as class is centered student.

These are points that should be served in pre-service training and professional development programs in in-service training of teachers. In in-service training about professional development of ICT teachers, should in the long run, be flexible and possible. (Cecchini and talat, 2002).

For many teachers lack the necessary conditions, and with less rights in developing countries, adaptation of ICT effectively subject to granting the necessary opportunities for learning things that they need to learn according to their own experience. Motivation of teachers and supporting teachers to pursue professional development plan is necessary. That can be promoted as with ICT initiatives for teachers who are classroom teachers or ensure adequate access to technology is after training.

Results:

This paper emphasizes adoption of a more systematic approach for integrating Traditional Knowledge Systems (TKS) and ICT inputs to ensure sustainability of rural e-governance projects. The study of literature related to rural development and e-governance has indicated various issues impeding success of such initiatives. The main issues are lack of localization of content for rural communities and inadequate participation of rural communities in design of rural ICT initiatives. The study therefore suggests the use the systems-approach to integrate the relevant TKS along with ICT initiatives in the design of e-governance systems for rural development. This participatory approach can lead to creation of more acceptable and sustainable e-governance projects.

Regardless of the wide differences in ICT access between rich and poor countries and between different groups in the country, there are concerns that challenge the application of ICT in education with the existing differences among the lines of economic, social, cultural, geographic and gender will be broader. Everyone equal opportunities in

terms of suitability for participation are necessary, but access to various factors, either as users or as producers through their sources is difficult and heavy. Therefore, the primary differences enhance and even grow. Consequently, programmers' international education is faced with a difficult challenge and how to help solve the problem and its development.

Promoting ICT in education, when done without careful study, can lead to the marginalization of those with more favorable conditions are unknown. For example, "women compared with men, because of illiteracy, lack of higher education, lack of time and mobility and poverty, controlling access to ICT and fewer opportunities for training are relevant. Also, more boys than girls' access to computers at home and school are not strange to say that if more boys than girls are willing to work with computers. The report of the University Association of American Women is that "Although some girls have an important gender gap have been limited, but today's technology, technology club, and boys in public schools while its own problems and programs are settled girls use computers for word processing the brand". In an assessment in four African countries, the activities organized by World links remote international cooperation on projects between teachers and students in developing countries will promote, despite creating programs without regard to sex contacts, sexual inequalities remain Uganda and Ghana. In addition, while more girls than boys in relation to academic performance and advanced communication skills program will enjoy more than boys, but they were unable to perform their technological skills were. A set of economic factors, organizational and cultural differences involved in the social.

"The high ratio of students to computers and politics, whoever came first, the first is used in accordance with the girls wanted it." Girls travel restrictions in the early hours of daily work and home responsibilities are that this will limit their access. Also because local patriarchal beliefs dominate the boys are in the computer lab environment. Including proposed measures to address this discrimination, strategies to encourage schools to create "fair use" in the computer labs and the holding of meetings and sexual sensibilities conductivity decreased defense duties after school girls. ICT provides access to only a small part of the action is created equal. Equal attention should also be applied to ensure the technology really "is used by learners and ways of how well their needs will cure.

An educational program that reinforced this approach shows the overall program is bilingual. The program seeks to establish technology learning centers for

bilingual teachers, students, teachers, parents and community members. Technical teams from each center three students, two teachers and the director of the Center with at least one female student and a teacher are female.

Another example of a general approach to the application of ICT in education, radio education project Gobi Women of Mongolia, which seeks to provide professional and educational structure of women's favorite courses around the nomads and their opportunities for income generation.

It contains topics such as livestock rearing, family support (family planning, health, nutrition and health) to create income in the application of local raw materials and basic skills for the job is a new market.

Abstract: In order to study of different levels of fertilizer treatment (K , Zn, S) on increase tolerance to cold on quality characteristics on genotypes of rapeseed in delayed planting , an investigation was carried out with factorial in random complete block with three replications and 36 treatment ,in Varamin - Pishva university field research (Ghaleh – sin) in 2008-2009. Factors were genotypes in three levels(Hyola -42 , SLM046 , Zarfam) and fertilizer treatment in 4 levels (1-Control , 2- C+ K, 3- C, K+Zn, 4- C, K, Zn +S). Planted seed at 10th November were delayed planting .The highest grain yield achieved from (C,K,Zn,S,SLM046)with 6564.6 Kg/ha ,That had 72 % grain yield further of (Control, Zarfam) genotype with 1807.65 Kg/ha. Also the highest number of pods per plant, number of grain per pods and biological yield with 156.97, 20.7 and 17384.9 Kg/ha respectively was obtained from Hyola-42 Hybrid and use of C, K, Zn, S. In this research the lowest these amounts were achieved for Zarfam genotype with Control fertilizer. In conclusion Slm046 genotype with C, K, Zn, S fertilizers was suitable for delayed planting (Cold Stress) for Varamin condition.

[Pourang kasraie, Mohammad Nasri, Mansoureh Khalatbari. Effect of K, P, Zn, S Fertilizer on cold tolerance on rapeseed genotypes (relay Cropping) in climatic region of Varamin. Journal of American Science 2011;7(6):386-390]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Rapeseed; Genotype; yield and yield components cold tolerance

Introduction

Considering the high cold tolerance in canola and desirable agronomic traits, using side products and the high percentage of oils such as canola cultivation is the most important benefits that can be placed in rotation with cereals.

Adequate to cover the field and appropriate growth and increased tolerance to cold, canola should be grown on suitable planting, in general, canola should be six weeks before the first frost. Planting In the late fall, often resulting in increased seedling departure time due to reduced soil temperatures and reducing withdrawal and seedling cold damage (Starnier et al., 2002).

In most cases what the delay in planting in the spring and in autumn will reduce performance. Combined with accelerated development by reducing plant growth after flowering (especially in late genotypes clay) is the main cause of yield loss (Mendham et al., 1995). In a research, with three genotypes of Canola Okapi, Orient, Colvert, the four planting dates (15th September, 25th September, 4th October and 14th October) at the research station, Miami and Florida was about concluded that planting on September 15 and 25 significant difference in terms of yield are not, while planting on October 14 produced the lowest yield (Afridi et al., 2002). Habekotte (2003) in the adaptation and comparison of quantitative and

qualitative characteristics of 11 genotypes of autumn-type rapeseed genotypes were the result of two genotypes Zarfam zero tolerance to cold and maximum grain weight is greatest and most seed oil to genotype Yantar Most growth and oil yield was related to genotype SLM046 (Gupta and Daws, 2008).

Mendham (1995) concluded that late planting dates before flowering time to receive radiation and there is a growing shortage of lower saddlebag number per square meter through more number of seeds per pod greater amount of compensation and performance.

In a study on determining the best planting date in the three species B. Rape, B. Juncea, B. Carinata was announced that delays in planting can make the required amount of heat (GDD) in the plant growth period to reach needs to be reduced, but the number of days elapsed, the total increase (Mulkurasi, 2006). Mendham and Scott (1995) showed that early planting dates, and grain losses portmanteau of lower canopy layers are more, but cultures later on, the mortality rate is the same throughout the canopy. Hierarchical arrangement of branches, portmanteau shows that the earlier lower saddlebag on the main stem and branches will be formed first from the standpoint of timing, development and access to material raised leaves, lower stems have the advantage.

Curtis (2006) also believes that potassium no effect on the rate increase hydrocarbon oils and

proteins are increased in this way to cold stress tolerance of canola. Sulfur tolerance of plants against environmental stresses and increases in winter rapeseed grown are using sulfur due to long period planting to harvest increased protein yield and seed oil content (Torsswel, 2004). Marschner (2002) believes that rapeseed is taking on increased plant mass and thus be used to increase hydrocarbon production and finally also because increased oil percent increase tolerance to cold stress.

In order to study the compatibility of the modified rapeseed in 24 genotype weather was cold country and slm046 Hyola -42 genotypes respectively 3852 and 3656 kg / hectare produced the highest yield (Grom bacher and Nelson, 2001). Since the units will try to use the maximum agronomic practice in the region comes after Varamin can delay harvest corn planted canola be grown using fertilizer is hoped to be some increase in cold tolerance in canola so that no Canola yield reduction, efficient use of farm land, the following research aim was to achieve such a major.

Material and Methods

To investigate the effect of potassium fertilizer, sulfur and zinc on quantitative characteristic on early planted canola, as a factorial experiment in randomized complete block design in three replications third decade of November 88-87 did at the farming year in the Agricultural Research Station Varamin. Experiment location, geographic coordinates of 39 and 51 and 19 along the east, 35 north latitude and altitude of 1000 meters above sea level is located in the experimental treatments included: genotype 1-Hyola-42 2 - Slm046 3 - Zarfam and second treatment Fertilizer: 1 - control (N + P) 2 - control + potassium sulfate 3 - Control + potassium sulfate + zinc sulfate II 4- control + potassium sulfate + zinc sulfate II + sulfur treatments. Treated fertilizers were selected according to soil test results. 200 kg/ ha urea, 50 kg/ ha triple superphosphate and 50 kg /ha potassium sulfate and 25 kg ha zinc sulfate and 30 kg ha sulfur were used. All fertilizer and 1.3 Nitrogen were used at planting and the other Nitrogen in two ways at the stage of rapid growth and stem elongation in spring. Each replicate

included 12 treatments and each treatment consisted of nine lines. Fight weeds manually in the third decade of April and early May 1388 was done to combat the toxin *Mtasytostoks* cabbage aphid wax ratio 1.5 was used in thousands. At physiological maturity used to determine yield components of five plant randomly selected in each treatment plant that the number saddlebag. To determine the yield: portmanteau of each plot area 3.20 m² 18 June 1388 harvest. For final drying and the humidity reaching 12 percent for one week and put in the air then manually separate seeds from the wallet and the seeds were harvested separately every plot with accurate laboratory scales and weighing data had been extended to the whole performance. The end of the experiment, the results of each of the characters, after expansion to hectare and with the help of computer software SAS (9) analysis of variance and comparison of data were drawn with the help Duncan test at 1 and 5 percent was conducted by the computer program Excel charts.

Results and Discussion

Number of silique per plant based on data from this study on the interaction effects and simple, and fertilizer treatments on the number of genotypes in plant satchel at 5 and 1 percent was significant. Treatment A2B4 (SLM046, C, K, Zn, S) with 156.7 numbers, highest levels and treatment A3B1 with 94.3 numbers lowest to allocated. Corelation line has been reported between the numbers portmanteau plant dry matter production and cumulative to the end *B.napus* L. flowering species (Habekotte, 2003). So it seems that cold stress on photosynthesis compared with restricting the number of actual satchel reduces potential. Perhaps this ratio index, influenced by the amount of stress Submit product on the plant. In this study, using oligo-elements and element sulfur, potassium, zinc and increased grain stored hydrocarbons in the synthesis of proteins that share the pollen tube and cause the storage protein is a member of the leading to increase pollination and fruit set is more seeds (Marschner, 2002).

Table 1. Analysis of variance of yield component as affected by Genotype and fertilizer treatment in rapeseed

S.O.V	df	No.ofsilique per plant	No.of grain per silique	1000grain weight(g)

**Significant difference (=1%), *significant difference (=5%), ns: No significant difference

Total grain satchel data showed that genetic differences between genotypes in terms of seeds per genotype SLM046 satchel is delayed planting conditions could produce 18.1 the number of seeds the best rates from the wallet to its genotype and Zarfam 14.7 minimum number of seeds in the wallet. Fertilizer treatments also caused changes 26.3 percent in the trait and the number 14 in the control treatment to 19 the number increased in the treated B4. The interaction between the genotype and fertilizer treatments on the number of seeds in the satchel was a significant level of 1 percent. Satchel of seeds per 11.8 numbers in the treatment A3B1 20.7 reached the number in treatment A2B4 genotype and fertilizer treatments affected about 43 percentage. Feeding Canola zinc, is due to increased hydrocarbon stored pollen, pollen longevity increases and the resulting increase in pollen grains and the formation of more wallet (Sharma et al., 1999). Any factor that increases the dry weight during the growth period is like planting date and the elements, number of seeds increases the saddlebag. Mendham (1995) concluded that late planting dates before flowering time to receive radiation and there is a growing shortage of lower saddlebag number per square meter through more number of seeds per pod to get some extra compensation and performance.

The study treated A2B4 (C, K, Zn, S, SLM046) than treatment A3B1 (Zarfam, C) superior 35.2 had shown that the effect of the elements used on rapeseed genotypes that could have negative effects that cause planting delays rapeseed plants weaken and fall due to reaching the appropriate LAI able to produce enough sap to fill the raised beads formed, especially in the seeds on the wallet is not sub-branches. The interaction was significant between genotype and fertilizer treatments on grain weight at =1%. A1B4 treated with the highest average amount of 3.8 g and the lowest average 3.18 g was obtained from A3B1 treatment.

Mulkurasi (2006) reported that planting later than the deadline, number of seeds per plant decreased and increased grain weight plant is canola seed weight, but this increase has not been able to reduce other components of grain yield to compensate, also increases the duration between increased germination to flowering. In the present study with genotype Hayvla -42 SLM046 Zarfam to excellence has been treated using elements of potas, zinc and sulfur content increases in leaf and stem carbohydrates during the formation of which appear to be portmanteau facilitate the flow carbohydrates to the reproductive organs and ultimately increase product quality seed. This action due to the impact on various stages and elements mentioned enzymes such as carbonic anhydraz and dhydvnaz (Tandon, 2001). Therefore able to use these elements much about the negative effects of cold stress to control and

prevent severe grain weight. The highest grain weight of the treated was obtained for A1B4 (Hayvla -42; control, potash, zinc and sulfur).

Interaction between genotypes and fertilizer treatments was significant on yield ($\alpha=1\%$) 1807.65 kg per hectare of treated A3B1 to 6579.6 kg per hectare, which was treated A2B4 has increased 72 percent.

Canola yield in fact is balance between vegetative growth and the potential number of flowers and seeds, research shows that low temperatures during flowering through pollen grains thwarting the main factor is to reduce grain products (Torsswel, 2004). To so that the tension during flowering and pollination role are in distinguishing genotypes of rapeseed yield and yield components (Smith and Gallway, 2008). In order to study the compatibility of the modified rapeseed in 24 genotype weather was cold country and SLM046 Hyola -42 genotypes respectively 3852 and 3656 kg per hectare produced the highest yield (Tandon, 2001).

In this study the use of fertilizers, potas, zinc and sulfur increased root growth, the branches and eventually (Grewal and Graham. 1997) (Smith and Gallway, 2008). Researchers in their research are showed that taking zinc and other micronutrients is to increase grain yield (Srinivasan and Morgan, 2006). Srinivasan and Morgan (2006) expressed in their reports that the consumption of oligo-elements before planting, the yield increases to 56 %. Sulfur used with nitrogen, phosphorus and potassium increased yield to 51.3%.

Table 4. Analysis of variance of yield and HI as affected by Genotype and fertilizer treatment in rapeseed

Performance of biological functions biologically from 8420.6 kg per hectare in genotype Zarfam to 13063 kg per hectare in genotype SLM046 hit. Fertilizer treatments had significant effect on yield biologically and biological yield from 7198.8 kg per hectare in the control treatment reached to 14405.9 kg per hectare in the B4 treatment. Curtis(2006) believes that late planting reduced biological function .But the result showed that taking elements such as potash, zinc and sulfur plant height and branch number scheme and eventually saddlebag and ultimately grain yield per plant and biological yield increases and has not killed late than too early influence on biological function.

Table 5. Means comparison of yield and HI as affected by Genotype and fertilizer treatment in rapeseed

Treatment	Grain yield(Kg/ha)	Biological Yield(Kg/ha)	HI (%)
Hyola-42 (A1)	4175.7 b	11034.5 b	37.75 a

Means with the same letter in each column have not statistically significant difference

The interaction was significant between genotype and harvest index of fertilizer treatments on the harvest index at $\alpha=1\%$. A1B4 had the highest harvest index of treatment with 38.1 %, and the lowest harvest index was obtained for A3B1 treatment with 33.9 %. Although SLM046 genotype has the highest biological yield and grain yield, but in terms of harvest index was the second; genotype Hayvla -42 due to less difference between grain yield and biological will be non-Vrs more efficient and effective use of nutrient elements, able, with greater harvest index. In this study, fertilizer quality genotypes and their genetic characteristics, which caused the highest harvest index of treatment A1B4 (-42 Hayvla and control, potash, zinc and sulfur), respectively. Loffe(2008) and the results In this study the delay in planting resulted in a significant reduction in harvest index but Srinivasan and Morgan(2006) stated that the delay in planting no effect on harvest index.

*drwesh123@yahoo.com

Abstract: Critical illness is accompanied by the activation of the hypothalamic-pituitary-adrenal (HPA) axis, which is highlighted by increased serum corticotropin and cortisol levels. In patients with severe sepsis, the integrity of the HPA axis can be impaired by a variety of mechanisms. These patients typically have an exaggerated proinflammatory response and are considered to be relatively corticosteroid insufficient. This complex syndrome is referred to as critical illness-related corticosteroid insufficiency (CIRCI) which manifests with insufficient corticosteroid mediated down regulation of inflammatory transcription factors. Similar to type II diabetes (relative insulin deficiency), CIRCI arises due to corticosteroid tissue resistance together with inadequate circulating levels of free cortisol. Numerous papers have reported a high incidence of adrenal failure in critically ill patients, including those with end stage liver disease and liver transplant recipients. The term hepatoadrenal syndrome e.i., Adrenocortical insufficiency in patients with liver cirrhosis has been used to describe such an association between liver disease and adrenal failure and the definition of this term extends beyond the occurrence of sepsis, which is a frequent complication of liver failure. Aim of work to assess: The prevalence of hepatoadrenal syndrome (HAS) among the Egyptian cirrhotic patients, the prevalence of HAS among those complicated with septic shock or hepatorenal syndrome and to find significant predictors for HAS. Patients and methods: Our study was a cross sectional study, conducted on 45 patients admitted to the liver intensive care unit and hepatology ward of Theodor Bilharz Research Institute (TBRI) in the period between November 2009 and February 2010, who were fulfilling the criteria of Child Pugh classification. Patients were divided into three groups. Group A included 15 patients with liver cirrhosis, with neither septic shock nor hepatorenal syndrome, Group B included 15 patients with liver cirrhosis and septic shock, but not associated with hepatorenal syndrome, Group C included 15 patients with hepatorenal syndrome. The adrenal function of all patients was assessed by the conventional dose, short synacthen test (250 ug.iv) which was performed within the first 24 h of admission. Blood samples to measure plasma cortisol levels were obtained before and 30 minutes after synacthen administration. Results: Our study revealed that adrenocortical insufficiency (ACI) was found in 33 patients out of the 45 patients subjected to this study (73.3%). Receiver Operating Characteristic (ROC) curve was done and showed that the MELD score may be a good predictor for ACI in liver cirrhosis patients. ROC curve showed also that the serum bilirubin may be a good predictor for ACI in liver cirrhosis patients. Conclusion: Adrenocortical insufficiency is common in patients with cirrhosis and in patients complicated with hepatorenal syndrome. According to our study MELD score and serum bilirubin level may be good predictors for Hepatoadrenal Syndrome. Recommendation: We recommend To make further studies with greater number of patients to detect hepatoadrenal syndrome and to study its effect on the prognosis, the complication of liver cirrhosis and mortality.

[Mohamed Badr Mohamed, Gamal Hamed, Ayman Heikal and Hisham Darwish. Prevalence of Adrenocortical Insufficiency in Patients with Liver Cirrhosis, Liver Cirrhosis with Septic Shock and in Patients with Hepatorenal Syndrome. Journal of American Science 2011;7(6):391-400]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Key words: Liver cirrhosis, child classification, hepatoadrenal syndrome, hepatorenal syndrome, adrenal dysfunction, adrenocortical insufficiency, relative adrenal insufficiency, MELD score

1. Introduction

Critical illness is accompanied by the activation of the hypothalamic pituitary-adrenal (HPA) axis, which is highlighted by increased serum corticotropin and cortisol levels [1-3].

The activation of the HPA axis is a crucial component of the host's adaptation to severe stress. Cortisol is essential for the normal function of the immune system, maintenance of vascular tone, and various cellular functions. In patients with severe

sepsis, the integrity of the HPA axis can be impaired by a variety of mechanisms [1-4].

These patients typically have an exaggerated proinflammatory response and are considered to be relatively corticosteroid insufficient. Until recently, the exaggerated proinflammatory response that characterizes patients with systemic inflammation has focused on suppression of the HPA axis and adrenal failure. However, experimental and clinical data suggest that corticosteroid tissue resistance may also

play an important role. This complex syndrome is referred to as critical illness-related corticosteroid insufficiency (CIRCI) which is defined as inadequate corticosteroid activity for the severity of the illness of a patient. CIRCI manifests with insufficient corticosteroid mediated down regulation of inflammatory transcription factors. Similar to type II diabetes (relative insulin deficiency), CIRCI arises due to corticosteroid tissue resistance together with inadequate circulating levels of free cortisol [5].

Recently, the concept of relative adrenal insufficiency (RAI) has been used to describe a subnormal adrenal response to adrenocorticotropin in severe illness, in which the cortisol levels, even though high in terms of absolute value, are inadequate to control the inflammatory situation [1].

The short corticotropin stimulation test i.e the short synacthem test (SST), is most commonly used to evaluate the appropriateness of the adrenal response in this setting. Numerous papers have reported a high incidence of adrenal failure in critically ill patients, including those with end stage liver disease and liver transplant recipients [6].

The term *hepatoadrenal syndrome* has been used to describe such an association between liver disease and adrenal failure and the definition of this term extends beyond the occurrence of sepsis, which is a frequent complication of liver failure [6].

Aim of the work

- To detect the prevalence of hepatoadrenal syndrome (HAS) in patients with live cirrhosis and in those complicated with septic shock or hepatorenal syndrome.
- To find out significant predictors for hepatoadrenal syndrome (HAS)

2. Patients and Methods

Our study was a across sectional study, conducted on 45 patients (21 males and 24 females) admitted to the liver intensive care unite and hepatology word of Theador Bilharz Research Institute (TBRI) in the period between November 2009 and February 2010, who were fulfilling the criteria of child Pugh classification. Patients were divided into three groups. **Group A** included 15 patients with liver cirrhosis, with neither septic shock nor hepatorenal syndrome, **Group B** included 15 patients with liver cirrhosis and septic shock, but not associated with hepatorenal syndrome, **Group C** included 15 patients with hepatorenal syndrome.

All patients were subjected to:

1. Full clinical evaluation,
2. Routine lab. Investigation,
3. Model for End stage Liver Disease (MELD) scoring.

The adrenal function of all patients was assessed by the conventional dose, short synacthem test (250 ug,iv .), which was performed within the first 24 hrs of admission.

Informed consent for participation in the study was obtained according to the guidelines of the institutional review boards for human subjects at the participating study centers.

Inclusion criteria:

1- Liver cirrhosis patients by:

- I. Full clinical assessment.
- II. Child. pugh classification.
- III. Abdominal ultrasonography

2-Cirrhotic patient with septic shock is considered present when:

I: Two or more of the following criteria are met :

1. Body temperature > 38°C or < 36°C
2. Tachycardia >90/minute
3. Hyperventilation: respiratory rate >20/minute or arterial hypocapnia < 32 mmHg
4. White blood cell count > 12,000/dL or <4,000/dL or immature forms > 10%

II: Source Of Infection.

III: Sepsis associated with circulatory failure characterized by persistent arterial hypotension (decrease of systolic blood pressure below 90 mmHg or >40 mmHg from baseline, or mean arterial pressure <60 mmHg, despite adequate fluid resuscitation) unexplained by other causes. [7]

Refractory circulatory failure was defined as a persistent or growing metabolic acidosis despite adequate vasoactive support over an observation period of 6–12hours, and was judged to be present if there was a base excess below 5 mmol/l at the end of this period [8].

3- Hepatorenal syndrome:

Diagnostic Criteria of Hepatorenal Syndrome in Cirrhosis [9]

- Cirrhosis with ascites
- Serum creatinine > 1.5 mg/dL
- No improvement of serum creatinine e.g decrease to a level of 1.5 mg%, after at least 2 days with diuretic withdrawal and volume expansion with albumin; the recommended dose of albumin is 1gm/kg/d up to maximum of 100 g/day.
- Absence of shock
- No current or recent treatment with nephrotoxic drugs
- Absence of parenchymal kidney disease as indicated by proteinuria >500 mg/day, microhematuria (>50 red blood cells per high-power field), and/or abnormal renal ultrasonography.
- Urine volume <500 mL/day [10]

-Urine sodium <10 mEq/L [10]

Exclusion criteria:

- History of long term steroid therapy.

All patients were subjected to the following:

- 1- Child–Pugh classification and score using full detailed history and clinical evaluation (Table 1 & 2).
- 2- MELD (Model of End stage Liver Disease) score using full detailed history and clinical evaluation. **MELD= 3.78 [Loge serum bilirubin (mg/dL)] + 11.2 [loge INR] ± 9.57 [Loge serum creatinine (mg/dL)] + 6.43**
- 3- **Full chemistry** including total lipid profile, liver function tests, renal functional tests Complete blood count, Prothrombin time (PT), Prothrombin Count (PC) and INR.
- 4- Urinary Na.
- 5- Abdominal ultrasonography

6- Synacthen test was performed within the first 24 hours of admission.

Synthetic adrenocorticotrophic hormone (250 µg, Synacthen), was given intravenously. Blood samples to measure plasma cortisol levels were obtained before and 30 minutes after synacthen administration.

According to the serum cortisol level one of the following three conditions could be detected:

1. Baseline serum cortisol level >35 g/dL, this means that functional hypoadrenalism is unlikely.
2. Baseline serum cortisol level <15 g/dL, this means that functional hypoadrenalism is likely.
3. If the baseline serum cortisol level is between 15-35 g/dL, at this situation the increase in plasma cortisol will be the determining factor, as if the increment is ≤ 9 mg/dL, hypoadrenalism is likely, while if the increment is ≥9 mg/dL, functional hypoadrenalism is unlikely (**II**).

Table (1): Showing Child Pugh Score (12, 13)

Measure	1 point	2 points	3 points	Units
Bilirubin (total)	<34 (<2)	34-50 (2-3)	>50 (>3)	mol/l (mg/dL)
Serum albumin	>3.5	2.8-3.5	<2.8	g/L
INR	<1.7	1.7-2.2	>2.2	-
Ascites	None	Improved by medication	Refractory	-
Hepatic encephalopathy	None	Grade I-II (or suppressed with medication)	Grade III-IV (or refractory)	-

Note: The Child-Pugh score is calculated by adding the scores of the five factors and can range from 5 to 15. Child Pugh class is either A (a score of 5 to 6), B (3 to 9), or C (10 or above). Decompensation indicates cirrhosis with a child Pugh score of 7 or more (class B). This level has been the accepted criterion for listing for liver transplantation.

Table (2): Child Pugh Score Interpretation (12, 13)

Points	Class	Life expectancy	Preoperative Mortality
5-6	A	15-20 years	10%
7-9	B	Candidate for transplant	30%
10-15	C	1-3 years	82%

3. Results :

Demographic Data:1. Age distribution:

The mean age of **group A** patients was 52.8±10.97 year, **group B** patients was 60.2±8.99 year, and **group C** patients was 59.33±8.65 year. There was no significant statistical difference in age between the three group (Table 3).

2. Adrenocortical insufficiency distribution:

Our study revealed that adrenocortical insufficiency (ACI) was found in 33 patients out of

the 45 patients subjected to this study (73.3% vs 26.7%) respectively (Figure 1).

Table (3): Showing age distribution

Group	No. Of Patients	Age (years)	P-Value
A	15	52.8± 10.97	0.081
B	15	60.2 ±8.99	
C	15	59.33 ±8.65	

Fig (1): Percentage of adrenocortical insufficiency In all patients

The prevalence of adrenocortical insufficiency (ACI) varied between the three groups, being found 53.5% in *group A* patients, 86.7% in *group B*, and 73.3% in *group C*. there was no significant statistical difference in adrenocortical insufficiency between the three groups (P: 0.092), also there was no statistical difference between each two groups as follow, between group A and group B (P: 0.54), between group A and group C (P: 0.123) and between group B and group C (P: 0.5) as seen in table (4).

Table (4): adrenocortical insufficiency–distribution

Adrenocortical insufficiency		Group A	Group B	Group C	total
		No.	7	2	3
	%	46.7%	13.3%	20%	26.7%
Yes	No.	8	13	12	33
	%	53.3%	86.7%	80%	73.3%

3. Child-pugh classification distribution:

According to child pugh classification, *group A* had 6 patients (40%) with child A, 4 patients (26.7%) with child B and 5 patients (33.3%) with child C, regarding patients in both *group B* and *C* they were all fulfilling the criteria of child C classification (Table 5).

Table (5) child-pugh classifications –distribution

	CHILD A		CHILD B		CHILDC	
	No.	%	No.	%	No.	%
<i>Group A</i>	6	40%	4	26.7%	5	33.3%
<i>Group B</i>	0	0%	0	0%	15	100%
<i>Group C</i>	0	0%	0	0%	15	100%

4. MELD score distribution:

Regarding MELD score, the mean score was highest in *group C* patients (33.93±3.08), followed by *group B* patients (28.67±5.23), and in *group A* patients it was (15.87±8.25).

There was a statistically significant difference in MELD score between each two groups of the three groups, group A and B < 0.001, group A and C < 0.001, and group B and C P: 0.003 (Table 6) .

Table (6): showing MELD score distribution

Group	Number of Patients	Mean ± SD	P-Value
A	15	15.87± 8.25	A,B<0.001
B	15	28.67 ±5.23	A,C<0.001
C	15	33.93 ±3.08	B,C=0.003
Total	45	26.16±9.6	

II. Relation between significant predictors and Adrenocortical Insufficiency:

1. Child Score and adrenocortical insufficiency:

There was a statistically significant relationship between child score and adrenocortical insufficiency (ACI), as the 33 patients diagnosed to have ACI had child score of 12.52±2.35, while the other 12 patients who did not have ACI, had a child score of 9.75±3.91 with a P value: 0.049 (Table 7).

Table (7): Mean±SD of Child score in patients with and without adrenocortical insufficiency

Adrenocortical Insufficiency	Number of patients	Mean ± SD Of Child Score	P-Value
Yes	33	12.52± 2.35	0.049
No	12	9.75± 3.91	

2. MELD score and adrenocortical insufficiency:

There was a highly statistically significant correlation between MELD score and ACI, as the 33

patients diagnosed to have ACI, had a MELD score of 28.66 ± 8.05 , while the other 12 patients who did not have ACI, had a MELD score of 19.25 ± 10.45 , with a P value: 0.008 (Table 8).

Table (8): Mean \pm SD of MELD score in patients with and without adrenocortical insufficiency

Adrenocortical Insufficiency	Number Of Patients	Mean \pm SD Of Meld Score	P-Value
No	12	19.2500 ± 10.45	0.008
Yes	33	28.66 ± 8.05	

3. Serum Bilirubin level and Adenocortical Insufficiency:

There was a highly statistically significant correlation between serum bilirubin level and ACI, as the 33 patients diagnosed to have ACI, had a serum bilirubin level of 50.1 ± 3.072 mg/dL, while the other 12 patients who did not have ACI, had a serum bilirubin level of 2.04 ± 1.35 mg/dl with a p value: 0.002 (Table 9).

Table (9): Mean \pm SD of serum Bilirubin level in patients with and without adrenocortical insufficiency

Adrenocortical Insufficiency	Number Of Patients	MEAN \pm SD Of Serum Bilirubin Level Mg/Dl	P-Value
No	12	2.40 ± 1.35	0.002
Yes	33	5.01 ± 3.072	

4. Serum creatinine level and adrenocortical insufficiency:

There was a highly statistically significant correlation between serum creatinine level and ACI, as the 33 patients diagnosed to have ACI, had a serum creatinine level of 3.033 ± 1.45 mg/dL while the other 12 patients who did not have ACI, had a serum creatinine level of 2 ± 1.5 mg%, with a P value of 0.027, (Table 10).

Table (10): Mean \pm SD of serum creatinine level in patients with and without adrenocortical insufficiency

Adrenocortical Insufficiency	Number OF Patients	MEAN \pm SD Of Serum Creatinine Level mg/dL	P-Value
No	12	2 ± 1.5	0.027
Yes	33	3.0333 ± 1.45	

5. Serum SGOT/AST and adenocortical insufficiency:

On evaluating the relationship between serum SGOT/AST and ACI in patients subjected to this study, it was found that the 33 patients diagnosed with ACI, had serum SGOT/AST level of 82.848 ± 93.34 mg/dL,

while the 12 patients who did not have ACI had serum SGOT/AST level of 31.66 ± 13.79 mg/dL with a highly significant statistical P value of 0.003 (Table 11).

Table (11): Mean \pm SD of serum SGOT/AST level in patients with and without adrenocortical insufficiency

Adrenocortical Insufficiency	Number of Patients	MEAN \pm SD Of Serum SGOT Level mg/dL	P-Value
No	12	31.66 ± 13.792	0.003
Yes	33	82.848 ± 93.34	

6. Serum albumin level and adrenocortical insufficiency:

On evaluating the relationship between serum albumin level and ACI, it was found that the 33 patients diagnosed to have ACI, had albumin serum level of 2.433 ± 0.612 mg/dL, while the 12 patients who did not have ACI, had albumin serum level of 2.958 ± 0.59 gm/dL with a significant P value: 0.014 (Table 12).

Table (12): Mean \pm SD of serum albumin level in patients with and without adrenocortical insufficiency

Adrenocortical Insufficiency	Number of Patients	Mean \pm Sd Of Serum Albumin Level mg/dL	P-Value
No	12	2.9583 ± 0.59766	0.014
Yes	33	2.4333 ± 0.612	

7. Blood urea nitrogen (BUN) and adrenocortical insufficiency:

The 33 patients diagnosed to have ACI, had a BUN level of 50.9 ± 24.08 gm/dL, while the 12 patient who did not have ACI, had BUN level of 30.83 ± 22.43 mg/dL with a P value: 0.012., (Table 13).

Table (13) Mean \pm SD of serum BUN level in patients with and without adrenocortical insufficiency

Adrenocortical Insufficiency	Number Of Patients	Mean \pm Sd Of Serum Bun Level mg/dL	P-Value
No	12	30.83 ± 22.433	0.012
Yes	33	50.9 ± 24.089	

III. Logistic regression analysis:

In statistics, logistic regression is used for prediction of the probability of occurrence of an event by fitting data to logic function e.i logistic curve. This study was done to find out the most significant predictor for ACI from the obtained data as child classification, serum SGOT/AST, serum bilirubin, Ascidsis, serum creatinine, serum albumin, and MELD score.

All these data were analyzed by the logistic regression analysis and only MELD score was found to

be a very significant predictor for ACI with a P value: 0.007 (Table 14).

Tab (14): Showing logistic regression analysis for significant variables

	B	S.E.	Wald	df	Sig.	Exp(B)
Step 1 MELD	.107	.040	7.193	1	.007	1.113

IV. Receiver operating characteristic (ROC) curve for adrenocortical insufficiency:

ROC curve is a graphical plot of sensitivity by plotting the fraction of true positives out of the positives (TPR= true positive rates) vs. the fraction of

false positives out of the negatives (FNR= false negative rate), in other words sensitivity vs specificity. It was found that MELD score and serum bilirubin could be good screening tests for ACI in patients with liver cirrhosis, (Figure 2).

Figure (2) ROC curve for adrenocortical insufficiency the area under the MELD score curve was 0.761, and that under the serum bilirubin curve was 0.811.

Cutoff level interpretation:

1. MELD Score:

Regarding MELD cut off score of 18.5, it had a sensitivity for predicting ACI of 0.879, and a specificity of 0.5. But with a higher MELD cutoff score of 25.5 the sensitivity declined to 0.727 and the specificity raised to 0.75 (Table 15).

2. Serum bilirubin levels:

The interpretation of the serum bilirubin level, showed a cutoff level of 2.75mg/dL, it had a sensitivity for predicting ACI of 0.909 and a specificity of 0.667. But with a higher cutoff serum bilirubin level the sensitivity declined to 0.788 and the specificity raised to 0.75 (Table16).

Table (15) Showing MELD score cut off levels

Positive if Greater Than or Equal To	Sensitivity	Specificity
18.5000	.879	.500
22.5000	.788	.583
24.5000	.758	.667
25.5000	.727	.750

Table (16) Showing bilirubin cut off levels

Test Result Variable(s)	Positive if Greater Than or Equal To	Sensitivity	Specificity
Bilirubin0.2-1	2.7500	.909	.667
	2.9500	.788	.750

3.The serum cortisol level before and 30 minutes after the conventional-dose (250 g IV) short synacthen test:

The whole population of patients had a mean serum cortisol level before synacthen test of 17.9 ± 6.94 , g/dL, P value: 0.44, while the mean serum cortisol level 30 minutes after synacthen test was 22.65 ± 8.96 g/dL P value: 0.539, with a median increment 4.1 g/dL (Table17).

From the previously mentioned data, there was no significant statistical difference between the three groups of patients.

Table (17): Showing synacthen tests results and shows P value between serum cortisol 0 min and 30 min after synacthen test

The whole population of patients	Serum cortisol	Mean±SD g/dL	P value	Median increment
	0 min.	17.9±69.4	0.44	4.1 g/dL
	30 min. after ACTH	22.65±89.6	0.539	

4. Discussion:

Our study was a cross sectional study, conducted on 45 patients diagnosed to have liver cirrhosis admitted to the hepatology intensive care unit & hepatology ward at Theodor Bilharz Research Institute (TBRI) they included 21 males (46.7%) & 24 females (53.3%).

- Group A included 15 patients with liver cirrhosis neither complicated with sepsis nor hepatorenal syndrome.
- Group B included 15 patients with liver cirrhosis complicated with septic shock.
- Group C included 15 patients with hepatorenal syndrome.

All patients had been subjected to full history taking, clinical examination, several

laboratory investigations, and statistically comparative studies.

Our study found that the prevalence of adrenocortical insufficiency (ACI) was 73% in all patients. The prevalence of adrenal insufficiency varied between the three groups, being found 53.5% of patients with liver cirrhosis only, 86.7% in liver cirrhosis associated with septic shock and 73.3% in patients with hepatorenal syndrome.

This goes with what Marik et al., found in 2005, as they conducted a study on 340 patients suffering for liver disease. Adrenal insufficiency was found in 72 % of the patients. The prevalence of ACI varied between the groups, being seen in 66% of ACLF (acute on top of chronic liver failure) patients, 33% of ALF (acute liver failure) patients, and 61% of patients who had undergone liver transplantation in the past [6]. In the study conducted by Harry et al., (14) on 20 patients, 69% of the patients had adrenal insufficiency. In another study conducted by Harry et al., (15) in they found that out of the 45 patients subjected to the study, 62% patients had ACI. In 2006 Fernandez et al.,(16) studied 25 patient's with liver disease, they found that 63% had ACI .

But in another study conducted by Tsai et al., (17) on 101 patient with liver cirrhosis complicated with severe sepsis and septic shock, they found that not more than 51.4% of the patients had ACI. This difference in ACI prevalence between our study and that one, might be due to the type of patients population subjected in both studies as we included patients with hepatorenal syndrome while Tsai et al., (17) studied only cirrhotic patients complicated with severe sepsis and septic shock.

Our study found that patients who had ACI, had a mean child score of 12.52 ± 1.6 , compared to 4.75 ± 3.9 in those who did not have ACI, P value: 0.049. This goes with what Tsai et al., (17), as patients with ACI had a mean child score of 12.7 ± 2.2 , while those who did not have ACI, had a mean child score of 11 ± 2.7 with a statistical significant P value: 0.022. Also they found a relation between the cortisol increment and Child-Pugh scores, suggesting that adrenal dysfunction is related to liver function reserve.

Regarding MELD score, our study found that patients with ACI had a mean MELD score of 28.6 ± 8 compared to 19.2 ± 10 in those without ACI (statistically significant P value: 0.008). This is in agreement with Tsai et al.,(17). who found that patients with ACI had a mean MELD score of 15.2 ± 5.2 and in patients without ACI the mean MELD score was 10.4 ± 6 with statistically significant P value < 0.001.

Logistic regression analysis was done to search for significant predictors ACI, only MELD

was found to be a significant predictor for ACI with a P value of 0.007.

ROC curve was done and showed that the MELD score may be a good predictor for ACI in liver cirrhosis patients. The area under the MELD curve was 0.76 and a MELD cutoff score of 25.5 had a sensitivity of 0.727 and specificity of 0.75, was shown while a MELD cut off score of 18.5, had a sensitivity of 0.879 and specificity of 0.500. This differs from the study Tsai et al., [17] who found in 2006 that MELD cutoff level of 12 had a sensitivity of 72.22% and specificity of 65.95%. Despite the difference in MELD score cutoff levels, MELD score could be a good predictor with a considerable sensitivity and specificity as with high score values the specificity in detecting ACI increase as the MELD score gets higher the ACI could prevail.

On evaluating serum blood urea nitrogen we found that patients with ACI had a mean serum BUN level of 50.9 ± 24.089 mg/dl, compared to 30.03 ± 22.43 in patients without ACI who statistically significant P value of 0.012. This does not go with Tsai et al. [17], who found in 2006, that patients with ACI had a mean serum BUN level of 58.1 ± 47.5 mg/dL, and in patients without ACI, the mean was 43.6 ± 40.3 mg/dL with no statistical significant p value: 0.103.

Regarding serum creatinine level, our study found that patients with ACI had a mean serum creatinine level of 3.03 ± 1.45 mg/dl, compared to 2 ± 1.5 in patients without ACI, with a statistically significant P value of 0.027. These findings are in agreement with Tsai et al., [17] who found that the patients with ACI had mean serum creatinine level of 3.2 ± 2.7 mg/dl and in patients without ACI the mean was 1.9 ± 1.6 mg/dl which showed statistical significant P value: 0.004.

On the other hand Fernandez et al., [18], found that the mean serum creatinine level in patients without ACI was 2.5 ± 2.4 mg/dL compared to 1.9 ± 1.1 in those suffering from ACI. This disagreement might be due to the number of patient in their (25 patients vs 45 patients in our study). Also it may be due to the patients clinical status in our study, as most of them were complicated with hepatorenal syndrome while in Fernandez et al.,(18) study patients were complicated with septic shock.

On evaluating the serum Bilirubin level, our study found that there was a correlation relation between ACI and Bilirubin. Patients with ACI had a mean serum bilirubin level of 5.01 ± 3.072 mg/dl compared to 2.4 ± 1.35 in those without ACI statistically significant P value of 0.002. This is agreement with Tsai et al., [17] who found a significant relation between ACI and serum Bilirubin $P < 0.001$.

ROC curve was done and showed that the serum bilirubin may be a good predictor for ACI in liver cirrhosis patients, as the area under the curve of bilirubin was 0.811. With a serum bilirubin cutoff level of 2.75 mg/dl a sensitivity of 0.909 and specificity of 0.667 were shown. When the bilirubin had a cutoff level of 2.95 mg/dl, the sensitivity was 0.788 and specificity was 0.75. This is in agreement with Tsai et al., [17], the that serum bilirubin was an independent factor in predicting adrenal insufficiency in critically ill patients with cirrhosis and severe sepsis.

Evolutionary endocrinology provides an example of tissue corticosteroid resistance. New world monkeys (eg, squirrel monkey and cotton-top tamarin) over-express FK binding protein-51 (a GR chaperone), resulting in decreased nuclear translocation of the glucocorticoid-GR- complex [19, 20]. In addition, these monkeys have a transcriptionally incompetent GR [20]. To overcome this inherent corticosteroid resistance, these primates have elevated circulating levels of both free and total cortisol relative to those in old world monkeys (eg, humans) [19]. Tissue corticosteroid resistance is a well known manifestation of chronic inflammatory diseases such as COPD, severe asthma, systematic lupus erythematosus, ulcerative colitis, and rheumatoid arthritis [21-24]. Emerging data suggest that corticosteroid tissue resistance may develop in patients with acute inflammatory diseases, such as sepsis and acute lung injury (ALI) [25].

In a sheep model of ALI induced by *Escherichia coli* endotoxin, Liu et al [26] demonstrated decreased nuclear GR- binding capacity and increased expression of phospholipase A2 (PLA2) despite increased serum cortisol levels. These authors demonstrated similar findings in the liver cytosol following a burn injury in rats, which were partially reversed by TNF- and IL-1 neutralizing antibodies [27]. Kino et al [28] and Kino and Chrousos [29] have demonstrated that TNF- inhibits the transcriptional activity of the GR- by interfering with its interaction with p160 type nuclear receptor coactivators. In an ex vivo model, Meduri et al [25] compared the cytoplasmic to nuclear density of the GR-complex in patients with ARDS whose conditions improved with that in patients that did not improve. These authors demonstrated a markedly reduced nuclear density of the GR-complex in patients who did not improve, while the cytoplasmic density was similar in patients who improved and in those who did not. This experiment provides further evidence that the nuclear glucocorticoid-GR activity may be impaired in critically ill patients despite adequate cytoplasmic (serum) levels of cortisol.

Conclusion:

Adrenocortical insufficiency (hepatoadrenal syndrome), is commonly present in patients with cirrhosis and in patients complicated with hepatorenal syndrome. In patients with liver cirrhosis adrenal dysfunction is associated with renal dysfunction, it occurs more frequently in patients with more severe liver disease and correlates with disease severity scores. According to our study MELD score and serum bilirubin level may be good predictors for hepatoadrenal syndrome.

Recommendation:

1. We recommend making further researches on hepatoadrenal syndrome and to study its effect on prognosis and complication of liver cirrhosis.
2. Further clarification is needed in terms of whether glucocorticoid supplements in this subset of patients can improve hemodynamic impairment, multiple organ dysfunction and outcomes.

Design and Development of a Portable Banana Ripeness Inspection System

Mahmoud Soltani*, Reza Alimardani and Mahmoud Omid

Department of Agricultural Machinery Engineering, Faculty of Agricultural Engineering and Technology,
University of Tehran, Karaj, Iran. *mahmoodsoltani39@yahoo.com

Abstract: Automatic control of environmental conditions is an important problem of banana ripening treatment. In this study, a capacitive sensing system was designed and developed. In this method banana fruit is placed in the capacitive sensor as a dielectric material and then the capacitance of sensor is measured. Experiments were carried out with 10 kHz to 10 MHz sinusoidal frequencies. A consistent decrease of ϵ_b had occurred at 100 kHz and 1 MHz frequencies when banana had been ripened. A high correlation was observed between ϵ_b and ripening period ($R^2 = 0.96$) at 100 kHz frequency. This system has the following characteristics: rapid response, simple operation, non-destructive measurement, and low cost.

[Mahmoud Soltani, Reza Alimardani and Mahmoud Omid. **Design and Development of a Portable Banana Ripeness Inspection System.** Journal of American Science 2011; 7(6):401-405]. (ISSN: 1545-1003). <http://www.americanscience.org>.

Keywords: Banana fruit, Dielectric constant, Electronic circuit.

1. Introduction

Recently, capacitive sensors have been used for property determination of agricultural products. The earliest use of capacitive sensor in agriculture as a function of a sensor refers to 80 years ago. The earlier application of this type of sensor was in sensing grain moisture content. The next application of capacitive sensor is qualification of agricultural products. Kato (1997) investigated the relationship between density and internal quality of watermelon. He developed a new electrical method for density sorting of spherical fruits, which measured the volume of fruit by electric capacity and mass by electronic balance. Jarimopas et al. (2005) designed and developed an electronic device with a cylindrical capacitive sensor to measure the volume of selected fruits and vegetables. They reported the electronic device volume measurements of a calibration set of 30 samples correlated very well with those produced by the water displacement method. The R^2 values for watermelons, large cucumbers, wax gourds and guavas were 0.999, 0.957, 0.999, and 0.99, respectively. Rai et al. (2005) designed and developed an electronic device with a parallel plate capacitor to measure the moisture content of selected grain. They reported that the developed instrument was working satisfactorily for all practical purposes in the range of 5-25 % of grain moisture with an accuracy of $\pm 1\%$. Ragni et al. (2006) used a sine wave radio frequency oscillator with parallel plate capacitor sample probe to predict the quality of egg during storage period. They noted the suggested models enabled to classify samples of shell eggs,

while they were not useful to assess with accuracy a single egg. Kumhála et al. (2009) tested a capacitive throughput sensor for potatoes and sugar beets. The principle of the sensor was based on the fact that the dielectric constant of an air/material mixture between two parallel plates increases with material volume concentration. They developed theoretical model for a capacitive throughput sensor. Soltani and Alimardani (2011) investigated correlation between moisture content and dielectric constant of pea and black-eyed pea. They obtained best results at 1 MHz frequency for pea and black-eyed pea with R^2 of 0.994 and 0.999, respectively.

To control the condition of banana ripening treatment and having a good ripened banana fruit, an expert person is needed for determining the level of banana ripeness. Sometimes, banana fruits do not reach to full-ripe step and so the green spots remain on the peel of banana. This problem is because of manual controlling of ripening treatment. To achieve a good ripening, an online controlling system is essential. This work aims to design and develop a device to monitor the ripeness level of banana fruit during ripening treatment and control ripening conditions such as temperature, air moisture content and ethylene concentration.

2. Materials and methods

Sample preparation

The Cavendish variety of banana fruits transported from the Ecuador was used. The banana fruits have been stored at 14°C temperature when they were transferred. Forty three fingers of banana

were randomly selected from banana boxes in a ripening room of Damirchiloo warehouse located in Karaj city, Alborz state, Iran. The experiment was carried out at the airtight ground-warehouse with storage humidity level of 85% - 88% for five days, the time needed for completing the ripening treatment of fruits. At this site, ripeness is currently assessed visually by comparing the peel color of banana with standardized color charts that describe various stages of ripeness. In trade market, seven ripening stages of bananas are usually discerned (Figure 1). Color stage is judged visually by using a chart scale provided to categorize banana based on its level of ripeness. On the first day, banana fruits were at stage one (0% ripened) and on the fifth day, they were at stage six (100% ripened). Ethylene gas with 1000 ppm concentration was treated about 24 hours on first day. It is very important to control temperature, humidity and ethylene gas concentration in the ripening room. In order to give a good artificial climacteric rise of banana fruits during the ripening, electrical measurements were performed in the ripening room. The experiments were conducted in controlled temperature room at 15.5 °C. To measure capacitive properties of banana, a rectangular parallel plate capacitor with 25 cm in length and 10 cm in width was constructed as a standard hardware instrument. The conductive plates were selected from aluminum materials because of its consistency that would not be easily ionized, as a factor that will ruin the results of experiments.

Figure 1. Color chart of banana fruit to recognize the stage of ripeness [1].

Electrical measurements

To study the feasibility of this method, an experimental electronic measuring system was developed. The system is composed of a function generator, data acquisition card and a personal computer. To extract the dielectric constant (ϵ_r) of the material in the sensor, an AC current was needed, because the DC current is not able to pass through the

capacitive sensor. A sinusoidal function generator (Model: AM-1300, Korea) was used to generate sweep sine wave from 10 kHz to 10 MHz. To measure the output voltage of sensor, a data acquisition card (Model: APC-40, Korea) with 100MS/s data sampling rate was used. Figure 2 shows the block diagram of ϵ_r measuring system. To avoid any conduction of fruit because of the banana being in contact with capacitor plates, samples were suspended between the sensor's plates.

Figure 2. The block diagram of experimental measurement system.

Estimation of banana fruit dielectric constant

When a banana sample is suspended through the sensor, an air gap is introduced between banana fruit and plates, therefore the dielectric material through the capacitive sensor is a mixture of air/banana fruit, and in fact, a series-parallel capacitor is formed. To estimate the banana fruit dielectric constant (ϵ_b), a model was proposed by Soltani et al. (2011). In their proposed model, the projected area and thickness of banana fruit is needed. Soltani et al. (2010) developed a new method to predict the projected area of banana as functions of fruit dimensions.

Design of capacitive sensing unit

In order to predict the ripeness percent of banana fruit in warehouses, an electronic unit was designed and developed. The electronic device for ripeness measurement has four components: two rectangular parallel plate capacitor, electronic circuitry, microcontroller, and display (Figure 3). Measuring of ϵ_b initiates after the banana is placed through capacitive sensor on two small brackets. All voltage measurements, calculations and analysis operations are done by microcontroller and then results of ripeness estimation are shown on the display.

The circuit diagram for predicting the ripeness stage of banana fruit is shown in Figure 3. The ATmega 32 microcontroller is the principal part of the system. The ATmega 32 converts analog voltage to digital voltage, estimates ϵ_b and hence of banana ripeness level. The main components of

sinusoidal signal generator circuit are IC-XR2206, resistors R1 and R3. R1 at pin 7 provides the desired frequency tuning and R3 at pin 3 adjusts the amplitude of signal. The output voltage from sensor is converted to DC current by a diode bridge, and then the A/D unit of ATmega 32 measures the output voltage. The system had been calibrated by standard capacitors previously and relation between measured voltage and capacitance was extracted. The dimensions of banana fruit are entered to microcontroller by a 4×4 keypad, finally the results of banana ripeness prediction is displayed on a 16×2 characters LCD (Figure 4). Figure 5 shows the flow diagram of banana ripeness sensing program.

Figure 3. Schematic diagram and designed system for ripeness level prediction.

3. Results and discussion

Relation between percent of ripeness and ϵ_b was investigated at 10 kHz, 100 kHz, 1 MHz and 10 MHz frequencies. Results of linear regression are presented in Table 1. The highest value of R^2 (~0.96) was obtained at 100 kHz. Therefore, the 100 kHz sine wave was selected for production of AC current and calibration of designed system. Relation between percent of ripeness and ϵ_b at 100 kHz is shown in Figure 6.

Table 1. Linear regression between ripeness percent and ϵ_b .

Frequency	R^2	Linear regression
10 kHz	0.811	$P_r = -75.45 \epsilon_b + 350.3$
100 kHz	0.96	$P_r = -178.5 \epsilon_b + 804.47$
1 MHz	0.937	$P_r = -304.8 \epsilon_b + 1374$
10 MHz	0.6	$P_r = -198.6 \epsilon_b + 998$

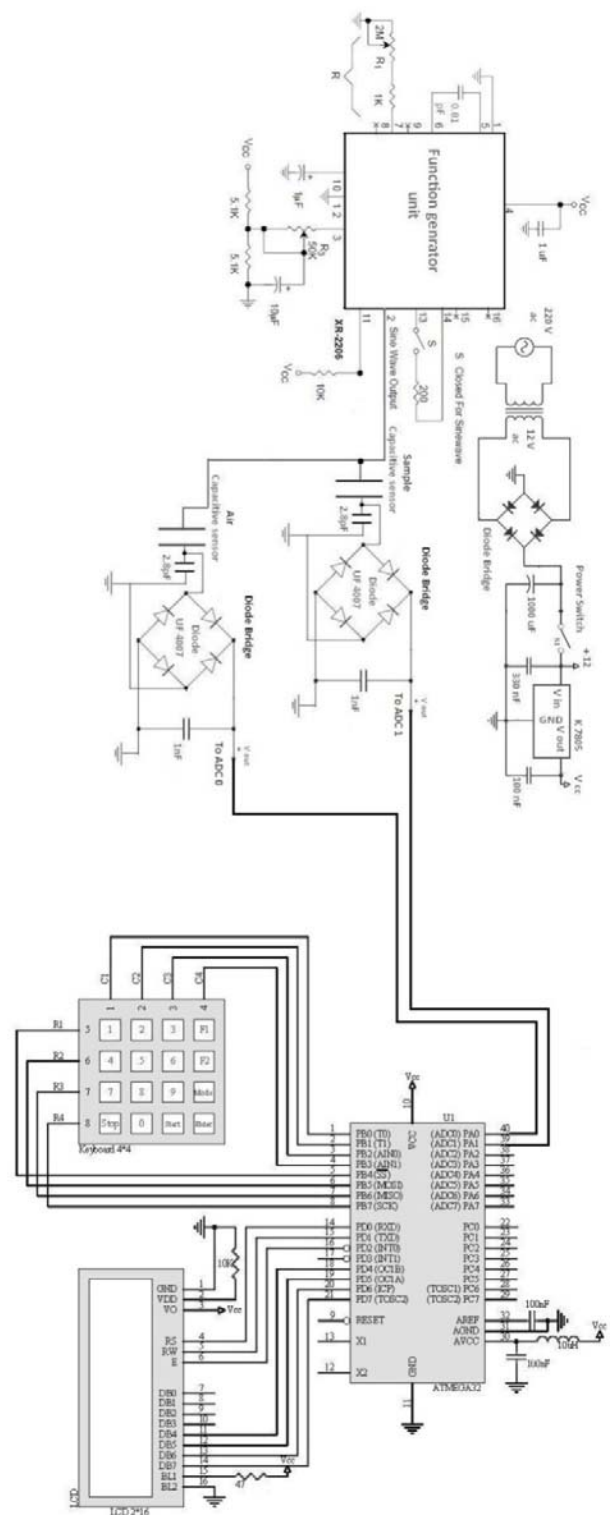

Figure 4. Electronic circuit diagram of the device for banana ripeness measurement.

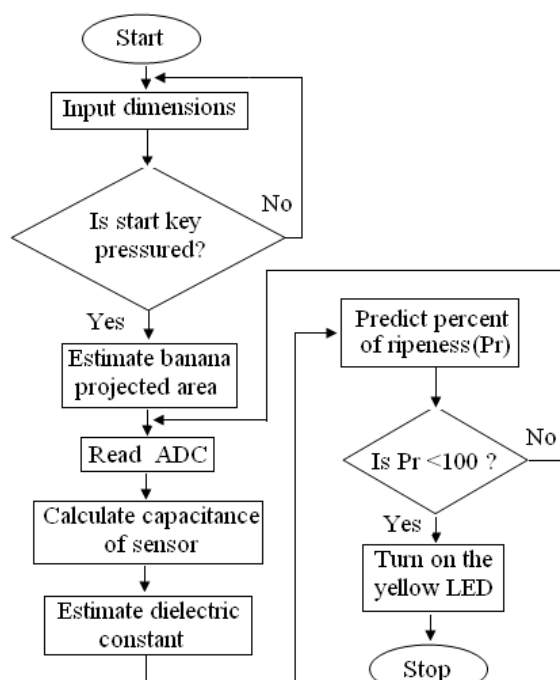

Figure 5. Flow chart of banana ripeness predicting program.

The slope of line was found by means of regression analysis. Since the initial values of dielectric constant differed among samples, to obtain calibration equation for each sample, the first day's dielectric constant, ϵ_{b0} , was used as the abscissa. The level of ripeness is computed by Eq. (1):

$$P_r = -178.5(\epsilon_b - \epsilon_{b0}) \quad (1)$$

Where P_r is the percent of ripeness, ϵ_b is dielectric constant of banana, and ϵ_{b0} is the dielectric constant of banana in first measuring and -178.5 is the coefficient of calibration.

Figure 6. Correlation between percent of ripeness and ϵ_b .

4. Conclusion

A low cost device for predicting the ripeness level of banana fruit was designed and built. This unit estimates the ripeness level of banana by its dielectric constant. The designed system can predict the ripeness level of banana fruit reliably. By this unit, the condition of ripening room such as temperature can be controlled automatically. Dimensions of sample had a direct effect on ϵ_r . The proposed model aiming to eliminate the effects of banana mass and air gap needs to dimensions measurement operation, so the operator need to measure dimensions of banana and inter into the system.

Effect of Chitosan on Oxidative Stress and Metabolic Disorders Induced In Rats Exposed to Radiation

N. E. Mohamed

Biological Applications Department, Nuclear Research Center, Atomic Energy Authority, Cairo, Egypt, P.O.13759
nelshahat@yahoo.com

Abstract: Radiation is one of the most widespread sources of environmental stress in living environment which cause oxidative stress and metabolic changes. Chitosan is widely distributed in nature as a component of bacterial cell walls and exoskeletons of crustaceans and insects. The present study aims to evaluate the antioxidant effect of chitosan against gamma rays induced oxidative stress and metabolic disorders in rats. The study was conducted on forty eight (48) female rats which were classified into four equal groups. Group1: Control group, rats administrated orally 1.0 ml vehicle solution for forty days Group. 2: Chitosan group, rats administrated orally (intragastric intubation) 1.0 ml of chitosan solution (100mg/kg b.wt. / day for 40 days).Group3: Irradiated rats, rats were subjected to whole body –irradiation to dose 4 Gy delivered as single exposure dose. Group 4: Combined treatment: rats administrated orally 1.0 ml of chitosan solution (100mg/kg b.wt. / day) for 40 days. At day 35 of chitosan treatment the rats were irradiated at dose level of 4Gy. Rats inspected after 1th and 5th days post irradiation and liver, spleen, lung and blood samples were collected. The animals exposed to gamma radiation had significant increase in TBARS, LDH, glucose, cholesterol, triglycerides, LDL-C, copper, iron, urea, creatinine, AFP and non significant increase in Mg. Also, significant decrease in GSH, CAT, HDL-C and estradiol was recorded. Administration of chitosan to rats prior and post gamma radiation improved the tested parameters so it is a therapeutic alternative for oxidative stress, hyperlipidaemia and hormonal changes. In this way, chitosan may be contributed to the prevention of atherogenic processes and contribute as safe functional fiber food.

Key words: Chitosan, - irradiation, Antioxidant, Lipid profile, Kidney function, Hormones, Rats.

1. Introduction:

Human exposed to ionizing radiation has become inevitable with its vast application in diagnosis and industry. Everyone on earth exposed to radiation either natural background radiation or some of the population has the occasional medical or dental X-ray (Stevenson, 2001). Radiation damage, is to a large extent caused by over production of reactive oxygen species(ROS) which cause disruption of membrane lipids leading to subsequent formation of peroxide radicals(Rajakpase *et al.*,2007). Oxygen free radicals are highly reactive and may cause cell and tissue damage by interacting with cell membranes and organelles, lipid peroxidation is a ubiquitous phenomenon in the body under the influence of oxidative stress (Ozturk *et al.*, 2003). Reactive oxygen species are constantly generated in aerobic organisms during normal metabolism and in response to both internal and external stimuli as a result of water radiolysis (Kamat *et al.*, 2000). ROS have been implicated as major initiators of tissue damage and can up regulate enzyme activity, signal transcription, and gene expression (Massafra *et al.*, 2000).

Evidences have shown that over production of ROS in both intra and extra cellular spaces results as an imbalance between pro-oxidants and antioxidants that cause ROS production exceed the activity of

endogenous antioxidants which increase oxidative stress. Once this imbalance takes place cellular molecules such as nucleic acids, proteins, structural carbohydrates, and lipids may be damaged by oxidative modifications (Ornoy, 2007). Also,ROS play a causative role in numerous disease pathologies such as cancer, ischemia, and degenerative disease such as aging, atherosclerosis, arthritis and neurodegeneration (Nelson and Melendez,2004)and cytotoxicity, metabolic and morphologic changes in animals and humans(Fang *et al.*,2002).

Marine organisms produce many bioactive substances, which are having a lot of potential applications. Chitosan, is the deacetylated form of chitin of marine origin is extracted from the shells of crustaceans (Sini *et al.*, 2005).

Chitosan (CS), is non toxic copolymer consisting of -(1, 4)-2- amino-2 deoxy-D-glucose (1, 4-linked polymer of glucosamine) and lesser amounts of N-acetylglucosamine. It is a naturally occurring biodegradable and biocompatible cationic polysaccharide derived from the N-deacetylation of chitin which is the most abundant natural structure polysaccharide after cellulose. It can be found in exoskeleton of crustaceans which can be obtained from the shell waste of the crab, shrimp and craw fish during processing industries and in fungal cell walls (Shahdat *et al.*, 2007). As a natural renewable

resource, chitosan has both reactive amino and hydroxyl groups that can be used under mild reaction for biomedical application. Chitosan is an attractive agent for drug development given its function in the gastrointestinal tract and its intrinsic safety when taken orally (Murata *et al.*, 2009).

Chitosan is the most abundant natural amino polysaccharide and is being used as a new source of dietary fiber (Liao *et al.*, 2007). Chitosan has a number of unique properties such as clarification, purification, antimicrobial activity, non toxicity, biocompatibility and biodegradability, which attract scientific and industrial interest in fields of biotechnology, pharmaceuticals, waste water treatment, cosmetics, agriculture, food science nutrition, paper and textiles to use it (Hua and Wang, 2009). Also, it combined with calcium phosphates for use as bone graft substitutes (Geffre *et al.*, 2010). Chitosan has many advantages due to its nontoxicity and biodegradability without damaging the environment. It is a biocompatible material that breaks down slowly into a harmless product, glucosamine, which is absorbed completely by the body (FDA, 2002).

Chitosan has been reported to possess immunological (Mori *et al.*, 1997), antibacterial (Tokura *et al.*, 1997) and wound healing (Okamoto *et al.*, 1993) properties. Both hard and soft contact lenses can be made from chitosan (Santhosh *et al.*, 2006). Sapelli *et al.* (1986) studied the application of chitosan in dentistry.

The present study designed to establish the putative protective, antioxidant and restorative effect of chitosan against gamma radiation induced oxidative stress which alternate the antioxidant status in hepatic, spleen and lung tissues and metabolic disturbances in serum.

2-Material and Methods

2.1.1-Materials

Chitosan with high molecular weight, Brookfield viscosity 800.000 cPS (Aldrich product of USA) was dissolved in 1% glacial acetic acid solution.

2.1.2- Animals

Female albino rats (130-140g) were obtained from the animal breeding house of Nuclear Research Center, Atomic Energy Authority, Inshas, Egypt. The animals were kept in isolated cages, under standard laboratory conditions including all hygienic measures with constant illumination and ventilation and normal conditions of temperature and humidity. Animals were maintained on a standard laboratory pellets containing all nutritive elements and free access to tap water was available. The animals were allowed to acclimatize for two weeks before the experiment.

2.1.3- Radiation Facility:

Whole body gamma irradiation was performed using gamma cell -60 (Cobalt-60) unit at the Middle Eastern Regional Radioisotopes Center for The Arab Countries (MERRCAC), Dokky, Cairo, Egypt. Animals were exposed to 4.0 Gy applied as a single shot dose.

2.1.4-Experimental design

The animals were randomly assigned into 4 groups (12 rats for each group).

Group1: Control group, rats administrated orally 1.0 ml vehicle solution (1% glacial acetic acid in distilled water) for forty days. Group 2: Chitosan group, rats administrated orally 1.0 ml of chitosan solution contains dose level of 100mg/kg b.wt. / day for forty days using stomach tube. Group3: Irradiated rats, rats were subjected to whole body - irradiation to dose 4 Gy delivered as single exposure dose. Group 4: Combined treatment: rats administrated orally (intra-gastric intubation) 1.0 ml of chitosan solution contains dose level of 100mg/kg b.wt. / day for 40 days. At day 35 of chitosan treatment the rats were irradiated at dose level of 4Gy.

2.1.5-Sample Collection

Animals were fasted overnight prior to sacrificing. Six rats from different animal groups sacrificed at 1st and 5th days after the irradiation. Blood samples were collected in two types of tubes the first contain sodium fluoride for glucose determination and the second plain tube to separate serum. Liver, spleen and lung were rapidly excised, washes with physiological saline solution, dried, weighed and homogenized in phosphate buffer (pH7.4) and kept frozen until used for biochemical assays.

2.2- Biochemical parameters

Lipid peroxidation content was determined by quantifying thiobarbituric acid reactive substance (TBARS) in tissue homogenates according to the colorimetric method described by Yoshioka *et al.* (1979), Catalase (CAT) activity was determined according to the method described by Johansson and Hakan Borg (1988). Determination of reduced glutathione (GSH) content was performed according to Beutler *et al.* (1963). Serum lactate dehydrogenase (LDH) estimated according to Young (2001). Serum levels of total cholesterol, triglycerides and high density lipoprotein (HDL-C) according to Allain *et al.* (1974), Fossati and Principe (1982) and Demacer *et al.* (1980) respectively. Low density lipoprotein (LDL-C) according to Friedewald *et al.* (1972). Serum urea and creatinine were estimated according to Young (1990) and Henery (1974) respectively. Serum copper, iron and magnesium determined

colorimetrically using commercial spectrum diagnostic kits (Germany). Plasma glucose determined according to Teitz (1986). Estimated sera and plasma parameters were colorimetrically methods performed by using spectrophotometer (Milton Roy Spectronic 1201). Serum alpha feto protein (AFP) and estradiol (E2) were determined using radioimmunoassay kit purchased from Immunotech A Bechman Coulter Company ,France ,using solid phase radioimmunoassay technique(RIA). The day before the animals were sacrificed vaginal smear was done to determine the oestrus cycle stage, so the data of estradiol (E2) represent the mean values of different oestrus cycle.

2.3-Statistical analysis

Data were recorded as mean \pm SE. The results were submitted to one way analysis of variance(ANOVA) according to Snedecore and Cochran(1989) and means were compared between groups by Duncan multiple range test(Duncan,1955).

3. Results

There were no significant differences in behavior or external appearance and food consumption between control and rats administrated chitosan. In addition, no significant difference in blood biochemistry was found in both control and treated rats with chitosan.

In the present study the TBARS levels in hepatic, spleen and lung tissues were significantly ($P<0.05$) increased, while GSH content and CAT activity significantly ($P<0.05$) decreased in irradiated rats group, when compared to control. The TBARS levels in hepatic, spleen and lung tissues showed a significant ($P<0.05$) decrease in rats treated with chitosan prior and post whole body - irradiation, when compared to irradiated group. In addition, significant ($P<0.05$) increases in the GSH content and the activity of CAT were observed in hepatic, spleen and lung tissues in rats administrated chitosan prior and post irradiation as compared to irradiated rats (Table 1).

Data are presented as mean \pm SE

The different small letters in the same row are significantly differ at $P<0.05$

The results presented in Table (2) showed that the serum activities of LDH was not significantly ($P>0.05$) affected by chitosan administration compared to the control group. However, - irradiation leads to significant ($P<0.05$) increase in the serum levels of these myocardial injury marker

compared to the control group. The prior administration of chitosan for thirty five days before whole body - irradiation and five days post irradiation at dose of 4 Gy maintained the activities of this enzyme close to their normal activity as compared to control group (Table 2).

Data are presented as mean ±SE

The different small letters in the same row are significantly differ at P<0.05

As shown in (Table 2), - irradiation significantly (P<0.05) increase plasma glucose and altered serum lipid profile. The levels of total cholesterol, triglycerides and LDL-C were significantly (P<0.05) increased and HDL-C was significantly decreased in the irradiated rats group when compared to control group. The prolonged administration of chitosan prior and post exposure to single shot dose body - irradiation showed significantly (P<0.05) lower the alteration in the plasma glucose and lipid profile levels when compared to the irradiated rats.

Results in Table (3) show that irradiation caused significant (P<0.05) increase in serum Cu, Fe, urea, creatinine and non significant increase in Mg as compared to control group. Chitosan administration prior and post irradiation discerned significantly

(P<0.05) lower levels than irradiated group and non significant decrease in Mg as compared to control group.

Table (4) show no significant changes in serum AFP and E2 levels in rats treated with chitosan when compared to control group. A significant (P<0.05) increase was observed in serum AFP level in the irradiated group compared to control group. While the irradiated group discerned significant (P<0.05) decrease in E2 compared to the control group. The prolonged administration of chitosan prior and post whole body exposure to single dose of 4 Gy - irradiation showed significant (P<0.05) decrease in AFP and significant (P<0.05) increase in E2 levels as compared to the irradiated group

4. Discussion

Lipid peroxidation, a process induced by free radicals leads to oxidative deterioration of polyunsaturated lipids (Català, 2009). Under normal physiological conditions, only low levels of lipid peroxides occur in body tissues. The excessive generation of free radicals leads to peroxidative changes that ultimately result in enhanced lipid peroxidation (Joshi *et al.*, 2007). Radiation exposure has been reported to be associated with increased disruption of membrane lipids leading to subsequent formation of peroxide radicals (Rajapakse *et al.*, 2007).

In the present investigation, such a disruption of membrane lipids possibly accumulated for the observed increase in TBARS levels in the hepatic, spleen and lung tissues of irradiated rats. In addition, insufficient levels of antioxidants to scavenge peroxy-radicals during radiation could also have contributed to the elevated level of TBARS in irradiated rats (Manda *et al.*, 2007).

Glutathione is the most abundant nonprotein sulfhydryl containing compound and constitutes the largest component of the endogenous thiol buffer (Holmgren *et al.*, 2005). Assessment of GSH in biological samples is essential for evaluation the redox homeostasis and detoxification status of cells in relation to its protective role against oxidative and free radical mediated cell injury (Rossi *et al.*, 2005). The present study recorded a significant depletion of GSH content in hepatic, spleen and lung tissues in irradiated animals as compared to control group due to oxidative stress. The depletion of GSH content in irradiated rats might be due to enhanced utilization during detoxification process. The resultant reduction in GSH level may thus increase susceptibility of the tissue to oxidative damage including lipid peroxidation. However, Glutathione has diverse cellular functions in addition to its antioxidant properties including enzymatic conjugation through the glutathione-S transferase family of proteins and non enzymatic conjugation to cytotoxic compounds. Glutathione may react with

H₂O₂ and lipid peroxides by action of GSH-PX to reduce their toxicity (Davis *et al.*, 2001).

Depletion in GSH level after radiation exposure might be resulted from diffusion through impaired cellular membranes and / or inhibition of GSH synthetase. Also, the decrease in the content of organs GSH might result from a diminished activity of glutathione reductase and a deficiency of NADPH which is necessary to change the oxidized glutathione to its reduced form (Pulpanova *et al.*, 1982). GSH can function as an antioxidant in many ways. It can react chemically with singlet oxygen, superoxide and hydroxyl radicals and therefore function directly as a free radical scavenger. GSH may stabilize membrane structure by removing acyl peroxides formed by lipid peroxidation reactions (Price *et al.*, 1990).

The prolonged administration of chitosan prior irradiation induced significant decrease in TBARS and significant elevation in GSH content and CAT activity in all tissues investigated as compared to irradiated group throughout the experiment. These results became in accordance with (Jeon *et al.*, 2003) who reported that chitosan administration significantly decreased liver thiobarbituric acid reactive substances (TBARS) and increased antioxidant enzyme activities catalase and superoxide dismutase

Antioxidants are necessary for preventing the formation of free radicals and they inhibit some of the deleterious actions of reactive oxygen species on lipids, DNA and proteins (Boojar and Shockravi, 2007). The observed reduction in the TBARS level in irradiated rats following administration of chitosan is one indicator of the antioxidant activity of chitosan as illustrated by (Chiang *et al.*, 2000).

Animals treated with chitosan alone did not record any abnormal changes as compared to the control group (Table 1). Xie *et al.* (2001) showed that the scavenging effect of chitosan on hydroxyl radicals inhibits lipid peroxidation of phosphatidylcholine and linoleate liposomes *in vitro*. Harish *et al.* (2007) reported that chitosan showed scavenging of ·OH and O₂⁻ radicals and offered

protection against calf thymus DNA damage. The free radical quenching property of this marine polysaccharide has been reported (Xing *et al.*, 2005). The results obtained are in agreement with De Jesuse Valle *et al.* (2008) who reported a protective effect against oxidative stress in lung tissue which might even be attributed to chitosan inhalation.

The decrease in the activities of CAT could be due to a feed back inhibition or oxidative inactivation of enzyme protein caused by ROS generation (Ohta *et al.*, 2004) the current study recorded significant depletion of CAT activity in irradiated rats. However, CAT is one of three families of primary antioxidant enzymes in mammalian cells which are critical to peroxide removal. So the recorded depletion of enzymatic activity of CAT may be due to the increased utilization of this antioxidant to counteract lipid peroxidation production, however CAT removing H₂O₂ which occurred (Kalpana and Menon, 2004). Also, the decrease in the activity of CAT might be attributed to excess of ·OH resulting from water radiolysis after exposure to ionizing radiation which causes oxidative damage to enzymes that lead to the modification of the activity of CAT (Kregal and Zhang, 2007).

Radiation is associated with a decrease in antioxidants and an increase in oxidant free radicals resulting in increased oxidative stress which is followed by development of a variety of sub cellular changes in the myocardium, typical of radiation induced cardiac injury (Diniz *et al.*, 2003). The results obtained showed significant elevations in the activities of LDH in the serum of irradiated rats which indicate the severity of radiation induced necrotic damage of the myocardial membrane and the release of LDH enzyme from damaged heart tissue into the blood stream and an alterations in dynamic permeability of cardiac cell membranes due to the excessive production of free radicals and lipid peroxides that caused cellular membrane damage and leakage of cytosolic enzymes (Sridharan and Shyamaladevi, 2002).

In the present study, the prior- administration of chitosan was found to significantly lower the radiation induced elevation in the levels of diagnostic marker enzyme. This could be due to the free radical scavenging property of chitosan (Santhosh *et al.*, 2007).

Major precursors of atherosclerosis (hyperglycaemia, hypercholesterolaemia, hypertriglycerolaemia and even the process of aging) all induce mitochondrial dysfunction. Chronic overproduction of mitochondrial ROS leads to destruction of pancreatic β -cells increased oxidation

of LDL-C and dysfunction of endothelial cells. Factors that promote arteriosclerosis (Nageswara *et al.*, 2007). In the present study, the elevated level of plasma glucose in - irradiated group may be correlated with hepatic gluconeogenesis and glycogenolysis (Verspohl *et al.*, 2003).

Radiation induced hyperglycemia could be attributed to the diminished utilization of glucose by irradiated tissues. Irradiation could induce the transport of certain amino acids and thus increased glucose formation through the processes of deamination and transamination (Alhersova *et al.*, 1981) as well as acceleration of gluconeogenesis, which resulted as an indirect effect of radiation exposure (Sedlakova *et al.*, 1998). The increase in glucose level may also be related to endocrine abnormalities induced by irradiation which promote the secretion of biologically active peptide as ACTH which has well documented relation to carbohydrate metabolism by promoting gluconeogenesis in the liver (Harper *et al.*, 1977). Elevated glucose levels in the blood causes the sugar to chemically react with proteins of the blood vessel walls and form glycosylated proteins that subsequently causes the capillaries to swell and get easily broken (Jean-Luc and Schmidt, 2004).

Administration of chitosan prior and post irradiation cause significant decrease in plasma glucose level. This result became in accordance with Yao *et al.* (2008). Other study demonstrated that oral chitosan microcapsulated insulin has the antihyperglycemic effect on the blood glucose level of streptozotcin diabetic rats (Huang *et al.*, 2001).

The hyperlipidaemic state observed after irradiation could be attributed to the mobilization of fats from the adipose tissue to the blood stream (Chajek-Shaul *et al.*, 1989), in addition to mitochondrial dysfunction (Nageswara *et al.*, 2007). Hypercholesterolaemia is an important risk factor for cardiovascular disease (Bokura and Kobayashi, 2003). Oxidation of LDL-C accelerates the growth of fatty streaks in blood vessel walls and the formation of plaque (Klebanov *et al.*, 1998). Toxic aldehydes formed in lipid oxidation react with the apo lipoprotein B of the LDL particle to produce a novel epitope that is recognized by macrophage receptors, resulting in the formation of foam cells and arteriosclerotic plaques and increased risk of heart disease and stroke (Burcham *et al.*, 2002).

Irradiation induces hyperlipidemia through cell membrane destruction, enhancement of lipid metabolism, cholesterol release and triglycerides synthesis (Bodwen *et al.*, 1989). Free radicals destruct cell membranes and enhance cholesterol release and increase lipid peroxidation (Karbownik and Reiter, 2000).

Increased triglycerides after irradiation might result from inhibition of lipoprotein lipase activity leading to reduction in uptake of triglycerides by adipose cells (Sedlakova *et al.*, 1998). The hypercholesterolemia and hypertriglyceridemia might be attributed to an increase in the activity of 3-hydroxyl methyl glutaryl COA, as an early reaction necessary for the restoration of biomembranes (Kolomijtseva, 1986). In addition to decreased fatty acid oxidation (Clark, 2001). Moreover, radiation enhanced the process of lipid peroxidation which results in cell membrane damage and the release of fats from peripheral and adipose tissues to the blood (Sedlakova *et al.*, 1998). This increase may be due to increased lipolysis of depot triglycerides liberates free fatty acids from adipose tissue stores and the free fatty acids liberated by the adipose tissue are also, taken up by the liver tissue, leading to the hypertriglyceridemic condition (Sedlakova *et al.*, 1998).

The data obtained demonstrated that chitosan administration to rats prior and post gamma irradiation resulted in amelioration of hyperlipidemic status. Such a protective effect was ascribed by Ylitalo *et al.* (2002). One mechanism by which CS might decrease cholesterol levels is by adsorption of bile acids (BAs) (Shields *et al.*, 2003). BAs are secreted in the gastrointestinal tract, primarily as glycine or taurine conjugates (primary BAs), after which secondary BAs, such as deoxycholate are produced from primary BAs by intestinal microorganisms. BAs are re-cycled via the enterohepatic circulation. Chitosan combined bile acids in the digestive tract and combined its products (primary bile acids, cholic acid and chenodeoxycholic) was excreted into the feces. Therefore, the oral administration of an anion – exchange resin, such as cholestyramine, inhibits the enterohepatic circulation of BAs, thereby decreasing serum cholesterol levels (Homma *et al.*, 1997). Also, Murata *et al.* (2009) reported that hypercholesterolaemic rats fed a diet containing chitosan significantly had increased fecal fat and cholesterol excretion, reduced the lipid level in plasma and liver and tended to relieve the degenerated fatty liver tissue. These results suggest that chitosan reduced the absorption of dietary fat and cholesterol *in vivo* and could effectively improve hypercholesterolemia in rats.

Animals administered chitosan did not alter the plasma glucose concentration as compared to the control group. This result became in agreement with (Yao *et al.*, 2006), who reported that diabetic rats administered chitosan had lower levels of plasma glucose, cholesterol, higher fecal cholesterol concentration and plasma TBARS was significantly

decreased in diabetic rats. Also, Xia *et al.* (2010) reported that the supplementation of chitosan to rats fed on high fat diet reduced effectively the serum lipid levels such as total cholesterol, LDL-c and triglycerides which were regarded as to cause the cardiovascular disease moreover it elevated effectively HDL-c value which was regarded protect cardiovascular diseases. This result suggested that chitosan could effectively prevent hypercholesterolemia with a high fat diet and a longer treatment time brought a greater hypercholesterolemic effect. These results are in agreement with Zhou *et al.* (2008) who reported that chitosan was thought to possess hypocholesterolemic properties. Xu *et al.* (2007) suggested that chitosan improve lipid metabolism by regulating cholesterol and LDL by upregulating of hepatic LDL receptor mRNA expression, increasing the excretion of fecal bile acids.

The results obtained suggest that the lipid lowering effects of chitosan may be mediated by increases in fecal fat and / or bile acid excretion resulting from the binding of bile acids and by a decrease in the absorption of dietary lipids from the small intestine as a result of the inhibition of pancreatic lipase activity. These results are in agreement with Santhosh *et al.* (2007). Other study by Shahdat *et al.* (2007) suggested that dietary chitosan decreases the atherogenic lipid profiles of both normocholesterolaemic and hypercholesterolaemic rats and reduces the body weight gain of hypercholesterolaemic rats.

Increased cholesterol levels in the liver might be due to increased uptake of LDL from the blood by the tissues (Kissler *et al.*, 2005). The abnormal cholesterol deposition is favored by the dangerous tendency of cholesterol to passive exchange between the plasma lipoproteins and the cell membranes (Brown and Goldstein 1986). The hepatoprotective effect of chitosan is probably related to its ability to inhibit the lipid accumulation in the liver tissue by its antilipidemic property (Xing *et al.*, 2005). Moreover, Anraku *et al.* (2011) reported that chitosan reduces the levels of pro-oxidants such as cholesterol and uremic toxins in the gastrointestinal tract, thereby inhibiting the subsequent development of oxidative stress in the system circulation.

Copper is absorbed into the intestine and transported by albumin to the liver. Copper is carried mostly in the blood stream on a plasma protein called ceruloplasmin. Exposure to gamma irradiation is associated with an increase in serum levels of Cu as compared to control rats. Hepatic Cu overload leads to progressive liver injury and eventually cirrhosis (Dashti *et al.*, 1992). Increased Cu level

may due to oxidative stress inducing proteolytic modification of ceruloplasmin (Kemal *et al.*, 2003).

In the present study the increased iron level in irradiated rats may be due to oxidative stress inducing proteolytic modification of ferritin and transferrin (Trinder *et al.*, 2000). Iron overload is associated with liver damage characterized by massive iron deposition in hepatic parenchymal cells, leading to fibrosis and eventually to hepatic cirrhosis. Accumulation of iron induced hepatotoxicity might be attributed to its role in enhancing lipid peroxidation. Free iron or low molecular iron or chelatable iron pool facilitates the decomposition of lipid hydroperoxides resulting in lipid peroxidation and induces the generation of $\bullet\text{OH}$ radicals and also accelerates the non enzymatic oxidation of glutathione to form $\text{O}_2^{\bullet-}$ radicals (Pulla and Lokesh, 1996).

Administration of chitosan prior and post irradiation was observed to prevent the generation of strongly oxidating hydroxyl radical by chelating of transitional metals ions, Cu and Fe. Furthermore, chitosan was shown to act as antioxidant (Chiang *et al.*, 2000) and prevent lipid peroxidation of cell membranes (Santhosh *et al.*, 2007).

Peroxidation of lipids can disturb the assembly of the membrane, causing changes in fluidity and permeability, alterations of ion transport and inhibition of metabolic processes (Nigam and Schewe, 2000). The serum level of magnesium was decreased in irradiated rats supplemented with chitosan. This results in agreement with Liao *et al.* (2007) who reported that chitosan supplementation over 8 weeks lowered blood lipids and maintain normal calcium, magnesium and iron status in elderly hyperlipidemic patients.

The exposure to single dose of γ - radiation leads to a significant increase in serum urea and creatinine levels due to the increased protein breakdown as the urea is the end product of protein catabolism however, the degradation of protein by exposure to ionizing radiation is accompanied by an increase in the serum urea and different tissues free ammonia (Moulder *et al.*, 2002). Also, ionizing radiation induce extensive retention in daily excreted urine that lead to increased creatinine and urea levels in the blood (Robbins *et al.*, 2001) and increased production of ROS and oxidative stress (Ogeturk *et al.*, 2005). The findings of Robbins *et al.* (2002) indicated that kidney irradiation clearly leads to a progressive reduction in function associated with concomitant glomerulosclerosis and / or tubulointerstitial fibrosis with many of pathologic changes. The results obtained indicated that water soluble chitosan did not cause liver, spleen, lung or kidney damage so that it is safe functional food

(Sumiyoshi and Kimura, 2006) and improve kidney function due to its antioxidant effect (Chiang *et al.*, 2000).

The serum level of AFP was significantly increased after irradiation which may be due to hepatic damage as a result of lipid peroxidation increased after irradiation. In the present study AFP showed significant increases in irradiated animals group concomitant with increased level of TBARS, marker of lipid peroxidation have high toxicity and an inhibitory action on protective enzyme and so it acts as a tumor promoter and carcinogenic agent (Taysi *et al.*, 2002). Alpha- feto protein (AFP) may be elevated due to hepatocellular carcinoma, as well as chronic hepatitis and liver cirrhosis (Kawai *et al.*, 2005).

Also, estradiol decrease in irradiated animals due to damage effect of radiation on gonad. The treatment with chitosan prior irradiation revealed significant modulatory effect of the studied parameters. A high molecular weight water soluble chitosan had significant effects on the ovulation rate, both the *in vivo* and *in vitro* fertilization rates and embryonic development. These results indicate an improvement in the ovarian and oviduct dysfunctions caused by obesity and suggest an adjustment in the internal secretions and metabolic functions (Choi *et al.*, 2002).

All rats appear healthy and remain active after oral administration of chitosan therefore chitosan is safe dietary fibers to inhibit hypercholesterolemia. The results obtained are in agreement with Tao *et al.* (2011).

In conclusion, the results of the present study indicate that the administration of chitosan prior and post irradiation may prevent the deleterious effects of irradiation. The overall hepatoprotective effect of chitosan is probably due to a counteraction of free radicals by its antioxidant nature which decrease TBARS production and increase antioxidant GSH content, enzyme CAT activity and / or to its ability to inhibit lipid accumulation by its antilipidemic property. Therefore, it is greatly recommended to incorporate chitosan in the diet as a nutritional fiber supplement before and during radiotherapy to prevent the oxidative daily damage induced by radiotherapy.
